et aegypto multa genera quae non aliubi, ante omnia ficus ob id aegyptia cognominata. arbor moro similis folio, magnitudine, aspectu; pomum fert non ramis, sed caudice ipso, idque ficus est praedulcis sine granis interioribus, perquam fecundo proventu scalpendo tantum ferreis unguibus; aliter non maturescit. sed cum hoc factum est, quarto die demetitur alio subnascente, septeno ita numerosa partu per singulas aestates, multo lacte abundante.

subnascitur, etiamsi non scalpatur, fetus quater aestate prioremque expellit immaturum. materies proprii generis inter utilissimas. caesa statim stagnis mergitur - hoc est eius siccari - et primo sedit, postea fluitare incipit, certoque eam sugit alienus umor, qui aliam omnem rigat. cum innatare coeperit, tempestivae habet signum.

huic similis quadamtenus quae vocatur cypria ficus in creta. nam et ipsa caudice ipso fert pomum et ramis, cum in crassitudinem adolevere, sed haec germen emittit sine ullis foliis radici simile. caudex arboris similis populo, folium ulmo. fructus quaternos fundit, totiens et germinat, sed grossus eius non maturescit nisi incisura emissio lacte. suavitas et interiora fici, magnitudo sorvi.

similis et quam iones cerauniam vocant, trunco et ipsa fertilis - pomum siliqua - ; ob id quidam aegyptiam ficum dixere, errore manifesto: non enim in aegypto nascitur, sed in syria ioniaque et circa cnidum atque in rhodo, semper comantibus foliis, flore candido cum vehementia odoris, plantigera imis partibus et ideo superficie flavescens, sucum auferente subole. pomo antecedentis anni circa canis ortus detracto statim alterum parit, postea floret per arcturum, hieme fetus eius nutriente.

aegyptus et perseam arborem sui generis habet, similem piro, folia retinentem. fertilitas adsidua eius, subnascente crastino fructu, maturitas etesiarum adflatu. pomum longius piro, inclusum amygdalae putamine et corio, colore herbido, sed ubi nux illi, huic prunum differens brevitate ac mollitia et, quamvis blandiatur praedulcis suavitas, innocuum. materies bonitate, firmitudine, nigritia quoque nihil differens a loto. simulacra et ex ea factitavere. non eadem gratia, quamquam fideli, materiae ex arbore quam balanum appellavimus, magna ex parte contortae; navalis itaque tantum est. at e diverso cuci in magno honore, palmae similis, quando et eius foliis utuntur ad textilia. differt quod in brachia ramorum spargitur. pomo magnitudo quae manum inpleat, colos fulvus, commendabili suco ex austero dulci. lignum intus grande firmaeque duritiae, ex quo velares detornant anulos. in eo nucleus dulcis, dum recens est; siccatus durescit ad infinitum, ut mandi non possit, nisi sit pluribus diebus maceratus. materies crispioris elegantiae et ob id persis gratissima. nec minus spina celebratur in eadem gente dumtaxat nigra, quoniam incorrupta etiam in aquis durat, ob id utilissima navium costis. candidae facile putrescunt. aculei spinarum et in foliis, semen in siliquis, quo coria perficiunt gallae vice. flos et coronis iucundus et medicamentis utilis. manat et cummis ex ea. sed praecipua utilitas quod caesa anno tertio resurgit. circa thebas haec, ubi et quercus et perseae et olivae, ccc a nilo stadiis, silvestri tractu et suis fontibus riguo. ibi et prunus aegyptia, non dissimilis spinarum proxime dictarum, pomo mespili, maturescens bruma nec folia dimittens. lignum in pomo grande, sed corpus ipsum natura et copia messium instar incolis; purgatum enim tundunt servantque eius offas. silvestris fuit et circa memphim regio tam vastis arboribus, ut terni non quirent circumplecti, unius peculiari miraculo, nec pomum propter usumve aliquem, sed eventum. facies est

spinae, folia habet ceu pinnas, quae tactis ab homine ramis cadunt protinus ac postea renascuntur.

cummim optimam esse ex aegyptia spina convenit, vermiculatam, colore glauco, puram, sine cortice, dentibus adhaerentem. pretium eius in libras #1108 iii. deterior ex amygdalis amaris et ceraso, pessima e prunis. fit et in vitibus infantium ulceribus aptissima, et aliquando in olea dentium dolori, ulmo etiam in coryco monte ciliciae ac iunipiro ad nihil utiles, ex ulmi vero cummi et culices ibi nascuntur. fit et e sarcocolla - ita vocatur arbor et cummis - utilissima pictoribus ac medicis, similis pollini turis et ideo candida quam rufa melior. pretium eius quod supra.

nondum palustria attingimus nec frutices amnium; prius tamen quam digrediamur ab aegypto, et papyri natura dicetur, cum chartae usu maxime humanitas vitae constet, certe memoria. et hanc alexandri magni victoria repertam auctor est M. Varro, condita in aegypto alexandria. antea non fuisse chartarum usum: in palmarum foliis primo scriptitatum, dein quarundam arborum libris. postea publica monumenta plumbeis voluminibus, mox et privata linteis confici coepta aut ceris; pugillarium enim usum fuisse etiam ante troiana tempora invenimus apud homerum, illo vero prodente ne terram quidem ipsam, quae nunc aegyptus, intellegitur, cum in sebennytico et saite eius nomo omnis charta nascatur, postea adaggeratam nilo, si quidem a pharo insula, quae nunc alexandriae ponte iungitur, noctis dieique velifico navigi cursu terram afuisse prodidit. mox aemulatione circa bibliothecas regum ptolemaei et eumenis, supprime chartas ptolemaeo, idem Varro membranas pergami tradit repertas. postea promiscue repatuit usus rei qua constat immortalitas hominum.

papyrus ergo nascitur in palustribus aegypti aut quiescentibus nili aquis, ubi evagatae stagnant duo cubita non excedente altitudine gurgitum, brachiali radice obliquae crassitudine, triangulis lateribus, decem non amplius cubitorum longitudine in gracilitatem fastigatum, thyrsi modo cacumen includens, nullo semine aut usu eius alio quam floris ad deos coronandos. radicibus incolae pro ligno utuntur, nec ignis tantum gratia, sed ad alia quoque utensilia vasorum. ex ipso quidem papyro navigia texunt et e libro vela tegetesque, nec non et vestem, etiam stragula ac funes. mandunt quoque crudum decoctumque, sucum tantum devorantes. nascitur et in syria circa quem odoratus ille calamus lacum, neque aliis usus est quam inde funibus rex antigonus in navalibus rebus, nondum sparto communicato. nuper et in euphrate nascens circa babylonem papyrus intellectum est eundem usum habere chartae; et tamen adhuc malunt parthi vestibis litteras intexere.

praeparatur ex eo charta diviso acu in praetenues, sed quam latissimas phyliras. principatus medio, atque inde scissurae ordine. hieratica appellabatur antiquitus religiosus tantum voluminibus dicata, quae adulatione Augusti nomen accepit, sicut secunda liviae a coniuge eius: ita descendit hieratica in tertium nomen. proximum amphitheatriticae datum fuerat a confecturae loco; excepit hanc romae fanni sagax officina tenuatamque curiosa interpolatione

principalem fecit e plebeia et nomen ei dedit; quae non esset ita recurata, in suo mansit amphitheatritica. post hanc saitica ab oppido ubi maxima fertilitas, ex vilioribus ramentis, propiorque etiamnum cortici taeneotica a vicino loco, pondere iam haec, non bonitate, venalis. nam emporitica inutilis scribendo involucris chartarum segestriumque mercibus usum praebet, ideo a mercatoribus cognominata. post hanc papyrum est extremumque eius scirpo simile ac ne funibus quidem nisi in umore utile. textitur omnis madente tabula nili aqua. turbidum liquoris glutinum praebet. in rectum primo supina tabulae schida adlinitur longitudine papyri quae potuit esse, resegminibus utrimque amputatis, traversa postea crates peragit. premitur ergo praelis, et siccantur sole plagulae atque inter se iunguntur, proximarum semper bonitatis deminutione ad deterrimas. numquam plures scapo quam vici-nae.

magna in latitudine earum differentia: xiii digitorum optimis, duo detrahuntur hieraticae, fanniana denos habet, et uno minus amphitheatritica, pauciores saitica, nec malleo sufficit; nam emporiticae brevitates sex digitos non excedit. praeterea spectatur in chartis tenuitas, densitas, candor, levor. primatum mutavit claudius caesar: nimia quippe augustae tenuitas tolerandis non sufficebat calamis; ad hoc tramittens litteras liturae metum adferebat ex aversis, et alias indecoro visu pertralucida. igitur e secundo corio statumina facta sunt, e primo subtemina. auxit et amplitudinem, pedali mensura. erat et cubitalis macrocollis, sed ratio deprehendit vitium, unius schidae revulsione plures infestante paginas. ob haec praelata omnibus claudia, augustae in epistulis auctoritas relicta; liviana suam tenuit, cui nihil e prima erat, sed omnia e secunda.

scabritia levigatur dente conchave, sed caducae litterae fiunt. minus sorbet politura charta, magis splendet. rebellat saepe umor incuriose datus primo, malleoque deprehenditur aut etiam odore, cum cura fuit indiligentior. deprehenditur et lentigo oculis, sed inserta mediis glutinamentis taenea fungo papyri bibula, vix nisi littera fundente se: tantum inest fraudis. alius igitur iterum texendis labor.

glutinum vulgare e pollinis flore temperatur fervente aqua, minimo aceti aspersu, nam fabrile cummisque fragilia sunt. diligentior cura mollia panis fermentati colat aqua fervente; minimum hoc modo intergerivi, atque etiam nili lenitas superatur. omne autem glutinum nec vetustius esse debet uno die nec recentius. - (postea malleo tenuatur et glutino percurritur, iterumque constricta erugatur atque extenditur malleo) - ita sint longinqua monumenta. tiberi gaique gracchorum manus apud pomponium secundum vatem civemque clarissimum vidi annos fere post ducentos; iam vero ciceronis ac Divi Augusti vergilique saepenumero videmus.

ingentia exempla contra M. Varronis sententiam de chartis reperiuntur. namque cassius hemina, vetustissimus auctor annalium, quarto eorum libro prodidit cn. terentium scribam agrum suum in ianiculo repastinantem effodisse arcam, in qua numa, qui romae regnavit, situs fuisset. in eadem libros eius repertos p. cornelio l. filio cethego, m. baebio q. filio tamphilo cos.,

ad quos a regno numae colliguntur anni dxxxv. hos fuisse e charta, maiore etiamnum miraculo, quod infossi duraverint - quapropter in re tanta ipsius heminae verba ponam: "mirabantur alii, quomodo illi libri durare possent; ille ita rationem reddebat: lapidem fuisse quadratum circiter in media arca evinctum candelis quoquoersus. in eo lapide insuper libros iii sitos fuisse; propterea arbitrarier non computuisse. et libros citratos fuisse; propterea arbitrarier tineas non tetigisse. in iis libris scripta erant philosophiae pythagoricae" - eosque combustos a q. petilio praetore, quia philosophiae scripta essent. hoc idem tradit piso censorius primo commentariorum, sed libros septem iuris pontificii, totidem pythagoricos fuisse; tuditanus tertio decimo numae decretorum fuisse. ipse Varro humanarum antiquitatum vii, antias secundo libros fuisse xii pontificales latinos, totidem graecos praecepta philosophiae continentes; idem tertio et sc. ponit quo comburi eos placuerit. inter omnes vero convenit sibyllam ad tarquinium superbum tres libros adtulisse, ex quibus sint duo cremati ab ipsa, tertius cum capitolio sullanis temporibus. praeterea mucianus ter cos. prodidit nuper se legisse, cum praesideret lyciae, sarpedonis ab troia scriptam in quodam templo epistulae chartam, quod eo magis miror, si etiamnum homero condente aegyptus non erat. aut cur, si iam hic erat usus, in plumbeis linteisque voluminibus scriptitatum constet, curve homerus in illa ipsa lycia bellerophonti codicillos datos, non epistulas, tradiderit sterilitatem sentit hoc quoque, factumque iam tiberio principe inopia chartae ut e senatu darentur arbitri dispensandis; alias in tumultu vita erat.

aethiopia aegypto contermina insignes arbores non fere habet praeter liniferam, qualis indorum atque arabiae dicta est. propior tamen huic natura lanae maiorque folliculus granati modo mali, similesque et inter se arbores ipsae. praeter hanc palmae, quales retulimus. insularum arbores ambitu aethiopiae et nemora odorata in mentione earum dicta sunt.

atlans mons peculiari proditur silva, de qua diximus. confines ei mauri, quibus plurima arbor citri et mensarum insania, quas feminae viris contra margaritas regerunt. exstat hodie m. ciceroni in illa paupertate et (quod magis mirum est) illo aevo empta hs [d]. memoratur et galli asini hs [30x]30. venumdatae sunt et duae ab iuba rege pendentes, quarum alteri pretium fuit hs [30xii]30, alteri paulo minus. interiit nuper incendio a cethegis descendens, hs [30xiii]30 permutata, latifundii taxatione, si quis praedia tanti mercari malit. magnitudo amplissimis adhuc fuit uni commissae ex orbibus dimidiatis duobus a rege mauretaniae ptolemaeo quattuor pedes et semipedem per medium ambitum, crassitudine quadrantali - maiusque miraculum in ea est artis latente iunctura quam potuisset esse naturae - , solidae autem a nomio caesaris liberto cognomen trahenti tribus sicilicis infra quattuor pedes totidemque infra pedem crassitudinis. qua in re non omittendum videtur tiberio principi mensam quattuor pedes sextante et sicilico excedentem, tota vero crassitudine sescunciali, operimento laminae vestitam fuisse, cum tam opima nomio liberto eius esset. tuber hoc est radicis, maximeque laudatum

quod sub terra totum fuerit, et rarius quam quae superne gignuntur etiam in ramis, proprieque quod tanti emitur arborum vitium est, quarum amplitudo ac radices aestimari possunt ex orbibus. sunt autem cupresso feminae atque etiamnum silvestri similes folio, odore, caudice. ancorarius mons vocatur citerioris mauretaniae, qui laudatissimum dedit citrum, iam exhaustus.

mensis praecipua dos in venam crispis vel in vertices parvos. illud oblongo evenit discursu ideoque tigrinum appellatur, hoc intorto et ideo tales pantherinae vocantur. sunt et undatim crispae, maiore gratia, si pavonum caudae oculos imitentur. magna, verum post has, gratia extra praedictas crispis densa veluti grani congerie, quas ob id a similitudine apiatas vocant. summa vero omnium in colore: hic maxime mulsi placet, vinis suis refulgens. post haec amplitudo est: iam toti caudices iuvant, pluresque in una. mensae vitia lignum - ita vocatur materiae surda et indigesta simplicitas aut platani foliorum modo digesta - , item ilignae venae similitudo vel coloris et, quibus maxime obnoxias fecere aestus ventique, rimae aut capillamenta rimas imitata; postea murena nigro transcurrens limite variisque corticum punctis adprehensus papaverum modo et in totum atro propior colos maculaeve discolores. - virides terra condunt barbari et inlinunt cera, artifices vero frumenti acervis inponunt septenis diebus totidem intermissis, mirumque ponderi quantum ita detrahatur. naufragia docuere nuper hanc quoque materiem siccata mari, duritie incorrupta, cospissari non ullo modo vehementius. nutriuntur optime splendescuntque manus siccae fricatu a balineis maxime, nec vinis laeduntur ut iis genitae.

inter pauca nitidioris vitae instrumenta haec arbor est, quapropter insistendum ei quoque paululum videtur. nota etiam homero fuit. thyon graece vocatur, ab aliis thya. hanc itaque inter odores uri tradidit in deliciis circae, quam deam volebat intellegi, magno errore eorum qui odoramenta in eo vocabulo accipiunt, cum praesertim eodem versu cedrum laricemque una tradat uri, quo manifestum est de arboribus tantum locutum. theophrastus, qui proximus a magni alexandri aetate scripsit haec circa urbis romae annum ccccxviii, magnum iam huic arbori honorem tribuit, memoratas ex ea referens templorum veterum contignationes quandamque immortalitatem materiae in tectis contra vitia omnia incorruptae. radice nihil crispium, nec aliunde pretiosiora opera. praecipuam autem esse eam arborem circa hammonis delubrum, nasci et in interiore cyrenaicae parte. de mensis tamen tacuit, et alias nullius ante ciceronianam vetustior memoria est, quo noviciae apparent. - alia est arbor eodem nomine, malum ferens exsecratum aliquis odore et amaritudine, aliis expetitur, domus etiam decorans, nec dicenda verbosius.

eadem africa, qua vergit ad nos, insignem arborem loton gignit, quam vocat celthim, et ipsam italiae familiarem, sed terra mutatam. praecipua est circa syrtis atque nasamonas. magnitudo quae piro, quamquam nepos cornelius brevem tradit. incisurae folio crebriores; alioqui ilicis viderentur. differentiae plures, eaeque maxime fructibus fiunt. magnitudo huic fabae, color croci, sed ante maturitatem alius atque alius, sicut uvis. nascitur densus

in ramis myrti modo, non ut in italia cerasis, tam dulcis ibi cibo, ut nomen etiam genti terraeque dederit nimis hospitali advenarum oblivione patriae. ferunt ventris non sentire morbos qui eum mandant. melior sine interiore nucleo, qui in altero genere osseus videtur. vinum quoque exprimitur illi simile mulso, quod ultra denos dies negat durare idem nepos bacasque concisas cum alica ad cibos doliis condi. quin et exercitus pastos eo accepimus ultro citroque commeantes per africanam. ligno colos niger; ad tibiarum cantus expetitur. e radice cultellis capulos brevesque alios usus excogitant.

haec ibi natura arboris. est autem eodem nomine et herba et in aegypto caulis in palustrium genere. recedentibus enim aquis nili riguis provenit, similis fabae caule foliisque densa congerie stipatis, brevioribus tantum gracilioribusque. fructus in capite papaveri similis incisuris omnique alio modo; intus grana ceu milium. incolae capita in acervis putrefaciunt, mox separant lavando et siccata tundunt eoque pane utuntur. mirum est quod praeter haec traditur, sole occidente papavera ea comprimi et integri foliis, ad ortum autem aperiri, donec maturescant flosque, qui est candidus, decidat. hoc amplius in euphrate tradunt, et caput ipsum et florem vespera mergi usque in medias noctes totumque abire in altum, ut ne demissa quidem manu possit inveniri, reverti deinde paulatimque subrigi et ad exortus solis emergere extra aquam ac florem patefacere atque etiamnum insurgere, ut plane ab aqua absit alte. radicem lotos habet mali cotonei magnitudine, opertam nigro cortice, qualis et castaneas tegit. interius candidum corpus, gratum cibus et crudum, gratius decoctum sive aqua sive pruna. neque aliunde magis quam pargamentis eius sues crassescunt.

cyrenaica regio loton suae postponit paliuro. fruticosior haec fructuque magis rubens, cuius nucleus non simul mandatur; iucundus per se ac suavior e vino, quin et vina suco suo commendans. interior africa ad garamantas usque et deserta palmarum magnitudine et suavitate constat, nobilibus maxime circa delubrum hammonis, sed circa carthaginem punicum malum cognomine sibi vindicat; aliqui granatum appellant. divisit et in genera apyrenum vocando cui lignosus nucleus abesset; candidior ei natura et blandiores acini minusque amaris distincti membranis. alias structura eorum quaedam ut in favis, communis nucleos habentium. horum quinque species: dulcia, acria, mixta, acida, vinosa. samia et aegyptia distinguuntur erythrocomis et leucocomis. corticis maior usus ex acerbis ad perficienda coria. flos balaustium vocatur, et medicis idoneus et tinguendis vestibus, quarum color inde nomen accepit.

in asia et graecia nascuntur frutices epicactis, quem alii embolinen vocant, parvis foliis, quae pota contra venena prosunt sicut erices contra serpentes, et in quo nascitur granum cnidium, quod aliqui linum vocant, fruticem vero thymelaean, alii chamelaean, alii pyros achnen, aliqui cnestorem, alii cneorum. est similis oleastro, foliis angustioribus, cumminosis, si mordeantur, myrti magnitudine. semen colore et specie farris, ad medicinae tantum usum.

tragion fruticem sola creta insula gignit, terebintho similem et semine,

quod contra sagittarum ictus efficacissimum tradunt. eadem et tragacantham spinae albae radice, multum praelatam apud medos aut in achaia nascenti. pretium eius in libras #1108 iii.

tragon et asia fert sive scorpionem, veprem sine foliis, racemis rubentibus, ad medicinae usum. myricen et italia, quam tamaricen vocat, achaia autem bryan silvestrem. insigne in ea quod sativa tantum fert gallae similem fructum. in syria et aegypto copiosa haec est, cuius infelicia ligna appellamus, qua tamen infelicia sunt graeciae. gignit enim arborem ostryn, quam et ostryam vocant, solitariam circa saxa aquosa, similem fraxino cortice et ramis, folio piris, paulo tamen longioribus crassioribusque ac rugosis incisuris, quae per tota discurrunt, semine hordeo simili et colore. materies est dura atque firma, qua in domum inlata difficiles partus fieri produnt mortisque miseras. nec auspiciatior in lesbo insula arbor quae vocatur euonymos, non absimilis punicae arbori - inter eam et laurum folia magnitudine, figura vero et mollitia punicae - , floris candidi odore statim pestem denuntians. fert siliquas sesames, intus granum quadriangula figura, spissum, letale animalibus; nec non et folio eadem vis. succurrit aliquando praeceps alvi exinanitio.

alexander cornelius arborem leonem appellavit, ex qua facta esset argo, similem robori viscum ferenti, quae neque aqua neque igni posset corrumpi, sicuti nec viscum, nulli alii cognitam, quod equidem sciam.

andrachlen omnes fere graecis porcillacae nomine interpretantur, cum sit herba et andrachne vocetur unius litterae diversitate. cetero andrachle est silvestris arbor neque in planis nascens, similis unedoni, folio tantum minore et numquam decedente, cortice non scabro quidem, sed qui circumgelatus videri possit: tam tristis aspectus est. similis et coccygia folio, magnitudine minor. proprietatem habet fructum amittendi lanugine (pappum vocant), quod nulli alii arbori evenit. similis et apharce, bifera aequae quam andrachle. priorem fructum incipiente pubescere uva peragunt, alterum initio hiemis, quales eos non traditur.

et ferulam inter externas dixisse conveniat arborumque generi adscripsisse, quoniam quarundam naturae, sicuti distinguemus, lignum omne corticis loco habent forinsecus, ligni autem loco fungosam intus medullam ut sabuci, quaedam vero inanitatem ut harundines. ferula calidis nascitur locis atque trans maria, geniculatis nodata scapis. duo eius genera: nartheca graeci vocant adsurgentem in altitudinem, nartheciam vero semper humilem. a genibus exeunt folia, maxima ut quaeque terrae proxima. cetera natura eadem quae anetho, et fructu simili. nulli fruticum levitas maior; ob id gestatu facilis baculorum usum senectuti praebet.

semen ferulae thapsian quidam vocavere, decepti quoniam ferula sine dubio est thapsia, sed sui generis, foliis feniculi, inani caule nec excedente baculi longitudinem. semen quale ferulae, radix candida. incisa lacte manat et contusa suco, nec corticem abdicant. omnia ea venena: quippe etiam fodientibus nocet, si minima aspiret aura; intumescunt corpora, faciemque invadunt ignes sacri; ob id cerato prius inlinunt. quibusdam tamen morbis

auxiliari dicunt medici permixtam aliis, item alopeciis suggillatisque ac viventibus, ceu vero remedia desint, ut scelera non tractent. sed ista praetexunt noxio instrumento, tantumque inpudentiae est, ut venenum artis esse persuadeant. thapsia in africa vehementissima. quidam caulem incidunt per messes et in ipsa excavant radice, quo sucus confluat, arefactumque tollunt. alii folia, caulem, radicem tundunt in pila et sucum in sole coactum dividunt in pastillos. nero caesar claritatem ei dedit initio imperi, nocturnis grassationibus converberata facie inlinens id cum ture ceraque et secuto die contra famam cutem sinceram circumferens. ignem ferulis optime servari certum est easque in aegypto praecellere.

vbi et cappari, firmioris ligni frutex seminisque et cibus vulgati, caule quoque una plerumque decerpto. cavenda eius genera peregrina, si quidem arabium pestilens, africum gingivis inimicum, marmaricum vulvis et omnibus inflationibus. apulum vomitus facit, stomachum et alvum solvit. quidam id cynosbaton vocant, alii ophiostaphylen.

fructosi est generis et saripha, circa nilum nascens, duorum ferme cubitorum altitudine, pollicari crassitudine, coma papyri, similique manditur modo, radice ferrariis officinis praecipua carbonis usu propter duritiam.

non omittendum est et quod babylone seritur in spinis, quoniam non aliubi vivit, sicut et viscum in arboribus, sed illud in spina tantum quae regia vocatur. mirum quod eodem die germinat quo iniectum est - inicitur autem ipso canis ortu - et celerrime arborem occupat. condiunt eo vina et ideo serunt. spina illa nascitur et athenis in longis muris.

frutex est et cytisu, ab amphilocho atheniense miris laudibus praedicatus pabulo omnium, aridus vero etiam suum, spondetque iugero eius annua hsm vel mediocri solo redditus. utilitas quae ervo, sed ocior satias, perquam modico pinguescente quadripede, ita ut iumenta hordeum spernant. non ex alio pabulo lactis maior copia aut melior, super omnia pecudum medicina validas a morbis omnibus praestante. quin et nutricibus in defectu lactis aridum atque in aqua decoctum potui cum vino dari iubet - firmiores excelsioresque infantes fore - , viridem etiam gallinis aut, si inaruerit, madefactum. apes quoque numquam defore cytisi pabulo contingente promittunt democritus atque aristomachus. nec aliud minoris impendi est. seritur, cum hordeum, aut vere semine ut porrum, vel caule autumnis ante brumam; si semine, madidum, aut, si desint imbres, satum spargitur. plantae cubitales transferuntur scrobe pedali. seritur per aequinoctia tenero frutice, perficitur triennio, demetitur verno aequinoctio, cum florere desiit, vel pueri anusve vilissima opera. canus aspectu, breviterque si quis exprimere similitudinem velit, angustioris trifoli frutex. datur animalibus post biduum semper, hieme vero quod inaruit madidum. satiant equos denae librae et ad portionem minora animalia, obiterque inter ordines alium, cepas seri fertile est. inventus est hic frutex in cythno insula, inde tralatus in omnes cycladas, mox in urbes graecas, magno casei proventu. praeterea - quo maxime miror rarum esse in italia - non aestuum, non frigorum, non grandinum aut nivis

iniuriam expavescit. adicit hyginus, ne cossium quidem propter nullam gratiam ligni.

nascuntur etiam in mari frutices arboresque - minores in nostro - , rubrum enim et totus orientis oceanus refertus est silvis. non habet lingua latia nomen quod graeci vocant phycos, quoniam alga herbarum maris vocabulum intellegitur, hic autem est frutex. folio lato, colore viridi gignit quod quidam prason vocant, alii zostera. alterum genus eiusdem capillaceo folio, simile feniculo, in saxis nascitur, superius in vadis haut procul litore, utrumque verno, et interit autumnno. circa cretam insulam nato in petris purpuras quoque inficiunt, laudatissimo a parte aquilonis ut spongeis. tertium est gramine simile, radice geniculata et caule qualiter calami. aliud genus fruticum bryon vocatur, folio lactucae, rugosiore tantum, iam hoc inferius nascens, in alto vero abies et quercus cubitali altitudine; ramis earum adhaerent conchae. quercu et tingui lanas tradunt, glandem etiam quasdam ferre in alto. naufragis haec deprehensa urinantibusque; ea et aliae traduntur praegrandes circa scionem. vitis enim passim nascitur, sed ficus sine foliis, rubro cortice. fit et palma fruticum generis. extra herculis columnas porri fronde nascitur frutex et alius lauri ac thymi, qui ambo eiecti in pumicem transfigurantur.

at in oriente mirum est statim a copto per solitudines nihil gigni praeter spinam quae sitiens vocatur, et hanc raram admodum, in mari vero rubro silvas virere, lauru maxime et oliva ferentibus bacas et, cum pluat, fungos, qui sole tacti mutantur in pumicem. fruticum ipsorum magnitudo ternum cubitorum est. caniculis referta maria, vix ut prospicere e nave tutum sit, remos plerumque ipsos invadentibus. qui navigavere ex indo alexandri milites frondem marinarum arborum tradidere in aqua viridem fuisse, exemptam sole protinus in salem arescentem, iuncos quoque lapideos perquam similes veris per litora, et in alto quasdam arbusculas colore bubuli cornus ramosas et cacuminibus rubentes, cum tractarentur, vitri modo fragiles, in igni autem ut ferrum inardescentes, restinctis colore suo redeunte. eodem tractu insularum silvas operit aestus, quamquam altiores platanis populisque altissimis. folia iis laurea, flos violae et odore et colore, bacae ut oleis, et ipsae odoris iucundi, autumnno nascentes, vere decedentes, foliis numquam deciduis. harum minores totas integit mare; maximarum cacumina extant, ad quae naves religantur et, cum recessit aestus, ad radices. alias quoque arbores in alto ab isdem accepimus eodem in mari visas, semper folia retinentes, fructu earum lupino simili. iuba tradit circa trogodytarum insulas fruticem in alto vocari isidis crinem, curialio similem sine foliis, praecisum mutato colore in nigrum durescere, cum cadat, frangi. item alium, qui vocatur chariton blepharon, efficacem in amatoriis. spatalia ex eo facere et monilia feminas; sentire eum se capi durarique cornus modo et hebetare aciem ferri. quod si fefellerint insidiae, in lapidem transfigurari.

LIBER XIV

externae arbores indocilesque nasci alibi quam ubi coepere et quae in alienas non commeant terras hactenus fere sunt, licetque iam de communibus loqui, quarum omnium peculiaris parens videri potest italia. noscentes tantum meminerint naturas earum a nobis interim dici, non culturas, quamquam et colendi maxima in natura portio est. illud satis mirari non queo, interisse quarundam memoriam atque etiam nominum quae auctores prodidere notitiam. quis enim non communicato orbe terrarum maiestate romani imperii profecisse vitam putet commercio rerum ac societate festae pacis omniaque, etiam quae ante occulta fuerant, in promiscuo usu facta at hercules non reperiuntur qui norint multa ab antiquis prodita. tanto priscorum cura fertilior aut industria felicior fuit, ante milia annorum inter principia litterarum hesiodo praecepta agricolis pandere orso subsecutisque non paucis hanc curam eius, unde nobis crevit labor, quippe cum requirenda sint non solum postea inventa, verum etiam ea quae invenerant prisci, desidia rerum internecone memoriae indicta. cuius vitii causas quis alias quam publicas mundi invenerit nimirum alii subiere ritus circaque alia mentes hominum detinentur et avaritiae tantum artes coluntur. antea inclusis gentium imperiis intra ipsas adeoque et ingeniis, quadam sterilitate fortunae necesse erat animi bona exercere, regesque innumeri honore artium colebantur et in ostentatione has praeferabant opes, immortalitatem sibi per illas prorogari arbitantes, quare abundabant et praemia et opera vitae. posteris laxitas mundi et rerum amplitudo damno fuit. postquam senator censu legi coeptus, iudex fieri censu, magistratum ducemque nihil magis exornare quam census, postquam coepere orbitas in auctoritate summa et potentia esse, captatio in quaestu fertilissimo ac sola gaudia in possidendo, pessum iere vitae pretia omnesque a maximo bono liberales dictae artes in contrarium cecidere ac servitute sola profici coeptum. hanc alius alio modo et in aliis adorare, eodem tamen habendique ad spes omnium tendente voto. passim vero etiam egregii aliena vitia quam bona sua colere malle. ergo hercules voluptas vivere coepit, vita ipsa desiit. sed nos oblitterata quoque scrutabimur, nec deterrebit quarundam rerum humilitas, sicuti nec in animalibus fecit, quamquam videmus vergilium praecellentissimum vatem ea de causa hortorum dotes fugisse et in his quae rettulit flores modo rerum decerpisse, beatum felicemque gratiae quindecim omnino generibus uvarum nominatis, tribus oleae, totidem pirorum, malo vero tantum assyrio, ceteris omnibus neglectis.

vnde autem potius incipiamus quam a vitibus quarum principatus in tantum peculiaris italiae est, ut vel hoc uno omnia gentium vicisse etiam odorifera possit videri bona, quamquam ubicumque pubescentium odori nulla suavitas praefertur.

vites iure apud priscos magnitudine quoque inter arbores numerabantur. iovis simulacrum in urbe populonio ex una conspiciamus tot aevis

incorruptum, item massiliae pateram. metaponti templum iunonis vitigineis columnis stetit. etiam nunc scalis tectum ephesiae diana scanditur una vite cypria, ut ferunt quoniam ibi ad praecipuam amplitudinem exeunt. nec est ligno ulli aeternior natura. verum ista ex silvestribus facta crediderim; hae vites tonsura annua coercentur, et vis earum omnis evocatur in palmites aut deprimitur in propagines, sucique tantum gratia ex iis petitur pluribus modis ad caeli mores solique ingenia. in campano agro populis nubunt, maritasque complexae atque per ramos earum procacibus bracchiis geniculato cursu scandentes cacumina aequant, in tantum sublimes, ut vindemitor auctoratus rogum ac tumulum excipiat, nulla fine crescendi, vidique iam porticus, villas et domos ambiri singularum palmitibus ac sequacibus loris. quodque memoria dignum inter prima valerianus quoque cornelius existimavit, una vitis romae in liviae porticibus subdiales inambulationes umbrosis pergulis opacat, eadem duodenis musti amphoris fecunda. ulmos quidem ubique exuperant, miratumque altitudinem earum ariciae ferunt legatum regis pyrrhi cineam facete luisse in austeriorem gustum vini, merito matrem eius pendere in tam alta cruce. rumpotinus vocatur et alio nomine opulus arbor italiae padum transgressis, cuius tabulata in orbem patula replent puroque perductae dracone in palmam eius inde sub rectos ramorum digitos flagella dispergunt. eadem modici hominis altitudine adminiculatae sudibus horrent, vineamque faciunt aliae inprobo reptatu pampinorumque per inania omnia discursu atria media complentes. tot differentias vel sola tantum italia recipit. stat provinciarum aliquarum per se vitis sine ullo pedamento, arcus suos in se colligens et brevitate crassitudinem pascens. vetant hoc aliubi venti, ut in africa et narbonensis provinciae partibus, ubi excrescere ultra suos pollices prohibitaе semperque pastinatis similes herbarum modo vagantur per arva ac sucum terrae passim uvis bibunt, quae ob id magnitudinem infantium puerorum in interiore parte africae exsuperant. vina non alibi tristiora, sed uva non alibi gratior callo, unde possit invenisse nomen durus acinus. namque genera magnitudine, colore, saporibus acini innumera etiamnum multiplicantur vino. hic purpureo lucent colore, illic fulgent roseo nitentque viridi; candicans enim nigerque vulgares. tument vero mammarum modo bumasti, praelongis dactyli porriguntur acinis. est et illa naturae lascivia, ut praegrandibus adhaereant parvi comites, suavitate certantes; leptorragas has vocant. durant aliae per hiemes, pensili concamaratae nodo. aliae in sua tantum continentur anima, ollis fictilibus et insuper doliis inclusae, stipatae vinaceis circumsudantibus. aliis gratiam, qui et vinis, fumus adfert, fabrilisque in eo gloriam praecipuam fornacibus africae tiberi caesaris auctoritas fecit; ante eum raeticis prior mensa erat uvis ex veroniensium agro. quin et patientia nomen acinis dat passis. conduntur et musto uvae ipsaeque vino suo inebriantur. aliae decocto in musto dulcescunt, aliae vero subolem novam in ipsa matre expectant tralucidae vitro, additque acinis eandem quam in doliis amphorisve duratricem illam firmitatem austeritas picis infusa pediculo. iam inventa vitis per se in vino picem respiens, viennensem agrum nobilitans taburno sotanoque et helvico

generibus, non pridem haec inlustrata atque vergili vatis aetate incognita, a cuius obitu xc aguntur anni. quid, quod inserta castris summam rerum imperiumque continet centurionum in manu vitis et opimo praemio tardos ordines ad lentas perducit aquilas atque etiam in delictis poenam ipsam honorat nec non vineae oppugnationum dedere rationem. nam in medicaminibus adeo magnum obtinent locum, ut per sese vino ipso remedia sint.

genera vitium numero comprehendi posse unus existimavit democritus, cuncta sibi graeciae cognita professus; ceteri innumera atque infinita esse prodiderunt, quod verius apparebit ex vinis. nec omnia dicentur, sed maxime insignia, quippe totidem paene sunt quot agri, quam ob rem celeberrimas vitium aut quibus est aliqua proprietate miraculum ostendisse satis erit.

principatus datur aminneis firmitatem propter senioque proficientem vini eius utique vitam. quinque earum genera. ex iis germana minor acino melius deflorescit, imbres tempestatesque tolerat, non item maior, sed in arbore quam in iugo minus obnoxia. gemellarum, quibus hoc nomen uvae semper geminae dedere, asperimus sapor, sed vires praecipuae. ex iis minor austro laeditur, ceteris ventis alitur, ut in vesuvio monte surrentinisque collibus, in reliquis italiae partibus non nisi arbori accommodata. quintum genus lanatae. ne seras miremur aut indos adeo, lanugo eam vestit. prima ex aminneis maturescit ocissimeque putrescit.

proxima dignitas nomentanis, rubente materia, quapropter quidam rubellas appellavere vineas. hae minus fertiles, vinaceis et faece nimiae, contra pruinas fortissimae, siccitate magis quam imbre, aestu quam algore vexantur. quam ob rem in frigidis umidisque principatum obtinent. fertilior quae minor acino et folio scissa minus.

apianis apes dedere cognomen, praecipue earum avidae. ex iis duo genera lanugine et ipsa pubescunt. distant quod altera celerius maturescit, quamquam et altera properante. situs frigidi iis non respuuntur, et tamen nullae celerius imbre putrescunt. vina primo dulcia austeritatem annis accipiunt. etruscia nulla magis vite gaudet. et hactenus potissima nobilitas datur peculiaribus atque vernaculis italiae; ceterae advenere. e chio thasove graecula non inferior aminneis bonitate, praetenera acino et uva tam parva, ut nisi pinguissimo solo colere non prosit. eugeniam tauromenitani colles cum generositatis cognomine misere albano tantum agro, quoniam translata statim mutatur. namque est aliquis tantus locorum amor, ut omnem in iis gloriam suam relinquunt nec usquam transeant totae. quod et in raetica allobrogicaque, quam supra picatam appellavimus, evenit, domi nobilibus nec agnoscendis alibi. fecundae tamen bonitatis vice copiam praestant, eugenia ferventibus locis, raetica temperatis, allobrogica frigidis, gelu maturescens et colore nigra. ex iis quas adhuc diximus, sed etiam e nigris, vina vetustate in album colorem transeunt. reliquae ignobiles, aliquando tamen caeli aut soli opera non fallunt vetustatem, sicuti faecenia et cum ea florens biturigiaca, acino rarior, numquam floris obnoxii, quoniam antecedunt ventisque et imbris resistunt,

meliores tamen argentibus locis quam calidis, umidis quam sitientibus. visulla grandi magis quam denso uvarum partu, inpatiens variantis caeli, sed contra tenorem unum alioris aestusve constans. quae minor est ex eo genere, melior. in eligendo solo morosa, pingui putrescit, gracili omnino non provenit; mediam temperiem delicate quaerit, ob hoc sabinis collibus familiaris. uva eius indecora visu, sapore iucunda. nisi matura protinus rapitur, etiam non putrescens cadit. contra grandines eam tuetur foliorum amplitudo atque duritia.

insignes iam colore inter purpureas nigrasque helvolae saepius variantes et ob id varianae a quibusdam appellatae. praefertur in iis nigrior; utraque alternis annis fertilis, sed melior vino, cum parciore. et praeciae duo genera magnitudine acini discernuntur, quibus materies plurima uvaque ollis utilissima; folium apio simile. baliscam dyrrachini celebrant, hispaniae coccolobin vocant. rarior uva, aestus austrosque tolerat, capiti inimica, copia larga. hispaniae duo genera eius faciunt, unum oblongo acino, alterum rotundo; novissimas vindemiant. quo dulcior est coccolobis, hoc melior. sed et austera transit in dulcem vetustatem, et quae dulcis fuit in austeritatem; tunc albano vino aemulantur. tradunt vesicae vitiis utilissimum ex iis potum. albuelis summis arboribus fertilior est, visulla imis; quam ob rem circa easdem satae diversitate naturae locupletant. inerticulam e nigris appellavere, iustius sobriam dicturi, inveterato praecipue commendabilem vino, sed viribus innoxiam, si quidem temulentiam sola non facit.

fertilitas commendat ceteras principemque helvennacam. duo eius genera: maior quam quidam longam, minor quam marcum appellant, non tam fecundam, sed gratiorem haustu. discernitur folio circinato, verum utraque gracilis. furcas subdere iis necessarium; alioqui ubertatem suam non tolerant. maritimo adflatu gaudent, roscida odere. nulla vitium minus italiam amat, rara, parva, putrescens in ea, vino quoque quod genuit aestatem non exuperans; nec alia macro solo familiarior. graecinus, qui alioqui cornelium celsum transcripsit, arbitratur non naturam eius repugnare italicae, sed culturam avidae palmites evocantium. ob id fertilitate sua absumi, si non praepinguis soli ubertas lassescentem sustineat. carbunculare negatur, magna dote, si verum est aliqua in vite caelo non esse ius.

aestus fert spionia, quam quidam spineam vocant, autumnisque imbribus pinguescit; quin immo nebulis una alitur, ob id ravennati agro peculiaris. vennunculam inter optime deflorescentes et ollis aptissimam campani malunt surculam vocare, alii scapulam, tarracina numisianam, nullas vires proprias habentem, sed totam perinde ac solum valeat, surrentinis tamen efficacissimam testis vesuvio tenus. ibi enim murgentina e sicilia potentissima, quam pompeianam aliqui vocant, laeto demum feracem, sicut horconia in campania tantum. e diverso arceraca, vergilio argitis dicta, ultro solum laetius facit, ipsa contra imbres et senectam fortissima, vino quidem vix annua ac vilitatis cibariae, sed ubertate praecipua. tolerat et annos mettica, contra omne sidus firmissima, nigro acino, vinis in vetustate rufescentibus.

et hactenus publica sunt genera, cetera regionum locorumque aut ex iis inter se insitis mixta: si quidem tuscis peculiaris est tudernis, atque etiam nomen iis florentiae sopina, arretio talpona et etesiaca et conseminia. talpona nigra candidum facit mustum. etesiaca fallax: quo plus tulit, hoc laudabilius fundit, mirumque, fecunditate pariter et bonitate cessat. conseminia nigra, vino minime durante, uva maxime, post xv dies quam ulla alia metitur, fertilis, set cibaria. huius folia sicuti labruscae prius quam decidant sanguineo colore mutantur. evenit hoc et quibusdam aliis, pessimi generis argumento. itriola vmbriae mevanatique et piceno agro peculiaris est, amitermino pumula. isdem bananica fallax est, adamant tamen eam. municipii suam pompeii nomine appellant, quamvis clusinis copiosiore; municipii et tiburtes appellavere, quamvis oleagineam nuper invenerint a similitudine olivae. novissima haec uvarum ad hoc tempus reperta est. vinaciolam soli noverunt sabini, calventinam gaurani. scio e falerno agro tralatas vocari falernas, celerrime ubique degenerantes. nec non surrentinum genus fecere aliqui praedulci uva. capnios et et buconiates et tharrupia in thurinibus collibus non ante demetuntur quam gelaverit. pariana gaudent pisae, mutina perusinia nigro acino, intra quadriennium albescente vino. mirum ibi cum sole circumagi uvam quae ob id streptis vocatur, et in italia gallicam placere, trans alpis vero picenam. dixit vergilius thasias et mareotidas et lageas compluresque externas, quae non reperiuntur in italia.

sed sunt etiamnum insignes uva, non vino, ambrosia e duracinis, sine ullis vasis in vite servabilis - tanta est contra frigora, aestus tempestatesque firmitas, nec orthampelos indiget arbore aut palis, ipsa se sustinens, non item dactylides digitali gracilitate - , columbinae e racemosis, et magis purpureae, cognomine bimammiae, quando non racemos, sed uvas alias gerunt, item tripedanea, cui nomen a mensura est, item scripula passo acino et raetica in maritimis alpihus appellata, dissimilis laudatae illi. namque haec brevis, conferta acino, degener vino, sed cute omnium tenuissima, nucleo (quod chium vocant) uno ac minimo, acinum praegrandem unum alterumve habens. est et nigra aminnea, cui syriacae nomen inponunt, item hispana ignobilium probatissima.

in pergulis vero seruntur escariae appellatae e duracinis, albae, nigrae, et bumasti totidem coloribus, ac nondum dictae aegia et rhodia et uncialis, velut a pondere acini, item picina, omnium nigerrima, et coronario naturae lusu stephanitis, acinos foliis intercurstantibus, et quae forenses vocantur, celeres proventu, vendibiles aspectu, portatu faciles. contra damnantur etiam visu cinerea et rabuscula et asinusca, minus tamen caudas vulpium imitata alopecis. alexandrina appellatur vitis circa phalacram brevis, ramis cubitalibus, acino nigro fabae magnitudine, nucleo molli et minimo, obliquis racemis praedulcibus, folio parvo et rotundo, sine divisuris. septem his annis in narbonensis provinciae alba helvia inventa est vitis uno die deflorescens, ob id tutissima; carbunicam vocant, quam nunc tota provincia conserit.

catonum ille primus, triumpho et censura super cetera insignis, magis

tamen etiamnum claritate litterarum praeceptisque omnium rerum expetendarum datis generi romano, inter prima vero agrum colendi, ille aevi confessione optimus ac sine aemulo agricola, pauca attigit vitium genera, quarundam ex iis iam etiam nominibus abolitis. separatim toto tractatu sententia eius indicanda est, ut in omni genere noscamus quae fuerint celeberrima anno dc urbis, circa captas carthaginem ac corinthum, cum supremum is diem obiit, et quantum postea ccxxx annis vita profecerit. ergo de vitibus uvisque ita prodidit: “qui locus vino optimus dicitur esse et ostentus solibus, aminnium minusculum et geminum eugenium, helvium minusculum conserito. qui locus crassior aut nebulosior, aminnium maius aut murgentinum, apicium, lucanum serito. ceterae vites miscellae maxime in quemvis agrum conveniunt. in olla vinaceis conduntur aminnium minusculum et maius et apicium, eadem in sapa et musto, in lora recte conduntur. quas suspendas duracinas, aminnias maiores, vel ad fabrum ferrarium pro passis hae recte servantur.” nec sunt vetustiora de illa re latinae linguae praecepta. tam prope ab origine rerum sumus. aminneam proxime dictam Varro scantianam vocat.

in nostra aetate pauca exempla consummatae huius artis fuere, verum eo minus omittenda, ut noscantur etiam praemia, quae in omni re maxime spectantur. summam ergo adeptus est gloriam acilius sthenelus e plebe libertina lx iugerum non amplius vineis excultis in nomentano agro atque [cccc] nummum venumdatis. magna fama et vetuleno aegialo, perinde libertino, fuit in campania rure liternino, maiorque etiam favore hominum, quoniam ipsum africani colebat exilium; sed maxima, eiusdem stheneli opera, remmio palaemoni, alias grammatica arte celebri, in hisce viginti annis mercato rus [dc] nummum in eodem nomentano decimi lapidis ab urbe deverticulo. est autem usquequaque nota vilitas mercis per omnia suburbana, ibi tamen maxime, quoniam et neglecta indiligentia praedia paraverat ac ne in pessimis quidem elegantioris soli. haec adgressus excolere non virtute animi, sed vanitate primo, quae nota mire in illo fuit, pastinatis de integro vineis cura stheneli, dum agricolam imitatur, ad vix credibile miraculum perduxit, intra octavum annum [cccc] nummum emptori addicta pendente vindemia. cucurritque non nemo ad spectandas uvarum in iis vineis strues, litteris eius altioribus contra id pigra vicinitate sibi patrocinate, novissime annaeo seneca, principe tum eruditorum ac potentia, quae postremo nimia ruit super ipsum, minime utique miratore inanium, tanto praedii huius amore capto, ut non puderet invisio alias et ostentaturo tradere palmam eam, emptis quadruplicato vineis illis intra decimum fere curae annum. digna opera quae in caecubis setinisque agris proficeret, quando et postea saepenumero septenos culleos singula iugera, hoc est amphoras centenas quadragenas, musti dedere! ac ne quis victam in hoc antiquitatem arbitretur, idem cato denos culleos redire ex iugeribus scripsit, efficacibus exemplis non maria plus temerata conferre mercatori, non in rubrum litus indicumve merces petitas quam sedulum ruris larem.

vino antiquissimo claritas maroneo in thraciae maritima parte genito, ut auctor est homerus. neque enim fabulosa aut de origine eius varie prodita consecramur, praeterquam aristaeum primum omnium in eadem gente mel miscuisse vino, suavitate praecipua utriusque naturae sponte provenientis. maroneum vices tanto addito aquae miscendum homerus prodidit. durat etiam nunc vis in eadem terra generi rigorque indomitus, quippe cum mucianus ter consul ex iis qui nuperrime prodidere sextarios singulos octonis aquae misceri compererit praesens in eo tractu, esse autem colore nigrum, odoratum, vetustate pinguescere. et pramnio, quod idem homerus celebravit, etiam nunc honos durat. nascitur zmyrnae regione iuxta delubrum matris deum. in reliquis claritas generi non fuit alicui: anno fuit omnium generum bonitate l. opimio cos., cum c. gracchus tribunus plebem seditionibus agitans est interemptus. ea caeli temperies fulsit (cocturam vocant) solis opere natali urbis dcxxxiii, durantque adhuc vina ea ducentis fere annis, iam in speciem redacta mellis asperi - etenim haec natura vinis in vetustate est - , nec potari per se queant pervincive aqua, usque in amaritudinem carie indomita; sed ceteris vinis commendandis minima aliqua mixtura medicamenta sunt. quod ut eius temporis aestimatione in singulas amphoras centeni nummi statuuntur, ex his tantum usura multiplicata semissibus, quae civilis ac modica est, in c. caesaris germanici filii principatu anno clx singulas uncias vini constitisse, nobili exemplo docuimus referentes vitam pomponii secundi vatis cenamque quam principi illi dedit. tantum pecuniarum detinent apothecae! nec alia res maius incrementum sentit ad vicensimum annum maiusve ab eo dispendium, non proficiente pretio; raro quippe adhuc fuere, nec nisi in nepotatu, singulis testis milia nummum. viennenses soli picata sua, quorum genera diximus, pluris permutare, sed inter sese amore patrio, creduntur; idque vinum frigidius reliquis existimatur in frigido potu.

vino natura est hausto accendendi calore viscera intus, foris infuso refrigerandi. nec alienum fuerit commemorare hoc in loco quod androcydes sapientia clarus ad alexandrum magnum scripsit, intemperantiam eius cohibens: “vinum poturus, rex, memento bibere te sanguinem terrae. cicuta hominis venenum est, cicutae vinum.” quibus praeceptis ille si obtemperavisset, profecto amicos in temulentia non interemisset, prorsus ut iure dici possit, neque viribus corporis utilius aliud neque voluptatibus perniciosius, si modus absit.

genera autem vini alia aliis gratiora esse quis dubitet aut non ex eodem lacu aliud praestantius altero germanitatem praecedere sive testa sive fortuito eventum quam ob rem de principatu se quisque iudicem statuet. iulia augusta lxxxvi annos vitae pucino vino rettulit acceptos, non alio usa. gignitur in sinu hadriatici maris non procul timavo fonte saxoso colle, maritimo adflatu paucas coquente amphoras; nec aliud aptius medicamentis iudicatur. hoc esse crediderim quod graeci celebrantes miris laudibus praetetianum appellaverint ex hadriatico sinu. Divus Augustus setinum praetulit cunctis et fere secuti principes, confessa propter experimenta, non temere cruditatibus noxiis ab ea

saliva. nascitur supra forum appi. antea caecubo erat generositas celeberrima in palustribus populetis sinu amynclano, quod iam intercidit incuria coloni locique angustia, magis tamen fossa neronis, quam a baiano lacu ostiam usque navigabilem incohaverat.

secunda nobilitas falerno agro erat et ex eo maxime faustiniano; cura culturaque id collegerat. exolescit haec quoque copiae potius quam bonitati studentium. falernus ager a ponte campano laeva petentibus vrbanam coloniam sullanam nuper capuae contributam incipit, faustinianus circiter iiii milia passuum a vico caedicio, qui vicus a sinuessa vi m passuum abest. nec ulli nunc vino maior auctoritas. solo vinorum flamma accenditur. tria eius genera: austerum, dulce, tenue. quidam ita distinguunt, summis collibus caucinum gigni, mediis faustinianum, imis falernum. non omittendum autem nulli eorum quae celebrentur iucundum saporem uvae esse.

at tertiam palmam varie venere albana urbi vicina, praedulcia ac rara in austero, item surrentina in vineis tantum nascentia, convalescentibus maxime probata propter tenuitatem salubritatemque. tiberius caesar dicebat consensisse medicos ut nobilitatem surrentino darent; alioqui esse generosum acetum; c. caesar, qui successit illi, nobilem vappam. certant massica atque a monte gauro puteolos baiasque prospectantia. nam falerno contermina statana ad principatum venere non dubie palamque fecere sua quibusque terris tempora esse, suos rerum proventus occasusque. iuncta iis praeponi solebant calena et quae in vineis arbustisque nascuntur fundana et alia ex vicinia urbis, veliterna, privernatia. nam quod signiae nascitur, austeritate nimia continendae utile alvo, inter medicamina numeratur.

quartum curriculum publicis epulis optinere a divo iulio - is enim primus auctoritatem iis dedit, ut epistulis eius apparet - mamertina circa messanam in sicilia genita; ex iis potulana, ab auctore dicta illo cognomine, proxima italiae laudantur praecipue. est in eadem sicilia et tauromenitanis honos lagonis pro mamertino plerumque subditis.

ex reliquis autem a supero mari praetutia atque ancone nascentia, et quae a palma una forte enata palmensia appellavere, in mediterraneo vero caesenatia ac maecenatiana, in veroniensi item raetica, falernis tantum postlata a vergilio, mox ab intimo sinu maris hadriana, ab infero autem latiniensia, gravisca, statoniensia. etrusiae luna palmam habet, liguriae genua, inter pyrenaeum alpesque massilia gemino sapore, quando et condiendis aliis pinguius gignit, quod vocat sucosum. baeterrarum intra gallias consistit auctoritas. de reliquis in narbonensi genitis adseverare non est, quoniam officinam eius rei fecere tinguentes fumo, utinamque non et herbis ac medicaminibus noxiis! quippe etiam aloe mercator saporem coloremque adulterat.

verum et longinquiora italiae ab ausonio mari non carent gloria, tarentina et servitia et consentinae genita et tempsae, calabrae luanaeque antecedentibus thurinibus. omnium vero eorum maxime inlustrata messalae potiti salute lagarina, non procul grumento nascentia. campania nuper excitavit novis nominibus auctoritatem sive cura sive casu ad quartum a neapoli lapidem

trebellicis, iuxta capuam caulinis et in suo agro trebulanis, alioqui semper inter plebeia et trifolinis gloriata. nam pompeianis summum decem annorum incrementum est, nihil senecta conferente. dolore etiam capitum in sextam horam diei sequentis infesta deprehenduntur. quibus exemplis, nisi fallor, manifestum est patriam terramque referre, non uvam, et supervacuum generum consecrationem in numerum, cum eadem vitis aliud aliis in locis polleat. hispaniarum laetana copia nobilitantur, elegantia vero tarraconensia atque lauronensia et baliarica ex insulis conferuntur italiae primis. nec ignoro multa praetermissa plerosque existimatuos, quando suum cuique placet et, quocumque eatur, fabula eadem reperitur, Divi Augusti iudiciorum ac palati peritissimum e libertis censuram vini in epulas eius facientem dixisse hospiti de indigena vino, novum quidem sibi gustum esse eum atque non ex nobilibus, sed caesarem non aliud poturum. nec negaverim et alia digna esse fama, sed de quibus consensus aevi iudicaverit haec sunt.

nunc simili modo transmarina dicemus. in summa gloria post homerica illa, de quibus supra diximus, fuere thasium chiumque, ex chio quod ariusium vocant. his addidit lesbium erasistrati maximi medici auctoritas, circiter ccccl anno urbis romae. nunc gratia ante omnia est clazomenio, postquam parcius mari condiunt. lesbium sponte naturae suae mare sapit. nec tmoliti per se gratia ut vino, sed cuius dulci admixto reliquorum duritia suavitatem accipiat simul et aetatem, quoniam vetustiora protinus videntur. ab his dignatio est sicyonio, cyprio, telmesico, tripolitico, berytio, tyrio, sebennytico. in aegypto hoc nascitur tribus generibus uvarum ibi nobilissimis, thasia, aethalo, peuce. post haec auctoritas hippodamantio, mystico, cantharitae, protropo cnidio, catacecaumenitae, petritae, myconio. nam mesogiten capitis dolores facere compertum est, nec ephesium salubre esse, quoniam mari et defruto condiatur. apamenum mulso praecipue convenire dicitur, sicut praetutium in italia. est enim et haec proprietas generum; dulcia utique inter se non congruunt. exolevit et protagion, quod italicis proximum fecerant asclepiadis scholae. apollodorus medicus in volumine, quo suasit ptolemaeo regi quae vina biberet, italicis etiam tum ignotis laudavit in ponto nasperceniten, mox oreticum, oeneaten, leucadium, ambracioten et, quod cunctis praetulit, peparethium, sed minoris famae esse dixit, quoniam ante sex annos non placeret.

hactenus bonitas vini nationibus debetur. apud graecos cura clarissimum nomen accepit quod appellaverunt bion, ad plurimos valitudinum usus excogitatum, ut docebimus in parte medicinae. fit autem hoc modo: uvae paulum ante maturitatem decerptae siccantur acri sole, ter die versatae per triduum, quarto exprimuntur, dein in cadis sole inveterantur. coi marinam aquam largiorem miscent, a servi furto origine orta sic mensuram explentis, qua re translata in album mustum leucocoum appellatur. in aliis autem gentibus simili modo factum tethalassomenon vocant, thalassiten autem vasis musti deiectis in mare, quo genere praecox fit vetustas. nec non apud nos quoque coum vinum ex italico faciendi rationem cato demonstravit, super

cetera in sole quadriennio maturandum praecipiens. rhodium coo simile est, phorineum salsius coo. omnia transmarina septem annis ad vetustatem mediam pervenire existimantur.

vinum omne dulce minus odoratum; quo tenuius, eo odoratius. colores vinis quattuor: albus, fulvus, sanguineus, niger. psithium et melampsithium passi genera sunt suo sapore, non vini, scybelites vero mulsi, in galatia nascens, et haluntium in sicilia. nam siraeum, quod alii hepsema, nostri sapam appellant, ingeni, non naturae, opus est musto usque ad tertiam mensurae decocto. quod ubi factum ad dimidiam est, defrutum vocatur. omnia in adulterium mellis excogitata, sed priora uva terraque constant. passum a cretico cilicium probatur et africanum. et in italia finitimisque provinciis fieri certum est ex uva quam graeci psithiam vocant, nos apianam, item scripulam, diutius uvis in vite sole adustis aut ferventi oleo. quidam ex quacumque dulci, dum praecocta, alba, faciunt siccantes sole, donec paulo amplius dimidium pondus supersit, tunsasque leniter exprimunt. dein quantum expressere adiciunt vinaceis aquae puteanae, ut et secundarium passum faciant. diligentiores eodem modo siccatis acinos eximunt ac sine sarmentis madefactos vino excellenti, donec intumescant, premunt - et hoc genus ante cetera laudant - ac simili modo aqua addita secundarium faciunt. medium inter dulcia vinumque est quod graeci aigleucos vocant, hoc est semper mustum. id evenit cura, quoniam fervere prohibetur - sic appellant musti in vina transitum - ; ergo mergunt e lacu protinus aqua cados, donec bruma transeat et consuetudo fiat algendi. est etiamnum aliud genus per se, quod vocat dulce narbonensis provincia et in ea maxime voconti. adservatur eius gratia uva diutius in vite pediculo intorto. ab aliis ipse palmes inciditur ad medullam, ab aliis uva torretur in tegulis, omnia ex helvinnaca vite. his adiciunt aliqui quod vocant diachyton, uvis in sole siccatis loco cluso per dies septem in cratibus, totidem pedes a terra alte, noctibus ab umore defensis, octavo die calcatis: ita fieri optimi odoris saporisque. e dulci genere est et melitites; distat a mulso, quod fit e musto, cum quinque congiis austeri musti congio mellis et salis cyatho subfervefactis. austerum, sed inter haec genera poni debet et protropum; ita appellatur a quibusdam mustum sponte defluens ante quam calcantur uvae. hoc protinus diffusum in lagonis suis defervere passi postea in sole xl diebus torrent aestatis secutae ipso canis ortu.

non possunt iure dici vina quae graeci deuteria appellant, cato et nos loram, maceratis aqua vinaceis, sed tamen inter vina operaria numerantur. tria eorum genera: decima parte aquae addita quam musti expressa sit et ita nocte ac die madefactis vinaceis rursusque prelo subiectis; alterum, quo modo graeci factitavere, tertia parte eius quod expressum sit addita aquae expressoque decocto ad tertias partes. tertium est faecibus vini expressum, quod faecatum cato appellat. nullum ex his plus quam annui usus.

verum inter haec subit mentem, cum sint genera nobilia, quae proprie vini intellegi possint, lxxx fere in toto orbe, duas partes ex hoc numero italiae esse, praeterea longe ante cunctas terras. et hinc deinde altius cura serpit, non a

primordio hanc gratiam fuisse, auctoritatem post de urbis annum coepisse. romulum lacte, non vino, libasse indicio sunt sacra ab eo instituta, quae hodie custodiunt morem. numae regis postumia lex est: “vino rogum ne respargito.” quod sanxisse illum propter inopiam rei nemo dubitet. eadem lege ex inputata vite libari vina diis nefas statuit, ratione excogitata ut putare cogherentur alias aratores et pigri circa pericula arbusti. M. Varro auctor est mezentium etruviae regem auxilium rutulis contra latinos tulisse vini mercede quod tum in latino agro fuisset. non licebat id feminis romae bibere. invenimus inter exempla egnati maetenni uxorem, quod vinum bibisset e dolio, interfectam fusti a marito, eumque caedis a romulo absolutum. fabius pictor in annalibus suis scripsit matronam, quod loculos in quibus erant claves cellae vinariae resignavisset, a suis inedia mori coactam, cato ideo propinquos feminis osculum dare, ut scirent an temetum olerent. hoc tum nomen vino erat, unde et temulentia appellata. cn. domitius iudex pronuntiavit mulierem videri plus vini bibisse quam valitudinis causa, viro insciente, et dote multavit. diuque eius rei magna parsimonia fuit. l. papirius imperator adversus samnites dimicaturus votum fecit, si vicisset, iovi pocillum vini. denique inter dona sextarios datos lactis invenimus, nusquam vini. idem cato cum in hispaniam navigasset, unde cum triumpho rediit: “non aliud vinum”, inquit, “bibere quam remiges,” in tantum dissimilis istis qui etiam convivis alia quam sibi met ipsis ministrant aut procedente mensa subiciunt.

lautissima apud priscos vina erant murrinae odore condita, ut apparet in plauti fabulis, quamquam in ea quae persa inscribitur et calamum addi iubet. ideo quidam aromatite delectatos maxime credunt. sed fabius dossennus his versibus decernit:

“mittebam vinum pulchrum, murrinam,” et in acharistione:

“panem et polentam, vinum murrinam.” scaevolam quoque et l. aelium et ateium capitonem in eadem sententia fuisse video, quoniam in pseudolo sit:

“quod si opus est, ut dulce promat indidem,
ecquid habet - rogas?

murrinam, passum, defrutum, mella,” quibus apparet non inter vina modo murrinam, sed inter dulcia quoque nominatum.

apothecas fuisse et diffundi solita vina anno dcxxxiii urbis apparet indubitato opimiani vini argumento. iam intelligentis suum bonum italiae nondum tamen ista genera in claritate erant; itaque omnia tunc genita unum habent consulis nomen. sic quoque postea diu transmarina in auctoritate fuerunt et ad avos usque nostros, quin et falerno iam reperto, sicut apparet ex illo comico versu:

“quinque thasi vini depromam, bina falerni.” P. Licinius Crassus l. iulius caesar censores anno urbis conditae dclxv edixerunt, “ne quis vinum graecum, aminniumque octonis aeris singula quadrantalia venderet.” haec enim verba sunt. tanta vero graeco vino gratia erat, ut singulae potiones in convictu darentur. quibus vinis auctoritas fuerit sua iuventa, M. Varro his verbis tradit: “l. lucullus puer apud patrem numquam lautum convivium vidit, in quo plus

semel graecum vinum daretur: ipse cum rediit ex asia, milia cadum congiarium divisit amplius centum. c. sentius, quem praetorem vidimus, chium vinum suam domum inlatum dicebat tum primum, cum sibi cardiaco medicus dedisset: hortensius super [x] cadum heredi reliquit.” hactenus Varro. quid non et caesar dictator triumphi sui cena vini falerni amphoras, chii cados in convivia distribuit idem hispaniensi triumpho chium et falernum dedit, epulo vero in tertio consulatu suo falernum, chium, lesbium, mamertinum, quo tempore primum quattuor genera vini adposita constat. postea ergo reliqua omnia in nobilitatem venere et circiter dcc urbis annum.

itaque non miror innumerabilia paene genera ficticii reperta multis ante saeculis, quae nunc dicemus, omnia ad medicinae usum pertinentia. omphacium quo modo fieret, propter unguenta diximus priore libro. fit e labrusca, hoc est vite silvestri, quod vocatur oenanthinum, floris eius libris duabus in musti cado maceratis. post dies xxx utuntur. praeter hoc radix labruscae, acini coria perficiunt. hi paulo post quam defloruere singulare remedium habent ad refrigerandos in morbis corporum ardores, gelidissima, ut ferunt, natura. pars eorum aestu moritur prius quam reliqua, quae solstitiales dicuntur. universi numquam maturescunt, et si prius quam tota inarescat uva incocta detur cibo gallinaceo generi, fastidium gignit uvas adpetendi.

ficticiorum primum fit ex ipso vino (quod vocant adynamon) hoc modo: albi musti sextarii xx, aquae dimidium fervent, donec excoquatur aquae mensura. alii marinae sextarios x, tantundem pluviae in sole xl diebus torrent. dant aegris quibus vini noxiam timent.

proximum fit e milii semine maturi cum ipsa stipula, libra quadrante in congios duos musti, macerato et post septimum mensem transfuso. ex loto arbore, frutice, herba dictum est ubi quaeque fierent.

fiunt et e pomis, quae dicemus interpretationibus non nisi necessariis additis, primumque e palmis, quo parthi, indi utuntur et oriens totus, mitiorum quas vocant chydaegas modio in aquae congiis tribus macerato expressoque. sic fit et sycites e fico, quem alii pharnuprium, alii trochin vocant, aut si dulce esse non libeat, pro aqua tantundem vinaceorum adicitur. e cypria fico et acetum fit praecellens atque alexandrino quoque melius. vinum fit et e siliqua syriaca et e piris malorumque omnibus generibus - sed e punicis rhoiten vocant - et e cornis, mespilis, sorvis, moris siccis, nucleis pineis. hi musto madidi exprimuntur, superiora per se mitia. myrtiten cato quem ad modum fieri docuerit mox paulo indicabimus, graeci et alio modo. ramis teneris cum suis foliis in salso musto coctis tunsis, libram in tribus musti congiis deferrefaciunt, donec duo supersint. quod ita e silvestris myrti bacis factum est, myrtidanum vocatur. hoc manus tinguit.

ex his quae in hortis gignuntur fit vinum e radice asparagi, cunila, origano, api semine, habrotono, mentastro, ruta, nepeta, serpyllo, marruvio. manipulos binos condunt in cadum musti et sapae sextarium et aquae marinae heminam. e napis fit duum denariorum pondere in sextarios binos musti addito, item e

scillae radice; inter flores ex rosae foliis tuis in linteolo in mustum collatis cum pondusculo, ut sidat, #1108 l pondere in sextarios musti vicanos - vetant ante tres menses vas aperiri - , item e nardo gallico et aliud e silvestri.

aromatiten quoque invenio factitatum tantum non unguentorum compositione, primo ex murra, ut diximus, mox et nardo celtico, calamo, bitumine, offis in mustum aut dulce vinum deiectis, alibi calamo, iunco, costo, nardo syriaco, amomo, casia, cinnamo, croco, palma, asaro, similiter in offa. apud alios nardi etiam et malobathri selibris in musti congios duos additis, qualia nunc quoque fiunt pipere et melle addito, quae alii condita, alii piperata appellant. invenitur et nectarites ex herba quam alii helenion, alii medicam, alii symphyton, alii idaeam, alii orestion, alii nectariam vocant, radice ponderis #1108 l in sextarios sex musti addita, similiter in linteo. ex ceteris herbis fit absinthites in xl sextariis musti absinthi pontici libra decocta ad tertias partes vel scopis absinthi in vinum additis. similiter hyssopites e cilicio hyssopo unciis tribus in duos congios musti coiectis aut tuis in vinum. fiunt utraque et alio modo, circa radices vitium sato. sic et elleboriten fieri ex veratro nigro cato docet. sic fit et scammonites, mira vitium natura saporem alienum in se trahendi, quare et salicem redolent patavinorum in palustribus vindemiae. sic et elleborum seritur in thaso aut cucumis silvester aut scammonia, quod vinum phthorium vocatur, quoniam abortus facit.

fit et ex herbis, quarum naturae suo loco dicentur: e stoechade et radice gentianae et tragorigano et dictamno, asaro, dauco, elelisphaco, panace, acoro, thymo, mandragora, iunco. vocarunt et scyzinum et itaeomelin et lectisphagiten, quorum iam obliterata ratio est.

e fruticum vero genere cedri utriusque, cupressus, laurus, iunipiri, terebinthi, calami, lentisci bacae aut lignum recens in musto decocuntur, item chamelaeae et chamaepityis, chamaedryis lignum. eodem modo et ex flore, in congiungium musti decem #1108 pondere addito.

fit vinum et ex aqua ac melle tantum. quinquennio ad hoc servari caelestem iubent. alii prudentiores statim ad tertias partes decocunt et tertiam veteris mellis adiciunt, dein xl diebus canis ortu in sole habent. alii diffusa ita decimo die obturant. hoc vocatur hydromeli et vetustate saporem vini adsequitur, nusquam laudatius quam in phrygia. quin et acetum melle temperabatur: adeo nihil intemptatum vitae fuit. oxymeli hoc vocarunt, mellis decem libris, aceti veteris heminis quinque, salis marini libra, aquae pluviae sextariis quinque suffervefactis deciens, mox elutriatis atque ita inveteratis. omnia ab themisone summo auctore damnata. et hercules coactus usus eorum videri potest, nisi si quis naturae opus esse credit aromatiten et ex unguentis vina composita aut ut biberentur genuisse eam frutices. ita sunt cognitu iucunda sollertiae humanae nomine omnia exquirentis. nihil quidem ex iis anno durare, praeterquam quae vetustate ipsa fieri diximus, et plura ne tricenis quidem diebus, non erit dubium.

sunt et in vino prodigia. dicitur in arcadia fieri quod fecunditatem feminis inportet, viris rabiem, at in achaia maxime circa ceryniam abigi partum vino

atque etiam si uvam edant gravidae, cum differentia in gustatu non sit. troezenium vinum qui bibant negantur generare. thasios duo genera vini diversa facere proditur, quo somnus concilietur, alterum vero quo fugetur. apud eosdem vitis theriaca vocatur, cuius et vinum et uva contra serpentium ictus medetur; libanodes turis odore, ex qua diis prolibant. e diverso aspendios damnata aris; ferunt eam nec ab alite ulla attingi. thasiam uvam aegyptus vocat apud se praedulcem, quae solvit alvum; est contra lycia, quae solutam firmat. aegyptus et ecbolada habet abortus facientem. vina in apothecis canis ortu mutantur quaedam posteaque restituuntur sibi. sic et mari navigato, cuius iactatus iis quae duraverint tantum vetustatis adicere sentitur, quantum habuerint.

et quoniam religione vita constat, prolibare diis nefastum habetur vina - praeter inputatae - vitis fulmine tactae quamque iuxta hominis mors laqueo pependerit aut vulneratis pedibus calcatae, et quod circumcisis vinaceis profluxerit, aut superne deciduo inmundiore lapsu aliquo polluta, item graeca, quoniam aquam habeant. - vitis ipsa quoque manditur decoctis caulibus summis, qui et condiuntur in aceto ac muria.

verum et de apparatu vini dixisse conveniat, cum graeci privatim ea praecepta condiderint artemque fecerint, sicut euphronius et aristomachus et commiades et hicesius. africa gypso mitigat asperitatem nec non aliquibus partibus sui calce. graecia argilla aut marmore aut sale aut mari lenitatem excitat, italiae pars aliqua crapulana pice, ac resina condire musta volgare ei est provinciisque finitimis. nonnusquam prioris vini faece acetove condiunt. nec non et ex ipso musto fiunt medicamina. decoquitur ut dulcescat portione virium, nec durare ultra annum spatium tale proditur. aliquibus in locis decocunt ad sapas musta infusisque iis ferociam frangunt. et in hoc tamen genere et in omni alio subministrant vasa ipsa condimentis picis, cuius faciendae ratio proximo dicetur volumine.

arborum suco manantium picem resinamque aliae ortae in oriente, aliae in europa ferunt. quae interest asia utrimque quasdam habet. in oriente optimam tenuissimamque terebinthi fundunt, dein lentisci, quam et mastichen vocant, postea cupressi, acerrimam sapore, liquidam omnes et tantum resinam, crassiorem vero et ad pices faciendas cedrus. arabica resina alba est, acri odore, difficilis coquenti, iudaea callosior et terebinthina quoque odoratior, syriaca attici mellis similitudinem habet. cypria antecedit omnes, item melleo colore, carnosa. colophonia, praeter ceteras fulva, si teratur, alba fit, gravior odore; ob id non utuntur ea unguentarii. in asia quae fit e picea, admodum candida, psagdas vocatur. resina omnis dissolvitur oleo - quidam et creta figularum hoc fieri arbitrantur - , pudetque confiteri maximum iam honorem eius esse in evellendis virorum corpori pilis.

ratio autem condiendi musta in primo fervore, qui novem diebus cum plurimum peragitur, adpersu picis, ut odor vino contingat et saporis quaedam acumina. vehementius id fieri arbitrantur crudo flore resinae excitarique lenitatem, e diverso crapula conpesci feritatem nimiam frangique virus aut,

ubi pigra lenitas torpeat, virus addi, liguriae maxime circumpadanisque mustis. utilitas discernitur hoc modo: pugnacibus mustis crapulae plus inditur, lenibus parcius. sunt qui et utroque condiri velint, nec non aliqua est musti picea natura vitiumque musto quibusdam in locis iterum sponte fervere, qua calamitate deperit sapor: vappae accipit nomen, probrosum etiam hominum, cum degeneravit animus. aceti enim nequitiae inest virtus magnos ad usus et sine quis mitior vita degi non possit. cetero vinorum medicaminis tanta cura est, ut cinere apud quosdam, ceu gypso alibi et quibus diximus modis, instaurentur; sed cinerem e vitis sarmentis aut quercu praeferunt. quin et marinam aquam eiusdem rei gratia ex alto peti iubent servarique ab aequinoctio verno, aut certe nocte solstitio et aquilone flante hauriri vel, si circa vindemiam hauriatur, decoqui.

pix in italia ad vasa vino condendo maxime probatur bruttia. fit e piceae resina, in hispania autem e pinastris minime laudata. est enim resina earum amara et arida et gravi odore. differentiam rationemque faciendi proximo volumine demonstrabimus inter arbores feras. vitia praeter supra dicta acor aut fumidum virus, picis autem adustio; experimentum vero, si fragmenta subluceant ac sub dente lentescant acore iucundo. asia picem idaeam maxime probat, graecia piericam, vergilius naryciam. diligentiores admiscent nigram mastichen, quae in ponto bitumini similis gignitur, et iris radicem oleumque. nam ceram accipientibus vasis conpertum vina acescere. sed transferre in ea vasa, in quibus acetum fuerit, utilius quam in ea, in quibus dulce aut mulsum. cato iubet vina concinnari - hoc enim utitur verbo - cineris lixivi cum defruto cocti parte quadragesima in culleum vel salis sesquilibra, interim et tuso marmore. facit et sulphuris mentionem, resinae vero in novissimis. super omnia addi maturescente iam vino iubet mustum, quod ille tortivum appellat, nos intellegimus novissime expressum. et addi scimus tinguendi gratia colores, ut pigmentum aliquod vini, atque ita pinguius fieri. tot veneficiis placere cogitur, et miramur noxium esse! in vitium inclinantis experimentum est lamnae plumbeae mutatus in eo colos.

proprium autem inter liquores vino mucescere aut in acetum verti, extantque medicinae volumina. faex vini siccata recipit ignes ac sine alimento per sese flagrat. cinis eius nitri naturam habet easdemque vires, hoc amplius quod pinguior sentitur.

magna et collecto iam vino differentia in caelo. circa alpes ligneis vasis condunt tectisque cingunt atque etiam hieme gelida ignibus rigorem arcent. rarum dictu, sed aliquando visum, ruptis vasis stetere glaciatae moles, prodigii modo, quoniam vini natura non gelascit; alias ad frigus stupet tantum. mitiores plagae doliis condunt infodiuntque terrae tota aut ad portionem situs. ita caelum prohibent, alibi vero inpositis tectis arcent, traduntque et haec praecepta: latus cellae vinariae aut certe fenestras obverti in aquilonem oportere vel utique in exortum aequinoctialem. sterculinia et arborum radices procul abesse omniaque odoris evitandi, facillimo in vina transitu, ficos utique et caprificos; doliis etiam intervalla dari, ne inter sese vitia serpent contagione

vini semper ocissima. quin et figuras referre; ventriosa ac patula minus utilia. picari oportere protinus a canis ortu, postea perfundi marina aqua aut salsa, dein cinere e sarmentis aspergi vel argilla, abstersa murra suffiri ipsasque saepius cellas. inbecilla vina demissis in terram doliis servanda, valida expositis. numquam inplenda, et quod supersit passo aut defruto perungendum admixto croco pistave iri cum sapa. sic opercula doliorum medicanda addita mastiche aut pice bruttia. aperiri vetant nisi sereno die, vetant austro flante lunave plena. flos vini candidus probatur; rubens triste signum esse, si non is vini colos sit, item vasa incaloescentia operculave sudantia. quod celeriter florere coeperit odoremque trahere, non fore diutinum. ipsa quoque defruta ac sapa, cum sit caelum sine luna, hoc est in sideris eius coitu, neque alio die coqui iubent, praeterea plumbeis vasis, non aereis, nucibusque iuglandibus additis; eas enim fumum excipere. campaniae nobilissima exposita sub diu in cadis verberari sole, luna, imbre, ventis aptissimum videtur.

ac si quis diligentius reputet, in nulla parte operosior vita est - ceu non saluberrimum ad potus aquae liquorem natura dederit, quo cetera omnia animalia utuntur; at nos vinum bibere et iumenta cogimus - tantoque opere, tanto labore et impendio praestat quod hominis mentem mutet ac furorem gignat, milibus scelorum ob id editis, tanta dulcedine, ut magna pars non aliud vitae praemium intellegat. quin immo, ut plus capiamus, sacco frangimus vires, et alia inritamenta excogitantur ac bibendi causa etiam venena concipiuntur, aliis cicutam praesumentibus, ut bibere mors cogat, aliis pumicis farinam et quae referendo pudet docere. cautissimos ex iis in balineis coqui videmus exanimesque efferri, iam vero alios lectum expectare non posse, immo vero nec tunicam, nudosque ibi protinus et anhelos ingentia vasa corripere, velut ad ostentationem virium, ac plena infundere, ut statim vomant rursusque hauriant, idque iterum tertiumque, tamquam ad perdenda vina geniti et tamquam effundi illa non possint nisi per corpus humanum! huc pertinent peregrinae exercitationes et volutatio in caeno ac pectorosa cervicis repandae ostentatio. per omnia haec praedicatur sitis quaeri. iam vero quae in bibendo certamina, quae vasa adulteriis caelata, tamquam per se parum doceat libidines temulentia! ita vina ex libidine hauriuntur, atque etiam praemio invitatur ebrietas et, si dis placet, emitur. alius, ut quantum biberit, tantum edit, pretium vinolentiae lege accipit, alius quantum alea quaesierit, tantum bibit. tunc avidi matronam oculi licentur, graves produnt maritum, tunc animi secreta proferuntur. alii testamenta sua nuncupant, alii mortifera elocuntur redditurasque per iugulum voces non continent - quam multis ita interemptis! - volgoque veritas iam attributa vino est. interea, ut optime cedat, solem orientem non vident ac minus diu vivunt. hinc pallor et genae pendulae, oculorum ulcera, tremulae manus effundentes plena vasa - quae sit poena praesens - , furiales somni et inquietas nocturna praemiumque summum ebrietatis libido portentosa ac iucundum nefas. postero die ex ore halitus cadi ac rerum omnium oblivio morsque memoriae. rapere se ita vitam praedicant,

cum priorem diem cotidie perdant; illi vero et venientem. tiberio claudio principe ante hos annos xl institutum, ut ieiuni biberent potiusque vinum antecederet cibos, externis et hoc artibus ac medicorum placitis novitate semper aliqua sese commendantium. gloriam hac virtute parthi quaerunt, famam apud graecos Alcibiades meruit, apud nos cognomen etiam novellius torquatus mediolanensis, ad proconsulatum usque praeturae honoribus gestis, tribus congiis - unde et cognomen illi fuit - epotis uno impetu, spectante miraculi gratia tiberio principe, in senecta iam severo atque etiam saevo alias. et ipsi iuventa ad merum pronior fuerat, eaque commendatione credidere l. pisonem urbis curae ab eo delectum, quod biduo duabusque noctibus perpotationem continuasset apud ipsum iam principem. nec alio magis drusus caesar regenerasse patrem tiberium ferebatur. torquato rara gloria, quando et haec ars suis legibus constat, non labasse sermone, non levatum vomitione nec alia corporis parte, dum biberet, matutinas obisse sine iniuria vigilias, plurimum hausisse uno potu, plurimum praeterea aliis minoribus addidisse, optima fide non respirasse in hauriendo neque expuisse nihilque ad elidendum in pavimentis sonum ex vino reliquisse, diligenti scito legum contra bibendi fallacias. tergilla ciceronem m. f. binos congios simul haurire solitum ipsi obicit marcoque agrippae a temulento scyphum in pactum. etenim haec sunt ebrietatis opera. sed nimirum hanc gloriam auferre cicero voluit interfectori patris sui m. antonio. is enim ante eum avidissime adprehenderat hanc palmam edito etiam volumine de sua ebrietate, quo patrocinari sibi ausus adprobavit plane, ut equidem arbitror, quanta mala per temulentiam terrarum orbi intulisset. exiguo tempore ante proelium actiacum id volumen evomuit, quo facile intellegatur ebrius iam sanguine civium et tanto magis eum sitiens. namque et haec necessitas vitium comitatur, ut bibendi consuetudo augeat aviditatem, scitumque est scytharum legati, quanto plus biberint, tanto magis sitire parthos.

est et occidentis populis sua ebrietas fruge madida, pluribus modis per gallias hispaniasque, nominibus aliis, sed ratione eadem. hispaniae iam et vetustatem ferre ea genera docuerunt. aegyptus quoque e fruge sibi potus similes excogitavit, nullaque in parte mundi cessat ebrietas, meros quippe hauriunt tales sucos nec diluendo ut vina mitigant. at hercules illic tellus fruges parere videbatur. heu mira vitiorum sollertia! inventum est quem ad modum aquae quoque inebriarent.

duo sunt liquores humanis corporibus gratissimi, intus vini, foris olei, arborum e genere ambo praecipui, sed olei necessarius; nec segniter in eo vita elaboravit. quanto tamen in potu ingeniosior fuerit, apparebit ad bibendum generibus centum octoginta quinque, si species vero aestimentur, paene duplici numero excogitatis tantoque paucioribus olei, de quo sequenti volumine dicemus.

LIBER XV

oleam theophrastus e celeberrimis graecorum auctoribus urbis romae anno circiter ccccxl negavit nisi intra [xxxx] passuum ab mari nasci, fenestella vero omnino non fuisse in italia hispaniaque aut africa tarquinio prisco regnante, ab annis populi romani clxxiii, quae nunc pervenit trans alpis quoque et in gallias hispaniasque medias. urbis quidem anno dv appio claudio caeci nepote l. iunio cos. olei librae duodenae denis assibus veniere, et mox anno dclxxx m. seius l. f. aedilis curulis olei denas libras singulis assibus praestitit populo romano per totum annum. minus ea miretur qui sciat post annos xxii cn. pompeio iii cos. oleum provinciis italiam misisse. hesiodus quoque, in primis culturam agrorum docendam arbitratus vitam, negavit oleae satorem fructum ex ea percepisse quemquam: tam tarda tunc res erat. at nunc etiam in plantariis ferunt, translatarumque altero anno decerpuntur bacae. fabianus negat provenire in frigidissimis oleam neque in calidissimis.

genera earum tria dixit vergilius, orchites et radios et posias, nec desiderare rastros aut falces ullamve curam. sine dubio et in iis solum maxime caelumque refert. verum tamen et tondentur, cum et vites, atque etiam interradi gaudent. consequens earum vindemia est arsque vel maior olei musta temperandi. ex eadem quippe oliva differunt suci. primum omnium cruda dat atque nondum inchoatae maturitatis; hoc sapore praestantissimum. quin et ex eo prima unda preli lautissima ac deinde per deminutiones, sive in sportis prematur sive, ut nuper inventum est, exilibus regulis pede incluso. quanto maturior baca, tanto pinguior sucus minusque gratus. optima autem aetas ad decerpendum inter copiam bonitatemque incipiente baca nigrescere, cum vocant druppas, graeci vero drypetidas. cetero distat tum, maturitas illa in torcularibus fiat an ramis, rigua fuerit arbor an suo tantum baca suco nihilque aliud quam rores caeli biberit.

vetustas oleo taedium adfert, non item ut vino, plurimumque aetatis annuo est, provida, si libeat intellegere, natura, quippe temulentiae nascentibus vinis uti necesse non est, quin immo invitat ad servandum blanda inveterati caries: oleo noluit parci fecitque ea necessitate promiscuum et vulgo. principatum in hoc quoque bono obtinuit italia e toto orbe, maxime agro venafrano eiusque parte quae licinianum fundit oleum, unde et licinae gloria praecipua olivae. unguenta hanc palmam dedere accommodato ipsis odore, dedit et palatum delicatiore sententia; de cetero bacas licinae nulla avis adpetit. relicum certamen inter histriae terram et baeticae par est. cetero fere vicina bonitas provinciis excepto africae frugifero solo: cereri id totum natura concessit, oleum ac vinum non invidit tantum satisque gloriae in messibus fecit. reliqua erroris plena, quem in nulla parte vitae numerosiorem esse docebimus.

oliva constat nucleo, oleo, carne, amurca. sanies haec est eius amara; fit ex aquis, ideo siccitatibus minima, riguis copiosa. suus quidem olivae sucus oleum est, idque praecipue ex in maturis intellegitur, sicut in omphacio

docuimus. augetur oleum ab arcturi exortu in a. d. xvi kal. oct., postea nuclei increscunt et caro. tum si etiam copiosi imbres accessere, vitiatur oleum in amurcam. huius color olivam cogit nigrescere, ideoque incipiente nigritia minimum amurcae, ante eam nihil est. error hominum falsus existimantium maturitatis initium quod est vitii proximum, deinde quod oleum crescere olivae carne arbitrantur, cum sucus omnis in corpus abeat lignumque intus grandescat. ergo tum maxime rigantur; quod ubi cura multisve imbribus accidit, oleum absumitur nisi consecuta serenitate quae corpus extenuet. omnino enim, ut theophrasto placet, et olei causa calor est, quare in torcularibus etiam ac cellis multo igni quaeritur. tertia est culpa in parsimonia, quoniam propter impendium decerpendi expectatur ut decidant olivae. qui medium temperamentum in hoc servant, perticis decutiunt cum iniuria arborum sequentisque anni damno. quippe olivantibus lex antiquissima fuit: “oleam ne stringito neve verberato.” qui cautissime agunt, harundine levi ictu nec adversos percutiunt ramos. sic quoque alternare fructus cogitur decussis germinibus, nec minus si expectetur ut cadant; haerendo enim ultra suum tempus absumunt venientibus alimentum et detinent locum. argumentum est quod nisi ante favonium collectae novas vires resumunt et difficilius cadunt.

primae ergo ab autumnno colliguntur vitio operae, non naturae, posia cui plurimum carnis, mox orchites cui olei, post radius. has enim ocissime occupatas, quia sunt tenerrimae, amurca cogit decidere. differuntur vero etiam in martium mensem callosae, contra umorem pugnaces ob idque minimae, licinia, cominia, contia, sergia, quam sabini regiam vocant, non ante favonii adflatum nigrescentes, hoc est a. d. vi id. feb. tunc arbitrantur eas maturescere, et quoniam probatissimum ex iis fiat oleum, accedere etiam ratio pravitati videtur feruntque frigore austeritatem fieri, sicut copiam maturitate, cum sit illa bonitas non temporis, sed generis tarde putrescentium in amurcam. similis error collectam servandi in tabulatis nec prius quam sudet premendi, cum omni mora oleum decrescat, amurca augeatur. itaque vulgo non amplius senas libras singulis modiis exprimi dicunt. amurcae mensuram nemo agit, quanto ea copiosior reperiatur in eodem genere diebus adiectis. omnino invictus error et publicus tumore olivae crescere oleum existimandi, cum praesertim nec magnitudine copiam olei constare indicio sint quae regiae vocantur, ab aliis maiorinae, ab aliis babbiae, grandissimae alioqui, minimo suco. et in aegypto carnosissimis olei exiguum, decapoli vero syriae perquam parvae, nec cappari maiores, carne tamen commendantur. quam ob causam italicis transmarinae praeferuntur in cibus, cum oleo vincantur, et in ipsa italia ceteris picenae et sidicinae. sale illae privatim condiuntur et ut reliquae amurca sapave, nec non aliquae oleo suo et sine arcessita commendatione purae innatant, colymbades. franguntur eadem herbarumque viridium sapore condiuntur. fiunt et praecoques ferventi aqua perfusae quamlibeat inmaturae; mirumque dulcem sucum olivas bibere et alieno sapore infici. purpureae sunt et in iis, ut uvis, in nigrum colorem transeuntibus positis. sunt et superbae praeter iam dicta genera. sunt et praedulces, per se tantum siccatae uvisque passis dulciores,

admodum rarae in africa et circa emeritam lusitaniae. oleum ipsum sale vindicatur a pinguitudinis vitio. cortice oleae conciso odorem accipit. medicatio alias ut vino; palati gratia nulla est nec tam numerosa differentia: tribus ut plurimum bonitatibus distat. odor in tenui argutior, et is tamen etiam in optimo brevis.

oleo natura tepefacere corpus et contra algores munire, eidem fervores capitis refrigerare. usum eius ad luxuriam vertere graeci, vitiorum omnium genitores, in gymnasiis publicando: notum est magistratus honoris eius octogenis sestertiis strigmenta olei vendidisse. oleae honorem romana maiestas magnum perhibuit turmas equitum idibus iuliis ea coronando, item minoribus triumphis ovantes. athenae quoque victores olea coronant, graecia oleastro olympiae.

nunc dicentur catonis placita de olivis. in calido et pingui solo radium maiorem, sallentinam, orchitem, posiam, sergianam, cominianam, albiceram seri iubet adicitque singulari prudentia: quam earum in iis locis optimam esse dicent, in frigido autem et macro liciniam. pingui enim aut ferventi vitari eius oleum arboremque ipsa fertilitate consumi, musco praeterea et rubore infestari. spectare oliveta in favonium loco exposito solibus censet, nec alio ullo modo laudat. condi olivas optime orchites et posias, vel virides in muria vel fractas in lentisco. oleum quam acerbissima oliva optimum fieri. cetero quam primum e terra colligendam, si inquinata sit, lavandam; siccari triduo satis esse. si gelent frigora, quarto die premendam; hanc et sale aspergi. oleum in tabulato minui deteriusque fieri, item in amurca et fracibus - hae sunt carnes et inde faeces - ; quare saepius die capulandum, praeterea concha et in plumbeas cortinas; aere vitari. ferventibus omnia ea fieri clausisque torcularibus et quam minime ventilatis, ideo nec ligna ibi caedi oportere - qua de causa e nucleis ipsarum ignis aptissimus - ; ex cortinis in labra fundendum, ut fraces et amurca linquantur. ob id crebrius vasa mutanda, fiscinas spongia tergendas, ut quam maxime pura sinceritas constet. postea inventum ut lavarentur utique ferventi aqua, protinus prelo subicerentur solidae - ita enim amurca exprimitur - , mox trapetis fractae premerentur iterum. premi plus quam centenos modios non probant: factus vocatur; quod vero post molam primum expressum est, flos. factus tres gemino foro a quaternis hominibus nocte et die premi iustum est.

non erat tum ficticium oleum, ideoque arbitror de eo nihil a catone dictum. nunc eius genera plura, primumque persequemur ea quae ex arboribus fiunt, et inter illas ante omnes ex oleastro. tenue id multoque amarius quam oleae et tantum ad medicamenta utile. simillimum huic est ex chamelaea, frutice saxoso, non altiore palmo, foliis oleastri bacisque. proximum fit e cici, arbore in aegypto copiosa (alii crotonem, alii sibi, alii sesamon silvestre eam appellant), ibique, non pridem et in hispania, repente provenit altitudine oleae, caule ferulaceo, folio vitium, semine uvarum gracilium pallidarumque. nostri eam ricinum vocant a similitudine seminis. coquitur id in aqua, innatansque oleum tollitur. at in aegypto, ubi abundat, sine igni et aqua sale adpersum

exprimitur, cibus foedum, lucernis exile. amygdalinum, quod aliqui neopum vocant, ex amaris nucibus arefactis et in offam contusis adpersam aqua iterumque tuis exprimitur. fit et lauru admixto drupparum oleo, quidamque e bacis exprimunt tantum, alii foliis modo, aliqui folio et cortice bacarum, nec non styracem addunt aliosque odores; optima laurus ad id latifolia, silvestris, nigris bacis. simile est et e myrto nigra, et haec latifolia melior. tunduntur bacae adpersae calida aqua, mox decoquuntur. alii foliorum mollissima decoquunt in oleo et exprimunt, alii deiecta ea in oleum prius sole maturant. eadem ratio et in sativa myrto, sed praefertur silvestris minore semine, quam quidam oxymyrsinen, alii chamaemyrsinen vocant, aliqui acoron a similitudine; est enim brevis, fruticosa. fit et e citro, cupresso, nucibus iuglandibus quod caryinum vocant, malis, cedro quod pisselaeon, e grano quoque cnidio purgato semine et tunso, item lentisco. nam cyprinum et e glande aegyptia ut fieret odorum causa dictum est. indi e castaneis ac sesima atque oryza facere dicuntur, ichthyophagi e piscibus. inopia cogit aliquando luminum causa et e platani bacis fieri aqua et sale maceratis. et oenanthinum fit; de ipsa oenanthe dictum est in unguentis. gleucino mustum incoquitur vapore lento, ab aliis sine igni circumdatis vinaceis diebus xxi bis singulis permixtum, consumiturque mustum oleo. aliqui non sampsuchum tantum admiscent, sed etiam pretiosiora odoramenta, ut in gymnasiis quoque conditur odoribus, sed vilissimis. fit ex aspalatho, calamo, balsamo, iri, cardamomo, meliloto, nardo gallico, panace, sampsucho, helenio, cinnamomi radice, omnium sucis in oleo maceratis expressisque. sic et rhodinum e rosis, iuncinum e iunco, quod et rosaceo simillimum, item hyoscyamo et lupinis, narcisso. plurimum autem in aegypto e raphani semine aut gramine herba quod chortinon vocant, item e sesima et urtica quod cnidinum appellant. e lilio et alibi fit sub diu sole, luna, pruina maceratum. suis herbis componunt inter cappadociam et galatiam quod selgiticum vocant, nervis admodum utile, sicut in italia iguvini. e pice fit quod pissinum appellant, cum coquitur, velleribus supra halitum eius expansis atque ita expressis. probatum maxime e bruttia; est enim pinguissima et resinosissima. color oleo fulvus. sponte nascitur in syriae maritimis quod elaeomeli vocant; manat ex arboribus pingue, crassius melle, resina tenuius, sapore dulci, et hoc medicis. veteri quoque oleo usus est ad quaedam genera morborum; existimaturque et ebori vindicando a carie utile esse: certe simulacrum saturni romae intus oleo repletum est.

super omnia vero celebravit amurcam laudibus caton. dolia olearia cadosque illa imbui, ne bibant oleum; amurca subigi areas terendis messibus, ut formicae rimaeque absint; quin et lutum parietum ac tectoria et pavimenta horreorum frumenti, vestiaria etiam contra teredines ac noxia animalium amurca aspergi, semina frugum perfundi. morbis quadripedum, arborum quoque, illa medendum, efficaci ad ulcera interiora humani quoque oris. lora etiam et coria omnia et calceamina axesque decocta ungui atque aeramenta contra aeruginem colorisque gratia elegantioris et totam supellectilem ligneam ac vasa fictilia, in quibus ficum aridam libeat adservare, aut si folia bacasque in

virgis myrti aliudve quod genus simile. postremo ligna macerata amurca nullo fumi taedio ardere. oleam si lambendo capra lingua contigerit depaveritque primo germinatu, sterilesce auctor est M. Varro. et hactenus de olea atque oleo.

reliqui arborum fructus vix specie figurave, non modo saporibus sucisque totiens permixtis atque insitis, enumerari queunt.

grandissimus pineis nucibus altissimeque suspensus. intus exiles nucleos lacunatis includit toris, vestitos alia ferruginis tunica, mira naturae cura molliter semina conlocandi. harum genus alterum tarentinae digitis fragili putamine aviumque furto in arbore. et tertium sappini e picea sativa, nucleorum cute verius quam putamine adeo molli, ut simul mandatur. quartum pitydia vocant e pinastris, singularis remedii adversus tussim in melle decoctis nucleis. taurini ravicelos vocant. pinea corona victores apud isthmum coronantur.

his proxima amplitudine mala quae vocamus cotonea et graece cydonea, e creta insula advecta. incurvatos trahunt ramos prohibentque crescere parentem. plura eorum genera: chrysomela incisuris distincta, colore ad aurum inclinato, qui candidior nostratia cognominat, odoris praestantissimi. est et neapolitanis suus honos. minora ex eodem genere struthea odoratius vibrant, serotino proventu, praecoci vero mustea. strutheis autem cotonea insita suum genus fecere mulvianum, quae sola ex iis vel cruda manduntur, iam et virorum saluatoriis cubiculis inclusa ac simulacris noctium consociis inposita. sunt praeterea parva silvestria, e strutheis odoratissima et in saepibus nascentia.

mala appellamus, quamquam diversi generis, persica et granata, quae in punicis arboribus novem generum dicta sunt. his acinus sub cortice intus, illis lignum in corpore. nec non et quaedam e piris libralia appellata amplitudinem sibi ponderis nomine adserunt. sed persicorum palma duracinis. nationum habent cognomen gallica et asiatica. post autumnum maturescunt asiatica, aestate praecocia intra xxx annos reperta et primo denariis singula venundata. supernatia e sabinis veniunt, popularia undique. pomum innocuum expetitur aegris, pretiumque iam singulis triceni nummi fuere, nullius maiore, quod miremur, quia non aliud fugacius. longissima namque decerpto bidui mora est cogitque se venundari.

ingens postea turba prunorum: versicoloria e nigro candicant, hordearia appellata a comitatu frugis eius; alia eodem colore seriora maioraque, asinina cognominata a vilitate. sunt minora, at laudatiora cerina atque purpurea, nec non ab externa gente armeniaca, quae sola et odore commendantur. peculiaris inprudencia est nucibus insitorum, quae faciem parentis sucumque adoptionis exhibent, appellata ab utroque nucipruna. et haec autem et persica et cerina ac silvestria ut uvae cadis condita usque ad alia nascentia aetatem sibi prorogant, reliquorum velocitas cito mitescentium transvolat. nuper in baetica malina appellari coeperunt malis insita et alia amygdalina amygdalis. his intus in ligno nucleus amygdalae est, nec aliud pomum ingeniosius geminatum est. in peregrinis arboribus dicta sunt damascena, a syriae damasco cognominata,

iam pridem in italia nascentia, grandiore quamquam ligno et exiliore carne nec umquam in rugas siccata, quoniam soles sui desunt. simul dici possunt populares eorum myxae, quae et ipsae nunc coeperunt romae nasci insitae in sorvis.

in totum quidem persica peregrina etiam asiae graeciaeque esse ex nomine ipso apparet atque e perside advecta. sed pruna silvestria ubique nasci certum est, quo magis miror huius pomi mentionem a catone non habitam, praesertim cum condenda demonstraret quaedam et silvestria. nam persicae arbores sero et cum difficultate transiere, ut quae in rhodo nihil ferant, quod primum ab aegypto earum fuerat hospitium. falsum est venenata cum cruciatu in persis gigni et poenarum causa ab regibus tralata in aegyptum terra mitigata. id enim de perseae diligentiores tradunt, quae in totum alia est, myxis rubentibus similis, nec extra orientem nasci voluit. eam quoque eruditiores negaverunt ex perside propter supplicia tralatam, sed a perseo memphi satam, et ob id alexandrum illa coronari victores ibi instituisse in honorem atavi sui. semper autem folia habet et poma subnascentibus aliis. sed pruna quoque omnia post catonem coepisse manifestum erit.

malorum plura sunt genera. de citreis cum sua arbore diximus, medica autem graeci vocant patriae nomine. aequae peregrina sunt zizipha et tubures, quae et ipsa non pridem venere in italiam, haec ex africa, illa ex syria. sex. papinius, quem consulem vidimus, primus utraque attulit Divi Augusti novissimis temporibus in castris sata, bacis similia quam malis, sed aggeribus praecipue decora, quoniam et in tecta iam silvae scandunt. tuburum duo genera: candidum et a colore syricum dictum. paene peregrina sunt in uno italiae agro veroniensi nascentia quae lanata appellantur; lanugo ea obducit, struthis quidem persicisque plurima, iis tamen peculiare nomen dedit, nulla alia commendatione insignibus.

reliqua cur pigeat nominatim indicare, cum conditoribus suis aeternam propagaverint memoriam, tamquam ob egregium aliquod in vita factum nisi fallor, apparebit ex eo ingenium inserendi nihilque tam parvum esse quod non gloriam parere possit. ergo habent originem a matio cestioque et mallio, item scaudio; quibus cotoneo insito ab appio e claudia gente appiana sunt cognominata. odor est iis cotoneorum, magnitudo quae scaudianis, color rubens. ac ne quis sic ambitum valuisse claritatis e familia putet, sunt et sceptiana ab inventore libertino, insignia rotunditate. cato adicit quiriniana et quae tradit in doliis condi scantiana. omnium autem nuperrime adoptata sunt parva gratissimi saporis, quae petisia nominantur. patrias nobilitavere amerina et graecula. cetera e causis traxere nomen: germanitatis cohaerentia gemella, numquam singula in fetu, colore syrica, cognatione melapia, mustea a celeritate mitescendi, quae nunc melimela dicuntur a sapore melleo, orbiculata a figura orbis in rotunditatem circumacti - haec in epiro primum provenisse argumento sunt graeci, qui epirotica vocant - , mammarum effigie orthomastia, condicione castrati seminis quae spadonia appellant belgae. melofoliis folium unum, aliquando et geminum, erumpit e latere medio.

celerrime in rugas marcescunt pannucea. stolidè tument pulmonea. est quibusdam sanguineus colos origine ex mori insitu tracta. cunctis vero quae fuere a sole partes rubent. sunt et parva gratia saporis atque etiam acutiora odore silvestria. peculiare inprobae iis acerbitalis conviciu et vis tanta, ut aciem gladii praestringat. dat aliis farina vilissimis nomen, quamquam primis adventu decerpique properantibus.

eadem causa in piris taxatur superbiae cognomine; parva haec, sed ocissima. e cunctis autem crustumia gratissima, proxima iis falerna potu, quoniam tanta vis suci abundat - lactere hoc vocatur - , in iisque alia colore nigro, dona syriae. reliquorum nomina aliter in aliis atque aliis locis appellantur. sed confessis urbis vocabulis auctores suos nobilitavere decimiana et ex eo tractum quod pseudodecimianum vocant, dolabelliana longissimi pediculi, pomponiana cognomine mammosa, liceriana, seviana et quae ex iis nata sunt turraniana, longitudine pediculi distantia, favoniana rubra, paulo superbis maiora, lateriana, aniciana postautumnalia, acidulo sapore iucunda. tiberiana appellantur quae maxime tiberio principi placuere. colorantur magis sole grandescuntque, alioqui eadem essent quae liceriana. patriae nomina habent serissima omnium amerina, picentina, numantina, alexandrina, numidiana, graeca et in iis tarentina, signina, quae alii a colore testacea appellant, sicut onychina, purpurea, ab odore myrapia, laurea, nardina, tempore hordearia, collo ampullacea, et coriolana, bruttia gentilitatis, cucurbitina, acidula suci. incerta nominum causa est barbaricis, veneriis quae colorata dicunt, regiis quae minimo pediculo sessilia, patriciis, vocimis, viridibus oblongisque. praeterea dixit volema vergilius a catone sumpta, qui et sementiva et mustea nominat.

pars haec vitae iam pridem pervenit ad columen, expertis cuncta hominibus, quippe cum vergilius insitam nucibus arbutum, malis platanum, cerasis ulmum dicat. nec quicquam amplius excogitari potest; nullum certe pomum novum diu iam invenitur. neque omnia insita misceri fas est, sicut nec spinas inseri, quando fulgura piari non queunt facile, quotque genera insita fuerint, tot fulgura uno ictu fieri pronuntiat.

turbator piris figura. in iis serotina ad hiemes usque in matre pendent gelu maturescentia graeca, ampullacea, laurea, sicut in malis amerina, scaudiana. conduntur vero pira ut uvae ac totidem modis, neque aliud in cadis praeterquam pruna. e pomis proprietas piris quae vini, similiterque in aegris medentes cavent. e vino et aqua cocuntur atque pulmentari vicem implent, quod non alia praeter cotonea ac struthaea.

in universum autem de pomis servandis praecipitur pomaria in loco frigido ac sicco contabulari, septentrionalibus fenestris sereno die patere, austros specularibus arcere, aquilonis quoque adflatu poma deturpante rugis. colligi mala post aequinoctium autumnii neque ante xvi lunam neque ultra duodetricesimam, nec pluvio die neque ante primam horam; cadiva separari; stramentis solidis paleisve substerni, rara componi, uti limites pervii spiritum aequalem accipiant. amerina maxime durare, melimela minime. - cotoneis in

concluso spiramentum omne adimendum aut incoqui melle ea mergive oportere. punica aqua marina fervente indurari, mox triduo sole siccata ita ne nocturno rore contingantur suspendi et, cum libeat uti, aqua dulci perlui. M. Varro et in doliis harenae servari iubet; et immatura obrui terra in ollis fundo effracto, sed spiritu excluso ac surculo pice inlito: sic etiam crescere amplitudine maiore quam possint in arbore. cetera mala et foliis ficulnis, praeterquam cadivis, singula convolvi cistisque vitilibus condi vel creta figularum inlini. - pira in vasis fictilibus picatis inversis obrui scrobe. tarentina serissima legi, aniciana servari et in passo, sorva quoque et scrobibus gypsato operculo, duum pedum terra superiniecta, in loco aprico inversis vasis et in doliis ut uvas interque uvas cum ramis suspendi.

e proximis auctoribus quidam altius curam repetunt deputarique statim poma ac vites ad hunc usum praecipiunt decrescente luna, post horam diei tertiam, caelo sereno aut siccis ventis. similiter deligi et ex locis siccis et ante perfectam maturitatem, addito ut luna infra terram sit, uvas cum malleolo sarmenti duro, demptis forfice corruptoribus acinis, in dolio picato recenti suspendi, exclusa omni aura operculo et gypso. sic et sorva ac pira, inlitis omnium surculis pice. dolia procul ab aqua esse. quidam sic cum palmite ipso condunt, capitibus eius scillae infixis utrimque, alii etiam vina habentibus doliis, dum ne contingant ea uvae, aliqui mala in patinis fictilibus fluitantia, quo genere et vino odorem adquiri putant. aliqui omnia haec in milio servari malunt, plerique vero in scrobe duum pedum altitudinis harena substrato et fictili operculo, dein terra operto. creta quidam figlina etiam uvas inlinunt siccataque sole suspendunt, in usu diluentes cretam. eandem pomis vino subigunt. mala vero generosissima eadem ratione crustant gypso vel cera, quae, nisi maturuerint, incremento calcem rumpunt. semper autem in pediculos conlocant ea. alii decerpunt cum surculis eosque in medullam sabuci additos obruunt, ut supra scriptum est. alii singulis malis pirisque singula vasa fictilia adsignant et operculo eorum picato dolio iterum includunt, nec non aliqui in floccis capsisque, quas luto paleato inlinunt; alii hoc idem in patinis fictilibus, aliqui et in scrobe subiecta harena: ita sicca operiunt mox terra. sunt qui cotonea cera pontica inlita melle demergant. columella auctor est in puteos cisternasve uvas in fictilibus vasis pice diligenti cura inlitis mergi. liguria maritima alpius proxima uvas sole siccatas iunci fasceis involvit cadisque conditas gypso includit. hoc idem graeci platani foliis aut vitis ipsius aut fici uno die in umbra siccatis atque in cado vinaceis interpositis. quo genere coa uva et berytia servantur, nullius suavitati postferendae. quidam, ut has faciant, in cinere lixivo tingunt protinus quam detraxere vitibus, mox in sole siccant passasque in aquam calidam mergunt et iterum sole siccant, tum foliis, ut supra dictum est, involutas vinaceis stipant. sunt qui malunt uvas in scrobe ramentisve abietis, populi, fraxini servare. sunt qui suspendi procul malis protinusque in granariis iubent, quoniam optime siccet frumenti pulvis. pensilibus contra vespas remedio est oleo adspergi ex ore. de palmis diximus.

e reliquo genere pomorum ficus amplissima est, quaedamque et piris magnitudine aemulae. de aegyptiae cypriaeque miraculis retulimus inter externas. idaea rubet olivae magnitudine, rotundior tantum, sapore mespili. alexandrinam hanc ibi vocant, crassitudine cubitali, ramosam, materie validam, lentam, sine lacte, cortice viridi, folio tiliae, sed molli. onesicritus tradit in hyrcania multum nostris esse dulciores fertilioresque, ut quae modios cclxx singulae ferant. ad nos ex aliis transiere gentibus, chalcide, chio, quarum plura genera. si quidem et lydiae, quae sunt purpureae, et mamillanae similitudinem earum habent et callistruthiae farti sapore praestantiores, ficorum omnium frigidissimae. nam de africanis, quoniam multi praeferunt cunctis, magna quaestio est, cum id genus in africanam nuperrime transierit. patriae nomen optinent etiam alexandrinae ex nigris, candicante rima, cognomine delicatae. nigra et rhodia est et tiburtina de praecocibus. sunt et auctorum nomina iis, liviae, pompeii. siccandis haec sole in annuos usus aptissima cum mariscis et quas harundinum folii macula variat. est et herculanea et albicerata et aratia alba, pediculo minimo, latissima. primo autem provenit porphyritis, longissimo pediculo. comitatur eam e minimis, vilissimis popularis dicta. contra novissima sub hieme maturatur chelidonia. sunt praeterea eadem serotinae et praecoces, biferae, alba ac nigra, cum messe vindemiaeque maturescentes. serotinae et a corio appellatae duro, ex chalcidicis quarundam trifero proventu. tarenti tantum praedulces nascuntur, quas vocant onas. cato de ficis ita memorat: “ficos mariscas in loco cretoso aut aperto serito, in loco autem crassiore aut stercoreato africanas et herculaneas, sacontinas, hibernas, tellanas atras pediculo longo.” postea tot subiere nomina atque genera, ut vel hoc solum aestimantibus appareat mutatam esse vitam. sunt et hibernae quibusdam provinciis, uti moesiae, sed artis, non naturae. parvarum genus arborum post autumnum fimo contegunt, deprehensasque in his hieme grossos, quae mitiore caelo refossae cum arbore atque in lucem remissae novos soles aliosque, quam quibus vixere, avide tamquam iterum natae accipiunt et cum venientium flore maturescunt, alieno praecoces anno, in tractu vel gelidissimo.

sed a catone appellata iam tum africana admonet africae ad ingens docimentum usi eo pomo. namque perniciali odio carthaginis flagrans nepotumque securitatis anxius, cum clamaret omni senatu carthaginem delendam, adtulit quodam die in curiam praecocem ex ea provincia ficum ostendensque patribus: “interrogo vos,” inquit, “quando hanc pomum demptam putetis ex arbore.” cum inter omnes recentem esse constaret: “atqui tertium,” inquit, “ante diem scitote decerptam carthagine. tam prope a moeris habemus hostem!” statimque sumptum est punicum tertium bellum, quo carthago deleta est, quamquam catone anno sequente raptum. quid primum in eo miremur, curam ingeni an occasionem fortuitam, celeritatemque cursus an vehementiam viri super omnia est, quo nihil equidem duco mirabilius, tantam illam urbem et de terrarum orbe per cxx annos aemulam unius pomi argumento eversam, quod non trebia aut trasimenus, non cannae busto romani

nominis perficere potuere, non castra punica ad tertium lapidem vallata portaeque collinae adequitans ipse Hannibal. tanto propius carthaginem pomo cato admovit!

colitur ficus arbor in foro ipso ac comitio romae nata, sacra fulguribus ibi conditis magisque ob memoriam eius quae, nutrix romuli ac remi, conditores imperii in lupercali prima protexit, ruminalis appellata, quoniam sub ea inventa est lupa infantibus praebens rumim (ita vocabant mammam), miraculo ex aere iuxta dicato, tamquam in comitium sponte transisset atto navio augurante. nec sine praesagio aliquo arescit rursusque cura sacerdotum seritur. fuit et ante saturni aedem, urbis anno ... sublata sacro a vestalibus facto, cum silvani simulacrum subverteret. eadem fortuito satu vivit in medio foro, qua sidentia imperii fundamenta ostento fatali curtiis maximis bonis, hoc est virtute ac pietate ac morte praeclara, expleverat. aequae fortuita eodem loco est vitis atque olea, umbrae gratia sedulitate plebeia satae, ara inde sublata gladiatorio munere divi iuli, quod novissime pugnavit in foro.

admirabilis est pomi huiusce festinatio, unius in cunctis ad maturitatem properantis arte naturae. caprificus vocatur e silvestri genere ficus numquam maturescens, sed quod ipsa non habet alii tribuens, quoniam est naturalis causarum transitus fitque ut e putrescentibus gignatur aliquid. ergo culices parit; hi fraudati alimento in matre, putri eius tabe, ad cognata evolant morsuque ficorum crebro, hoc est avidiore pastu, aperientes ora earum, ita penetrantes intus solem primo secum inducunt cerialesque auras inmittunt foribus adapertis. mox lacteum umorem, hoc est infantiam pomi, absumunt - quod fit et sponte - , ideoque ficetis caprificus permittitur ad rationem venti, ut flatus evolantes in ficos ferat. inde repertum ut inlatae quoque aliunde et inter se colligatae inicerentur fico, quod in macro solo et aquilonio non desiderant, quoniam sponte arescunt loci situ rimisque eadem quae culicum opere causa perficit, nec ubi multus pulvis, quod evenit maxime frequenti via adposita. namque et pulveri vis siccandi sucumque lactis absorbendi. quae ratio pulvere et caprificatione hoc quoque praestat ne decidunt, absumpto umore tenero et cum quadam fragilitate ponderoso. ficis mollis omnibus tactus, maturis frumenta intus, sucus maturescentibus lactis, percoctis mellis. senescunt in arbore anusque destillant cummum lacrima. siccant honos laudatas, servat in capsis, ebuso in insula praestantissimas amplissimasque, mox in marrucinis; at ubi copia abundat, implentur orcae in asia, cadi autem in ruspina africae urbe, panisque simul et opsonii vicem siccatae implent, utpote cum cato cibaria ruris operariis iusta ceu lege sanciens minui iubeat per fici maturitatem. cum recenti fico salis vice caseo vesci nuper excogitatum est. ex hoc genere sunt, ut diximus, cottana et caricae quaeque conscendenti navem adversus parthos omen fecere M. Crasso venales praedicantis voce, cavneae. omnia haec in albense rus e syria intulit l. vitellius, qui postea censor fuit, cum legatus in ea provincia esset, novissimis ti. caesaris temporibus.

malorum pirorumque generi adnumerentur iure mespila atque sorva. mespilis tria genera: anthedon, setania; tertium degenerat, anthedoni tamen

similius, quod gallicum vocant. setaniae maius pomum candidiusque, acini molliore ligno; ceteris minus pomum, sed odore praestantius et quod diutius servetur. arbor ipsa de amplissimis. folia ante quam decidant rubescunt; radices multae atque altae et ideo inexstirpabiles. non fuit haec arbor in italia catonis aevo.

sorvis quadruplex differentia. aliis enim eorum rotunditas mali, aliis turbinatio piri, aliis ovata species ceu malorum aliquis; haec obnoxia acori. odore et suavitate rotunda praecellunt, ceteris vini sapor. generosissima quibus circa pediculos tenera folia. quartum genus torminale appellant, remedio tantum probabile, adsiduum proventu minimumque pomo, arbore dissimile, foliis paene platani. non ferunt ante trimatum ex ullo genere. cato et sorva condi sapa tradit.

ab his locum amplitudine vindicaverint, quae cessere auctoritate, nuces iuglandes, quamquam et ipsae nuptialium fescenninorum comites, multum pineis minores universitate eademque portione ampliores nucleo. nec non et honor iis naturae peculiaris gemino protectis operimento, pulvinati primum calycis, mox lignei putaminis. quae causa eas nuptiis fecit religiosas, tot modis fetu munito, quod est veri similius quam quia cadendo tripudium sonivium faciant. et has e perside regibus translatas indicio sunt graeca nomina: optimum quippe genus earum persicum atque basilicon vocant, et haec fuere prima nomina; caryon a capitis gravedine propter odoris gravitatem convenit dictum. tinguntur cortice earum lanae et rufatur capillus primum prodeuntibus nuculis; id conpertum infectis tractatu manibus. pinguescunt vetustate. sola differentia generum in putamine duro fragilive et tenui aut crasso, loculoso aut simplici. solum hoc pomum natura compactili operimento clausit. namque sunt bifidae putaminum carinae nucleorumque alia quadripartita distinctio, lignea intercursante membrana. ceteris quidquid est solidum est, ut in abellanis, et ipso nucum genere, quas antea abellinas patriae nomine appellabant. in asiam graeciamque e ponto venire eae ideoque et ponticae nuces vocantur. has quoque mollis protegit barba, sed putamini nucleisque solida rotunditas inest. hae et torrentur. umbilicus illis intus in ventre medio. tertia in his natura amygdalis tenuiore, sed simili iuglandium, summo operimento, item secundo putaminis; nucleus dissimilis latitudine et acriore callo. haec arbor an fuerit in italia catonis aetate dubitatur, quoniam graecas nominat, quas quidam et in iuglandium genere servant. adicit praeterea abellanas et galbas, praenestinas, quas maxime laudat et conditas ollis in terra servari virides tradit. nunc thasiae et albenses celebrantur et tarentinarum duo genera, fragili putamine ac duro, quae sunt et amplissimae ac minime rotundae; praeterea molluscae putamen rumpentes. sunt qui honori nomen interpretentur et iovis glandem esse dicant. nuper consularem virum audiavi biferas et iuglandes nuces habere se profitentem. de pistaciis, et ipso nucum genere, in suo loco retulimus. et haec autem idem vitellius in italiam primus intulit eodem tempore, simulque in hispaniam flaccus pompeius eques romanus, qui cum eo militabat.

nucēs vocamus et castaneas, quamquam adcommodatiores glandium generi. armatum iis echinato calyce vallum, quod inchoatum glandibus, mirumque vilissima esse quae tanta occultaverit cura naturae. trini quibusdam partus ex uno calyce; cortexque lentus, proxima vero corpori membrana et in his et in nucibus saporem, ni detrahatur, infestat. torrere has in cibus gratius, modo molantur, et praestant ieiunio feminarum quandam imaginem panis. sardibus hae provenire primum, ideo apud graecos sardianos balanos appellant, nam Διὸς βαλάνου nomen postea inposuere excellentioribus satu factis. nunc plura earum genera. tarentinae faciles nec operosae cibo, planae figura. rotundior quae balanitis vocatur, purgabilis maxime et sponte prosiliens pura. plana est et salariana, tarentina minus tractabilis, laudatior corelliana et ex ea facta quo dicemus in insitis modo tereiana, quam rubens cortex praefert triangulis et popularibus nigris, quae coctivae vocantur. patria laudatissimis tarentum et in campania neapolis. ceterae suum pabulo gignuntur, scrupulosa corticis intra nucleos quoque ruminatione.

haut procul abesse videantur et praedulces siliquae, nisi quod in iis ipse manditur cortex. digitorum omnis longitudo illis et interim falcata, pollicari latitudine. glandes inter poma numerari non possunt, quam ob rem in sua natura dicentur.

reliqua carnosī sunt generis, eaque bacis atque carnibus distant. alia acinis caro, alia moris, alia unedonibus, et alia acinis, inter cutem sucumque, alia myxis, alia bacis ut olivis. moris sucus in carne vinosus, trini colores, candidus primo, mox rubens, maturis niger. in novissimis florent, inter prima maturescunt. tingunt manus suco matura, eluunt acerba. minimum in hac arbore ingenia profecerunt, nec nominibus nec insitis; nec alio modo quam pomi magnitudine differunt mora ostiensia et tusculana romae. nascuntur et in rubis, multum differente callo.

aliud corpus et terrestribus fragis, aliud congeneri eorum unedoni, quod solum pomum simul e frutice terraeque gignitur. arbor ipsa fruticosa. fructus anno maturescit, pariterque floret subnascens et prior coquitur. mas sit an femina sterilis, inter auctores non constat. pomum inhonorum, ut cui nomen ex argumento sit unum tantum edendi. duobus tamen his nominibus appellant graeci comaron et memaecylon, quo apparet totidem esse genera; et apud nos alio nomine arbutus vocatur. iuba auctor est quinquagenum cubitorum altitudine in arabia esse eas.

acinorum quoque magna est differentia, primum inter uvas ipsas callo, teneritate, crassitudine, interiore ligno aliis parvo et aliis etiam gemino, qui minime feraces musti. plurimum vero differunt hederæ sabucique acini, et figura etiam punici, angulosi quippe soli. nec cutis ulla singulis praeter communem quae est candida. totisque sucus et caro est, iis praecipue quibus parvolum inest ligni. magna et bacis differentia: aliae namque sunt olivis, lauris et alio modo loto, cornis, alio myrtis, lentisco. aquifolio enim ac spinæ sine suco, medioque etiamnum genere inter bacas acinosque cerasis. pomum iis primo candidum et fere omnibus bacis; mox aliis virescit, ut olivis, lauris,

rubet vero moris, cerasis, cornis. dein nigrescit moris, cerasis, olivis.

cerasi ante victoriam mithridaticam l. luculli non fuere in italia, ad urbis annum dclxxx. is primum invexit e ponto, annisque cxx trans oceanum in britanniam usque pervenere; eadem ut diximus in aegypto nulla cura potuere gigni. cerasorum aproniana maxime rubent, nigerrima sunt lutatia, caeciliana vero et rotunda. iunianis gratus sapor, sed paene tantum sub arbore sua, adeo teneris, ut gestatum non tolerant. principatus duracinis quae pliniana campania appellat, in belgica vero lusitanis, in ripis etiam rheni. tertius iis colos e nigro ac rubenti viridique, similis maturescentibus semper. minus quinquennium est quod prodire quae vocant laurea, non ingratae amaritudinis, insitae in lauru. sunt et macedonica, parvae arboris raroque tria cubita excedentis, et minore etiamnum frutice chamaecerasi. inter prima hoc e pomis colono gratiam annuam refert. septentrione frigidisque gaudet, siccatur etiam sole conditurque ut oliva cadis. quae cura et cornis atque etiam lentisco adhibetur. ne quid non hominis ventri natum esse videatur, miscentur saporis et alio alius placere cogitur; miscentur vero et terrae caelique tractus: in alio cibi genere india advocatur, in alio aegyptus, creta, cyrene singulaeque terrae. nec cessat in veneficiis vita, dum modo omnia devoret. planius hoc fiet in herbarum natura.

interim quae sunt communia et pomis omnibusque sucis saporum genera xiii reperiuntur: dulcis, suavis, pinguis, amarus, austerus, acer, acutus, acerbus, acidus, salsus. praeter haec tria sunt genera mirabili maxime natura: unum in quo plures pariter sentiuntur saporis, ut vinis; namque in iis et austerus et acutus et dulcis et suavis, omnes alieni. alterum est genus in quo sit et alienus quidem, sed et suus quidam ac peculiaris, ut in lacte; si quidem inest ei quod tamen iure dici dulce et pingue et suave non possit, optinente lenitate, quae ipsa succedit in saporis vicem. nullus hic aquis nec sucus, ut tamen eo ipso fiat aliquis ac suum genus faciat. sentiri quidem aquae saporem ullum sucumve vitium est. magnum his omnibus in odore momentum et magna cognatio; qui et ipse nullus est aquis aut, si sentitur omnino, vitium est. mirum tria naturae praecipua elementa sine sapore esse, sine odore, sine suco: aquas, ae+ra, ignes.

ergo sucorum vinosi piro, moro, myrto, minime, quod miremur, uvis; pingues olivae, lauro, nuci iuglandi, amygdalis; dulces uvis, ficis, palmis; aquosus prunis. magna differentia et in colore suci: sanguineus moris, cerasis, cornis, uvis nigris; idem albis candidus, lacteus in capite ficis, in corpore non item, spumeus malis, nullus persicis, cum praesertim duracina suco abundant. sed quis eius ullum dixerit colorem sua et in odore miracula: malis acutus, persicis dilutus, dulcibus nullus. nam et vinum tale sine odore, tenue odoratius multoque celerius talia ad usum veniunt quam pingua. quae odorata, non eadem in gustu tenera, quia non sunt pariter odor et sapor. quam ob rem citreis odor acerrimus, sapor asperrimus, quadamtenus et cotoneis, nullusque odor ficis.

et hactenus sint species ac genera pomorum: naturas artius colligi par est. alia siliquis distinguuntur, ipsis dulcibus semenque complexis amarum, cum in

pluribus semina placeant, in siliqua damnentur; alia bacis, quarum intus lignum et extra caro, ut olivis, cerasis; aliquorum intus bacae, foris lignum, ut iis quae in aegypto diximus gigni. quae bacis natura, eadem et pomis. aliorum intus corpus et foris lignum, ut nucum; aliis foris corpus, intus lignum, ut persicis et prunis, vitiumque cinctum fructu, cum fructus alibi muniatur vitio. putamine clauduntur nuces, corio castaneae; detrahitur hoc iis, at in mespilis manditur. crusta teguntur glandes, cute uvae, corio et membrana punica. carne et suco mora constant, cute et suco cerasi. quaedam statim a ligno recedunt, ut nuces et palmae; quaedam adhaerent, ut olivae laurusque. quorundam generi utraque est natura, ut in persicis; etenim duracinis adhaeret corpus et ligno avelli non quit, cum in ceteris facile separetur. quibusdam nec intus nec extra lignum, ut in palmarum genere. aliquorum lignum ipsum in usu et pomi vice, ut genera e nucleis quaedam in aegypto diximus. quorundam extra geminantur vitia, ut in castaneis et amygdalis nucibusque iuglandibus. quorundam natura trigemina: corpus est, dein lignum rursusque semen in ligno, ut in persicis. quaedam inter se densa, ut uvae, sorva, quae ramos circumdata ex omni parte uvarum modo degravant; alia rara, ut in persicis; quaedam alvo continentur, ut granata. dependent alia pediculis, ut pira, alia racemis, ut uvae, palmae, alia et pediculis et racemis, ut hederæ, sabuci; alia ramo adhaerent, ut in lauru; quaedam utroque modo, ut olivae. nam et breves pediculi et longi. quaedam vasculis constant, ut punica et mespila lotosque in aegypto et euphrate. iam vero diversa gratia et commendatio: carne palmae placent, crusta thebaicae, suco uvae et caryotae, callo pira ac mala, corpore mora, cartilagine nuclei, grano quaedam in aegypto, cute caricae. detrahitur haec ficis virentibus ut putamen, eademque in siccis maxime placet. in papyris et ferulis spinaque alba caulis ipse pomum est, sicut et ficulni caules, in fruticoso genere cum caule capparis; in siliquis vero quod manditur quid nisi lignum est non omittenda seminis earum proprietate: nam neque corpus nec lignum nec cartilago dici potest neque aliud nomen inveniat.

sucorum natura praecipuam admirationem in myrto habet, quando ex una omnium olei vinique bina genera fiunt, item myrtidanum, ut diximus. et alius usus bacae fuit apud antiquos ante quam piper reperiretur illam optinens vicem, in quodam etiam genere opsonii nomine inde tracto, quod etiam nunc myrtatum vocatur. eademque origine aprorum sapor commendatur, plerumque ad intinctus additis myrtis.

arbor ipsa in europae citeriore caelo, quod a cerauniis montibus incipit, primum cerceis in elpenoris tumulo visa traditur graecumque ei nomen remanet, quo peregrinam esse apparet. fuit, ubi nunc roma est, iam cum conderetur; quippe ita traditur, myrtea verbena romanos sabinosque, cum propter raptas virgines dimicare voluissent, depositis armis purgatos in eo loco qui nunc signa veneris cluacinae habet; cluere enim antiqui purgare dicebant. et in ea quoque arbore suffimenti genus habetur, ideo tum electa, quoniam coniunctioni et huic arbori venus praeest, haud scio an prima etiam omnium in locis publicis romae sata, fatidico quidem et memorabili augurio.

inter antiquissima namque delubra habetur quirini, hoc est ipsius romuli. in eo sacrae fuere myrti duae ante aedem ipsam per longum tempus, altera patricia appellata, altera plebeia. patricia multis annis praevaluit exuberans ac laeta; quamdiu senatus quoque floruit, illa ingens, plebeia retorrida ac squalida. quae postquam evaluit flavescente patricia, a marsico bello languida auctoritas patrum facta est ac paulatim in sterilitatem emarcuit maiestas. quin et ara vetus fuit veneri myrteae, quam nunc murciam vocant.

cato tria genera myrti prodidit, nigram, candidam, coniugulam, fortassis a coniugiis, ex illo cluacinae genere. nunc et alia distinctio sativae aut silvestris et in utraque latifoliae, in silvestri propria oxymyrsinae. sativarum genera topiarii faciunt tarentinam folio minuto, nostratem patulo, hexasticham densissimo, senis foliorum versibus. haec non est in usu, ramosa atque non alta. coniugalem existimo nunc nostratem dici. myrtus odoratissima aegyptio. cato docuit vinum fieri e nigra siccata usque in ariditatem in umbra atque ita musto indita. si non siccentur bacae, oleum gigni. postea conpertum et ex alba vinum fieri album, duobus sextariis myrti tusae in vini tribus heminis maceratae expressaeque. folia et per se siccantur in farinam ad ulcerum remedia in corpore humano, leniter mordaci pulvere, ac refrigerandis sudoribus. quin immo oleo quoque, mirum dictu, inest quidam vini sapor simulque pinguis liquor, praecipua vi ad corrigenda vina saccis ante perfusis. retinet quippe faecem nec praeter purum liquorem transire patitur datque se comitem praecipua commendatione liquato. virgae quoque eius, gestatae modo, viatori prosunt in longo itinere pediti; quin et virgei anuli expertes ferri inguinum tumori medentur.

bellicis quoque se rebus inseruit, triumphansque de sabinis p. postumius tubertus in consulatu, qui primus omnium ovans ingressus urbem est, quoniam rem leniter sine cruore gesserat, myrto veneris victricis coronatus incessit optabilemque arborem etiam hostibus fecit. haec postea ovantium fuit corona excepto M. Crasso, qui de fugitivis et spartaco laurea coronatus incessit. masurius auctor est curru quoque triumphantes myrtea corona usos. l. piso tradit papirium masonem, qui primus in monte albano triumphavit de corsis, myrto coronatum ludos circenses spectare solitum; avus maternus africani sequentis hic fuit. marcus valerius duabus coronis utebatur, laurea et myrtea, qui et hoc voverat.

laurus triumphis proprie dicatur, vel gratissima domibus, ianitrix caesarum pontificumque. sola et domos exornat et ante limina excubat. duo eius genera tradidit cato, delphicam et cypriam. pompeius lenaeus adiecit quam mustacem appellavit, quoniam mustaceis subiceretur: hanc esse folio maximo flaccidoque et albicante; delphicam aequali colore viridiorem, maximis bacis atque e viridi rubentibus ac victores delphis coronare ut triumphantes romae; cypriam esse folio brevi, nigro, per margines imbricato crispam. postea accessere genera: tinus - hanc silvestrem laurum aliqui intellegunt, nonnulli sui generis arborem - differt colore; est enim caerula baca. accessit et regia, quae coepit augusta appellari, amplissima et arbore et folio, bacis gustatu

quoque non asperis. aliqui negant eandem esse et suum genus regiae faciunt longioribus foliis latoribusque. iidem in alio genere bacaliam appellant hanc quae vulgatissima est bacarumque fertilissima, sterilem vero earum, quod maxime miror, triumphalem eaque dicunt triumphantes uti, nisi id a Divo Augusto coepit, ut docebimus, ex ea lauru quae ei missa e caelo est, minima altitudine, folio crispo, brevi, inventu rara. accedit in topiario opere thasia, excrescente in medio folio parvola veluti lacinia folii, et sine ea spadonina, mira opacitatis patientia, itaque quantalibet sub umbra solum implet. est et chamaedaphne silvestris frutex et alexandrina, quam aliqui idaeam, alii hypoglotion, alii danaen, alii carpophyllon, alii hypelaten vocant. ramos spargit a radice dodrantes, coronarii operis, folio acutius quam myrti ac molliore et candidiore, maiore, semine inter folia rubro, plurima in ida et circa heracleam ponti, nec nisi in montuosis. id quoque quod daphnoides vocatur genus in nominum ambitu est; alii enim pelasgum, alii eupetalon, alii stephanon alexandri vocant. et hic frutex est ramosus, crassius ac molliore quam laurus folio, cuius gustatu accenditur os, baccis e nigro rufis. notatum antiquis, nullum genus laurus in corsica fuisse, quod nunc satum et ibi provenit.

ipsa pacifera, ut quam praetendi etiam inter armatos hostes quietis sit indicium. romanis praecipue laetitiae victoriarumque nuntia additur litteris et militum lanceis pilisque, fasces imperatorum decorat. ex iis in gremio iovis optimi maximique deponitur, quotiens laetitiam nova victoria adtulit, idque non quia perpetuo viret nec quia pacifera est, praefereunda ei utroque olea, sed quia spectatissima in monte parnaso ideoque etiam grata apollini visa, adsuetis eo dona mittere, oracula inde repetere iam et regibus romanis teste L. Bruto, fortassis etiam in argumentum, quoniam ibi libertatem publicam is meruisset lauriferam tellurem illam osculatus ex responso et quia manu satarum receptarumque in domos fulmine sola non icitur. ob has causas equidem crediderim honorem ei habitum in triumphis potius quam quia suffimentum sit caedis hostium et purgatio, ut tradit masurius, adeoque in profanis usibus pollui laurum et oleam fas non est, ut ne propitiandis quidem numinibus accendi ex iis altaria araeve debeant. laurus quidem manifesto abdicat ignes crepitu et quadam detestatione, interaneorum etiam vitia et nervorum ligno torquente. ti. principem tonante caelo coronari ea solitum ferunt contra fulminum metus.

sunt et circa Divum Augustum eventa eius digna memoratu. namque liviae drusillae, quae postea augusta matrimonii nomen accepit, cum pacta esset illa caesari, gallinam conspicui candoris sedenti aquila ex alto abiecit in gremium inlaesam, intrepideque miranti accessit miraculum. quoniam teneret in rostro laureum ramum onustum suis baccis, conservari alitem et subolem iussere haruspices ramumque eum seri ac rite custodiri: quod factum est in villa caesarum fluvio tiberi inposita iuxta nonum lapidem flaminiae viae, quae ob id vocatur ad gallinas, mireque silva provenit. ex ea triumphans postea caesar laurum in manu tenuit coronamque capite gessit, ac deinde imperatores

caesares cuncti. traditusque mos est ramos quos tenuerunt serendi, et durant silvae nominibus suis discretas, fortassis ideo mutatis triumphalibus. unius arborum latina lingua nomen inponitur viris, unius folia distinguntur appellatione; lauream enim vocamus. durat et in urbe inpositum loco, quando loretum in aventino vocatur ubi silva laurus fuit. eadem purificationibus adhibetur, testatumque sit obiter et ramo eam seri, quoniam dubitare democritus atque theophrastus.

nunc dicemus silvestrium naturas.

LIBER XVI

pomiferae arbores quaeque mitioribus sucis voluptatem primae cibis attulerunt et necessario alimento delicias miscere docuerunt, sive illae ultro ab homine didicere blandos sapes adoptione et conubio - idque munus etiam feris volucrisque dedimus - , intra praedictas constant. proximum erat narrare glandiferas, quae primae victum mortalium aluerunt nutrices inopis ac ferae sortis, ni praeverti cogeret admiratio usu comperta, quanam qualisque esset vita sine arbore ulla, sine frutice viventium.

diximus et in oriente quidem iuxta oceanum complures ea in necessitate gentes. sunt vero et in septentrione visae nobis chaucorum, qui maiores minoresque appellantur. vasto ibi meatu bis dierum noctiumque singularum intervallis effusus in inensum agitur oceanus, operiens aeternam rerum naturae controversiam dubiamque terrae sit an partem maris. illic, misera gens, tumulos optinent altos aut tribunalia exstructa manibus ad experimenta altissimi aestus, casis ita inpositis navigantibus similes, cum integant aquae circumdata, naufragis vero, cum recesserint, fugientesque cum mari pisces circa tuguria venantur. non pecudem his habere, non lacte ali, ut finitimis, ne cum feris quidem dimicare contingit omni procul abacto frutice. ulva et palustri iunco funes nectunt ad praetexenda piscibus retia captumque manibus lutum ventis magis quam sole siccantes terra cibos et regentia septentrione viscera sua urunt. potus non nisi ex imbre servato scrobibus in vestibulo domus. et hae gentes, si vincantur hodie a populo romano, servire se dicunt! ita est profecto: multis fortuna parcit in poenam.

aliud e silvis miraculum: totam reliquam germaniam operiunt adduntque frigori umbras, altissimae tamen haud procul supra dictis chaucis circa duos praecipue lacus. litora ipsa optinent quercus maxima aviditate nascendi, suffossaeque fluctibus aut propulsae flatibus vastas complexu radicum insulas secum auferunt, atque ita libratae stantes navigant, ingentium ramorum armamentis saepe territis classibus nostris, cum velut ex industria fluctibus agerentur in proras stantium noctu, inopesque remedii illae proelium navale adversus arbores inirent. in eadem septentrionali plaga hercyniae silvae roborum vastitas intacta aevis et congenita mundo prope immortali sorte miracula excedit. ut alia omittantur fide caritura, constat attolli colles occursantium inter se radicum percussu aut, ubi secuta tellus non sit, arcus ad ramos usque et ipsos inter se rixantes curvari portarum patentium modo, ut turmas equitum tramittant.

glandiferi maxime generis omnes, quibus honos apud romanos perpetuus. hinc civicae coronae, militum virtutis insigne clarissimum, iam pridem vero et clementiae imperatorum, postquam civilium bellorum profano meritum coepit videri civem non occidere. cedunt his murales vallaesque et aureae, quamquam pretio antecedentes, cedunt et rostratae, quamvis in duobus maxime ad hoc aevi celebres, M. Varrone e piraticis bellis dante magno

pompeio, itemque m. agrippa tribuente caesare e sículis, quae et ipsa piratica fuere. antea rostra navium tribunali praefixa fori decus erant, veluti p. r. ipsi corona inposita. postquam vero tribuniciis seditionibus calcari ac pollui coepere, postquam vires ex publico in privatum agi singulisque civium quaeri et sacrosancti omnia profana facere, tum a pedibus eorum subiere in capita civium rostra. dedit hanc Augustus coronam agrippae, sed civicam a genere humano accepit ipse.

antiquitus quidem nulla nisi deo dabatur - ob id homerus caelo tantum eam et proelio universo tribuit, viritim vero ne in certamine quidem ulli - feruntque primum omnium liberum patrem inposuisse capiti suo ex hedera. postea deorum honori sacrificantes sumpsere, victimis simul coronatis. novissime et in sacris certaminibus usurpatae, in quibus hodieque non victori dantur, sed patriam ab eo coronari pronuntiatur; inde natum ut et triumphaturis conferrentur in templis dicandae, mox ut et ludis darentur. longum est nec instituti operis disserere, quis quamque romanorum primus acceperit; neque enim alias noverant quam bellicas. quod certum est, uni gentium huic plura sunt genera quam cunctis.

romulus frondea coronavit hostum hostilium, quod fidenam primus inrupisset. avus hic tullii hostilii regis fuit. p. decium patrem tribunum militum frondea donavit exercitus ab eo servatus imperatore cornelio cosso cos. samnitium bello. civica iligna primo fuit, postea magis placuit ex aesculo iovi sacra, variatumque et cum quercu est ac data ubique quae fuerat, custodito tantum honore glandis. additae leges artae et ideo superbae quasque conferre libeat cum illa graecorum summa, quae sub ipso iove datur cuique muros patria gaudens rumpit: civem servare, hostem occidere, utque eum locum, in quo sit actum, hostis optineat eo die, ut servatus fateatur - alias testes nihil prosunt - , ut civis fuerit. auxilia quamvis rege servato decus non dant, nec crescit honos idem imperatore conservato, quoniam conditores in quocumque cive summum esse voluere. accepta licet uti perpetuo. ludis ineunti semper adsurgit etiam ab senatu in more est, sedendi ius in proximo senatui, vacatio munerum omnium ipsi patrique et avo paterno. xiiii eas accepit siccius dentatus, ut retulimus suo loco, vi capitulinus, is quidem et de duce servilio. africanus de patre accipere noluit apud trebiam. o mores aeternos, qui tanta opera honore solo donaverint et, cum reliquas coronas auro commendarent, salutem civis in pretio esse noluerint, clare professi ne servari quidem hominem fas esse lucri causa!

glande opes nunc quoque multarum gentium etiam pace gaudentium constant. nec non et inopia frugum arefactis emolitur farina spissaturque in panis usum; quin et hodieque per hispanias secundis mensis glans inseritur. dulcior eadem in cinere tosta. cautum est praeterea lege xii tabularum, ut glandem in alienum fundum procidentem liceret colligere.

genera earum multa. distant fructu, situ, sexu, sapore. namque alia fageae glandi figura, quernae alia et ilignae, atque inter se quoque generum singulorum differentiae. praeterea sunt aliquae silvestres, aliae placidiores,

quae culta optinent. iam montuosis planisque distant, sicut et sexu, mares ac feminae, item sapore: dulcissima omnium fagi, ut qua obsessos etiam homines durasse in oppido chio tradat cornelius alexander. genera distinguere non datur nominibus, quae sunt alia alibi, quippe cum robur quercumque vulgo nasci videamus, aesculum non ubique, quartam vero generis eiusdem, quae cerrus vocatur, ne italiae quidem maiore ex parte notam esse. distinguemus ergo proprietate naturaque et, ubi res coget, etiam graecis nominibus.

fagi glans nucleis similis triangula cute includitur. folium tenue atque e levissimis, populo simile, celerrime flavescens et media parte plerumque gignens superne parvolam bacam viridem, cacumine aculeatam. fagum muribus gratissimum est, et ideo animalis eius una proventus, glires quoque saginat, expetitur et turdis. arborum fertilitas omnium fere alternat, sed maxime fagi.

glandem, quae proprie intellegitur, ferunt robur, quercus, aesculus, cerrus, ilex, suber. continent hispido calyce per genera plus minusve complectente. folia praeter ilicem gravia, carnosa, procera, sinuosa lateribus, nec, cum cadunt, flavescentia, ut fagi, pro differentia generum breviora vel longiora.

ilicis duo genera. ex his in italia folio non multum ab oleis distant milaces a quibusdam graecis dictae; in provinciis aquifoliae sunt ilices. glans utriusque brevior et gracilior, quam homerus aculon appellat eoque nomine a glande distinguit. masculas ilices negant ferre.

glans optima in quercu atque grandissima, mox aesculo. nam robori parva, cerro tristis, horrida, echinato calyce ceu castaneae. sed et in querna alia dulcior, molliorque feminae, mari spissior. maxime autem probantur latifoliae ex argumento dictae. distant inter se magnitudine et cutis tenuitate, item quod aliis subest tunica robigine scabra, aliis protinus candidum corpus. probatur et ea, cuius in balano utrimque ex longitudine extrema lapidescit duritia, melior cui in cortice quam cui in corpore, utrumque non nisi mari. praeterea aliis ovata, aliis rotunda, aliis acutior figura, sicut et colos nigrior candidiorve, qui praefertur. amaritudo in extremitatibus, mediae dulces. quin et pediculi brevitatis proceritatisque differentiam habet. in ipsis vero arboribus quae maximam fert hemeris vocatur, brevior et in orbem comosa alasque ramorum crebro cavata. fortius lignum quercus habet et incorruptius, ramosa et ipsa, procerior tamen et crassior caudice, excelsissima autem aegilops, incultis amica.

ab hac proxima latifoliae proceritas, sed minus utilis aedificiis atque carboni: dolata vitiis obnoxia est, quamobrem solida utuntur; carbo in aerariorum tantum officinis compendio, quoniam desinente flatu protinus emoriens saepius recoquitur, cetero plurimus scintillis. idem e novellis melior. acervi consertis taleis recentibus luto caminantur, accensa strue contis pungitur durescens calyx atque ita sudorem emittit.

pessima et carboni et materiae haliphloeos dicta, cui crassissimus cortex atque caudex et plerumque cavus fungosusque. nec alia putrescit ex hoc genere, etiam cum vivit. quin et fulmine saepissime icitur, quamvis altitudine

non excellat. ideo ligno eius nec ad sacrificia uti fas habetur. eidem rara glans et, cum tulit, amara, quam praeter sues nullum attingat animal, ac ne hae quidem, si aliud pabulum habeant. hoc quoque inter reliqua neglectae religionis est, quod emortuo carbone sacrificatur.

glans fagea suem hilarem facit, carnem cocibilem ac levem et utilem stomacho; iligna suem angustam, nitidam, strigosam; ponderosam querna, diffusam, gravissima et ipsa glandium atque dulcissima. proximam huic cerream tradit nigidius, nec ex alia solidiorem carnem, sed duram. iligna temptari sues, nisi paulatim detur. hanc novissimam cadere. fungosam carnem fieri aesculo, robore, subere.

quae glandem ferunt, omnes et gallam alternisque annis glandem, sed gallam hemeris optimam et coriis perficiendis aptissimam, similem huic latifolia, sed leviolem multoque minus probatam. fert et nigram - duo enim genera sunt - ; haec tinguendis lanis utilior. nascitur autem galla sole de geminis exeunte erumpens noctu semper universa. crescit uno die candidior et, si aestu excepta est, arescit protinus neque ad iustum incrementum pervenit, hoc est ut nucleum fabae magnitudine habeat. nigra diutius viret crescitque, ut interdum mali compleat magnitudinem. optima commagena, deterrima ex robore. signum eius quod cavernae tralucent.

robur praeter fructum plurima et alia gignit. namque fert et gallae utrumque genus et quaedam veluti mora, ni distarent arida duritie, plerumque et tauri caput imitantia, quibus fructus inest nucleis olivae similis. nascuntur in eo et pilulae nucibus non absimiles, intus habentes floccos molles, lucernarum luminibus aptos. nam et sine oleo flagrant, sicuti galla nigra. fert et aliam inutilem pilulam cum capillo, verno tamen tempore melliginis suci. gignunt et alae ramorum eius pilulas corpore, non pediculo adhaerentes, candicantes umbilicis, cetera nigra varietate dispersa; media cocci colorem habent, apertis atra inanitas est. aliquando et pumices gignit nec non et e foliis convolutas pilulas et in foliorum venis aquosos nucleos candicantes ac tralucidos, quamdiu molles sint, in quibus et culices nascuntur. maturescunt in modum ...

ferunt robora et cachrym; ita vocatur pilula in medicina urendi vim habens. gignitur et in abiete, larice, picea, tilia, nuce, platano, postquam folia cecidere, hieme durans. continet nucleum pineis similem. is crescit hieme, aperitur vere. pilula tota cadit, cum folia coepere crescere. tam multifera sunt, tot res praeter glandem pariunt robora, sed et boletos suillosque - gulae novissima inritamenta - , qui circa radices gignuntur, quercus probatissimos, robur autem et cupressus et pinus noxios. robora ferunt et viscum et mella, ut auctor est hesiodus, constatque rores melleos e caelo, ut diximus, cadentes non aliis magis insidere frondibus. crematoque robore cinerem nitrosum esse certum est.

omnes tamen has eius dotes ilex solo provocat cocco. granum hoc primoque ceu scabies fruticis, parvae aquifoliae ilicis. cusculium vocant. pensionem alteram tributi pauperibus hispaniae donat. usum eius ac rationem

in conchylii mentione tradidimus. gignitur et in galatia, africa, pisidia, cilicia, pessimum in sardinia.

galliarum glandiferae maxime arbores agaricum ferunt. est autem fungus candidus, odoratus, antidotis efficax, in summis arboribus nascens, nocte relucens. signum hoc eius, quo in tenebris decerpitur. e glandiferis sola quae vocatur aegilops fert pannos arentes, muscoso villo canos, non in cortice modo, verum et e ramis dependentes cubitali magnitudine, odoratos, uti diximus inter unguenta. suberi minima arbor, glans pessima, rara, cortex tantum in fructu, praecrassus ac renascens atque etiam in denos pedes undique explanatus. usus eius ancoralibus maxime navium piscantiumque tragulis et cadorum obturamentis, praeterea in hiberno feminarum calceatu. quamobrem non infacete graeci corticis arborem appellant. sunt et qui feminam ilicem vocent atque, ubi non nascitur ilex, pro ea subere utantur in carpentariis praecipue fabricis, ut circa elim et lacedaemonem. nec in italia tota nascitur aut in gallia omnino.

cortex et fagis, tiliae, abieti, piceae in magno usu agrestium. vasa eo corbesque ac patentiora quaedam messibus convehendis vindemiisque faciunt atque protecta tuguriorum. scribit in recenti ad duces explorator incidens litteras a suco. nec non et in quodam usu sacrorum religiosus est fagi cortex. sed non durat arbor ipsa.

scandula e robore aptissima, mox e glandiferis aliis fagoque, facillima ex omnibus, quae resinam ferunt, sed minime durans praeterquam e pino. scandula contectam fuisse romam ad pyrrhi usque bellum annis ccclxx cornelius nepos auctor est. silvarum certe distinguebatur insignibus, fagutali iove etiam nunc ubi lucus fageus fuit, porta querquetulana, colle in quem vimina petebantur, totque lucis, quibusdam et geminis. q. hortensius dictator, cum plebes secessisset in ianiculum, legem in aesculeto tulit, ut quod ea iussisset omnes quirites teneret.

peregrinae tum videbantur, quoniam non erant suburbanae, pinus atque abies omnesque, quae picem gignunt. de quibus nunc dicemus, simul ut tota condiendi vina origo cognoscatur, quae ferunt in asia aut oriente praedictis.

picem in europa sex genera cognatarum arborum ferunt. ex his pinus atque pinaster folium habent capillamenti modo praetenue longumque et mucrone aculeatum. pinus fert minimum resinae, interdum et nucibus ipsis, de quibus dictum est, vixque ut adscribatur generi.

pinaster nihil est aliud quam pinus silvestris minor altitudine et a medio ramosa, sicut pinus in vertice. copiosiore dat haec resinam quo dicemus modo. gignitur et in planis. easdem arbores alio nomine esse per oram italiae quas tibulos vocant, plerique arbitrantur, sed graciles succinctioresque et enodes liburnicarum ad usus, paene sine resina.

picea montes amat atque frigora, feralis arbor et funebri indicio ad fores posita ac rogis virens, iam tamen et in domos recepta tonsili facilitate. haec plurimam fundit interveniente candida gemma, tam simili turis, ut mixta visu discerni non queat; unde fraus seplasiae. omnibus his generibus folia brevia,

sed crassiora duraque ceu cupressis. piceae rami paene statim ab radice modici velut brachia lateribus inhaerent.

similiter abieti expetitae navigiis situs in excelso montium, ceu maria fuerit, nec forma alia. materies vero praecipua est trabibus et plurimis vitae operibus. resina in ea vitium, unde fructus piceae, exiguumque sudat aliquando contactu solis. e diverso materies, quae abieti pulcherrima, piceae ad fissiles scandulas cupasque et pauca alia secamenta.

quinto generi est situs idem, facies eadem. larix vocatur. materies praestantior longe, incorrupta aevis, umori contumax, rubens praeterea et odore acrior. plusculum huic erumpit liquoris melleo colore atque lentore, numquam durescentis.

sextum genus est taeda proprie dicta, abundantior suco quam reliqua, parciore liquidiorque quam picea, flammis ac lumini sacrorum etiam grata. hae, mares dumtaxat, ferunt et eam, quam graeci sycen vocant, odoris gravissimi. laricis morbus est ut taeda fiat.

omnia autem haec genera accensa fuligine inmodica carbonem repente exspuunt cum eruptionis crepitu eiaculanturque longe, excepta larice, quae nec ardet nec carbonem facit nec alio modo ignis vi consumitur quam lapides. omnia ea perpetuo virent nec facile discernuntur in fronde etiam a peritis; tanta natalium mixtura est. sed picea minus alta quam larix; illa crassior leviorque cortice, folio villosior, pinguior et densior, mollius flexo; at piceae rariora siccioraque folia et tenuiora ac magis algentia, totaque horridior et perfusa resina, lignum abieti similis. larix ustis radicibus non repullulat, picea repullulat, ut in lesbo accidit incenso nemore pyrrhaeo. alia etiamnunc generibus ipsis in sexu differentia. mas brevior et durior, femina procerior, pinguioribus foliis et simplicibus atque non rigentibus. lignum maribus durum et in fabrilis opere contortum, feminae mollius, publico discrimine in securibus. hae in quocumque genere deprehendunt marem, quippe respuuntur et fragosius sidunt, aegrius revelluntur. ipsa materies retorrída et nigrior maribus. laricis circa idam in troade et alia differentia, montanae maritimaeque. nam in macedonia et arcadia circaque elim permutant nomina, nec constat auctoribus, quod cuique generi adtribuant. nos ista romano discernimus iudicio. abies e cunctis amplissima est et femina etiam prolixior, materie mollior utiliorque, arbore rotundior, folio pinnato densa, ut imbres non tramittat, atque hilarior in totum. e ramis generum horum panicularum modo nucamenta squamatim compacta dependent praeterquam larici. haec abietis masculae primori parte nucleos habent, non item feminae. piceae vero totis paniculis, minoribus gracilioribusque, minimos ac nigros, propter quod graeci phthiropoeon eam appellant. in eadem nucamenta maribus compressiora sunt ac minus resina roscida.

similis his etiamnunc aspectu est, ne quid praetereatur, taxus minime virens gracilisque et tristis ac dira, nullo suco, ex omnibus sola bacifera. mas noxio fructu; letale quippe bacis in hispania praecipue venenum inest, vasa etiam viatoria ex ea vinis in gallia facta mortifera fuisse compertum est. hanc sextius

milacem a graecis vocari dicit et esse in arcadia tam praesentis veneni, ut qui obdormiant sub ea cibumve capiant moriantur. sunt qui et taxica hinc appellata dicant venena - quae nunc toxica dicimus - , quibus sagittae tinguntur. repertum innoxiam fieri, si in ipsam arborem clavus aereus adigatur.

pix liquida in europa e taeda coquitur, navalibus muniendis multosque alios ad usus. lignum eius concisum furnis undique igni extra circumdato fervet. primus sudor aquae modo fluit canali. hoc in syria cedrium vocatur, cui tanta vis est, ut in aegypto corpora hominum defunctorum perfusa eo servantur.

sequens liquor crassior iam picem fundit. haec rursus in cortinas aereas coniecta aceto spissatur ut coagulo et bruttiae cognomen accepit, doliis dumtaxat vasisque ceteris utilis, lentore ab alia pice differens, item colore rutilante et quod pinguior est reliqua omni. illa fit e piceae resina ferventibus coacta lapidibus in alveis validi roboris aut, si alvei non sint, struis congerie, velut in carbonis usu. haec in vinum additur farinae modo tusa, nigrior colore. eadem resina si cum aqua lenius decoquatur coleturque, rufo colore lentescit ac stillaticia vocatur. seponuntur autem ad id fere vitia resinae cortexque. alia temperies ad crapulam. namque flos crudus resinae cum multa astula tenui brevique avulsus conciditur ad cribrum minuta. dein ferventi aqua, donec coquatur, perfunditur.

huius expressum pingue praecipua resina fit atque rara nec nisi paucis in locis subalpinae italiae, conveniens medicis. resinae albae congium in ii aquae pluviae cocunt. alii utilius putant sine aqua coquere lento igne toto die, utique vase aeris albi, item terebinthinam in sartagine cinere ferventi, hanc ceteris praeferentes. proxima e lentisco. non omittendum apud eosdem zopissam vocari derasam navibus maritimis picem cum cera, nihil non experiente vita, multoque efficaciorum ad omnia, quibus pices resinaeque prosunt, videlicet adiecto salis callo.

aperitur picea e parte solari, non plaga, sed vulnere ablati corticis, cum plurimum bipedali hiatu, ut a terra cubito cum minimum absit. nec corpori ipsi parcuritur, ut in ceteris, quoniam astula in fructu est. verum haec proxima laudatur, altior amaritudinem adfert. postea umor omnis e tota confluit in ulcus. item in taeda. cum id manare desiit, simili modo ex alia parte aperitur ac deinde alia. postea tota arbor succiditur et medulla eius uritur. sic et in syria terebintho detrahunt cortices, ibi quidem et e ramis ac radicibus, cum resina damnetur ex his partibus. in macedonia laricem masculam urunt, feminae radices tantum. theopompus scripsit in apolloniatarum agro picem fossilem, non deteriorem macedonica, inveniri. pix optima ubique ex apricis aquilonis situ, ex opacis horridior virusque praeferens, frigida hieme deterior ac minus copiosa et decolor. quidam arbitrantur in montuosis copia praestantiorum ac colore et dulciorem fieri, odore quoque gratiorem, dum resina sit, decoctam autem minus picis reddere, quoniam in serum abeat, tenuioresque esse ipsas arbores quam in planis, sed has et illas serenitate steriliores. fructum quaedam proximo anno ab incisu largiuntur, aliae secundo, quaedam tertio. expletur

autem plaga resina, non cortice nec cicatrice, quae in hac arbore non coit.

inter haec genera propriam quidam fecere sappinum, quoniam ex cognatione harum seritur, qualis dicta est in nucleis, eiusdemque arboris imas partes taedas vocant, cum sit illa arbor nil aliud quam picea feritatis paulum mitigatae satu, sappinus autem materies caesurae genere fiat, sicuti docebimus.

materiae enim causa reliquas arbores natura genuit copiosissimamque fraxinum. procera haec ac teres, pinnata et ipsa folio, multumque homeri praeconio et achillis hasta nobilitata. materies est ad plurima utilis; ea quidem, quae fit in ida troadis, in tantum cedro similis, ut ementes fallat cortice ablato. graeci duo genera eius fecere: longam enodem, alteram brevem duriolem fusciolemque, laureis foliis. bumeliam vocant in macedonia amplissimam lentissimamque. alii situ divisere, campestem enim esse crispam, montanam spissam. folia earum iumentis mortifera, ceteris ruminantium innocua graeci prodidere; in italia nec iumentis nocent. contra serpentes vero suco expresso ad potum et inposita ulceri opifera, ut nihil aeque, reperiuntur, tantaque est vis, ut ne matutinas quidem occidentesve umbras, cum sunt longissimae, serpens arboris eius adtingat, adeo ipsam procul fugiat. experti prodimus, si fronde ea circumcludantur ignis et serpens, in ignes potius quam in fraxinum fugere serpentem. mira naturae benignitas, prius quam hae prodeant, florere fraxinum nec ante conditas folia demittere.

in tilia mas et femina differunt omni modo. namque et materies maris dura rufiorque ac nodosa et odoratior, cortex quoque crassior ac detractus inflexibilis. nec semen fert aut florem ut femina, quae crassior arbore, materie candida praecellensque est. mirum in hac arbore fructum a nullo animalium adtingi, foliorum corticisque sucum esse dulcem. inter corticem ac lignum tenues tunicae multiplici membrana, e quibus vincula tiliae vocantur tenuissimumque eorum philyrae, coronarum lemniscis celebres antiquorum honore. materies teredinem non sentit, proceritate perquam modica, verum utilis.

acer eiusdem fere amplitudinis, operum elegantia ac subtilitate citro secundum. plura eius genera: album, quod praecipui candoris, vocatur gallicum in transpadana italia transque alpes nascens. alterum genus crispo macularum discursu, qui cum excellentior fuit, a similitudine caudae pavonum nomen accepit, in histria rætiaeque praecipuum. e viliori genere crassivenium vocatur. graeci situ discernunt, campestre enim candidum esse nec crispum - quod glinon vocant - , montanum vero crispus duriusque, etiam nunc e mascula crispus ad lautiora opera, tertium genus zygian rubentem, fissili ligno, cortice livido, scabro. hoc alii generis proprii esse malunt et latine carpinum appellant.

pulcherrimum vero est bruscum, multoque excellentius etiamnum molluscum. tuber utrumque arboris eius, bruscum intortius crispum, molluscum simplicius sparsum et, si magnitudinem mensurarum caperet, haud dubie praeferretur citro; nunc intra pugillares lectorumque solidos aut lamnas

raro usu spectatur. e brusco fiunt et mensae nigrescentes. reperitur et in alno tuber, tanto deterius, quantum ab acere alnus ipsa distat. aceris mares prius florent. etiamnum in siccis natae praeferuntur aquaticis, sicut et fraxini. est trans alpes arbor simillima aceri albo materie, quae vocatur staphylodendron. fert siliquas et in iis nucleos sapore nucis abellanae.

in primis vero materies honorata buxo est raro crispanti nec nisi radice, de cetero ... levisque est materiae, set lentore quodam et duritie ac pallore commendabilis, ipsa vero arbor et topiario opere. tria eius genera: gallicum, quod in metas emittitur amplitudinemque proceriorem. oleastrum, in omni usu damnatum, gravem praefert odorem. tertium genus nostratis vocant, e silvestri, ut credo, mitigatum satu, diffusius et densitate parietum, virens semper ac tonsile. buxus pyrenaeis ac cytoriis montibus plurima et berecynthio tractu, crassissima in corsica, flore non spernendo, quae causa amaritudinis mellis. semen cunctis animantibus invisum. nec in olympo macedoniae gracilior, sed brevis. amat frigida, aprica. in igni quoque duritia quae ferro, nec flamma nec carbone utili.

inter has atque frugiferas materie vitiumque amicitia accipitur ulmus. graeci duo genera eius novere: montanam quae sit amplior, campestem quae fruticosa. italia atinias vocat excelsissimas et ex iis siccaneas praefert, quae non sint riguae, alterum genus gallicas, tertium nostrates, densiore folio et ab eodem pediculo numerosiore, quartum silvestre. atiniae non ferunt samaram - ita vocatur ulmi semen - , omnesque radicum plantis proveniunt, reliquae semine.

nunc celeberrimis arborum dictis quaedam in universum de cunctis indicanda sunt. montes amant cedrus, larix, taeda et ceterae, e quibus resina gignitur, item aquifolia, buxus, ilex, iuniperus, terebinthus, populus, ornus, carpinus. est in appennino et frutex, qui vocatur cotinus, ad linamenta modo conchylii colore insignis. montes et valles diligit abies, robur, castaneae, tilia, ilex, cornus. aquosis montibus gaudent acer, fraxinus, sorbus, tilia, cerasus. non temere in montibus visae sunt prunus, punicae, oleastri, iuglans, mori, sabuci. descendunt et in plana cornus, corylus, quercus, ornus, acer, fraxinus, fagus, carpinus. subeunt et in montuosa ulmus, malus, pirus, laurus, myrtus, sanguinei frutices, ilex tinguendisque vestibis nascentes genistae. gaudet frigidis sorbus, sed magis etiam betulla. gallica haec arbor mirabili candore atque tenuitate, terribilis magistratuum virgis, eadem circulis flexilis, item corbium costis. bitumen ex ea galliae excoquunt. in eisdem situs comitantur et spina, nuptiarum facibus auspicatissima, quoniam inde fecerint pastores qui rapuerunt sabinas, ut auctor est masurius. nunc facibus carpinus, corylus familiarissimae.

aquas odere cupressi, iuglandes, castaneae, laburnum. alpina et haec arbor, nec vulgo nota, dura ac candida materie, cuius florem cubitalem longitudine apes non adtingunt. odit et quae appellatur iovis barba, in opere topiario tonsilis et in rotunditatem spissa, argenteo folio. non nisi in aquosis proveniunt salices, alni, populi, siler, ligustra tesseris utilissima, item vaccinia

italiae in aucupiiis sata, galliae vero etiam purpurae tinguendae causa ad servitiorum vestes. quaecumque communia sunt montibus planisque, maiora fiunt et aspectu pulchriora quae in campestribus, meliora autem fructu, materie crispiora quae in montibus, exceptis malis pirisque.

praeterea arborum aliis decidunt folia, aliae sempiterna coma virent, quam differentiam antecedit necesse est prior. sunt enim arborum quaedam omnino silvestres, quaedam urbaniores, quoniam his placet nominibus distinguere ac mites, quae fructu aut aliqua dote umbrarumque officio humanius iuvant, non improbe dicantur urbanae.

harum generis non decidunt oleae, lauro, palmae, myrto, cupressis, pinis, hederæ, rhododendro et, quamvis herba dicatur, sabinae. rhododendron, ut nomine apparet, a graecis venit. alii nerium vocarunt, alii rhododaphnen, sempiternum fronde, rosae similitudine, caulibus fruticosum. iumentis caprisque et ovibus venenum est, idem homini contra serpentium venena remedio.

silvestrium generis folia non decidunt abieti, larici, pinastro, iunipero, cedro, terebintho, buxo, ilici, aquifolio, suberi, taxo, tamarici. inter utraque genera sunt andrachle in graecia et ubique unedo; reliqua enim folia decidunt iis praeterquam in cacuminibus. non decidunt autem et in fruticum genere cedro cuidam, rubo, calamo. in thurino agro, ubi sybaris fuit, ex ipsa urbe prospiciebatur quercus una numquam folia demittens nec ante mediam aestatem germinans; idque mirum est, graecis auctoribus proditum, apud nos postea sileri. nam locorum tanta vis est, ut circa memphim aegypti et in elephantine thebaidis nulli arborum decidant, ne vitibus quidem.

ceterae omnes extra praedictas - etenim enumerare longum est - folia deperdunt, observatumque non arescere nisi tenuia et lata et mollia, quae vero non decidant, callo crassa et angusta esse. falsa definitio est non decidere iis, quarum pinguior sucus sit. quis enim potest in ilice intellegere decidere timaeus mathematicus sole scorpionem transeunte sideris vi et quodam veneno aëris putat. cur ergo non eadem causa adversum omnes polleat, iure miremur. cadunt plurimis autumno, quaedam amittunt tardius atque in hiemes prorogant moras, neque interest maturius germinasse, utpote cum quaedam primae germinent et inter novissimas nudentur, ut amygdalae, fraxini, sabuci, morus autem novissima germinet, cum primis folia demittat. magna et in hoc vis soli. prius decidunt in siccis macrisque, et vetustae prius arbori, multis etiam antequam maturescat fructus, ut serotinae fico et hibernae piro et malo, granatumque est pomum tali tantum aspici in matre. neque iis autem, quae semper retinent comas, eadem folia durant subnascentibus aliis; tum arescunt vetera, quod evenit circa solstitia maxime.

foliorum unitas in suo cuique genere permanet, praeterquam populo, hederæ, crotoni, quam et cici diximus vocari. populi tria genera: alba ac nigra et quae libyca appellatur, minima folio ac nigerrima fungisque enascentibus laudatissima. alba folio bicolor, superne candicans, inferiore parte viridi. huic nigraeque et crotoni in iuventa circinatae rotunditatis sunt, vetustiora in

angulos exeunt. e contrario hederæ angulosa rotundantur. populorum foliis grandissima lanugo evolat candida et radiata, folio numerosiore candicant ut villi. folia granatis et amygdalis rubentia.

mirum in primis id quod ulmo tiliaequæ et oleæ et populo albae et salici evenit. circumaguntur enim folia earum post solstitium, nec alio argumento certius intellegitur sidus confectum. est et publica omnium foliorum in ipsis differentia. namque pars inferior a terra herbido viret colore, ab eadem leviora nervos callumque et articulos in superiore habent parte, incisuras vero subter, ut manus humana. oleæ superne candidiora et minus levia, item hederæ. sed omnium folia cotidie ad solem oscitant, inferiores partes tepefieri volentia. superior pars omnium lanuginem quantulamcumque habet, quæ in aliis gentium lana est.

in oriente funes validos e foliis palmae fieri dictum est, eosque in umore utiliores esse. et apud nos vero palmis a messe decerpuntur. ex his meliora quæ sese non diviserint. siccantur sub tecto quaternis diebus, mox in sole expanduntur et noctibus relictæ, donec candore inarescant, postea in opera finduntur.

latissima fico, viti, platano, angusta myrto, punicae, oleæ, capillata pino, cedro, aculeata aquifolio et ilicum generi - nam iuniperis spina pro folio est - , carnosæ cupresso, tamarici, crassissima alno, longa harundini, salici, palmae et duplicia, circinata pino, mucronata malo, angulosa hederæ, divisa platano, insecta pectinum modo piceae, abieti, sinuosa toto ambitu robori, spinosa cute rubo. mordacia sunt quibusdam, ut urticis, pungentia pino, piceae, abieti, larici, cedro, aquifoliis, pediculo brevi oleæ, ilici, longo vitibus, tremulo populis, et iisdem solis inter se crepitantia. iam et in pomo ipso mali quodam in genere parva mediis emicant folia, interim et gemina, praeterea aliis circa ramos, aliis et in cacumine ramorum, robori et in caudice ipso. iam densa aut rara semperque lata rariora. disposita myrto, concava buxo, inordinata pomis, plura eodem pediculo exeuntia malis pirisque, ramulosa ulmo et cytiso. quibus adicit cato decidua populea quænaque, animalibus iubens dari non perarida, bubus quidem et ficulnea ilignaque et hederacea. dantur et ex harundine ac luru. decidunt sorbo universa, ceteris paulatim. et de foliis hactenus.

ordo autem naturæ annuus ita se habet: primus est conceptus flare incipiente vento favonio, ex a. d. fere vi idus febr. hoc maritantur vivescencia e terra, quippe cum etiam equæ in hispania, ut diximus. hic est genitalis spiritus mundi a fovendo dictus, ut quidam existimavere. flat ab occasu æquinoctiali ver inchoans. catlitionem rustici vocant, gestiente natura semina accipere eaque animam ferente omnibus satis. concipiunt variis diebus et pro sua quæque natura alia protinus, ut animalia, tardius aliqua et diutius gravida partus gerunt, quod germinatio ideo vocatur. pariunt vero, cum florent, flosque ille ruptis constat utriculis; educatio in pomo est.

haec et germinatio labor arborum, flos est pleni veris indicium et anni renascentis, flos gaudium arborum. tunc se novas aliasque quam sunt ostendunt, tunc variis colorum picturis in certamen usque luxuriant. sed hoc

negatum plerisque; non enim omnes florent, et sunt tristes quaedam quaeque non sentiant gaudia annorum. nam neque ilex, picea, larix, pinus ullo flore exhilarantur natalesve pomorum annuos versicolori nuntio promittunt, nec fici atque caprifici; protinus enim fructum pro flore gignunt. in ficis mirabiles sunt et abortus qui numquam maturescunt. nec iuniperi florent. quidam earum duo genera tradunt: alteram florere nec ferre, quae vero non floreat ferre protinus bacis nascentibus, quae biennio haereant. sed id falsum, omnibusque his dura facies semper. sic et hominum multis fortuna sine flore est.

omnes autem germinant, etiam quae non florent, magna et locorum differentia, quippe cum ex eodem genere quae sunt in palustribus priora germinent, mox campestris, novissima in silvis, per se autem tardius piri silvestres quam ceterae. primo favonio cornus, proxime laurus pauloque ante aequinoctium tilia, acer, inter primas vero populus, ulmus, salix, alnus, nuces. festinat et platanus. cetera vere coepturo, aquifolium, terebinthus, paliurus, castanea, glandes, serotino autem germine malus, tardissimo suber. quibusdam geminatur germinatio, nimia soli ubertate aut invitantis caeli voluptate, quod magis in herbis segetum evenit. in arboribus tamen nimia germinatio elactescit. sunt aliae naturales quibusdam praeterque vernam, quae suis constant sideribus - quorum ratio aptius reddetur tertio ab hoc volumine - , hiberna aquilae exortu, aestiva canis ortu, tertia arcturi. has duas quidam omnibus arboribus communes putant, sentiri autem maxime in fico, vite, punicis, causam adferentes, quoniam in thessalia macedoniaque plurima tum ficus exeat. maxime tamen in aegypto apparet haec ratio. et reliquae quidem arbores, ut primum coepere, continuant germinationem, robur et abies et larix intermittunt tripertito ac terna germina edunt. ideo et ter squamas corticum spargunt, quod omnibus arboribus in germinatione evenit, quoniam praegnatum rumpitur cortex. est autem prima earum incipiente vere circiter xv diebus. iterum germinant transeunte geminos sole. sic fit, ut prima cacumina inPELLI secutis appareat, geniculato incremento. tertia est earundem a solstitio brevissima, nec diutius septenis diebus, clareque et tunc cernitur excrecentium cacuminum articulatio. vitis sola bis parturit, primum cum emittit uvam, iterum cum digerit. eorum, quae non florent, partus tantum est et maturitas. quaedam statim in germinatione florent properantque in eo, sed tarde maturescunt, ut vitis. serotino quaedam germinatu florent maturantque celeriter, sicuti morus, quae novissima urbanarum germinat nec nisi exacto frigore, ob id dicta sapientissima arborum. sed cum coepit, in tantum universa germinatio erumpit, ut una nocte peragatur etiam cum strepitu.

ex iis, quae hieme aquila exoriente, ut diximus, concipiunt, floret prima omnium amygdala mense ianuario, martio vero pomum maturat. ab ea proximae florent armeniaca, dein tuberes et praecoces, illae peregrinae, hae coactae; ordine autem naturae silvestrium primae sabucus, cui medulla plurima, et cui nulla, cornus mascula, urbanarum malus parvoque post, ut simul possit videri, pirus et cerasus et prunus. sequitur laurus, illam cupressus, dein punica, fici. et vites et oleae florentibus iam his germinant, concipiunt

vergiliarum exortu. hoc sidus illarum est. floret autem solstitio vitis et, quae paulo serius incipit, olea. deflorescunt omnia septenis diebus non celerius, quaedam tardius, sed nulla pluribus bis septenis, omnia et intra viii id. iul. etesiarum praecursu. nec statim fructus sequitur in aliquibus. cornus enim circa solstitia reddit primo candidum, postea sanguineum. ex eo genere femina post autumnum fert bacas acerbis et ingustabiles cunctis animantibus, ligno quoque fungosa et inutilis, cum mas e fortissimis durissimisque sit. tanta differentia ab eodem genere fit sexu. et terebinthus messibus reddit semen et acer et fraxinus, nuces et mala et pira praeterquam hiberna aut praecocia autumnus, glandiferae serius etiamnum, vergiliarum occasu, aesculus tantum autumnus, incipiente autem hieme quaedam genera mali pirique et suber. abies floret croci colore circa solstitium, semen reddit post vergiliarum occasum. pinus autem et picea praeveniunt germinatione xv fere diebus, semen vero post vergilias et ipsae reddunt.

citreae et iuniperus et ilex anniferae habentur, novusque fructus in his cum annotino pendet. in maxima tamen admiratione pinus est: habet fructum maturescentem, habet proximo anno ad maturitatem venturum ac deinde tertio. nec ulla arborum avidius se promittit; quo mense ex ea nux decerpitur, eodem maturescit alia; sic dispensatur, ut nullo non mense maturescant. quae se in arbore ipsa divisere, azaniae vocantur laeduntque ceteras, nisi detrahantur.

fructum arborum solae nullum ferunt - hoc est ne semen quidem - tamarix, scopis tantum nascens, populus, alnus, ulmus atinia, alaternus, cui folia inter ilicem et olivam. infelices autem existimantur damnataeque religione, quae neque seruntur umquam neque fructum ferunt. cremutius auctor est numquam virere arborem, ex qua phyllis se suspenderit. quae cummim gignunt, post germinationem aperiunt; cummis non nisi fructu detracto spissatur.

novellae arbores carent fructu, quamdiu crescunt. perdunt facillime ante maturitatem palma, ficus, amygdala, malus, pirus, item punica, quae etiam roribus nimis et pruinis florem amittit. qua de causa inflectunt ramos eius, ne subrecti umorem infestum excipiant atque contineant. pirus et amygdala, etiam si non pluat, sed fiat austrinum caelum aut nubilum, amittunt florem et primos fructus, si, cum defloruere, tales dies fuerint. ocissime autem salix amittit semen, antequam omnino maturitatem sentiat, ob id dicta homero frugiperdia. secuta aetas scelere suo interpretata est hanc sententiam, quando semen salicis mulieri sterilitatis medicamentum esse constat. sed in hoc quoque providens natura facile nascenti et depacto surculo incuriosius semen dedit. una tamen proditur ad maturitatem perferre solita in creta insula ipso descensu iovis speluncae durum ligneumque, magnitudine ciceris.

fiunt vero quaedam loci vitio infructuosa, sicut in paro silva cende quae nihil fert. persicae arbores in rhodo florent tantum. fit haec differentia et sexu, ut in iis quae mares non ferunt; aliqui hoc permutant et mares esse quae ferant tradunt. facit et densitas sterilitatem.

gignentium autem quaedam et lateribus ramorum et cacuminibus ferunt, ut

pirus, punica, ficus, myrtus. cetero eadem natura quae frugibus. namque et in eis spica in cacumine nascitur, legumina in lateribus. palma sola, ut dictum est, in spathis habet fructum, racemis pendentem.

reliquis sub folio pomum, ut protegatur, excepta fico, cui folium maximum umbrosissimumque, et ideo supra id pomum. eidem uni serius folium nascitur quam pomum. insigne proditur in quodam genere ciliciae, cypri, helladis, ficos sub folio, grossos vero post folium nasci. ficus et praecoces habet, quas athenis prodromos vocant, in laconico genere maxime.

sunt et biferae in isdem; in ceo insula caprifici triferae sunt; primo fetu sequens evocatur, sequenti tertius. hoc fici caprificantur. et caprifici autem ab adversis foliis nascuntur. biferae et in malis ac piris quaedam, sicut et praecoces. malus silvestris bifera. sequens eius fructus post arcturum, in apricis maxime. vites quidem et triferae sunt, quas ob id insanas vocant, quoniam in his alia maturescunt, alia turgescunt, alia florent. M. Varro auctor est vitem fuisse zmyrnae apud matroon triferam et malum in agro consentino. hoc autem evenit perpetuo in venesi africae agro, de quo plura alias. ea est soli fertilitas. trifera est et cupressus. namque bacae eius colliguntur mense ianuario et maio et septembri, ternasque earum gerit magnitudines.

est vero et in ipsis arboribus etiam onustis peculiaris differentia. summa sui parte fertiliores arbutus, quercus, inferiore iuglandes, fici mariscae. omnes quo magis senescunt, hoc maturius ferunt, et in apricis locis nec pingui terra. silvestria omnia tardiora. quaedam ex his omnino nec maturescunt. item quae subarantur aut quae ablaqueantur celeriora neglectis. haec et fertiliora.

est etiamnum aetatis differentia. amygdala enim et pirus in senecta fertilissimae, ut et glandiferae et quoddam genus ficorum, ceterae in iuventa tardiusque maturantes, quod maxime notatur in vitibus. vetustioribus enim vinum melius, novellis copiosius. celerrime vero senescit et in senecta deteriore fructum gignit malus. namque et minora poma proveniunt et vermiculis obnoxia; quin et in ipsa arbore nascuntur. ficus sola ex omnium arborum fetu maturitatis causa medicatur, iam quidem et portentis, quoniam maiora sunt pretia praeposteris. omnia autem celerius senescunt praefecunda. quin et protinus moriuntur aliqua caelo fecunditatem omnem eblandito, quod maxime vitibus evenit. contra morus tardissime senescit, fructu minime laborans, tarde et ea, quorum crispa materies, ut palma, acer, populus. et subarata ocus senescunt, silvestria autem tardissime. atque in totum omnis cura fertilitatem adicit, fertilitas senectam. ideo et praeflorent talia et praegerminant, in totum praecocia fiunt, quoniam omnis infirmitas caelo magis oboedit.

multae plura gignunt, ut diximus in glandiferis, inter quas laurus uvas suas maximeque sterilis, quae non gignit aliud; ob id a quibusdam mas existimatur. ferunt et abellanae iulos compactili callo, ad nihil utiles, plurima vero ilices, nam et semen suum et granum, quod crataegum vocant, et a septentrione viscum, a meridie hyphear - de quibus plura mox paulo - interdumque pariter res quaternas habent.

arbores quaedam simplices, quibus a radice caudex unus et rami frequentes, ut olivae, fico, viti. quaedam fruticosi generis, ut paliurus, myrtus, item nux abellana, quin immo melior et copiosior fructu in plures dispersa ramos. hi quibusdam omnino nulli, ut in sato genere buxi, loto transmarinae. quaedam bifurcae atque etiam in quinas partes diffusae, quaedam dividuae nec ramosae, ut sabuci, quaedam individuae, ramosae, ut piceae. quibusdam ramorum ordo, sicut piceae, abieti, aliis inconditus, ut robori, malo, piro. et abieti quidem subrecta divisura ramique in caelum tendentes, non in latera proni. mirum, cacuminibus eorum decisis moritur, totis vero detruncatis durat. et si infra quam rami fuere praecidatur, quod superest vivit, si vero cacumen tantum auferatur, tota moritur. alia ab radice brachchiata, ut ulmus, alia in cacumine ramosa, ut pinus, faba graeca, quam romae a suavitate fructus, silvestris quidem, sed cerasorum paene natura, loton appellant. praecipue domibus expetitur ramorum petulantia brevi caudice latissima expatiantium umbra et in vicinas domos saepe transilientium. nulla opacitas brevior, nec auferunt rami solem hieme decidentibus foliis. nullis cortex iucundior aut oculos excipiens blandius, nullis rami longiores validioresque aut plures, ut dixisse totidem arbores liceat. cortice pelles tingunt, radice lanas. malis proprium genus. ferarum enim rostra reddunt adhaerentibus uni maximo minoribus.

ramorum aliqui caeci, qui non germinant, quod natura fit, si non evaluere, aut poena, cum deputatos cicatrix hebetavit. quae dividuis in ramo natura est, haec viti in oculo, harundini in geniculo. omnium terrae proxima crassiora. in longitudinem excrescunt abies, larix, palma, cupressus, ulmus et si qua unistirpia. ramosarum cerasus etiam in xl cubitorum trabes aequali per totam duum cubitorum crassitudine reperitur. quaedam statim in ramos sparguntur, ut mali.

cortex aliis tenuis, ut lauro, tiliae, aliis crassus, ut robori, aliis levis, ut malo, fico, idem scaber robori, palmae, omnibus in senecta rugosior. quibusdam rumpitur sponte, ut viti, quibusdam etiam cadit, ut malo, unedoni, carnosus suberi, populo, membranaceus viti, harundini, libris similis ceraso, multiplex tunicis vitibus, tiliae, abieti, quibusdam simplex, ut fico, harundini.

magna et radicum differentia: copiosae fico, robori, platano, breves et angustae malo, singulares abieti, larici; singulis enim innituntur, quamquam minutis in latera dispersis. crassiores lauro et inaequales, item oleae, cui et ramosae. at robori carnosae. robora suas in profundum agunt; si vergilio quidem credimus, aesculus quantum corpore eminet, tantum radice descendit. oleae malisque et cupressis per summa caespitum, aliis recto meatu, ut lauro, oleae, aliis flexuoso, ut fico. minutis haec capillamentis hirsuta et abies multaeque silvestrium, e quibus montani praetenuia fila decerpentes spectabiles lagoenas et alia vasa nectunt. quidam non altius descendere radices, quam solis calor tepefaciat, idque natura loci tenuioris crassive dixere, quod falsum arbitror. apud auctores certe invenitur, abietis planta cum transferretur, octo cubitorum in altitudinem nec totam refossam, sed

abruptam. maxima spatio atque plenitudine citri est, ab ea platani, roboris et glandiferarum. quarundam radix vivacior superficie, ut laurus. itaque cum trunco inaruit, recisa etiam laetius fruticat. quidam brevitate radicum celerius senescere arbores putant, quod coarguunt fici, quarum radices longissimae et senectus ocissima. falsum arbitror et quod aliqui prodidere, radices arborum vetustate minui. visa enim est annosa quercus eversa tempestatis vi, iugerum soli amplexa.

prostratas restitui plerumque et quadam terrae cicatrice vivescere vulgare est. familiarissimum hoc platanis, quae plurimum ventorum concipiunt propter densitatem ramorum, quibus amputatis levato onere in suo scrobe reponuntur; factumque iam est hoc et in iuglandibus oleisque ac multis aliis. est in exemplis et sine tempestate ullave causa alia quam prodigi cecidisse multas ac sua sponte resurrexisse. factum hoc populi romani quiritis ostentum cimbricis bellis nuceriae in luco iunonis ulmo, postquam etiam cacumen amputatum erat, quoniam in aram ipsam procumbebat, restituta sponte ita ut protinus floreret, a quo deinde tempore maiestas p. r. resurrexit, quae ante vastata cladibus fuerat. memoratur hoc idem factum et in philippis salice procidua atque detruncata et stagiris in museo populo alba, omnia fausti ominis. sed maxime mirum, antandri platanus etiam circumdolatis lateribus restibilis sponte facta vitaeque reddita longitudine xv cubitorum, crassitudine quattuor ulnarum.

arbores quas naturae debemus tribus modis nascuntur, sponte aut semine aut ab radice. cura numerosior extitit, de qua suo dicemus volumine. nunc enim totus sermo de natura est multis modis mirisque memorabili. namque non omnia in omnibus locis nasci docuimus nec tralata vivere. hoc alias fastidio, alias contumacia, saepius inbecillitate eorum quae transferantur evenit, alias caelo invidente, alias solo repugnante.

fastidit balsamum alibi nasci, nata assyria malus alibi ferre, nec non et palma ubique nasci aut nata parere vel, cum promisit etiam ostenditque, educare, tamquam invita pepererit. non habet vires frutex cinnami in syriae vicina perveniendi. non ferunt amomi nardique deliciae, ne in arabiam quidem, ex india et nave peregrinari; temptavit enim seleucus rex. illud maxime mirum, ipsas plerumque arbores exorari, ut vivant atque tramigrent, aliquando et a solo impetrari, ut alienas alat advenasque nutriat, caelum nullo modo flecti. vivit in italia piperis arbor, casiae vero etiam in septentrionali plaga, vixit in lydia turis, sed unde sorbentes sucum omnem ex iis soles coquentesve lacrimam illud proxime mirum, mutari naturam in iisdem atque pro indiviso valere. cedrum aestuosis partibus dederat, set in lyciis phrygiisque montibus nascitur. frigus inimicum lauro fecerat, sed in olympo copiosior nulla est. circa bosporum cimmerium in panticapaeo urbe omni modo laboravit mithridates rex et ceteri incolae sacrorum certe causa laurum myrtumque habere: non contigit, cum teporis arbores abundant ibi, punicae ficique, iam mali et piri laudatissimae. frigidas eodem tractu non genuit arbores, pinum, abietem, piceam. et quid attinet in pontum abire iuxta romam

ipsam castaneae cerasique aegre proveniunt, persica in tusculano, nuces graecae cum taedio inseruntur tarracina silvis scatente earum.

cupressus advena et difficillime nascentium fuit, ut de qua verbosius saepiusque quam de omnibus aliis prodiderit cato, satu morosa, fructu supervacua, baxis torva, folio amara, odore violenta ac ne umbra quidem gratiosa, materie rara, ut paene fruticosi generis, diti sacra et ideo funebri signo ad domos posita. femina ... sterilis. diu metae demum aspectu non repudiata distinguendis tantum pinorum ordinibus, nunc vero tonsilis facta in densitatem parietum coercitaque gracilitate perpetuo teres trahitur etiam in picturas operis topiarii, venatus classesve et imagines rerum tenui folio brevique et virente semper vestiens. duo genera earum: meta in fastigium convoluta, quae et femina appellatur. mas spargit extra se ramos deputaturque et accipit vitem. utraque autem immittitur in perticas asseresve amputatione ramorum, qui xiii anno denariis singulis veneunt, quaestuosissima in satus ratione silva, vulgoque dotem filiae antiqui plantaria ea appellabant. huic patria insula creta, quamquam cato tarentinam eam appellat, credo, quod primum eo venerit. et in aenaria succisa regerminat; sed in creta quocumque in loco terram moverit quispiam, nisu naturali haec gignitur protinusque emicat, illa vero etiam non appellato solo ac sponte maximeque in idaeis montibus et quos albos vocant summisque in his, unde numquam nives absunt, plurima, quod miremur, alibi non nisi in tepore proveniens et nutricem magno opere fastidiens.

nec terrae tantum natura circa has refert aut perpetua caeli, verum et quaedam temporaria vis. imbres aliqua plerumque semina adferunt et certo fluunt genere, aliquando etiam incognito, quod accidit cyrenaicae regioni, cum primum ibi laserpicium natum est, ut in herbarum natura dicemus. nata est et silva urbi ei proxima imbre piceo crassoque.

hedera iam dicitur in asia nasci. circiter urbis romae annum ccccxix negaverat theophrastus, nec in india nisi in monte mero, quin et harpalum omni modo laborasse, ut sereret eam in medis frustra, alexandrum vero ob raritatem ita coronato exercitu victorem ex india redisse exemplo liberi patris. cuius dei et nunc adornat thyrsos galeasque etiam ac scuta in thraciae populis sollemnibus sacris, inimica arboribus satisque omnibus, sepulchra, muros rumpens, serpentium frigori gratissima, ut mirum sit ullum honorem habitum ei.

duo genera prima, ut reliquarum, mas atque femina. maior traditur mas et corpore et folio, duriore etiam ac pinguiore et flore ad purpuram accedente; utriusque autem similis est rosae silvestri, nisi quod caret odore. species horum generum tres: est enim candida aut nigra hedera tertiaque vocatur helix. etiamnum haec species dividuntur in alias, quoniam est aliqua fructu tantum candida, alia et folio. fructum quoque candidum ferentium aliis densus acinus et grandior, racemis in orbem circumactis, qui vocantur corymbi, iidem silenici, cum est minor acinus, sparsior racemus, simili modo ut in nigra. alicui et semen nigrum, alii crocatum, cuius coronis poetae utuntur, foliis

minus nigris, quam quidam nysiam, alii bacchicam vocant, maximis inter nigras corymbis. quidam apud graecos etiamnum duo genera huius faciunt a colore acinorum, erythranum et chrysocarpum.

plurimas autem habet differentias helix, quoniam folio maxime distat. parva sunt et angulosa concinnioraque, cum reliquorum generum simplicia sint. distat et longitudine internodiorum, praecipue tamen sterilitate, quoniam fructum non gignit. quidam hoc aetatis esse, non generis existimant primoque helicem esse, fieri hederam vetustate. horum error manifestus intellegitur, quoniam helicis plura genera reperiuntur, sed tria maxime insignia: herbacea ac virens, quae plurima est, altera candido folio, tertia versicolori, quae thracia vocatur. etiamnum herbaceae tenuiora folia et in ordinem digesta densioraque; in alio genere diversa omnia ea. in versicolori alia tenuioribus foliis et similiter ordinatis densioribusque est, alteri generi neglecta haec omnia; maiora quoque aut minora sunt folia macularumque habitu distant. et in candidis aliis sunt candidiora. adulescit in longitudinem maxime herbacea. arbores autem necat candida omnemque sucum auferendo tanta crassitudine augetur, ut ipsa arbor fiat. signa eius folia maxima atque latissima, mammae rigentes, quae sunt ceteris inflexae, racemi stantes ac subrecti. et quamquam omnium hederarum generi radicata brachia, huic tamen maxime ramosa ac robusta, ab ea nigrae. sed proprium albae, quod inter media folia emittit brachia utrumque semper amplectens, hoc et in muris, quamvis ambire non possit. itaque etiam pluribus locis intercisa vivit tamen duratque, et totidem initia radicum habet quot brachia, quibus incolumis et solida arbores sugit ac strangulat. est et in fructu differentia albae nigraeque hederae, quoniam aliis tanta amaritudo acini, ut aves non attingant. est et rigens hedera, quae sine adminiculo stat sola omnium generum, ob id vocata orthocissos, e diverso numquam nisi humi repens chamaecissos.

similis est hederae e cilicia quidem primum profecta, sed in graecia frequentior, quam vocant smilacem, densis geniculata caulibus, spinosis frutectosa ramis, folio hederaceo, parvo, non anguloso, a pediculo emittente pampinos, flore candido, olente lilium. fert racemos labruscae modo, non hederae, colore rubro, complexa acinis maioribus nucleos ternos, minoribus singulos, nigros durosque, infausta omnibus sacris et coronis, quoniam sit lugubris virgine eius nominis propter amorem iuvenis croci mutata in hunc fruticem. id volgus ignorans plerumque festa sua polluit hederam existimando, sicut in poetis aut libero patre aut sileno quis omnino scit quibus coronentur

e smilace fiunt codicilli, propriumque materiae est, ut admota auribus lenem sonum reddat. - hederae mira proditur natura ad experienda vina, si vas fiat e ligno eius, vina transfluere ac remanere aquam, si qua fuerit mixta.

inter ea, quae frigidis gaudent, et aquaticos frutices dixisse conveniat. principatum in his tenebunt harundines belli pacisque experimentis necessariae atque etiam deliciis gratiae.

tegulo earum domus suas septentrionales populi operiunt, durantque aevis

tecta talia; et in reliquo vero orbe et camaras levissime suspendunt. chartisque serviunt calami, aegyptii maxime cognatione quadam papyri. probatiores tamen cnidii et qui in asia circa anaeticum lacum nascuntur. nostratibus fungosior subest natura, cartilagine bibula, quae cavo corpore intus, superne tenui inarescit ligno, fissilis, praeacuta semper acie. geniculata cetero gracilitas nodisque distincta leni fastigio tenuatur in cacumina, crassiore paniculae coma, neque hac supervacua. aut enim pro pluma strata cauponarum replet aut, ubi lignosiore induruit callo, sicut in belgis, contusa et interiecta navium commissuris feruminat textus glutino tenacior rimisque explendis fidelior pice.

calamis orientis populi bella conficiunt, calamis mortem adcelerant pinna addita, calamis spicula addunt inrevocabili hamo noxia fitque et ex ipso telum aliud fracto in vulneribus. his armis solem ipsum obumbrant. propter hoc maxime serenos dies optant, odere ventos et imbres, qui inter illos pacem esse cogunt. ac si quis aethiopas, aegyptum, arabas, indos, scythas, bactros, sarmatarum tot gentes et orientis omniaque parthorum regna diligentius computet, aequa ferme pars hominum in toto mundo calamis superata degit. praecipuus hic usus in creta bellatores suos nobilitavit. sed in hoc quoque, ut ceteris in rebus, vicit italia, quando nullus sagittis aptior calamus quam in rheno bononiensi amne, cui plurima inest medulla pondusque volucre et contra flatus quoque pervicax libra. quippe non eadem gratia belgicis haec et creticis commendationibus. quamquam praeferuntur indici, quorum alia quibusdam videtur natura, quando et hastarum vicem praebent additis cuspidibus. harundini quidem indicae arborea amplitudo, quales vulgo in templis videmus. differre mares ac feminas in his quoque indi tradunt. spissius mari corpus, feminae capacius. navigiorumque etiam vicem praestant, si credimus, singula internodia. circa acesinen amnem maxime nascitur.

harundo omnis ex una stirpe numerosa, atque etiam recisa fecundius resurgit. radix natura vivax, geniculata et ipsa. folia indicis tantum brevia, omnibus vero a nodo orsa complexu tenues per ambitum inducunt tunicas, atque a medio internodio cum plurimum desinunt vestire procumbuntque. latera harundini calamoque in rotunditate bina, super nodos alterno semper inguine, ut alterum a dextera fiat, alterum superiore geniculo ab laeva per vices. inde exeunt aliquando rami, qui sunt calami tenues.

plura autem genera. alia spissior densiorque geniculis, brevibus internodiis, alia rarior maioribus, tenuiorque et ipsa. calamus vero alius totus concavus, quem vocant syringian, utilissimus fistulis, quoniam nihil est ei cartilaginis atque carnis. orchomenio et nodi continuo foramine pervii, quem auleton vocant. hic tibiis utilior, fistulis ille. est alius crassiore ligno et tenui foramine. hunc totum fungosa replet medulla. alius brevior, alius procerior, exilior crassiorque. fruticosissimus, qui vocatur donax, non nisi in aquaticis natus, quoniam et haec differentia est, multum praelata harundine quae in siccis proveniat. suum genus sagittario calamo, ut diximus, sed cretico longissimis internodiis, obsequiumque quo libeat flecti calefacto. differentias faciunt et

folia non multitudine tantum et longitudine, verum et colore. varia laconicis et ab ima parte densiora, quales in totum circa stagna gigni putant dissimiles amnicis longisque vestiri foliis spatiosius a nodo scandente complexu. est et obliqua harundo, non in excelsitatem nascens, sed iuxta terram fruticis modo se spargens, suavissima in teneritate animalibus. vocatur a quibusdam eletia. est et in italia palustris ex cortice tantum sub ipsa coma nascens, adarca nomine, utilissima dentibus, quoniam vis eadem est quae sinapi.

de orchomenii lacus harundinetis accuratius dici cogit admiratio antiqua. characian vocabant crassiorem firmioremque, plocimon vero subtiliorem, hanc in insulis fluvitantiibus natam, illam in ripis exspatiantis lacus. tertia est harundo tibialis calami, quem auleton dicebant. nono hic anno nascebatur. nam et lacus incrementa hoc temporis spatio servabat, prodigiosus, si quando amplitudinem biennio extendisset, quod notatum apud chaeroniam infausto atheniensium proelio est. ... aepe ... lebadia ... vocatur influente cephisso. cum igitur anno permansit inundatio, proficiunt in aucupatoriam quoque amplitudinem. vocabantur zeugitae, contra bombyciae maturius reciproco; graciles, feminarum latiore folio atque candidiore, modica lanugine; at omnino nulla spadonum nomine insignibus. hinc erant armamenta ad inclutos cantus, non silendo et reliquo curae miraculo, ut venia sit argento iam potius cani. caedi solebant tempestivae usque ad antigeniden tibicinem, cum adhuc simplici musica uterentur, sub arcturo. sic praeparatae aliquot post annos utiles esse incipiebant, tunc quoque multa domandae exercitatione et canere tibiae ipsae edocendae, complimentibus se linguis, quod erat illis theatrorum moribus utilius. postquam varietas accessit et cantus quoque luxuria, caedi ante solstitia coeptae et fieri utiles in trimatu, apertioribus earum lingulis ad flectendos sonos, quae inde sunt et hodie. sed tum ex sua quamque tantum harundine congruere persuasum erat, et eam, quae radicem antecesserat, laevae tibiae convenire, quae cacumen, dexterae, immensum quantum praelatis quas ipse cephisus abluisset. nunc sacrificae tuscorum e buxo, ludicrae vero e loto ossibusque asininis et argento fiunt. - aucupatoria harundo e panhormo laudatissima, piscatoria abaritana ex africa.

harundinis italiae usus ad vineas maxime. cato seri eam iubet in umidis agris bipalio subacto prius solo, oculis dispositis intervallo ternorum pedum, simul et corrudae, unde asparagi fiant, concordare amicitiam, salicis vero circa. qua nulla aquaticarum utilior, licet populi vitibus placeant et caecuba educent, licet alni saepibus muniant contraque erumpentium amnium impetus riparum muro in tutela ruris excubent in aqua satae densius caesaeque innumero herede prosint.

salicis etiam plura genera. namque et in proceritatem magnam emittunt iugis vinearum perticas pariuntque balteo corticis vincula, et aliae virgas sequacis ad vincturas lentitiae, aliae praetenuis viminibus texendis spectabili subtilitate, rursus aliae firmiores corbis ac plurimae agrorum suppellectili, candidiores ablato cortice lenique tractatu maioribus vasis, quam ut e corio fiant eadem, atque etiam supinarum in delicias cathedrarum

aptissimae. caedua salici fertilitas densiorque tonsura ex brevi pugno verius quam ramo, non, ut remur, in novissimis curanda arbore. nullius quippe tutior reditus est minorisve impendi aut tempestatum securior.

tertium locum ei in aestimatione ruris cato adtribuit prioremque quam olivetis quamque frumento aut pratis, nec quia desint alia vincula. siquidem et genistae et populi et ulmi et sanguinei frutices et betullae et harundo fissa et harundinum folia, ut in liguria, et vitis ipsa recisisque aculeis rubi alligant et intorta corylus - mirumque contuso ligno alicui maiores ad vincula esse vires - , salici tamen praecipua dos. finditur graeca rubens, candidior amerina, sed paulo fragilior, ideo solido ligat nexu. in asia tria genera observant: nigram utiliorem viminibus, candidam agricolarum usibus, tertiam, quae brevissima est, helicem vocant. apud nos quoque multi totidem generibus nomina inponunt, viminalem vocant eandemque purpuream, alteram nitelinam a colore, quae sit tenuior, tertiam gallicam, quae tenuissima.

nec in fruticum nec in veprium cauliumve neque in herbarum aut alio ullo quam suo genere numerentur iure scirpi fragiles palustresque, e quibus et tegulum tegetesque, detracto cortice candelae luminibus et funeribus serviunt. firmior quibusdam in locis eorum rigor. namque iis velificant non in pado tantum nautici, verum et in mari piscator africanus praepostero more velum intra malos suspendens, et mapalia sua mauri tegunt, proximeque aestimanti hoc videantur esse, quod in interiore parte mundi papyrus.

sui, sed frutectosi generis sunt inter aquaticas et rubi atque sabuci, fungosi generis, aliter tamen quam ferulae, quippe plus ligni est, utique sabuco, ex qua magis canoram bucinam tubamque credit pastor ibi caesa, ubi gallorum cantum frutex ille non exaudiat. rubi mora ferunt et alio genere similitudinem rosae quae vocatur cynosbatos. tertium genus idaeum vocant graeci a loco, tenerius quam cetera minoribusque spinis et minus aduncis. flos eius contra lippitudines inlinitur ex melle et igni sacro; contra stomachi quoque vitia bibitur ex aqua. sabuci acinos habent nigros atque parvos, umoris lenti, inficiendo maxime capillo. qui et ipsi aqua decocti manduntur.

umor et corpori arborum est, qui sanguis earum intellegi debet, non idem omnibus: ficis lacteus - huic ad caseos figurandos coaguli vis - , cerasis cumminosus, ulmis salivosus, lentus ac pinguis, malis, vitibus, piris aquosus. vivaciora quibus lentior. atque in totum corpori arborum, ut reliquorum animalium, cutis, sanguis, caro, nervi, venae, ossa, medullae. pro cute cortex. mirum, is in moro medicis sucum quaerentibus vere hora diei secunda lapide incisus manat, altius fractus siccus videtur. proximi plerisque adipēs. hi vocantur a colore alburnum, mollis ac pessima pars ligni, etiam in robore facile putrescens, teredini obnoxia, quare semper amputabitur. subest huic caro, carni ossa, id est materiae optimum. alternant fructus quibus siccus lignum, ut olea, magis quam quibus carnosum, ut cerasus. nec omnibus adipēs carnesve largae, uti nec animalium acerrimis. neutrum habent buxus, cornus, olea, nec medullam minimumque etiam sanguinis, sicuti ossa non habent sorba, carnem sabuci - at plurimam ambae medullam - nec harundines maiore

ex parte.

in quarundam arborum carnibus pulpae venaque sunt. discrimen earum facile; venae latiores candidioresque. pulpae fissilibus insunt. ideo fit, ut aure ad caput trabis quamlibet praelongae admota ictus ab altero capite vel graphii sentiantur penetrante rectis meatibus sono, unde deprehenditur, an torta sit materies nodisque concisa. quibus sunt tubera, sicut sunt in carne glandia, in iis nec vena nec pulpa, quodam callo carnis in se convoluta. hoc pretiosissimum in citro et acere. cetera mensarum genera fissis arboribus circinantur in pulpam; alioqui fragilis esset vena in orbem arboris caesa. fagis pectines traversi in pulpa. apud antiquos inde et vasis honos. m'. curius iuravit se nihil ex praeda attigisse praeter guttum faginum, quo sacrificaret. - lignum in longitudinem fluvitat, ut quaeque pars fuit ab radice, validius sidit. - quibusdam pulpa sine venis mero stamine et tenui constat. haec maxime fissilia. alia frangi celeriora quam findi, quibus pulpa non est, ut oleae, vites. at e contrario totum e carne corpus fico, tota ossea ilex, ornus, robur, cytisus, morus, hebenus, lotos et quae sine medulla esse diximus. ceteris nigricans color, fulva cornus in venabulis nitet incisuris nodata propter decorem. cedrus et larix et iuniperus rubent. larix femina habet quam graeci vocant aegida mellei coloris. hoc lignum proximum medullae est. in abiete lusson graeci vocant. inventum pictorum tabellis immortale nullisque fissile rimis. cedri quoque durissima quae medullae proxima, ut in corpore ossa, deraso modo limo. et sabuci interiora mire firma traduntur, quidamque venabula ex ea praeferunt omnibus, constat enim ex cute et ossibus.

caedi tempestivum quae decorticentur et teretes ad templa ceteraque usus rotundi, cum germinant, alias cortice inextricabili et carie subnascente ei materiaque nigrescente; tigna et quibus aufert securis corticem a bruma ad favonium aut, si praevenire cogamur, arcturi occasu et ante eum fidiculae, novissima ratione solstitio. dies siderum horum reddentur suo loco. vulgo satis putant observare, ne qua dedolanda sternatur ante editos suos fructus. robur vere caesum teredinem sentit, bruma autem neque vitatur neque pandatur, alias obnoxium etiam, ut torqueat sese findatque, quod in subere tempestive quoque caeso evenit. infinitum refert et lunaris ratio, nec nisi a xx in xxx caedi volunt. inter omnes vero convenit utilissime in coitu eius sterni, quem diem alii interlunii, alii silentis lunae appellant. sic certe tiberius caesar concremato ponte naumachiaro larices ad restituendum caedi in raetia praefinivit. quidam dicunt, ut in coitu et sub terra sit luna, quod fieri non potest nisi noctu. si competant coitus in novissimum diem brumae, illa fit aeterna materies; proxime, cum supra dictis sideribus. quidam et canis ortum addunt, et sic caesas materias in forum augustum. nec novellae autem ad materiem nec veteres utilissimae. circumcisas quoque in medullam aliqui non inutiliter relinquunt, ut omnisumor stantibus defluat. mirum apud antiquos primo punico bello classem duilli imperatoris ab arbore lx die navigavisse, contra vero hieronem regem ccxx naves effectas diebus xlv tradit l. piso. secundo quoque punico scipionis classis xl die a securi navigavit. tantum tempestivitas

etiam in rapida celeritate pollet.

cato hominum summus in omni usu de materiis haec adicit: “prelum ex sappino atra potissimum facito. ulmeam, pineam, nuceam, hanc atque aliam materiem omnem cum ecfodies, luna decrescente eximito post meridiem sine vento austro. tum erit tempestiva, cum semen suum maturum erit. cavetoque per rorem trahas aut doles.” idemque mox: “nisi intermestri lunaque dimidiata ne tangas materiem. quam effodias aut praecidas abs terra. diebus vii proximis, quibus luna plena fuerit, optime eximitur. omnino caveto ni quam materiem doles neve caedas neve tangas nisi siccam, neve gelidam neve rorulentam.” tiberius item et in capillo tendendo servavit interlunia. M. Varro adversus defluvia praecipit observandum id a pleniluniis.

larici et magis abieti succisis umor diu defluit. haec omnium arborum altissimae ac rectissimae. navium malis antemnisque propter levitatem praefertur abies. communia his pinoque, ut quadriperitos venarum cursus bifidosve habeant vel omnino simplices. fabrorum in intestina opera medulla sectilis optima quadriperitis, ... materies et mollior quam ceterae. intellectus in cortice protinus peritis. abietis quae pars a terra fuit, enodis est. haec qua diximus ratione fluviata detoratur atque ita sappinus vocatur, superior pars nodosa duriorque fusterna. et in ipsis autem arboribus robustiores aquiloniae partes, et in totum deteriores ex umidis opacisque, spissiores ex apricis ac diuturnae. ideo romae infernas abies supernati praefertur.

est per se gentium quoque in his differentia. alpius appenninoque laudatissimae, in gallia iuribus ac monte vosego, in corsica, bithynia, ponto, macedonia. deterior aenianica et arcadica, pessima parnasia et euboica, quoniam ramosae ibi et contortae putrescentesque facile. at cedrus in creta, africa, syria laudatissima. cedri oleo peruncta materies nec tiniam nec cariem sentit. iunipero eadem virtus quae cedro. vasta haec in hispania maximeque vaccaeis. medulla eius ubicumque solidior etiam quam cedris. publicum omnium vitium vocant spiras, ubi convolvere se venae atque nodi. inveniuntur in quibusdam, sicut in marmore, centra, id est duritia clavo similis, inimica serris. et quaedam forte accidunt, ut lapide comprehenso aut recepto in corpus aut alterius arboris ramo. megaris diu stetit oleaster in foro, cui viri fortes adfixerant arma, quae cortice ambiente aetas longa occultaverat, fuitque arbor illa fatalis excidio urbis praemonitae oraculo, cum arbor arma peperisset, quod succisae accidit ocreis galeisque intus repertis. ferunt lapides ita inventos ad continendos partus esse remedio.

amplissima arborum ad hoc aevi existimatur romae visa, quam propter miraculum tiberius caesar in eodem ponte naumachiaro exposuerat advectam cum reliqua materie, duravitque ad neronis principis amphitheatrum. fuit autem trabs ea e larice, longa pedes cxx, bipedali crassitudine aequalis, quo intellegebatur vix credibilis reliqua altitudo fastigium ad cacumen aestimantibus. fuit memoria nostra et in porticibus saeptorum a m. agrippa relicta aequae miraculi causa, quae diribitorio superfuerat, xx pedibus brevior, sesquipedali crassitudine. abies admirationis praecipuae visa est in nave, quae

ex aegypto gai principis iussu obeliscum in vaticano circo statutum quattuorque truncos lapidis eiusdem ad sustinendum eum adduxit. qua nave nihil admirabilius visum in mari certum est. [cxx] modium lentis pro saburra ei fuere. longitudo spatium obtinuit magna ex parte ostiensis portus latere laevo. ibi namque demersa est claudio principe cum tribus molibus turrium altitudine in ea exaedificatis obiter puteolano pulvere advectisque. arboris eius crassitudo quattuor hominum ulnas conplectentium implebat, vulgoque auditur [lxxx] nummum et pluris malos venundari ad eos usus, rates vero conecti [xl] sestertium plerasque. at in aegypto ac syria reges inopia abietis cedro ad classes feruntur usi. maxima ea in cypro traditur ad undecirem demetri succisa [cxxx] pedum, crassitudinis vero ad trium hominum complexum. germaniae praedones singulis arboribus cavatis navigant, quarum quaedam et xxx homines ferunt. spississima ex omni materie, ideo et gravissima iudicatur hebenus et buxus, graciles natura. neutra in aquis fluvitat, nec suber, si dematur cortex, nec larix. ex reliquis spississima lotos, quae romae ita appellatur, dein robur exalburnatum. et huic nigricans color magisque etiam cytiso, quae proxime accedere hebenum videtur, quamquam non desunt qui syriacas terebinthos nigriores adfirmant. celebravit et thericles nomine calices ex terebintho solitus facere torno; perquam probatur materies. omnium haec sola ungui vult meliorque fit oleo. colos mire adulteratur iuglande ac piro silvestri tinctis atque in medicamine decoctis. omnibus quae diximus spissa firmitas. ab iis proxima est cornus, quamquam non potest videri materies propter exilitatem, sed lignum non alio paene quam ad radios rotarum utile aut si quid cuneandum sit in ligno clavisve figendum ceu ferreis. ilex item et oleaster et olea atque castanea, carpinus, populus. haec et crispa aceris modo, si ulla materies idonea esset ramis saepe deputatis. castratio illa est adimitque vires. de cetero plerisque horum, sed utique robori, tanta durtia, ut terebrari nisi madefactum non queat et ne sic quidem adactus avelli clavus. e diverso clavum non tenet cedrus. mollissima tilia. eadem videtur et calidissima. argumentum adferunt quod citissime ascias retundat. calidae et morus, laurus, hederæ et omnia, e quibus igniaria fiunt.

exploratorum hoc usus in castris pastorumque repperit, quoniam ad excudendum ignem non semper lapidis occasio est. teritur ergo lignum ligno ignemque concipit adtritu, excipiente materie aridi fomitibus, fungi vel foliorum facillimo conceptu. sed nihil hedera praestantius quae teratur, lauro quae terat. probatur et vitis e silvestribus - alia quam labrusca - , et ipsa hederæ modo arborem scandens. frigidissima quaecumque aquatica, lentissima autem et ideo scutis faciendis aptissima quorum plaga contrahit se protinus cluditque suum vulnus et ob id contumacius tramittit ferrum, in quo sunt genere vitis, vitex, salix, tilia, betulla, sabucus, populus utraque. levissimae ex his vitex, salix ideoque utilissimae; omnes autem ad cistas quaeque flexili crate constant. habent et candorem, rigorem et in sculpturis facilitatem. est lentitia platano, sed madida, sicut alno. siccior eadem ulmo, fraxino, moro, ceraso, sed ponderosior. rigorem fortissime servat ulmus, ob id cardinibus

coassamentisque portarum utilissima, quoniam minime torquetur, permutanda tantum sic, ut cacumen ab inferiore sit cardine, radix superior. palma est ... similis et suberis materies, spissae et malus pirusque, nec non acer, sed fragile, et quaecumque crispa. in omnibus silvestria et mascula differentiam cuiusque generis augent. et infecunda firmiora fertilibus, nisi quo in genere mares ferunt, sicut cupressus et cornus.

cariam vetustatemque non sentiunt cupressus, cedrus, hebenus, lotus, buxum, taxus, iuniperus, oleaster, olea, e reliquis tardissime larix, robur, suber, castanea, iuglans. rimam fissuramque non capit sponte cedrus, cupressus, olea, buxum.

maxime aeternam putant hebenum et cupressum cedrumque, claro de omnibus materiis iudicio in templo ephesiae diana, utpote cum tota asia extruente cxx annis peractum sit. convenit tectum eius esse e cedrinis trabibus. de simulacro ipso deae ambigitur. ceteri ex hebeno esse tradunt, mucianus iii cos. ex iis, qui proxime viso eo scripsere, vitigineum et numquam mutatum septies restituto templo, hanc materiam elegerit endoeon, etiam nomen artificis nuncupans, quod equidem miror, cum antiquiorem minerva quoque, non modo libero patre, vetustatem ei tribuat. adicit multis foraminibus nardo rigari, ut medicatus umor alat teneatque iuncturas - quas et ipsas esse modico admodum miror - , valvas esse e cupresso et iam cccc prope annis durare materiem omnem novae similem. id quoque notandum, valvas in glutinis compage quadriennio fuisse. cupressus in eas electa, quoniam praeter cetera in uno genere materiae nitor maxime valeat aeternus. non et simulacrum veiovis in arce e cupresso durat a condita urbe dlxi anno dicatum memorabile et uticae templum apollinis, ubi cedro numidica trabes durant ita, ut positae fuere prima urbis eius origine annis mclxxviii, et in hispania sagunti templum diana a zacyntho advectae cum conditoribus annis cc ante excidium troiae, ut auctor est bocchus; infra ipsum oppidum id habent - pepercit religione inductus Hannibal - iuniperi trabibus etiam nunc durantibus. super omnia memoratur aedis aulide eiusdem deae saeculis ante troianum bellum exaedificata, quoniam genere materiae, scientia oblitterata. in plenum dici potest utique quae odore praecellant, eas et aeternitate praestare. a praedictis morus proxime laudatur, quae vetustate etiam nigrescit. et quaedam tamen in aliis diuturniora sunt usibus quam alia: ulmus in perflatu firma, robur defossum et in aquis quercus obruta. eadem supra terram rimosa facit opera torquendo sese. larix in umore praecipua et alnus nigra. robur marina aqua conrumpitur. non inprobatur et fagus in aqua et iuglans, hae quidem in iis quae defodiuntur vel principales, item iuniperus, eadem et subdialibus aptissima. fagus et cerrus celeriter marcescunt. aesculus quoque umoris inpatiens. contra adacta in terram in palustribus alnus aeterna onerisque quantilibet patiens. cerasus firma, ulmus et fraxinus lentae, sed facile pandantur, flexiles tamen, stantesque ac circumcisura siccatae fideliores. laricem in maritimis navibus obnoxiam teredini tradunt, omniaque praeterquam oleastrum et oleam. quaedam enim in mari, quaedam in terra

vitiis opportuniore.

infestantium quattuor genera: teredines capite ad portionem grandissimo rodunt dentibus. hae tantum in mari sentiuntur, nec aliam putant teredinem proprie dici. terrestres tinias vocant, culicibus vero similes thripas. quantum est et e vermiculorum genere, et eorum alii putrescente suco ipsa materie, alii pariuntur sicut in arboribus ex eo, qui cerastes vocatur. cum tantum erosit, ut circumagat se, generat alium. haec nasci prohibet in aliis amaritudo, ut cupresso, in aliis duritia, ut buxo. tradunt et abietem circa germinationes decorticatam qua diximus luna aquis non corrumpi. alexandri magni comites prodiderunt in tylo rubri maris insula arbores esse, ex quibus naves fierent; quas ducentis annis durantes inventas, etsi mergerentur, incorruptas. in eadem esse fruticem baculis tantum idoneae crassitudinis, varium tigrium maculis, ponderosum et, cum in spissiora deciderat, vitri modo fragilem.

apud nos materiae finduntur aliquae sponte, ob id architecti eas fimo inlitas siccari iubent, ut adflatus ne noceant. pondus sustinere validae abies, larix, etiam in transversum positae. robur, olea incurvantur ceduntque ponderi. illae renituntur nec temere rumpuntur, priusque carie quam viribus deficiunt. et palmae arbor valida; in diversum enim curvatur, et populus cetera omnia in inferiora pandantur, palma ex contrario fornicatim. pinus et cupressus adversus cariem tiniasque firmissimae. facile pandatur iuglans, fiunt enim et ex ea trabes. frangi se praenuntiat crepitu, quod et in antandro accidit, cum e balineis teriti sono profugerunt. pinus, piceae, alni ad aquarum ductus in tubos cavantur; obrutae terra plurimis duraturae annis eadem, si non integantur, cito senescunt, mirum in modum fortiores, si umor extra quoque supersit.

firmissima in rectum abies, eadem valvarum paginis et ad quaecumque libeat intestina opera aptissima sive graeco sive campano sive siculo fabricae artis genere, spectabilis ramentorum crinibus, pampinato semper orbe se volvens ad incitatos runcinae raptus, eadem e cunctis maxime sociabilis glutino in tantum, ut findatur ante, qua solida est.

magna autem et glutinatio propter ea, quae sectilibus laminis aut alio genere operiuntur. stamineam in hoc usu probant venam, et vocant ferulaceam argumento similitudinis, quoniam lacunosa et crispa in omni genere glutinum abdicant. quaedam et inter se et cum aliis insociabilia glutino, sicut robur, nec fere cohaerent nisi similia natura, ut si quis lapidem lignumque coniungat. cornum maxime odit sorbus, carpinus, buxus, postea tilia. cuicumque operi facilia flexilia omnia, quae lenta diximus, praeterque morus et caprificus. forabilia ac sectilia, quae modice umida. arida enim latius quam teras cedunt, viridia praeter robur et buxum pertinacius resistunt serrarumque dentes replent aequalitate inertii. qua de causa alterna inclinatione egerunt scobem.

oboedientissima quocumque in opere fraxinus, eademque hastis corylo melior, cornu levior, sorbo lentior, gallica vero etiam ad currus flexili levitate. aemularetur ulmus, ni pondus esset in culpa. facilis et fagus, quamquam fragilis et tenera. eadem sectilibus lamnis in tenui flexilis capsisque ac scrineis

sola utilis. secatur in lamnas praetenuēs et ilex, colore quoque non ingrata, sed maxime fida iis, quae terantur, ut rotarum axibus, ad quos lentore fraxinus sicut duritia ilex et utroque legitur ulmus. sunt vero et parvi usus fabrilium ministeriorum insignes, ideoque proditum, terebris vaginas ex oleastro, buxo, ilice, ulmo, fraxino utilissimas fieri, ex iisdem malleos, maioresque e pinu et ilice. et his autem maior ad firmitatem causa tempestivae caesurae quam immaturae, quippe cum ex olea, durissimo ligno, cardines in foribus diutius immoti plantae modo germinaverint. cato vectes aquifolios, laureos, ulmeos fieri iubet, hyginus manubria rusticis carpinea, iligna, cerrea.

quae in lamnas secantur quorumque operimento vestiatur alia materies, praecipua sunt citrum, terebinthus, aceris genera, buxum, palma, aquifolium, ilex, sabuci radix, populus. dat et alnus, ut dictum est, tuber sectile, sicut citrum acerque. nec aliarum tuber iam in pretio. media pars arborum crispior et, quo propior radici, minoribus magisque flexilibus maculis. haec prima origo luxuriae arborum, alia integri et vilioris ligni e pretiosiore corticem fieri. ut una arbor saepius veniret, excogitatae sunt et ligni bratteae. nec satis, coepere tingui animalium cornua, dentes secari lignumque ebore distingui, mox operiri. placuit deinde materiem et in mari quaeri. testudo in hoc secta, nuperque portentosis ingeniis principatu neronis inventum, ut pigmentis perderet se plurisque veniret imitata lignum. sic lectis pretia quaeruntur, sic terebinthum vinci iuvat, sic citrum pretiosius fieri, sic acer decipi. modo luxuria non fuerat contenta ligno, iam lignum et e testudine facit.

vita arborum quarundam inmensa credi potest, si quis profunda mundi et saltus inaccessos cogitet. verum ex iis, quas memoria hominum custodit, durant in liternino africani prioris manu satae olea, item myrtus eodem loco conspicuae magnitudinis - subest specus, in quo manes eius custodire draco traditur - , romae vero lotos in lucinae area, anno, qui fuit sine magistratibus, ccclxxix urbis aede condita. incertum, ipsa quanto vetustior; esse quidem vetustiore non est dubium, cum ab eo luco lucina nominetur. haec nunc d circiter annum habet. antiquior, sed incerta eius aetas, quae capillata dicitur, quoniam vestalium virginum capillus ad eam defertur.

verum altera lotos in volcanali, quod romulus constituit ex victoria de decumis, aequaeva urbi intellegitur, ut auctor est masurius. radices eius in forum usque caesaris per stationes municipiorum penetrant. fuit cum ea cupressus aequalis, circa suprema neronis principis prolapsa atque neglecta.

vetustior autem urbe in vaticano ilex, in qua titulus aereis litteris etruscis religione arborem iam tum dignam fuisse significat. tiburtes quoque originem multo ante urbem romam habent. apud eos extant ilices tres etiam tiburno conditore eorum vetustiores, apud quas inauguratus traditur. fuisse autem eum tradunt filium amphiarai, qui apud thebas obierit una aetate ante iliacum bellum.

sunt auctores et delphicam platanum agamemnonis manu satam et alteram in caphya arcadiae loco. sunt hodie ex adverso iliensium urbis iuxta hellespontum in protesilai sepulchro arbores, quae omnibus ex eo aevis, cum

in tantum adcrevere, ut ilium aspiciant, inarescunt rursusque adollescunt. iuxta urbem autem quercus in ili tumulto tunc satae dicuntur, cum coepit ilium vocari.

argis olea etiamnum durare dicitur, ad quam io in tauram mutatam argus alligaverit. in ponto citra heracleam arae sunt iovis Στρατίου cognomine, ibi quercus duae ab hercule satae. in eodem tractu portus amyci est, bebruce rege interfecto clarus. eius tumulus a supremo die lauro tegitur, quam insanam vocant, quoniam, si quid ex ea decerptum inferatur navibus, iurgia fiunt, donec abiciatur. regionem aulocrenen diximus, per quam apamea in phrygiam itur. ibi platanus ostenditur, ex qua pependerit marsuas victus ab apolline, quae iam tum magnitudine electa est. nec non palma deli ab eiusdem dei aetate conspicitur, olympiae oleaster, ex quo primus hercules coronatus est, et nunc custoditur religio. athenis quoque olea durare traditur in certamine edita a minerva.

ex diverso brevissima vita est punicis, fico, malis, et ex his praecocibus brevior quam serotinis, dulcibus quam acidis, et dulciori in punicis, item in vitibus, praecipueque fertilioribus. graecinus auctor est sexagenis annis durasse vites. videntur et aquaticae celerius interire. senescunt quidem velociter, sed e radicibus repullulant laurus et mali et punicae. firmissimae ergo ad vivendum oleae, ut quas durare annis cc inter auctores conveniat.

est in suburbano tusculani agri colle, qui corne appellatur, lucus antiqua religione diana sacrat a latio, velut arte tonsili coma fagei nemoris. in hoc arborem eximiam aetate nostra amavit passienus crispus bis cos., orator, agrippinae matrimonio et nerone privigno clarior postea, osculari conplectique eam solitus, non modo cubare sub ea vinumque illi adfundere. vicina luco est ilex, et ipsa nobilis xxxiv pedum ambitu caudicis, decem arbores emittens singulas magnitudinis visendae silvamque sola faciens.

hedera necari arbores certum est. similem quidam et in visco, tametsi tardiozem, iniuriam earum arbitrantur. namque et hoc praeter fructus adgnascitur, non in novissimis mirabile. quaedam enim in terra gigni non possunt et in arboribus nascuntur. namque cum suam sedem non habeant, in aliena vivunt, sicut viscum et in syria herba quae vocatur cadytas, non tantum arboribus, sed ipsis etiam spinis circumvolvens sese, item circa tempe thessalica quae polypodion vocatur et quae dolichos ac serpyllum. oleastro quoque deputato quod gignatur, vocant phaunos; quod vero in spina fullonia, hippophaeston, cauliculis inanibus, foliis parvis, radice alba, cuius sucus ad detractones in comitali morbo utilissimus habetur.

visci tria genera. namque in abiete, larice stelin dicit euboea nasci, hyphear arcadia, viscum autem in quercu, robore, ilice, piro silvestri, terebintho, nec non et aliis arboribus adgnasci plerique. copiosissimum in quercu quod hyphear vocant. in omni arbore, excepta ilice et quercu, differentiam facit ... odor virusque, et folium non iucundi odoris, utroque visci amaro et lento. hyphear ad saginanda pecora utilius. vitia modo purgat primo, dein pinguefacit quae suffecere purgationi; quibus sit aliqua tabes intus, negant

durare. ea medendi ratio aestatis quadragenis diebus. adiciunt discrimen: visco in iis, quae folia amittant, et ipsi decidere, contra inhaerere nato in aeterna fronde. omnino autem satum nullo modo nascitur nec nisi per alvum avium redditum, maxime palumbis ac turdi. haec est natura, ut nisi maturatum in ventre avium non proveniat. altitudo eius non excedit cubitalem, semper fructuosi ac viridis. mas fertilis, femina sterilis, nisi quod et fertilis aliquando non fert.

viscum fit ex acinis, qui colliguntur messium tempore in maturi. nam si accessere imbres, amplitudine quidem augentur, visco vero marcescunt. siccantur deinde et aridi tunduntur ac conditi in aqua putrescunt duodenis fere diebus, unumque hoc rerum putrescendo gratiam invenit. inde in profluente, rursus malleo tusi, amissis corticibus interiore carne lentescunt. hoc est viscum pinnis avium tactu ligandis oleo subactum, cum libeat insidias moliri.

non est omittenda in hac re et galliarum admiratio. nihil habent druidae - ita suos appellant magos - visco et arbore, in qua gignatur, si modo sit robur, sacratius. iam per se roborum eligunt lucos nec ulla sacra sine earum fronde conficiunt, ut inde appellati quoque interpretatione graeca possint druidae videri. enimvero quidquid adgnascatur illis e caelo missum putant signumque esse electae ab ipso deo arboris. est autem id rarum admodum inventu et repertum magna religione petitur et ante omnia sexta luna, quae principia mensum annorumque his facit et saeculi post tricesimum annum, quia iam virium abunde habeat nec sit sui dimidia. omnia sanantem appellant suo vocabulo. sacrificio epulisque rite sub arbore comparatis duos admovent candidi coloris tauros, quorum cornua tum primum vinciantur. sacerdos candida veste cultus arborem scandit, falce aurea demetit, candido id excipitur sago. tum deinde victimas immolant precantes, suum donum deus prosperum faciat iis quibus dederit. fecunditatem eo poto dari cuicumque animalium sterili arbitrantur, contra venena esse omnia remedio. tanta gentium in rebus frivolis plerumque religio est.

LIBER XVII

natura arborum terra marique sponte sua provenientium dicta est; restat earum, quae arte et humanis ingeniis fiunt verius quam nascuntur. sed prius mirari succurrit, quae retulimus paenuria pro indiviso possessa feris, depugnante cum his homine circa caducos fructus, circa pendentes vero et cum alitibus, in tanta deliciarum pretia venisse, clarissimo, ut equidem arbitror, exemplo L. Crassi atque cn. domiti ahenobarbi. Crassus orator fuit in primis nominis romani. domus ei magnifica, sed aliquanto praestantior in eodem palatio q. catuli, qui cimbros cum c. mario fudit, multo vero pulcherrima consensu omnium aetate ea in colle viminali c. aquili, equitis romani clarioris illa etiam quam iuris civilis scientia, cum tamen obiecta Crasso sua est. nobilissimarum gentium ambo censuram post consulatus simul gessere anno conditae urbis dclxii frequentem iurgiis propter dissimilitudinem morum. tum cn. domitius, ut erat vehemens natura, praeterea accensus odio, quod ex aemulatione avidissimum est, graviter increpuit tanti censorem habitare, [30lx]30 hs pro domo eius identidem promittens, et Crassus, ut praesens ingenio semper, ut faceto lepore sollers, addicere se respondit exceptis sex arboribus. ac ne uno quidem denario, si adimerentur, emptam volente domitio, Crassus: “utrumne igitur ego sum,” inquit, “quaeso, domiti, exemplo gravis et ipsa mea censura notandus, qui domo, quae mihi hereditate obvenit, comiter habitem, an tu, qui sex arbores [30lx]30 aestimes” haec fuere lotoe patula ramorum opacitate lascivae, caecina largo e proceribus crebro iuventa nostra eas in domo sua ostentante, duraveruntque - quoniam et de longissimo aevo arborum diximus - ad neronis principis incendia cultu virides iuvenesque, ni princeps ille adcelerasset etiam arborum mortem. ac ne quis vilem de cetero Crassi domum nihilque in ea iurganti domitio fuisse licendum praeter arbores iudicet, iam columnas vi hymetti marmoris, aedilitatis gratia ad scenam ornandam advectas, in atrio eius domus statuerat, cum in publico nondum essent ulla marmoreae. tam recens est opulentia, tantoque tunc plus honoris arbores domibus adferebant, ut sine illis ne inimicitarum quidem pretium servaverit domitius.

fuere ab his et cognomina antiquis: frondicio militi illi, qui praeclara facinora volturum transnatans fronde inposita adversus Hannibalem edidit, stolonum liciniae genti. ita appellatur in ipsis arboribus fruticatio inutilis, unde et pampinatio inventa primo stoloni dedit nomen. fuit et arborum cura legibus priscis, cautumque est xii tabulis ut, qui iniuria cecidisset alienas, lueret in singulas aeris xxv. quid existimamus venturasne eas credidisse ad supra dictam aestimationem illos, qui vel frugiferas tanti taxaverant nec minus miraculum in pomo est multarum circa suburbana fructu annuo addicto binis milibus nummum, maiore singularum reditu quam erat apud antiquos praediorum. ob hoc insita et arborum quoque adulteria excogitata sunt, ut nec poma pauperibus nascerentur. nunc ergo dicemus, quonam maxime modo

tantum ex his vectigal contingat, veram colendi rationem absolutamque prodituri, et ideo non volgata tractabimus nec quae constare animo advertimus, sed incerta atque dubia, in quibus maxime fallitur vita. nam diligentiam supervacuis adfectare non nostrum est. ante omnia autem in universum et quae ad cuncta arborum genera pertinent in commune de caelo terraque dicemus.

aquilone maxime gaudent, densiores ab adflatu eius laetioresque et materie firmiores. qua in re plerique falluntur, cum in vineis pedamenta non sint a vento eo opponenda et id tantum a septentrione servandum. quin immo tempestiva frigora plurimum arborum firmitati conferunt, et sic optime germinant, alioqui, si blandiantur austri, defetiscentes, ac magis etiam in flore. nam si, cum defloruere, protinus sequantur imbres, in totum poma depereunt, adeo ut amygdalae et piri, etiam si omnino nubilum fuit austrinusve flatus, amittant fetus. circa vergilias quidem pluvie inimicissimum viti et oleae, quoniam tum coitus est earum. hoc est illud quadriduum oleis decretorium, hic articulus austrinus nubili spurci, quod diximus. fruges quoque peius maturescunt austrinis diebus, sed celerius. illa sunt noxia frigora, quae septentrionibus aut praeposteris fiunt horis. hiemem quidem aquiloniam esse omnibus satis utilissimum. imbres vero tum expetendi evidens causa est, quoniam arbores fetu exinanitas et foliorum quoque amissione languidas naturale est avidè esurire, cibus autem earum imber. quare tepidam esse hiemem, ut absumpto partu arborum sequatur protinus conceptus, id est germinatio, ac deinde alia florescendi exinanitio, inutilissimum experimentis creditur. quin immo si plures ita continuentur anni, etiam ipsae moriuntur arbores, quando nemini dubia poena est in fame laborantium. ergo qui dixit hiemes serenas optandas, non pro arboribus vota fecit; nec per solstitia imbres vitibus conducunt; hiberno quidem pulvere laetiores fieri messes luxuriantis ingenii fertilitate dictum est. alioqui vota arborum frugumque communia sunt nives diutinas sedere. causa non solum quia animam terrae evanescentem exhalatione includunt et conprimunt retroque agunt in vires frugum atque radices, verum quod et liquorem sensim praebent, purum praeterea levissimumque, quando nix aquarum caelestium spuma est. ergoumor ex his non universus ingurgitans diluensque, sed quomodo sititur destillans velut ex ubere, alit omnia, quia non inundat. tellus quoque illo modo fermentescit, et sui plena, a lactescentibus satis non effeta, cum tempus aperit, tepidis adridet horis. ita maxime frumenta pinguescunt, praeterquam ubi calidus semper aer est, ut in aegypto. continuatio enim et ipsa consuetudo idem quod modus aliubi efficit, plurimumque prodest ubicumque non esse quod noceat. in maiore parte orbis, cum praecoces excurrere germinationes evocatae indulgentia caeli, secutis frigoribus exuruntur. qua de causa serotinae hiemes noxiae, silvestribus quoque, quae magis etiam dolent urgente umbra sua nec adiuvante medicina, quando vestire teneras intorto stramento in silvestribus non est. ergo tempestivae aquae hibernis primum imbribus, dein germinationem antecedentibus; tertium tempus est, cum educant poma, nec

protinus, sed iam valido fetu. quae fructus suos diutius continent longioresque desiderant cibos, his et serotinae aquae utiles, ut viti, oleae, punicis. hae tamen pluviae generis cuiusque arboribus diverso modo desiderantur, aliis alio tempore maturantibus. quapropter eisdem imbribus aliqua laedi videas, aliqua iuari, etiam in eodem genere, sicut in piris alio die hiberna quaerunt pluvias, alio vero praecocia, ut pariter quidem omnia desiderent hibernum tempus, set ante germinationem. quae aquilonem austro utiliore facit ratio, eadem mediterranea maritimis praefert - sunt enim plerumque frigidiora - et montuosa planis et nocturnos imbres diurnis. magis fruuntur aquis sata non statim auferente eas sole.

conexa et situs vinearum arbustorumque ratio est, quas in horas debeant spectare. vergilius ad occasus seri damnavit, aliqui sic maluere quam in exortus. a pluribus meridiem probari adverto, nec arbitror perpetuum quicquam in hoc praecipere posse. ad soli naturam, ad loci ingenium, ad caeli cuiusque mores dirigenda sollertia est. in africa meridiem vineas spectare et viti inutile et colono insalubre est, quoniam ipsa meridiana subiacet plagae, quapropter ibi, qui in occasum aut septentriones conseret, optime miscebit solum caelo. cum vergilius occasus improbet, nec de septentrione relinqui dubitatio videtur. atqui in cisalpina italia magna ex parte vineis ita positis compertum est nullas esse fertiliores. multum rationis optinent et venti. in narbonensi provincia atque liguria et parte etrusiae contra circium serere imperitia existimatur, eundemque oblicum accipere providentia. is namque aestates ibi temperat, sed tanta plerumque violentia, ut auferat tecta. quidam caelum terrae parere cogunt, ut, quae in siccis serantur, orientem ac septentriones spectent, quae in umidis, meridiem. nec non ex ipsis vitibus causas mutantur in frigidis praecoces serendo, ut maturitas antecedit algorem, quae poma vitesque rorem oderint, contra ortus, ut statim auferat sol, quae ament, ad occasus vel etiam ad septentriones, ut diutius eo fruuntur. ceteri fere rationem naturae secuti in aquilonem obversas vites et arbores poni suasere. odoratiorem etiam fieri talem fructum democritus putat. aquilonis situm ventorumque reliquorum diximus secundo volumine dicemusque proximo plura caelestia. interim manifestum videtur salubritatis argumentum, quoniam in meridiem etiam spectantium semper ante decidunt folia. similis et in maritimis causa. quibusdam locis adflatus maris noxii, in plurimis iidem alunt. quibusdam satis e longinquo aspicere maria iucundum, propius admoveri salis halitum inutile. similis et fluminum stagnorumque ratio. nebulis adurunt aut aestuantia refrigerant. opacitate atque etiam rigore gaudent quae diximus. quare experimentis optime creditur.

a caelo proximum est terrae dixisse rationem, haud faciliore tractatu, quippe non eadem arboribus convenit et frugibus plerumque, nec pulla, qualem habet campania, ubique optima vitibus, aut quae tenues exhalat nebulas, nec rubrica multis laudata. cretam in albensium pompeianorum agro et argillam cunctis ad vineas generibus anteponunt, quamquam praepingues, quod excipitur in eo genere. invicem sabulum album in ticiniensi multisque in

locis nigrum itemque rubrum, etiam pingui terrae permixtum, infecundum est. argumenta quoque iudicantium saepe fallunt. non utique laetum solum est, in quo procerae arbores nitent, praeterquam illis arboribus. quid enim abiete procerius at quae vixisse possit alia in loco eodem nec luxuriosa pabula pinguis soli semper indicium habent. nam quid laudatius germaniae pabulis at statim subest harena tenuissimo caespitum corio. nec semper aquosa est terra, cui proceritas herbarum, non, hercules, magis quam pinguis, adhaerens digitis, quod in argillis arguitur. scrobes quidem regesta in eos nulla conplet, ut densa atque rara ad hunc modum deprehendi possit, ferroque omnis rubiginem obducit. nec gravis aut levior iusto deprehenditur pondere. quod enim pondus terrae iustum intellegi potest neque fluminibus adgesta semper laudabilis, quando senescant sata quaedam aqua. sed neque illa, quae laudatur, diu praeterquam salici utilis sentitur. inter argumenta stipulae crassitudo est, tanta alioqui in leborino campaniae nobili campo, ut ligni vice utantur. sed id solum ubicumque arduum opere, difficili cultu, bonis suis acrius paene, quam vitiis posset, adfligit agricolam. et carbunculus, quae terra ita vocatur, emendari intenta cura videtur. nam tofus naturae friabilis expetitur quoque ab auctoribus. vergilius et quae felicem ferat non inprobat vitibus. salsaeque terrae multa melius creduntur, tutiora a vitiis innascentium animalium. nec colles opere nudantur, si quis perite fodiat, nec campi omnes minus solis atque perflatus, quam opus sit, accipiunt, et quasdam pruinis ac nebulis pasci diximus vites. omnium rerum sunt quaedam in alto secreta et suo cuique corde pervidenda. quid quod mutantur saepe iudicata quoque et diu comperta in thessalia circa larisam emissio lacu frigidior facta ea regio est, oleaeque desierunt, quae prius fuerant, item vites aduri, quod non antea, ... aenos sensit admoto hebro, et circa philippos cultura siccata regio mutavit caeli habitum. at in syracusano agro advena cultor elapidato solo perdidit fruges luto, donec regessit lapides. in syria levem tenui sulco inprimunt vomerem, quia subest saxum exurens aestate semina. iam in quibusdam locis similes aestus inmodici et frigorum effectus. est fertilis thracia frugum rigore, aestibus africa et aegyptus. in chalcia rhodiorum insula locus quidam est in tantum fecundus, ut suo tempore satum demetant hordeum sublatumque protinus serant et cum aliis frugibus metant. glareosum oleis solum aptissimum in venafrano, pinguissimum in baetica. pucina vina in saxo cocuntur, caecubae vites in pomtinis paludibus madent. tanta est argumentorum ac soli varietas ac differentia. caesar vopiscus, cum causam apud censores ageret, campos rosiae dixit italiae sumen esse, in quibus perticas pridie relictas gramen operiret, sed non nisi ad pabulum probantur. non tamen indociles natura nos esse voluit, et vitia confessa fecit etiam ubi bona certa non fecerat. quamobrem primum crimina dicemus.

terram amaram probaverim demonstrant eius atrae degeneresque herbae, frigidam autem retorride nata, item uliginosam tristia, rubricam oculi argillamque, operi difficillimas quaeque rastros aut vomeres ingentibus glaebis onerent, quamquam non quod operi, hoc et fructui adversum; item e

contrario cineraceam et sabulum album. nam sterilis denso callo facile deprehenditur vel uno ictu cuspidis. cato breviter atque ex suo more vitia determinat: “terram cariosam cave, neve plastro neve pecore inpellas.” quid putamus hac appellatione ab eo tantopere reformidari, ut paene vestigiis quoque interdicat redigamus ad ligni cariem, et inveniemus illa, quae in tantum abominatur, vitia aridae, fistulosae, scabrae, canescentis, exesae, pumicosae. plus dixit una significatione quam possit ulla copia sermonis enarrari. est enim interpretatione vitiorum quaedam non aetate (quae nulla in ea intellegi potest), sed natura sua anus terra, et ideo infecunda ad omnia atque inbecilla. idem agrum optimum iudicat ab radice montium planitie in meridiem excurrente, qui est totius italiae situs, terram vero teneram, quae vocetur pulla. erit igitur haec optima et operi et satis. intellegere modo libeat dictam mira significatione teneram, et quidquid optari debet, in eo vocabulo invenietur. illa temperatae ubertatis, illa mollis facilisque culturae, nec madida nec sitiens. illa post vomerem nitescent, qualem fons ingeniorum homerus in armis a deo caelatam dixit addiditque miraculum nigrescentis, quamvis fieret ex auro. illa quam recentem exquirunt improbae alites vomerem comitantes corvique aratoris vestigia ipsa rodentes. reddatur hoc in loco luxuriae quoque sententia et aliqua in propositum certe. cicero, lux doctrinarum altera, “meliora,” inquit, “unguenta sunt quae terram, quam quae crocum sapiunt.” hoc enim maluit dixisse quam “redolent.” ita est profecto, illa erit optima quae unguenta sapiet. quod si admonendi sumus, qualis sit terrae odor ille qui quaeritur, contingit saepe etiam quiescente ea sub occasum solis, in quo loco arcus caelestes deiecere capita sua, et cum a siccitate continua immaduit imbre. tunc emittit illum suum halitum divinum ex sole conceptum, cui comparari suavitas nulla possit. is esse e commota debet repertusque neminem fallet, ac de terra odor optime iudicabit. talis fere est in novalibus caesa vetere silva, quae consensu laudatur. et in frugibus quidem ferendis eadem terra utilior intellegitur, quotiens intermissa cultura quievit, quod in vineis non fit, eoque est diligentius eligenda, ne vera existat opinio eorum, qui iam italiae terram existimavere lassam. operis quidem facilitas in aliis generibus constat et caelo, nec potest arari post imbres aliqua, ubertatis vitio lentescens. contra in byzacio africae illum centena quinquagena fruge fertilem campum nullis, cum siccum est, arabilem tauris, post imbres vili asello et a parte altera iugi anu vomerem trahente vidimus scindi. terram enim terra emendandi, ut aliqui praecipiant, super tenuem pingui iniecta aut gracili bibulaque super umidam ac praepinguem, dementis operae est. quid potest sperare qui colit talem

alia est ratio, quam britanniae et galliae invenere, alendi eam ipsa, genusque, quod vocant margam. spissior ubertas in ea intellegitur et quidam terrae adipēs ac velut glandia in corporibus, ibi densante se pinguitudinis nucleo. non omisere et hoc graeci - quid enim intemptatum illis - leucargillon vocant candidam argillam, qua in megarico agro utuntur, sed tantum in umida frigidaque terra. illam gallias britanniasque locupletantem cum cura dici

convenit.

duo genera fuerant, plura nuper exerceri coepta proficientibus ingeniis. est enim alba, rufa, columbina, argillacea, tofacea, harenacea. natura duplex, aspera aut pinguis; experimenta utriusque in manu. usus aequae geminus, ut fruges tantum alant aut eadem et pabulum. fruges alit tofacea albaque, si inter fontes reperta est, ad infinitum fertilis, verum aspera tractatu; si nimia iniecta est, exurit solum. proxima est rufa, quae vocatur acaunumarga, intermixto lapide terrae minutae, harenosae. lapis contunditur in ipso campo, primisque annis stipula difficulter caeditur propter lapides; inpendio tamen minima levitate dimidio minoris, quam ceterae, invehitur. inspergitur rara; sale eam misceri putant. utrumque hoc genus semel iniectum in l annos valet et frugum et pabuli ubertate.

quae pingues esse sentiuntur, ex his praecipua alba. plura eius genera: mordacissimum quod supra diximus. alterum genus albae creta argentaria est. petitur ex alto, in centenos pedes actis plerumque puteis, ore angusto intus, ut in metallis, spatiente vena. hac maxime britannia utitur. durat annis lxxx, neque est exemplum ullius, qui bis in vita hanc eidem iniecerit. tertium genus candidae glisomargam vocant. est autem creta fullonia mixta pingui terra, pabuli quam frugum fertilior, ita ut messe sublata ante sementem alteram laetissimum secetur. dum fruges, nullum aliud gramen emittit. durat xxx annis. densior iusto signini modo strangulat solum. columbinam galliae suo nomine eglecopalam appellant. glaebis excitatur lapidum modo, sole et gelatione ita solvitur, ut tenuissimas bratteas faciat. haec ex aequo fertilis. harenacea utuntur, si alia non sit; in uliginosis vero, et si alia sit. ubios gentium solos novimus, qui fertilissimum agrum colentes quacumque terra infra pedes tres effossa et pedali crassitudine iniecta laetificent. sed ea non diutius annis x prodest. aedui et pictones calce uberrimos fecere agros, quae sane et oleis vitibusque utilissima reperitur. omnis autem marga arato inicienda est. ut medicamentum rapiatur, et fimi desiderat quantulumcumque, primo plus aspera et quae in herbas non effunditur; alioquin novitate quaecumque fuerit solum laedet, ne sic quidem primo anno fertilis. interest et quali solo quaeratur. sicca enim umido melior, arido pinguis. temperato alterutra, creta vel columbina, convenit.

transpadanis cineris usus adeo placet, ut anteponant fimo iumentorumque, quod levissimum est, ob id exurant. utroque tamen pariter non utuntur in eodem arvo, nec in arbustis cinere nec quasdam ad fruges, ut dicemus. sunt qui pulvere quoque uvas ali iudicent pubescentesque pulverent et vitium arborumque radicibus adspergant. quod certum est, narbonensi provinciae et vindemias circius sic coquit, plusque pulvis ibi quam sol confert.

fimi plures differentiae, ipsa res antiqua. iam apud homerum regius senex agrum ita laetificans suis manibus reperitur. augeas rex in graecia excogitasse traditur, divulgasse vero hercules in italia, quae regi suo stercuto fauni filio ob hoc inventum immortalitatem tribuit. M. Varro principatum dat turdorum fimo ex aviariis, quod etiam pabulo boum suumque magnificat neque alio cibo

celerius pinguescere adseverat. de nostris moribus bene sperare est, si tanta apud maiores fuere aviaria, ut ex his agri stercorearentur. primum columella e columbariis, mox gallinariis facit, natantium alitum damnato. ceteri auctores consensu humanas dapes ad hoc in primis advocant. alii ex his praeferunt potus hominum in coriariorum officinis pilo madefacto, alii per sese aqua iterum largiusque etiam, quam cum bibitur, admixta. quippe plus ibi mali domandum est, cum ad virus illud vini homo accesserit. haec sunt certamina, invicemque ad tellurem quoque alendam aluntur homines. proxime spurcitiis suum laudant, columella solus damnat. alii cuiuscumque quadripedis ex cytiso, aliqui columbaria praeferunt. proximum deinde caprarum est, ab hoc ovium, dein boum, novissimum iumentorum.

hae fuere apud priscos differentiae, simulque praecepta non invenio recenti utendi, quando et hic vetustas utilior; visumque iam est apud quosdam provincialium inveteratum, abundante geniali copia pecudum, farinae vice cribris superinici, faetore aspectuque temporis viribus in quandam etiam gratiam mutato. - (nuper repertum oleas gaudere maxime cinere e calcariis fornacibus.) Varro praeceptis adicit equino, quod sit levissimum, segetes alendi, prata vero graviore et quod ex hordeo fiat multasque gignat herbas. quidam etiam bubulo iumentorum praeferunt ovillumque caprino, omnibus vero asininum, quoniam lentissime mandant. e contrario usus adversus utrumque pronuntiat. inter omnes autem constat nihil esse utilius lupini segete, priusquam siliquetur, aratro vel bidentibus versa manipulisve desectae circa radices arborum ac vitium obrutis. et ubi non sit pecus, culmo ipso vel etiam felice stercoreare arbitrantur.

cato: “stercus unde facias, stramenta, lupinum, paleas, fabalia ac frondis iligneam querneam. ex segete evellito ebulum, cicutam et circum salicta herbam altam ulvamque. eam substernito ovibus, bubusque frondem putidam. - vinea si macra erit, sarmenta sua comburito et indidem inarato.” idemque: “ubi saturus eris frumentum, oves ibi delectato.”

nec non et satis quibusdam ipsis pasci terram dicit: “segetem stercoreant fruges: lupinum, faba, vicia”; sicut e contrario: “cicer, quia vellitur et quia salsum est, hordeum, fenum graecum, ervum, haec omnia segetem exurunt et omnia quae velluntur. nucleos in segetem ne indideris.” - vergilius et lino segetem exuri et avena et papavere arbitratur.

fimeta sub diu concavo loco et qui umorem colligat, stramento intacta, ne in sole arescant, palo e robore depacto fieri iubent. ita fore ne innascantur iis serpentes. fimum inicere terrae plurimum refert favonio flante ac luna sitiente. id plerique prave intellegunt a favonii ortu faciendum ac februario mense tantum, cum id pleraque sata aliis postulent mensibus. quocumque tempore facere libeat, curandum, ut ab occasu aequinoctiali flante vento fiat lunaque decrescente ac sicca. mirum in modum augetur ubertas effectusque eius observatione tali.

et abunde praedicta ratione caeli ac terrae nunc de iis arboribus dicemus, quae cura hominum atque arte proveniunt. nec pauciora prope sunt genera;

tam benigne naturae gratiam retulimus. aut enim semine proveniunt aut plantis radicis aut propagine aut avolsione aut surculo aut insito aut consecto arboris trunco. nam folia palmarum apud babylonios seri atque ita arborem provenire trogum credidisse demiror. quaedam autem pluribus generibus seruntur, quaedam omnibus.

ac pleraque ex his natura ipsa docuit et in primis semen serere, cum decidens exceptumque terra viveret. sed quaedam non aliter proveniunt, ut castaneae, iuglandes, caeduis dumtaxat exceptis; et semine autem, quamquam dissimili, ea quoque, quae aliis modis seruntur, ut vites et mala atque pira. namque his pro semine nucleus, non, ut supra dictis, fructus ipse. et mespila semine nasci possunt. omnia haec tarda proventu ac degenerantia et insito restituenda, interdumque etiam castaneae.

quibusdam natura contra omnino non degenerandi, quoquo modo serantur, ut cupressis, palmae, lauris. namque et laurus pluribus modis seritur. genera eius diximus. ex his augusta et bacalis et tinus simili modo seruntur. bacae mense ianuario aquilonis adflatu siccatae leguntur expandunturque rariae, ne calefiant acervo. postea quidam fimo ad satum praeparatas urina madefaciunt, alii in qualo pedibus in profluente deculcant, donec auferatur cutis, quae alioqui uligine infestat nec patitur partum. in sulco repastinato palmi altitudine vicienae fere acervatim seruntur, mense martio. eadem et propagine, triumphalis talea tantum. myrti genera omnia in campania bacis seruntur, romae propagine. tarentinam democritus et alio modo seri docet, grandissimis bacarum tusis leviter, ne grana frangantur, ... eaque intrita restem circumlini atque ita seri. parietem fore ... densitatis, ex quo virgulae differantur. sic et spinas saepis causa serunt, tomice moris spinarum circumlita. pilas autem laurus et myrti inopia a trimatu tempestivum est transferre.

inter ea, quae semine seruntur, mago in nucibus operosus est. amygdalam in argilla molli meridiem spectante seri iubet; gaudere et dura calidaque terra, in pingui aut umida mori aut sterilescere; serendas quam maxime falcatas et e novella fimoque diluto maceratas per triduum aut pridie, quam serantur, aqua mulsa; mucrone defigi, aciem lateris in aquilonem spectare; ternas simul serendas, triangula ratione palmo inter se distantes; denis diebus adaquari, donec grandescant. iuglandes nuces porrectae seruntur commissuris iacentibus, pineae nucleis septenis fere in ollas perforatas additis aut ut laurus, quae bacis seritur. citrea grano et propagine, sorba semine et a radice planta et avolsione proveniunt, sed illa in calidis, sorba in frigidis et umidis.

natura et plantaria demonstravit multarum radicibus pullulante subole densa et pariente matre, quas necet: eius quippe umbra turba indigesta premitur, ut in lauris, punicis, platanis, cerasis, prunis. paucarum in hoc genere rami parcent suboli, ut ulmorum palmarumque. nullis vero tales pulluli proveniunt nisi quarum radices amore solis atque imbris in summa tellure spatiantur. omnia ea non statim moris est in sua locari, sed prius nutrici dari atque in seminariis adolescere iterumque migrare, qui transitus mirum in modum mitigat etiam silvestres, sive arborum quoque, ut hominum, natura

novitatis ac peregrinationis avida est, sive discedentes virus relinquant mansuescuntque tractatu ceu ferae, dum radici avellitur planta.

et aliud genus simile monstravit, avolsisque arboribus stolones vixere, quo in genere et cum perna sua avelluntur partemque aliquam e matris quoque corpore auferunt secum fimbriato corpore. hoc modo plantantur punicae, coryli, mali, sorbi, mespilae, fraxini, fici inprimisque vites. cotoneum ita satum degenerat. ex eodem inventum est surculos abscisos serere. hoc primo saepis causa factum, sabucis, cotoneo et rubis depactis, mox et culturae, ut populis, alnis, salici, quae vel inverso surculo seritur. iam haec ibi disponuntur, ubi libeat esse eas. quamquam seminarii curam ante convenit dici, quam transeatur ad alia genera.

namque ad id praecipuum eligi solum refert, quoniam nutricem indulgentiorem esse quam matrem saepe convenit. sit ergo siccum sucosumque, bipalio subactum, advenis hospitale et quam simillimum terrae ei, in quam transferendae sint, ante omnia elapidatum munitumque ab incursu etiam gallinacei generis, quam minime rimosum, ne penetrans sol exurat fibras. intervallo sesquipedum seri - nam si inter se contingant, praeter alia vitia etiam verminosa fiunt - , sariri convenit saepius herbasque evelli, praeterea semina ipsa fruticantia supputare ac falcem pati consuescere. cato et furcis crates inponi iubet altitudine hominis ad solem recipiendum atque integri culmo ad frigora arcenda. sic pirorum malorumque semina nutriri, sic pineas nuces, sic cupressos semine satas et ipsas. minimis id granis constat, vix ut perspici quaedam possint, non omittendo naturae miraculo e tam parvo gigni arbores, tanto maiore tritici et hordei grano, ne quis fabam reputet. quid simile origini suae habent malorum pirorumque semina his principiis respuentem securis materiem nasci, indomita ponderibus immensis prela, arbores velis, turribus murisque inpellendis arietes! haec est naturae vis haec potentia. super omnia erit e lacrima nasci aliquid, ut suo loco dicemus.

ergo e cupresso femina - mas enim, ut diximus, non gignit - pilulae collectae quibus docui mensibus siccantur sole, ruptaeque emittunt semen formicis mire expetitur, ampliato etiam miraculo tantuli animalis cibo absumi natalem tantarum arborum. seritur aprili mense, area aequata cylindris aut volviculis, densum, terraque cribris superincernitur pollicis crassitudine. contra maius pondus attollere se non valet torqueturque sub terra. ob hoc et pavitur vestigiis. leniter rigatur a solis occasu in trinis diebus, ut aequaliter bibat, donec erumpant. differuntur post annum dodrantali filo, custodita temperie, ut viridi caelo serantur ac sine aura. mirumque dictu, periculum eo tantum die est, si roravit quantulumcumque imbris, aut si adflavit. de reliquo tutae sunt perpetua securitate aquasque postea odere. et zizipha grano seruntur aprili mense. tubures melius inseruntur in pruno silvestri et malo cotoneo et in calabrice. ea est spina silvestris; quaecumque optime et myxas recipit; utiliter et sorbos.

plantas ex seminario transferre in aliud, priusquam suo loco ponantur, operose praecipi arbitror, licet translatione folia latiora fieri spondeant.

ulmorum, priusquam foliis vestiantur, samara colligenda est circa martias kalendas, cum flavescere incipit. dein, biduo in umbra siccata, serenda densa in refracto, terra super minuta incribrata crassitudine, qua in cupressis. pluviae si non adiuvent, rigandum. differendae ex arearum venis post annum in ulmaria intervallo pedali in quamque partem. atinias ulmos autumnos serere utilius, quia carentes semine plantis seruntur. in arbustum quinquennes sub urbe transferunt aut, ut quibusdam placet, quae vicenum pedum esse coeperunt. sulco, qui novenarius dicitur, altitudine pedum iii, pari latitudine et eo amplius circa positas pedes terni undique e solido adaggerantur. arulas id vocant in campania. intervalla ex loci natura sumuntur. rariores serendas in campestribus convenit. populos et fraxinos, quia festinantius germinant, disponi quoque maturius convenit, hoc est ab idibus februariis, plantis et ipsas nascentes. in disponendis arboribus arbustisque ac vineis quincuncialis ordinum ratio vulgata et necessaria, non perflatu modo utilis, verum et aspectu grata, quoquo modo intueare, in ordinem se porrigente versu. populos eadem ratio semine quae ulmos serendi, transferendi quoque e seminariis eadem et silvis.

ante omnia igitur in similem transferri terram aut meliorem oportet, nec ex tepidis aut praecocibus in frigidos aut serotinos situs, ut neque ex his in illos; praefodere scrobes ante; si fieri possit, tanto, donec pingui caespite obducantur. mago ante annum iubet, ut solem pluviasque conbibant, aut, si id condicio largita non sit, ignes in mediis fieri ante menses duos, nec nisi post imbres in his seri, altitudinem eorum in argilloso aut duro solo trium cubitorum esse in quamque partem, in pronis palmo amplius, iubetque caminata fossura ore compressiore esse, in nigra vero terra duo cubita et palmum quadratis angulis eadem mensura. graeci auctores consentiunt non altiores quino semipede esse debere nec latiores ii pedibus, nusquam vero semisquiped minus altos. quoniam in umido solo ad vicina aquae perveniatur, cato, si locus aquosus sit, latos pedes ternos in faucibus imosque palmum et pedem, altitudine iiii pedum, eos lapide consterni aut, si non sit, perticis salignis viridibus, si neque hae sint, sarmentis, ita ut in altitudinem semipes detrahatur. nobis adiciendum videtur ex praedicta arborum natura, ut altius demittantur ea, quae summa tellure gaudent, tamquam fraxinus, olea. haec et similia quaternos pedes oporteat demitti. ceteris altitudinis pedes terni suffecerint. est innoxium adradi partes, quae se nudaverint. “excide radicem,” inquit, “istam”, papirius cursor imperator, ad terrorem praenestorum praetoris destringi securi iussa. testas, aliqui lapides rotundos subici malunt, qui et contineant umorem et transmittant, non idem planos facere et a terreno arcere radicem existimantes. glarea substrata inter utramque sententiam fuerit.

arborem nec minorem bima nec maiorem trima transferre quidam praecipiant, alii cum manum conpleat, cato crassiorem v digitis. non omisisset idem, si attineret, meridianam caeli partem signare in cortice, ut translatae isdem et adsuetis statuerentur horis, ne aquiloniae meridianis oppositae solibus finderentur et algerent meridianae aquilonibus. quod e diverso

adfectant etiam quidam in vite ficoque, permutantes in contrarium. densiores enim folio ita fieri magisque protegere fructum et minus amittere, ficumque sic etiam scansilem fieri. plerique id demum cavent, ut plaga deputati cacuminis meridiem spectet, ignari fissuris nimii vaporis opponi. id quidem in horam diei quintam vel octavam spectare maluerim. aequae latet non neglegendum, ne radices mora inarescant neve a septentrionibus aut ab ea parte caeli usque ad exortum brumalem vento flante effodiantur arbores, aut certe non adversae his ventis radices praebeantur, propter quod emoriuntur ignaris causae agricolis. cato omnes ventos et imbrem quoque in tota translatione damnat. et ad haec proderit quam plurimum terrae, in qua vixerint, radicibus cohaerere ac totas cum caespite circumligari, cum ob id cato in corbibus transferri iubeat, procul dubio utilissime. qui quidem summam terram contentus est subdi. quidam punicis malis substrato lapide non rumpi pomum in arboribus tradunt. radices inflexas poni melius; arborem ipsam ita locari, ut media sit totius scrobis, necessarium. ficus si in scilla - bulborum hoc genus est - seratur, ocissime ferre traditur pomum neque vermiculationi obnoxium, quo vitio carent et reliqua poma similiter sata. radicum filis magnam adhibendam curam, ut exemptas appareat, non evolsas, quis dubitet qua ratione et reliqua confessa omittimus, sicuti terram circa radices festuca cospissandam, quod cato primum in ea re esse censet, plagam quoque a trunco oblini fimo et foliis praeligari praecipiens.

huius loci pars est ad intervalla pertinens: quidam punicas et myrtos et lauros densiores seri iusserunt, in pedibus tamen novenis, malos amplius paulo, vel magis etiam puros magisque amygdalas et ficos. quamquam optime diiudicabit ramorum amplitudinis ratio locorumque; et umbrae cuiusque arboris, quoniam has quoque observari oportet. breves sunt quamvis magnarum arborum, cum ramos in orbem circinant, ut in malis pirisque; eadem enormes cerasis, lauris.

iam quaedam umbrarum proprietas: iuglandum gravis et noxia, etiam capiti humano omnibusque iuxta satis. necat gramina et pinus, sed ventis utraque resistit, quoniam et protecta vinearum ratione egent. stilicidia pinus, quercus, ilicis ponderosissima, nullum cupressi, umbra minima et in se convoluta. ficorum levis, quamvis sparsa, ideoque inter vineas seri non vetentur. ulmorum lenis, etiam nutriens, quacumque opacat. attico haec quoque videtur e gravissimis, nec dubito, si emittantur in ramos; constrictae quidem illius noxiam esse non arbitror. iucunda et platani, quamquam crassa. licet gramine credere non sub alia laetius operienti toros. populo nulla ludentibus foliis, pinguis alno, sed pascens sata. vitis sibi sufficit, mobili folio iactatuque crebro solem umbra temperans, eodem gravi protegens in imbre. omnium fere levis umbra, quorum pediculi longi. non fastidienda haec quoque scientia atque non in ultimis ponenda, quando satis quibusque umbra aut nutrix aut noverca est. iuglandum quidem pinorumque et picearum et abietis quaecumque attingere non dubie venenum.

stilicidii brevis definitio est: omnium, quae proiectu frondis ita

defenduntur, ut per ipsas non defluant imbres, stilla saeva est. ergo plurimum intererit hac in quaestione, terra, in qua seremus, in quantum arbores quasque alat. iam per se colles minora quaerunt intervalla. ventosis locis crebriores seri conducit, oleam tamen maximo intervallo, de qua catonis italica sententia est in xxv pedibus, plurimum xxx seri. sed hoc variatur locorum natura. non alia maior in baetica arbor, in africa vero - fides penes auctores erit - miliarias vocari multas narrant a pondere olei, quod ferant annuo proventu. ideo lxxv pedes mago intervallo dedit undique aut in macro solo ac duro atque ventoso, cum minimum, xlv. baetica quidem uberrimas messes inter oleas metit. illam inscientiam pudendam esse conveniet adultas interlucare iusto plus et in senectam praecipitare aut, ut plerumque ipsis, qui posuere, coarguentibus imperitiam suam, totas excidere. nihil est foedius agricolis quam gestae rei poenitentia, multo iam ut praestet laxitate delinquere.

quaedam autem natura tarde crescunt, et in primis semine tantum nascentia et longo aevo durantia. at quae cito occidunt, velocia sunt, ut ficus, punica, prunus, malus, pirus, myrtus, salix, et tamen antecedunt divitiis. in trimatu enim ferre incipiunt, ostendentes et ante. ex his lentissima est pirus, ocissima omnium cypirus et pseudocypirus frutex. protinus enim floret semenque perfert. omnia vero celerius adollescunt stolonibus ablatis unamque in stirpem redactis alimentis.

eadem natura et propagines docuit. rubi namque curvati gracilitate et simul proceritate nimia defigunt rursus in terram capita iterumque nascuntur ex sese repleturi omnia, ni resistat cultura, prorsus ut possint videri homines terrae causa geniti. ita pessima atque execranda res propaginem tamen docuit ac viviradicem. eadem autem natura et hederis. cato propagari praeter vitem tradit ficum, oleam, punicam, malorum genera omnia, laurus, pruna, myrtum, nuces abellanas et praenestinas, platanum.

propaginum duo genera: ramo ab arbore depresso in scrobem iiii pedum quoquo et post biennium amputato flexu plantaque translata post trimatum, quas si longius ferre libeat, in qualis statim aut vasis fictilibus defodere propagines aptissimum, ut in his transferantur. alterum genus luxuriosius, in ipsa arbore radices sollicitando traiectis per vasa fictilia vel qualos ramis terraeque circumfartis, atque hoc blandimento inpetratis radicibus inter poma ipsa et cacumina - in summa etenim cacumina hoc modo petuntur audaci ingenio arborem aliam longe a tellure faciendi - eodem quo supra biennii spatio abscisa propagine et cum quasillis sata. sabina herba propagine seritur et avolsione; tradunt faece vini aut e parietibus latere tuso mire ali. iisdem modis rosmarinum seritur et ramo, quoniam neutri semen, rhododendrum propagine et semine.

semine quoque inserere natura docuit raptim avium fame devorato solidoque et alvi tepore madido cum fecundo fimi medicamine abiecto in mollibus arborum lecticis et ventis saepe translato in aliquas corticum rimas, unde vidimus cerasum in salice, platanum in lauru, laurum in ceraso et bacas simul discolores. tradunt et monedulam condentem semina in thensauros

cavernarum eiusdem rei praeberere causas.

hinc nata inoculatio sutoriae simili fistula aperiendi in arbore oculum cortice exciso semenque includendi eadem fistula sublatum ex alia. in ficis et malis haec fuit inoculatio antiqua. vergiliana quaerit sinum in nodo germine expulsi corticis gemmamque ex alia arbore includit.

et hactenus natura ipsa docuit, insitionem autem casus, magister alius et paene numerosior, ad hunc modum: agricola sedulus casam saepis munimento cingens, quo minus putrescerent sudes, limen subdidit ex hedera. at illae vivaci morsu adprehensae suam ex aliena fecere vitam, apparuitque truncum esse pro terra. aufertur ergo serra aequaliter superficies, levigatur falce truncus. ratio postea duplex, et prima inter corticem lignumque inserendi. timebant prisci truncum findere, mox inforare ausi medio ipsique in eo medullae calamum imprimebant, unum inserentes, neque enim plures capiebat medulla. subtilior postea ratio vel senos addi, mortalitati eorum et numero, per media trunco leniter fisso cuneoque tenui fissuram custodiente, donec cuspidatim decisis descendat in rimam calamus.

multa in hoc servanda: primum omnium, quae patiatur coitum talem arbor et cuius arboris. varie quoque et non isdem in partibus subest omnibus sucus. vitibus ficisque media sicciora et e summa parte conceptus; ideo illinc surculi petuntur. oleis circa media sucus, inde et surculi; cacumina sitiunt. facillime coalescunt quibus eadem corticis natura quaeque pariter florentia eiusdem horae cognationem suorumque societatem habent. lenta res, quotiens umidis repugnant sicca, mollibus corticum duri. reliqua observatio, ne fissura in nodo fiat - repudiat quippe advenam inhospitalis duritia - , ut in parte nitidissima, ne longior multo tribus digitis, ne obliqua, ne tralucens. vergilius e cacumine inseri vetat, certumque est ab umeris arborum orientem aestivum spectantibus surculos petendos, et e feracibus et e germine novello, nisi vetustae arbori inserantur; ii enim robustiores esse debent. praeterea ut praegnates, hoc est germinatione turgentes et qui parere illo speraverint anno, bimi utique nec tenuiores digito minimo. inseruntur autem et inversi, cum id agitur, ut minor altitudo in latitudinem se fundat. ante omnia gemmantes nitere conveniet; nihil usquam ulcerosum aut retorridum spei favet. medulla calami commissurae in matre ligni corticisque iungatur, id enim satius quam foris cortici aequari. calami exacutio medullam ne nudet, tamen tenui fistula detegat. fastigatio levi descendat cuneo tribus non ampliore digitis, quod facillime contingit tinctum aqua radentibus. ne exacuatur in vento, ne cortex a ligno decedat alterutri. calamus ad corticem usque suum deprimatur. ne luxetur, dum deprimitur, neve cortex replicetur in rugas. ideo lacrimantes calamos inseri non oportet, non, hercules, magis quam aridos, quia illo modo labat umore nimio cortex, hoc vitali defectu non umescit neque concorporatur. id etiam religionis servant, ut luna crescente, ut calamus utraque deprimatur manu. et alioqui hoc in opere duae simul manus minus nituntur, necessario temperamento. validius demissi tardius ferunt, fortius durant, contraria ex diverso. ne hiscat nimium rima laxequae capiat, aut ne parum et exprimat aut

compressum necet; hoc maxime cavendum in praevalide accipientis trunco. ut media fissura relinquatur, quidam vestigio fissurae falce in truncis facto salice praeligant marginem ipsum, postea cuneo findunt continente vinculo libertatem dehiscendi. - (quaedam in plantario insita eodem die transferuntur). - si crassior truncus inseratur, inter corticem et lignum inseri melius, cuneo optime osseo, cortex ne rumpatur, laxato. cerasi libro dempto finduntur. hae solae et post brumam inseruntur. dempto libro habent veluti lanuginem, quae si comprehendit insitum, putrefacit. vinculum cuneo adacto utilissime adstringitur. inserere aptissimum, quam proxime terrae patiatur nodorum truncique ratio. eminere calami vi digitorum longitudine non amplius debent. cato argillae vel cretae harenam fimumque bubulum admiscet atque ita usque ad lentorem subigi iubet idque interponi et circumlini. ex iis, quae commentatus est, facile apparet illa aetate inter lignum et corticem nec alio modo inserere solitos aut ultra latitudinem ii digitorum calamos demittere. inseri autem praecipit pira ac mala per ver et post solstitium diebus I et post vindemiam, oleas autem et ficos per ver tantum, luna sitiente, hoc est sicca praeterea post meridiem ac sine vento austro. mirum quod non contentus insitum munisse, ut dictum est, et caespitem ab imbre frigoribusque protexisse ac mollibus bifidorum viminum fasciis, lingua bubula - herbae id genus est - insuper optegi iubet eamque inligari opertam stramentis. nunc abunde arbitrantur paleato luto sarcire et libro ii digitos insito exstante. verno inserentes tempus urguet, incitantibus se gemmis praeterquam in olea, cuius diutissime oculi parturiunt, minimumque suci habet sub cortice, qui nimius insitis nocet. punica vero et ficum quaeque alia sicca sunt recrastinare minime utile. pirum vel florentem inserere licet et in maium quoque mensem protendere insitiones. quod si longius adferantur pomorum calami, rapo infixos optime custodire sucum arbitrantur, servari inter duos imbrices iuxta rivos vel piscinas utrimque terra obstructos, vitium vero in scrobibus siccis stramento opertos ac deinde terra obrutos, ut cacumine exstant.

cato vitem tribus modis inserit: praeseptam findi iubet per medullam, in eam surculos exacutos, ut dictum est, addi, medullas iungi. altero, si inter se vites contingant, utriusque in obliquum latere contrario adraso iunctis medullis colligari. tertium genus est terebrare vitem in obliquum ad medullam calamosque addere longos pedes binos atque ita ligatum insitum intritaque inlitum operire terra calamis subrectis. nostra aetas correxit, ut gallica uteretur terebra, quae excavat nec urit - quoniam adustio omnis hebetat - , atque ut gemmascere incipiens eligeretur calamus, nec plus quam binis ab insito emeretur oculis, ulmi ... vimine alligato ... bina circumdarentur ... acie a duabus partibus, ut inde potius destillaret mucor, qui maxime vites infestat; dein cum evaluissent flagella pedes binos, vinculum insiti incideretur, ubertati crassitudine permissa. vitibus inserendis tempus dedere ab aequinoctio autumnus ad germinationis initia. sativae plantae silvestrium radicibus inseruntur natura siccioribus; si sativae silvestribus inserantur, degenerant in feritatem. reliqua caelo constant. aptissima insitis siccitas; huius enim

remedium: adpositis fictilibus vasis modicus umor per cinerem destillat. inoculatio rores amat lenes.

emplastratio et ipsa ex inoculatione nata videri potest, Crasso autem maxime cortici convenit, sicut est ficis. ergo amputatis omnibus ramis, ne sucum avocent, nitidissima in parte quaque praecipua cernatur hilaritas, exempta scutula ita, ne descendat ultra corticem ferrum, inprimitur ex alia cortex par cum sui germinis mamma, sic conpage densata, ut cicatrici locus non sit et statim fiat unitas, nec umorem nec adflatum recipiens; nihilominus tamen et luto munire et vinculo melius. hoc genus non pridem repertum volunt qui novis moribus favent, sed iam et apud veteres graecos invenitur et apud catonem, qui oleam ficumque sic inseri iussit, mensura etiam praefinita secundum reliquam diligentiam suam: cortices scalpro excidi quattuor digitorum longitudine et trium latitudine atque ita coagmentari et illa sua intrita oblini, eadem ratione ut in malo. quidam huic generi miscuere fissuram in vitibus, exempta cortici tessella latere plano adigendo. tot modis insitam arborem vidimus iuxta tiburtes tullios omni genere pomorum onustam, alio ramo nucibus, alio baxis, aliunde vite, piris, ficis, punicis malorumque generibus. sed huic brevis fuit vita. nec tamen omnia experimentis adsequi in natura possumus. quaedam enim nasci nisi sponte nullo modo queunt, eaque inmitibus tantum et desertis locis proveniunt. capacissima insitorum omnium ducitur platanus, postea robor, verum utraque saporis corrumpit. quaedam omni genere inseruntur, ut ficus, ut punicae. vitis non recipit emplastra, nec quibus tenuis aut caducus rimosusque cortex, neque inoculationem siccae aut umoris exigui. fertilissima omnium inoculatio, postea emplastratio, sed utraque infirmissima; et quae cortice tantum nituntur, vel levi aura ocissime deplantantur. inserere firmissimum et fecundius quam serere.

non est omittenda raritas unius exempli. corellius eques romanus ateste genitus insevit castaneam suomet ipsam surculo in neapolitano agro. sic facta est castanea, quae ab eo nomen accepit inter laudatas. postea tereus eiusdem libertus corellianam iterum insevit. haec est inter eas differentia: illa copiosior, haec tereiana melior.

reliqua genera casus ingenio suo excogitavit ac defractus serere ramos docuit, cum pali defixi radices cepissent. multa sic seruntur inprimisque ficus omnibus aliis modis nascens praeterquam talea, optime quidem, si vastiore ramo pali modo exacuto adigatur alte, exiguo super terram relicto capite eoque ipso harena cooperto. ramo seruntur et punica, palis laxato prius meatu, item myrtus, omnium horum longitudine iii pedum, crassitudine minus brachiali, cortice diligenter servato, trunco exacuto.

myrtus et taleis seritur, morus talea tantum, quoniam in ulmo eam inseri religio fulgurum prohibet. quapropter de talearum satu nunc dicendum est. servandum in eo ante omnia, ut taleae ex feracibus fiant arboribus, ne curvae neve scabrae aut bifurcae, ne tenuiores quam ut manum impleant, ne minores pedalibus, ut inlibato cortice atque ut sectura inferior ponatur semper et quod fuerit ab radice, adcumuleturque germinatio terra, donec robor planta capiat.

quae custodienda in olearum cura cato iudicaverit, ipsius verbis optime praecipiemus: “taleas oleagineas, quas in scrobe saturus eris, tripedaneas facito, diligenterque tractato, ne liber labore, cum dolabis aut secabis. quas in seminario saturus eris, pedales facito. eas sic inserito: locus bipalio subactus sit beneque gluttus. cum taleam demittes, pede taleam opprimito. si parum descendet, malleo aut mateola adigito, cavetoque, ne librum scindas, cum adiges. palo prius locum ne feceris, quo taleam demittas; ita melius vivet. taleae ubi trimae sunt, tum denique maturae sunt, ubi liber se vertet. si in scrobibus aut in sulcis seres, ternas taleas ponito easque divaricato. supra terram ne plus quattuor digitos transversos emineant, vel oculos serito. - diligenter eximere oleam oportet et radices quam plurimas cum terra ferre, ubi radices bene operueris, calcare bene, ne quid noceat. si quis quaeret, quod tempus oleae serendae sit, agro sicco per sementem, agro laeto per ver. olivetum diebus xv ante aequinoctium vernum incipito putare. ex eo die dies xl recte putabis. id hoc modo putato: qua locus recte ferax erit, quae arida erunt et si quid ventus interfregerit, inde ea omnia eximito. qua locus ferax non erit, id plus concidito aratoque bene enodatoque stirpisque leves facito. - circum oleas autumnitate ablaqueato et stercus addito. - qui oletum saepissime et altissime miscebit, is tenuissimas radices exarabit. si male arabit, radices susum abibunt, crassiores fient et eo in radices vires oleae abibunt.”

quae genera olearum et in quo genere terrae iuberet seri quoque spectare oliveta, diximus in ratione olei. mago in colle et siccis et argilla inter autumnum et brumam seri iussit, in crasso aut umido aut subriguo solo a messe ad brumam. quod praecepisse eum africae intellegitur. italia quidem nunc vere maxime serit. sed si et autumnno libeat, post aequinoctium xl diebus ad vergiliarum occasum iiii soli dies sunt, quibus seri noceat. africae peculiare, quod in oleastro eas inserit quadam aeternitate, cum senescant, proxima adoptione virga emissa atque ita alia arbore ex eadem iuvenescante iterumque et quotiens opus sit, ut aevis eadem oliveta constent. inseritur autem oleaster calamo et inoculatione.

olea, ubi quercus effossa est, male ponitur, quoniam vermes, qui raucae vocantur, in radice quercus nascuntur et transeunt. non infumare taleas aut siccare prius, quam serantur, utilius conpertum. vetus olivetum ab aequinoctio verno intra vergiliarum exortum interradi alternis annis melius inventum, item muscum radi, circumfodi autem omnibus annis a solstitio ii cubitorum scrobe pedali altitudine, stercorari tertio anno.

mago idem amygdalas ab occasu arcturi ad brumam seri iubet, pira non eodem tempore omnia, quoniam neque florent eodem, oblonga aut rotunda ab occasu vergiliarum ad brumam, reliqua genera media hieme ab occasu sagittae, subsolanum aut septentrionis spectantia, laurum ab occasu aquilae ad occasum sagittae. conexa enim de tempore serendi inserendique ratio est. vere et autumnno id magna ex parte fieri decrevere. est et alia hora circa canis ortus, paucioribus nota, quoniam non omnibus locis pariter utilis intellegitur, sed haud omittenda nobis non tractus alicuius rationem, verum naturae totius

indagantibus. in cyrenaica regione sub etesiarum flatu conserunt, nec non et in graecia, oleam maxime in laconia. coos insula et vites tunc serit, ceteri apud graecos inoculare et inserere non dubitant, sed arbores non serunt. plurimumque in eo locorum natura pollet; namque in aegypto omni serunt mense et ubicumque imbres aestivi sunt, ut in india et aethiopia, necessario post haec autumno seruntur arbores. ergo tria tempora eadem germinationis, ver et canis arcturique ortus. neque enim animalium tantum est ad coitus aviditas, sed multo maior est terrae ac satorum omnium libido, qua tempestive uti plurimum interest conceptus, peculiare utique in insitis, cum sit mutua cupiditas utrimque coeundi. qui ver probant, ab aequinoctio statim admittunt, praedicantes germina parturire, ideo faciles corticum esse complexus. qui praeferunt autumnum, ab arcturi ortu, quoniam statim radicem quandam capiant et ad ver parata veniant atque non protinus germinatio auferat vires. quaedam tamen statutum tempus anni habent ubique, ut cerasi et amygdalae circa brumam serendi vel inserendi. de pluribus locorum situs optime iudicabit. frigida enim et aquosa verno conseri oportet, sicca et calida autumno. communis quidem italiae ratio tempora ad hunc modum distribuit: moro ab idibus februaryiis in aequinoctium, piro autumnum, ita ut brumam xv ne minus diebus antecedant, malis aestivis et cotoneis, item sorbis, prunis, post mediam hiemem in idus februarias, siliquae graecae et persicis ante brumam per autumnum, nucibus iuglandi et pineae et abellanae et graecae atque castaneae a kal. martiis ad idus easdem, salici et genistae circa martias kal. hanc in siccis semine, illam in umidis virga seri diximus.

est etiamnum nova inserendi ratio, ne quid sciens quidem praeteream, quod usquam invenerim, columellae excogitata, ut adfirmat ipse, qua vel diversae insociabilesque arborum naturae copulentur, ut fici atque oleae. iuxta hanc seri ficum iubet non ampliore intervallo, quam ut contingi large possit ramo oleae quam maxime sequaci atque oboedituro, eumque omni interim tempore edomari meditatione curvandi. postea fico adepta vires, quod evenire trimae aut utique quinquenni, detruncata superficie ipsum quoque deputatum et, ut dictum est, adraso cacumine defigi in crure fici, custoditum vinculis, ne curvatura fugiat. ita quodam propaginum insitorumque temperamento triennio communem inter duas matres coalescere, quarto anno abscisum totum adoptantis esse, nondum vulgata ratione aut mihi certe satis conperta.

cetero eadem illa de calidis frigidisque et umidis aut siccis supra dicta ratio et scrobes fodere monstravit. in aquosis enim neque amplos neque altos facere expediet, aliter in aestuoso et sicco, ut quam maxime accipiant aquam contineantque. haec et veteres arbores colendi ratio est. ferventibus enim locis accumulant aestate radices operiuntque, ne solis ardor exurat. aliubi ablaqueant perflatusque admittunt. iidem hieme cumulis a gelu vindicant. contra illi hieme aperiunt umoremque sitientibus quaerunt. ubicumque circumfodiendi arbores ratio in circuitum pedes in orbem ternos, neque id in pratis, quoniam amore solis umorisque in summa tellure oberrant.

et de arboribus quidem fructus gratia serendis inserendisque in universum

sint dicta haec: restat earum ratio, quae propter alias seruntur ac vineas maxime, caeduo ligno.

principatum in his optinent salices, quas serunt loco madido, tamen refosso pedes ii et semipedem, talea sesquipedali vel pertica, quae utilior, quo plenior. intervallo esse debent pedes seni. trimae pedibus binis a terra putatione coercentur, ut se in latitudinem fundant ac sine scalis tondeantur. salix enim fecundior, quo terrae propior. has quoque omnibus annis confodi iubent mense aprili. haec est viminalium cultura. perticalis et virga et talea seritur, fossura eadem. perticas ex ea caedi iustum est quarto fere anno. et hae autem senescentium locum propagine sarciunt praecisa post annum. salicis viminalis iugera singula sufficiunt xxv vineae iugeribus. eiusdem rei causa populus alba seritur bipedaneo pastinato, talea sesquipedali, biduo siccata, palmipedi intervallo, terra superiniecta ii cubitorum crassitudine.

harundo etiamnum dilutiore quam hae solo gaudet. seritur bulbo radice, quod alii oculum vocant, dodrantali scrobe, intervallo ii pedum et semipedis, reficiturque ex sese vetere harundineti extirpato, quod utilius repertum quam castrare, sicut antea. namque inter se radices serpunt mutuoque discursu necantur. tempus conserendi, priusquam oculi harundinum intumescant, ante kal. martias. crescit ad brumam usque desinitque, cum durescere incipit. hoc signum tempestivam habet caesuram. et hanc autem, quotiens et vineam, fodiendam putant. seritur et traversa, non alte terra condita, erumpuntque e singulis oculis totidem plantae. seritur et deplantata pedali sulco, binis obrutis gemmis, ut tertius nodus terram attingat, prono cacumine, ne rores concipiat. caeditur decrescente luna. vineis anno siccata utilior quam viridis.

castanea pedamentis omnibus praefertur facilitate tractatus, perdurandi pervicacia; regerminatione caedua vel salice laetior. quaerit solum facile nec tamen harenosum, maximeque sabulum umidum aut carbunculum vel tofi etiam farinam, quamlibet opaco septentrionalique et praefrigido situ, vel etiam declivi. recusat eadem glaream, rubricam, cretam omnemque terrae fecunditatem. seri nuce diximus, sed nisi ex maximis non provenit, nec nisi quinis acervatim satis. refringi solum debet sub ea ex novembri mense in februarium, quo solutae sponte cadunt ex arbore atque subnascuntur. intervalla sint pedalia, undique sulco dodrantali. ex hoc seminario transferuntur in aliud bipedali intervallo post biennium. sunt et propagines, nulli quidem faciliores. nudata enim radice tota in sulco prosternitur; tum ex cacumine supra terram relicto renascitur et alia ab radice. sed tralata nescit hospitari pavetque novitatem biennio fere; postea prosilit. ideo nucibus potius quam viveradicibus plantaria caedua implentur. cultura non alia quam supra dictis, fodiendo supputandisque per biennium sequens. de cetero ipsa se colit umbra stolones supervacuos enecante. caeditur intra septimum annum. sufficiunt pedamenta iugeri vicenis vinearum iugeribus, quando etiam bifida ex stirpe fiunt, durantque ultra alteram silvae suae caesuram.

aesculus similiter provenit, caesura triennio senior, minus morosa nasci in quacumque terra seritur vere balano, sed non nisi aesculi, scrobe dodrantali,

intervallis ii pedum. saritur leviter quater anno. hoc pedamentum minime putrescit caesumque maxime fructat.

praeter haec, quae diximus, sunt caedua fraxinus, laurus, persica, corulus, malus, sed tardius nascuntur terramque defixa vix tolerant, non modo umorem. sabucus contra firmissima ad palum taleis seritur, ut populus. nam de cupresso satis diximus.

et praedictis velut armamentis vinearum restat ipsarum natura praecipua tradenda cura. vitium surculis et quarundam arborum, quibus fungosior intus natura, geniculati scaporum nodi intersaepiunt medullam. ferulae ipsae breves, et ad summa breviores articuli utrimque sua internodia includunt. medulla, sive illa vitalis anima est, ante se tendit longitudinem implens, quamdiu nodi pervia patent fistula. cum vero concreti ademere transitum, reperiussa erumpit ab ima sui parte iuxta priorem nodum alternis laterum semper inguinibus, ut dictum est in harundine ac ferula, quorum dexterum ab imo intellegitur articulo, laevum in proximo, atque ita per vices. hoc vocatur in vite gemma, cum ibi caespitem fecit; ante vero quam faciat, in concavo oculus et in cacumine ipso germen. sic palmites, nepotes, uvae, folia, pampini gignuntur, mirumque firmiora esse in dextera parte genita.

hos ergo in surculis nodos, cum seruntur, medios secare oportet ita, ne profluat medulla. et in fico quidem dodrantes, paxillis solo patefacto, seruntur sic, ut descendant quae proxima arbori fuerint, ii oculi extra terram emineant. oculi autem in arborum surculis proprie vocantur, unde germinantur. hac de causa et in plantariis aliquando eodem anno ferunt, quo fuere laturo fructus in arbore, cum tempestive sati praegnates inchoatos conceptus aliubi pariunt. ita satas ficos tertio anno transferre facile. hoc pro senescendi celeritate adtributum huic arbori, ut citissime proveniat.

vitium numerosior satus est. primum omnium nihil seritur ex his nisi inutile et deputatum in sarmenta. opputatur autem quidquid proximo tulit fructum. solebat capitulatus utrimque e duro surculus seri, eoque argumento malleolus vocatur etiamnunc. postea avelli cum sua calce coeptus est, ut in fico, neque est aliud vivacius. tertium genus adiectum etiamnum expeditius sine calce, quod sagittae vocantur, cum intorti panguntur, iidem cum recisi nec intorti, trigemmes. plures autem ex eodem surculo hoc modo fiunt. serere e pampinariis sterile est, nec nisi fecundo oportet. quae raros habet nodos, infecunda iudicatur; densitas gemmarum fertilitatis indicium est. quidam seri vetant nisi eos qui floruerint surculos. sagittas serere minus utile, quoniam in transferendo facile rumpitur quod intortum fuit. seruntur pedali, non breviores, longitudine, quinque sexve nodorum. pauciores tribus gemmis in hac mensura esse non poterunt. inseri eodem die, quo deputentur, utilissimum; si multo postea necesse sit serere custoditos, uti praecepimus, caveri utique, ne extra terram positi sole inarescant, vento aut frigore hebetentur. qui diutius in sicco fuerint, priusquam serantur, in aqua pluribus diebus revirescant.

solum apricum et quam amplissimum in seminario sive in vinea bidente pastinari debet, ternos pedes bipalio alto, marra reici quaternum pedum

fermento, ita ut in pedes binos fossa procedat, fossum purgari et extendi, ne crudum relinquatur, verum exigi mensura. male pastinatum deprendunt scamna inaequalia. metienda est et ea pars, quae interiacet, pulvini. surculi seruntur et in scrobe et in sulco longiore; super quam tenerrima ingeritur terra, sed in gracili solo frustra nisi substrato pinguiore corio ... quam duas integri oportet et proximam attingi, terram eodem paxillo deprimi et spissari, interesse in plantario sesquipedes inter bina semina in latitudinem, in longitudinem semisses; ita satos malleolos xxiiii mense recidere ad imum articulum, nisi ipsi parcatur. oculorum inde materia emicat, cum qua xxxvi mense viveradix transfertur.

est et luxuriosa ratio vites serendi, ut quattuor malleoli vehementi vinculo colligentur ima parte luxuriosa atque ita vel per ossa bubuli cruris vel per colla fictilia traieci obruantur binis eminentibus gemmis. uniscunt hoc modo recisisque palmitem emittunt. postea fistula fracta radix libere capit vires, uvaque fert omnium corporum suorum acinos. in alio genere invento novicio finditur malleolus, medullaque erasa in se colligantur ipsi caules ita, ut gemmis parcatur omni modo. tum malleolus in terra fimo mixta seritur et, cum spargere caules coepit, deciditur foditurque saepius. talis uvae acinos nihil intus ligni habituros columella promittit, cum vivere semina ipsa perquam mirum sit medulla adempta.

nasci surculis etiam, quibus non sit articulatio, arbores non omittendum videtur. namque buxi tenuissimis quinis senisve colligatis depacti proveniunt. quondam in observatione erat, ut defringerentur ex inputata buxo, aliter vivere non crediti. detraxere hoc experimenta.

seminarii curam sequitur vinearum ratio. quinque generum hae: sparsis per terram palmitibus aut per se vite subrecta vel cum amminiculo sine iugo aut pedatae simplici iugo aut conpluviatae quadriplici. quae pedatae ratio, eadem intellegetur eius quoque, in qua sine amminiculo vitis per se stabit. id enim non fit nisi pedamenti inopia. simplici iugo constat porrecto ordine quem canterium appellant. melior ea vino, quoniam sibi ipsa non obumbrat adsiduoque sole coquitur et adflatum magis sentit, celerius rorem dimittit, pampinationi quoque et occationi omnique operi facilius. super cetera deflorescit utilius. iugum fit pertica aut harundine aut crine funiculove, ut in hispania brundisique. conpluviata copiosior vino est, dicta a cavis aedium conpluviis. dividitur in quaternas partes totidem iugis. huius serendi ratio dicetur, eadem valitura in omni genere, in hoc vero numerosior tantum. iii vero seritur modis: optime in pastinato, proxime in sulco, novissime in scrobe.

de pastinatione dictum est; sulco latitudo palae satis est, scrobibus tenorum pedum in quamque partem. altitudo in quocumque genere tripedalis, ideo nec vitis minor transferri debet, exstatura etiamnum duabus gemmis. emolliri terram minutis in scrobe imo sulcis fimoque misceri necessarium. clivosa altiores scrobes poscunt, praeterea pulvinatis a devexitate labris. qui ex his longiores fient, ut vites binas accipiant e diverso, alvei vocabuntur. esse vitis radicem in medio scrobe oportet, sed ipsam innixam solido in orientem

aequinoctialem spectare, adminicula prima e calamo accipere; vineas limitari decumano xviii pedum latitudinis ad contrarios vehiculorum transitus, aliisque traversis limitibus denum pedum distingui per media iugera aut, si maior modus sit, totidem pedum cardine, quot decumano, limitari, semper vero quintanis semitari, hoc est ut quinto quoque palo singulae iugo paginae includantur; solo spisso non nisi repastinato nec nisi viveradicem seri, tenero et soluto vel malleolum sulco vel scrobe. in colles sulcos agere transversos melius quam pastinare, ut defluvia transtris eorum contineantur; aquoso caelo vel sicco solo malleolos serere autumno, nisi si tractus ratio mutabit. siccus enim et calidus autumno poscet, umidus frigidusque etiam veris exitu. in arido solo viveradix quoque frustra seritur, male et in siccis malleolus, nisi post imbrem, at in riguis vel frondens vitis et usque ad solstitium recte, ut in hispania. quiescere ventos sationis die utilissimum. plerique austros optant, cato abdicat.

interesse medio temperamento inter binas vites oportet pedes quinos, minimum autem laeto solo pedes quaternos, tenui plurimum octonos - umbri et marsi ad vicanos intermittunt arationis gratia in his, quae vocant porculeta - , pluvio et caliginoso tractu rariores poni, sicco densiores. subtilitas parsimoniae compendia invenit, cum vinea in pastinato seratur, obiter seminarium faciendi, ut et viveradix loco suo et malleolus, qui transferatur, inter vites et ordines seratur, quae ratio in iugero circiter [xvi] viveradicum donat. interest autem biennium fructus, quo tardius in sato provenit quam in tralato.

viveradix posita in vinea post annum resecatur usque ad terram, ut unus tantum emineat oculus, adminiculo iuxta adfixo et fimo addito. simili modo et secundo anno reciditur viresque concipit et intra se pascit suffecturas oneri. alias festinatione pariendi gracilis atque eiuncida, ni cohibeatur castigatione tali, in fetum exeat tota. nihil avidius nascitur ac, nisi ad pariendum vires servantur, tota fit fetus.

pedamenta optima, quae diximus, aut ridicae e robore oleaque, si non sint, pali e iunipero, cupresso, laburno, sabuco. reliquorum generum sudes omnibus annis reciduntur. saluberrima in iugo harundo conexa fasciculis durat annis quinis. cum breviores palmites sarmento iunguntur inter se funium modo, ex hoc arcus funeta dicuntur.

tertius vineae annus palmitem velocem robustumque emittit et quem faciat aetas vitem. hic in iugum insilit. aliqui tum excaecant eum supina falce auferendo oculos, ut longius evocent, noxia iniuria. utilior enim consuetudo pariendi satiusque pampinos adiugatae detergere usque quo placeat roborari eam. sunt qui vetant tangi proximo anno, quam tralata sit, neque ante lx mensem falce curari, tunc autem ad iii gemmas recidi. alii et proximo quidem anno recidunt, sed ut ternos quaternosve singulis annis adiciant articulos, quarto demum perducant ad iugum. id utrimque fructu tardum, praeterea retorridum et nodosum pumilionum incremento. optimum autem matrem esse firmam, postea fetum audacem. nec tutum est quod cicatricosum, magno

imperitiae errore; quidquid est tale, plagis nascitur, non e matre. totas habeat illa vires, dum roboratur, et annuos accipiet tota fetus, cum permissum fuerit nasci. nihil natura portionibus parit. quae excreverit satis firma, protinus in iugo collocari debbit; si etiamnum infirmior erit, sub ipso iugo hospitari recisa. viribus, non aetate, decernitur. temerarium est ante crassitudinem pollicarem viti imperare. sequente anno palmites educuntur pro viribus matris singuli aut gemini. iidem et secuto, si coget infirmitas, nutriantur, tertioque demum ii adiciantur. nec sunt plures quaternis umquam permittendi, breviterque non indulgendum et semper inhibenda fecunditas est. ea est natura, ut parere malit quam vivere. quidquid materiae adimitur, fructui accedit. illa semina mavult quam fructum gigni, quoniam fructus caduca res est. sic perniciose luxuriat, nec ampliat se, sed egerit.

dabit consilium et soli natura. in macro, etiamsi vires habebit, recisa intra iugum moretur, ut omnis fetura sub eo exeat. minimum id esse debbit intervallum, ut attingat iugum speretque, non teneat, adeo non recumbat in eo nec delicate se spargat. ita temperetur hic modus, ut crescere etiamnum malit quam parere.

palmes duas tresve gemmas habere sub iugo debet, ex quibus materia nascatur, tunc per iugum mergi alligarique, ut sustineatur iugo, non pendeat, vinculo mox adstrictius a tertia gemma alligari, quoniam et sic coercetur impetus materiae densioresque citra pampini exultant. cacumen religari vetant. natura haec est: deiecta pars aut praeligata fructum dat, plurimumque ipsa curvatura. quod citra est, materiem emittit, offensante, credo, spiritu et illa quam diximus medulla. quae ita emicuerit materia fructum dabit anno sequente. sic duo genera palmitum: quod e duro exit materiamque in proximum annum promittit, pampinarium vocatur aut, ubi supra cicatricem est, fructuarium; alterum ex anniculo palmitis semper fructuarium. relinquitur sub iugo et qui vocatur custos - hic est novellus palmes, non longior tribus gemmis - proximo anno materiam daturus, si vitis luxuria se consumpserit, et alius iuxta eum, verrucae magnitudine, qui furunculus appellatur, si forte custos fallat.

vitis, antequam septimum annum a surculo compleat, evocata ad fructum eiunescit ac moritur. nec veterem placet palmitem in longum et ad quartum usque pedamentum emitti, quod alii dracones, alii funiculos vocant, ut faciant quae masculata appellant. cum induruit vitis, pessimum in vinea traducere. quinto anno et ipsi palmites intorquentur singulaeque singulis materiae emittuntur ac deinde proximis, prioresque amputantur. semper custodem relinqui melius, sed is proximus viti esse debet, nec longior quam dictum est, et, si luxuriaverint palmites, intorqueri, ut iv materias vel ii, si uniuga erit vinea, emittat.

si per se vitis ordinabitur sine pedamento, quaecumque initio adminiculum desiderabit, dum stare discat et recta surgere, cetera a primordio eadem, dividi autem putatione pollices in aequali examine undique, ne praegravet fructus parte aliqua. obiter idem deprimens prohibebit in excelsum emicare.

huic vineae trium pedum altitudo excelsior nutat, ceteris a quinto, dum ne excedat hominis longitudinem iustam. iis quoque, quae sparguntur in terra, breves ad limitandum caveas circumdant, scrobibus per ambitum factis, ne vagi palmites inter se pugnent occursantes, maiorque pars terrarum ita supinam in tellure vindemiam metit, siquidem et in africa et in aegypto syriaque ac tota asia et multis locis europae hic mos praevallet. ibi ergo iuxta terram conprimi debet vitis, eodem modo et tempore nutrita radice, quo in iugata vinea, ut semper pollices tantum relinquantur, fertili solo cum tribus gemmis, graciliore binis, praestatque multos esse quam longos. quae de natura soli diximus, tanto potentiora sentientur, quanto propior fuerit uva terrae.

genera separari ac singulis conseri tractus utilissimum - mixtura enim generum etiam in vino, non modo in musto, discors - aut, si misceantur, non alia quam pariter maturescentia iungi necessarium. iuga altiora, quo laetior ager et quo planior, item roscido, nebuloso minusque ventoso conveniunt, contra humiliora gracili et arido et aestuoso ventisque exposito. iuga ad pedamentum quam artissimo nodo vinciri oportet, vitem levi contineri. quae genera vitium et in quali solo caeloque essent conserenda, cum enumeraremus naturas earum et vinorum, docuimus.

de reliquo cultu vehementer ambigitur. plerique aestate tota post singulos rores confodi iubent vineam, alii vetant gemmantem; decuti enim oculos tractuque intrantium deteri, et ob id arcendum procul omne quidem pecus, sed maxime lanatum, quoniam facillime auferat gemmas. inimicos et pubescente uva rastros, satisque esse vineam ter anno confodi, ab aequinoctio verno ad vergiliarum exortum et canis ortu et nigrescente acino. quidam ita determinant: veterem semel a vindemia ante brumam, cum alii ablaqueare et stercorare satis putent, iterum ab idibus aprilibus, antequam concipiat, hoc est in vi idus maias; dein prius quam florere incipiat et cum defloruerit et variante se uva. peritiores adfirmant, si iusto saepius fodiatur, in tantum tenerescere acinos, ut rumpantur. quae fodiantur, ante ferventes horas diei fodiendas convenit, sicuti lutum neque arare neque fodere, fossione pulverem excitatum contra soles nebulasque prodesset.

pampinatio verna in confesso est ab idibus maiis, intra dies x, utique antequam florere incipiat, et eam infra iugum debere fieri. de sequente variant sententiae. cum defloruerit, aliqui pampinandum putant, alii sub ipsa maturitate. sed de his catonis praecepta decernent. namque et putationum tradenda ratio est.

protinus hanc a vindemia, ubi caeli tepor indulget, adoriuntur. sed et in hoc fieri numquam debet ratione naturae ante exortum aquilae, ut in siderum causis docebimus proximo volumine, immo vero favonio, quoniam anceps culpa sit praeproperae festinationis. si saucias recenti medicina mordeat quaedam hiemis ruminatio, certum est gemmas earum frigore hebetari plagasque findi et caeli vitio exuri oculos lacrima destillante. nam gelu fragiles fieri quis nescit operarum ista conputatio est in latifundis, non legitima naturae festinatio. quo maturius putantur aptis diebus, eo plus

materiae fundunt; quo serius, eo fructum uberiores. quare macras prius conveniet putare, validas novissime, plagam omnem obliquam fieri, ut facile decidant imbres, et ad terram verti quam levissima cicatrice acie falcis exacuta plagaque conlevata, recidi autem semper inter ii gemmas, ne sit vulnus oculis in recisa parte. nigram esse eam existimant et, donec ad sincera veniatur, recidendam, quoniam e vitioso materia utilis non exeat. si macra vitis idoneos palmites non habeat, ad terram recidi eam novosque elici utilissimum, in pampinatione non hos detrahare pampinos, qui cum uva sint; id enim et uvas supplantat praeterquam in novella vinea. inutiles iudicantur in latere nati, non ab oculo, quippe etiam uva, quae nascatur e duro, rigescente, ut nisi ferro detrahi non possit. pedamentum quidam inter ii vites utilius putant statui, et facilius ablaqueantur ita, meliusque est uniugae vineae, si tamen et ipsi iugo sint vires nec flatu infesta regio. in quadripertita quam proximum oneri adminiculum esse debet, ne tamen impedimentum sentiat ablaqueatio, cubito abesse non amplius, ablaqueari autem prius quam putari iubent.

cato de omni cultura vitium ita praecipit: “quam altissimam vineam facito alligatoque recte, dum ne nimium constringas. hoc modo eam curato: capita vitium per sementim ablaqueato. vineam putatam circumfodito, arare incipito, ultro citroque sulcos perpetuos ducito. vites teneras quam primum propagato, sic occato: veteres quam minimum castrato; potius, si opus erit, deicito biennioque post praecidito. vitem novellam resecari tum erit tempus, ubi valebit. si vinea ab vite calvata erit, sulcos interponito ibique vivam radicem serito. umbram a sulcis removeto, crebroque fodito. in vinea vetere serito ocinum, si macra erit - quod granum capit ni serito - , et circum capita addito stercus, paleas, vinaceas, aliquid horumce. ubi vinea frondere coeperit, pampinato. vineas novellas alligato crebro, ne caulis praefringatur, et quae iam in perticam ibit, eius pampinos teneros alligato leviter porrigitoque, uti recte stent. ubi uva varia fieri coeperit, vites subligato ... vitis insitio una est per ver, altera cum uva floret; ea optima est. - vineam veterem si in alium locum transferre voles, dumtaxat brachium crassam licebit. primum deputato; binas gemmas ne amplius relinquo. ex radicibus bene exfodito et cave, ne radices saucies. ita uti fuerit, ponito in scrobe aut in sulco operitoque et bene occulcato, eodemque modo vineam statuito, alligato flexatoque, uti fuerit, crebroque fodito.” - ocinum, quod in vinea seri iubet, antiqui appellabant pabulum umbrae patiens, quod celerrime proveniat.

sequitur arbusti ratio mirum in modum damnata sasernae patri filioque, celebrata scrofae, vetustissimis post catonem peritissimisque, ac ne a scrofa quidem nisi italiae concessa, cum tam longo iudicetur aevo nobilia vina non nisi in arbustis gigni et in his quoque laudatiora summis sicut uberiores imis. adeo excelsitate proficitur. hac ratione et arbores eliguntur. prima omnium ulmus, excepta propter nimiam frondem atinia. dein populus nigra, eadem de causa, minus densa folio. non spernunt plerique et fraxinum ficumque, etiam oleam, si non sit umbrosa ramis. harum satus cultusque abunde tractatus est. ante xxxvi mensem attingi falce vetantur. alterna servantur brachia, alternis

putantur annis, sexto anno marituntur. transpadana italia praeter supra dictas cornu, opulo, tilia, acere, orno carpino, quercu arbustat agros, venetia salice propter uliginem soli. et ulmus detruncata media in tria ramorum scamna digeritur, nulla fere xx pedum altiore arbore. tabulata earum ab octavo pede altitudinis dilatantur in collibus siccisque agris, a duodecimo in campestribus et umidis. meridianum solem spectare palmae debent, rami a proiectu digitorum modo subrigi, tonsili in his tenuium quoque virgultorum barba, ne obumbrent. intervallum iustum arborum, si aretur solum, quadragenii pedes in terga frontemque, in latera vicini; si non aretur, hoc in omnes partes. singulis denas saepe adnutriunt vites, damnato agricola minus ternis. maritare nisi validas inimicum, enecante veloci vitium incremento. serere tripedaneo scrobe necessarium distantes inter sese arboremque singulis pedibus. nihil ibi malleoli atque pastinationis, nulla fodiendi impendia, utpote cum arbusti ratio hac peculiari dote praestet, quod ab eodem solo ferri fruges et vitibus prodest, superque quod vindicans se altitudo non, ut in vinea, ad arcendas animalium iniurias pariete vel saepe vel fossarum utique impendio muniri se cogit.

in arbusto e praedictis sola viveradicum ratio, item propaginum, et haec gemina, ut diximus: qualorum ex ipso tabulato maxime probata, quoniam a pecore tutissima est, altera deflexa vite vel palmite iuxta suam arborem aut circa proximam caelibem. quod supra terram est e matre, radi iubetur, ne fruticet. in terra non pauciores iv gemmae obruuntur ad radicem capiendam, extra in capite binae relinuntur. vitis in arbusto iv pedes longo constat omnis sulco, tres lato, alto duos cum semipede. post annum propago inciditur ad medullam, ut paulatim radicibus suis adsuescat; caulis a capite ad duas gemmas reciditur; tertio totus mergus absciditur repetiturque altius in terram, ne ex reciso frondeat. tolli viveradix a vindemia protinus debet.

nuper repertum draconem serere iuxta arborem; ita appellamus palmitem emeritum pluribusque induratum annis. hunc praecisum quam maxima amplitudine, tribus partibus longitudinis deraso cortice, quatenus obruatur - unde et rasilem vocant - , deprimere sulco, reliqua parte ad arborem erecta, ocissimum in vite. si gracilis sit vitis aut terra, usitatum est quam proxime solum decidi, donec firmetur radix, sicuti neque roscidam seri neque a septentrionis flatu. vites aquilonem spectare debent ipsae, palmites autem earum meridiem.

non est festinandum ad putationem novellae, sed primo in circulos materies colligenda, nec nisi validae putatio admovenda, seriore anno fere ad fructum arbusta vite quam iugata. sunt qui omnino putari vetent, priusquam arborem longitudine aequaverit. prima falce vi pedes a terra recidatur, flagello infra relicto et nasci coacto incurvatione materiae. iii ei gemmae, non amplius, deputato supersint. ex his omissi palmites proximo anno imis digerantur scamnis ac per singulos annos ad superiora scandant, relicto semper duramento in singulis tabulatis et emissario uno, qui subeat usque quo placuerit. de cetero putatione omnia flagella, quae proxime tulerint, recidantur, nova circumcisis undique capeolis spargantur in tabulatis.

vernacula putatio deiectis per ramos vitium crinibus circumvestit arborem crinesque ipsos uvis, gallica in traduces porrigitur, aemiliae viae in ridicas atiniarum ambitu, frondem earum fugiens.

est quorundam inperitia sub ramo vitem vinculo suspendendi, suffocante iniuria. contineri debet vimine, non artari; quin immo etiam quibus salices supersunt, molliore hoc vinculo facere malunt, herbaque sicali, quam vocant ampelodesmon, graecia vero universa iunco, cypero, ulva. liberata quoque vinculo per aliquot dies vagari et incondita spargi atque in terra, quam per totum annum spectaverit, recumbere; namque ut veterina a iugo et canes a cursu volutatio iuvat, ita tum et vitium porrigi lumbos. arbor quoque ipsa gaudet adsiduo levata onere, similis respiranti, nihilque est in opere naturae, quod non exemplo dierum noctiumque aliquas vices feriarum velit. ob id protinus a vindemia putari et lassas etiamnum fructu edito inprobatur. putatae rursus alligentur alio loco, namque orbitas vinculi sentiunt vexatione non dubia.

traduces gallicae culturae bini utrimque e lateribus, si par quadrageno distet spatio, quaterni, si viceno, inter se obvii miscentur alliganturque una conciliati, virgultorum comitatu obiter rigorati, qua deficient, aut, si brevitatis non patiatur ipsorum, adalligato protenduntur in viduam arborem unco. traducem bimum praecidere solebant - onerat enim vetustate - ; melius donare tempus, ut rasilem faciant, si largiatur crassitudo. alias utile toros futuri draconis pasci.

unum etiamnum genus est medium inter hoc et propaginem, totas supplantandi in terram vites cuneisque findendi et in sulcos plures simul ex una propagandi, gracilitate singularum firmata circumligatis hastilibus nec recisis, qui a lateribus excurrant, pampinis. novariensis agricola, traducum turba non contentus nec copia ramorum, inpositis etiamnum patibulis palmites circumvolvit; itaque praeter soli vitia cultura quoque torva fiunt vina. alia culpa iuxta urbem aricinis, quae alternis putantur annis, non quia id viti conducat, sed quia vilitate reditum impendia exuperent. medium temperamentum in carsulano secuntur cariosasque tantum vitis partes incipientesque inarescere deputando, ceteris ad uvam relictis. detracto onere supervacuo pro nutrimento omni est raritas volneris; sed nisi pingui solo talis cultura degenerat in labruscam.

arbusta arari quam altissime desiderant, tametsi frumenti ratio non exigit. pampinari ea non est moris; et hoc compendium operae. deputantur cum vite pariter interlucata densitate ramorum, qui sint supervacui et absumant alimenta. plagas ad septentriones aut ad meridiem spectare vetuimus; melius, si neque in occasus solis. diu dolent talia quoque ulcera et difficile sanescunt algendo nimis aestuandove. non eadem ut in vite libertas, quoniam certa latera, sed facilius abscondere et detorquere, quo velis, plagas. in arborum tonsura supiniore velut calices faciendi, ne consistat umor.

viti adminicula addenda, quae scandat adprehensa, si maiora sint. vitium generosarum pergulas quinquatribus putandas et, quarum servare uvas libeat,

decescente luna tradunt; quae vero interlunio sint putatae, nullis animalium obnoxias esse. alia ratione plena luna noctu tondendas, cum sit ea in leone, scorpione, sagittario, tauro, atque in totum serendas plena aut crescente utique censent. sufficiunt in italia cultores deni in centena iugera vinearum.

et abunde satu cultuque arborum tractato, quoniam de palmis et cytiso in peregrinis arboribus adfatim diximus, ne quid desit, indicanda reliqua natura est magno opere pertinens ad omnia ea. infestantur namque et arbores morbis. quid enim genitum caret his malis et silvestrium quidem perniciosos negant esse vexarique tantum grandine in germinatione aut flore, aduri quoque fervore aut flatu frigidiore, praepostero die, nam suo frigora etiam prosunt, ut diximus. quid ergo non et vites algore intereunt hoc quidem est, quo deprehendatur soli vitium, quoniam non evenit nisi in frigido. itaque per hiemes caeli rigorem probamus, non soli. nec infirmissimae arbores gelu periclitantur, sed maximae, vexatisque ita cacumina prima inarescunt, quoniam praestriatus non potuit eo pervenire umor.

arborum quidam communes morbi, quidam privati generum. communis vermiculatio et sideratio ac dolor membrorum, unde partium debilitas, societate nominum quoque cum hominis miseriis. trunca dicimus certe corpora et oculos germinum exustos ac multa simili sorte. itaque laborant et fame et cruditate, quae fiunt umoris quantitate, aliqua vero et obesitate, ut omnia, quae resinam ferunt, nimia pinguitudine in taedam mutantur et, cum radices quoque pinguescere coepere, intereunt, ut animalia nimio adipe, aliquando et pestilentia per genera, sicut inter homines nunc servitia, nunc plebes urbana vel rustica.

vermiculantur magis minusve quaedam, omnes tamen fere, idque aves cavi corticis sono experiuntur. iam quidem et hoc in luxuria esse coepit, praegrandesque roborum delicatiore sunt in cibo - cosses vocant - atque etiam farina saginati hi quoque altiles fiunt. maxime autem arborum hoc sentiunt piri, mali, fici, minus quae amarae sunt et odoratae. eorum, qui in ficis existunt, alii nascuntur ex ipsis, alios parit qui vocatur cerastes, omnes tamen in cerasten figurantur sonumque edunt parvoli stridoris. et sorbus arbor infestatur vermiculis rufis ac pilosis atque ita emoritur; mespila quoque in senecta obnoxia ei morbo est.

sideratio tota e caelo constat. quapropter et grandio in his causis intellegi debet et carbunculatio et quod pruinarum iniuria evenit. haec enim verno tepore invitatis et erumpere audentibus satis mollibus insidens adurit lactescentes germinum oculos, quod in flore carbunculum vocant. pruinae perniciosior natura, quoniam lapsa persidit gelatque ac ne aura quidem ulla depellitur, quia non fit nisi inmoto ae+re et sereno. proprium tamen siderationis est sub ortu canis siccitatum vapor, cum insita ac novellae arbores moriuntur, praecipue ficus et vitis.

olea praeter vermiculationem, quam aequae ac ficus sentit, clavum etiam patitur, sive fungum placet dici vel patellam. haec est solis exustio. nocere tradit cato et muscum rubrum. nocet plerumque vitibus atque oleis et nimia

fertilitas. scabies communis omnium est. inpetigo et, quae adgnosci solent, cocleae peculiaris ficorum vitia, nec ubique. sunt enim quaedam aegritudines et locorum.

verum ut homini nervorum cruciatus, sic et arbori, ac duobus aequè modis. aut enim in pedes, hoc est radices, inrumpit vis morbi, aut in articulos, hoc est cacuminum digitos, qui longissime a toto corpore exeunt. nigrescunt ergo, et sunt apud graecos sua nomina utrique vitio. undique primo dolor, mox et macies earum partium fragilis, postremo tabes morsque, non intrante suco aut non perveniente, maximeque id fieri sentiunt. caprificus omnibus immunis est, quae adhuc diximus. scabies gignitur roribus lentis post vergilias; nam si largiores fuere, perfundunt arborem, non scalpunt scabie, et grossi cadunt; sive imbres nimii fuere, alio modo ficus laborat, radicibus madidis.

vitibus praeter vermiculationem et siderationem morbus peculiaris articulatio tribus de causis: una vi tempestatum germinibus ablatis, altera, ut notavit theophrastus, in supinum excisis, tertia culturae imperitia laesis. omnes enim earum iniuriae in articulis sentiuntur. siderationis genus est et his deflorescentibus roratio, aut cum acini, priusquam crescant, decocuntur in callum. aegrotant et cum alere, laesis uredine attonsarum oculis. et calore hoc evenit intempestivo, quoniam omnia modo constant certoque temperamento. fiunt et culpa colentium vitia, cum praestringuntur, ut dictum est, aut circumfossor iniurioso ictu verberavit vel etiam subarator imprudens luxavit radices corpusve desquamavit. est et quaedam contusio falcis hebetioris. quibus omnibus causis difficilius tolerant frigora aut aestus, quoniam in ulcus penetrat iniuria omnis a foris. infirmissima vero malus, maximeque quae dulcis est. quibusdam debilitas sterilitatem, non necem, adfert, ut si quis pino cacumen auferat vel palmae. sterilescent enim nec moriuntur. aegrotant aliquando et poma ipsa per se sine arbore, si necessariis temporibus imbres aut tepores vel adflatus defuere aut contra abundavere. decidunt enim aut deteriora fiunt. pessimum est inter omnia, cum deflorescentem vitem et oleam percussit imber, quoniam simul defluit fructus.

sunt ex eadem causa nascentes et urucae, dirum animal, eroduntque frondem, aliae florem quoque, olivarum, ut in mileto, ac depastam arborem turpi facie relinquunt. nascitur hoc malum tepore umido et lento. fit aliud ex eodem, si sol acrior insecutus inussit ipsum vitium ideoque mutavit. est etiamnum peculiare olivis et vitibus - araneum vocant - , cum veluti telae involvunt fructum et absumunt. adurunt et flatus quidam eas maxime, sed et alios fructus. nam vermiculationem et poma ipsa per se quibusdam annis sentiunt, mala, pira, mespila, punica. in oliva ancipiti eventu, quando sub cute innati fructum adimunt, augent, si in ipso nucleo fuere erodentes eum. gigni illos prohibent pluviae, quae fiunt post arcturum. eadem si austrinae fuere, generant druppis quoque, quae maturescentes tum sunt praecipue caducae. id riguis magis evenit, etiam si non cecidere, fastidiendis. sunt et culicum genera aliquis molesta, ut glandibus, fico; qui videntur ex umore nasci, tum dulci subdito corticibus. et aegrotatio quidem fere in his est.

quaedam temporum causae aut locorum non proprie dicantur morbi, quoniam protinus necant, sicut tabes cum invasit arborem aut uredo vel flatus alicuius regionis proprius, ut est in apulia atabulus, in euboea olympias. hic enim si flavit circa brumam, frigore exurit arefaciens, ut nullis postea solibus recreari possint. hoc genere convalles et adposita fluminibus laborant, praecipueque vitis, olea, ficus. quod cum evenit, detegitur statim in germinatione, in oliva tardius. sed in omnibus signum est revivescendi, si folia amisere. alioqui quas putes praevaluisse moriuntur. nonnumquam inarescunt folia eademque revivescunt. alia in terris septentrionalibus, ut ponto, thracia, frigore aut gelu laborant, si post brumam continuavere xl diebus. et ibi autem et in reliquis partibus, si protinus editis fructibus gelatio magna consecuta est, etiam paucis diebus necat.

quae iniuria hominum constant, secundum ... habent causas. pix, oleum, adeps inimica praecipue novellis. cortice in orbem detracto necantur, excepto subere, quod sic etiam iuvatur; crassescens enim praestringit et strangulat. nec andrachle offenditur, si non simul incidatur et corpus. alioqui et cerasus et tilia et vitis corticem mittunt, sed non vitalem nec proximum corpori, verum eum, qui subnascente alio expellitur. quarundam natura rimosus cortex, ut platanis. tiliae renascitur paulo minus quam totus. ergo his, quarum cicatricem trahit, medentur luto fimoque, et aliquando prosunt, si non vehementior frigorum aut calorum vis secuta est. quaedam tardius ita moriuntur, ut robora et quercus. refert et tempus anni. abieti enim et pino si quis detraxerit sole taurum vel geminos transeunte, cum germinant, statim moriuntur; eandem iniuriam hieme passae diutius tolerant. similiter ilex et robur quercusque. si angusta decorticatio fuit, nihil nocetur supra dictis; infirmioribus quidem et in solo gracili vel ab una tantum parte detractus interemit. similem et decacuminatio rationem habet piceae, cedri, cupressi - haec enim detracto cacumine aut ignibus adusto intereunt - , similem et depastio animalium. oleam quidem etiam, si lambat capra, sterilesce auctor est Varro, ut diximus. quaedam hac iniuria moriuntur, aliqua deteriora tantum fiunt, ut amygdalae - ex dulcibus enim transfigurantur in amaras - , aliqua vero etiam utiliora, ut apud chios pirus, quam phocida appellant. nam detruncatio diximus quibus prodesset. intereunt pleraque et fissa stirpe, exceptis vite, malo, fico, punicis, quaedam vel ab ulcere tantum. pinus hanc iniuriam spernit et omnia, quae resinam gignunt. radicibus amputatis mori minime mirum est; pleraeque etiam non omnibus, sed maximis aut, quae sunt inter illas vitales, abscisis moriuntur.

necant invicem inter sese umbra vel densitate atque alimenti rapina. necat et hedera vinciens - nec viscum prodest - et cytisus, necatur eo, quod halimon vocant graeci. quorundam natura non necat quidem, sed laedit odorum aut suci mixtura, ut raphanus et laurus vitem. olfactatrix enim intellegitur et tingui odore mirum in modum, ideo, cum iuxta sit, averti et recedere saporemque inimicum fugere. hinc sumpsit androcydes medicinam contra ebrietates, raphanum manducari praecipiens. odit et caulem et olus omne, odit et corylum, ni procul absint, tristis atque aegra. nitrum quidem et alumen,

marina aqua calida et fabae putamina vel ervi ultima venena sunt.

inter vitia arborum est et prodigiis locus. invenimus ficos sub foliis natas, vitem et malum punicam stirpe fructum tulisse, non palmite aut ramis, vitem uvas sine foliis, oleas quoque amisisse folia bacis haerentibus. sunt et miracula fortuita. nam et oliva in totum ambusta revixit et in boeotia derosae locustis fici regerminavere. mutantur arbores et colore fiuntque ex nigris candidae, non semper prodigio, sed eae maxime, quae ex semine nascuntur. et populus alba in nigram transit. quidam et sorbum, si in calidiora loca venerit, sterilesce putant. prodigio autem fiunt ex dulcibus acerba poma aut dulcia ex acerbis, e caprifico fici aut contra, gravi ostento, cum in deteriora mutantur, ex olea in oleastrum, ex candida uva et fico in nigras aut, ut laudiceae xerxis adventu, platano in oleam mutata. qualibus ostentis aristandri apud graecos volumen scatet, ne in infinitum abeamus, apud nos vero c. epidii commentarii, in quibus arbores locutae quoque reperiuntur. subsedit in cumano arbor gravi ostento paulo ante pompeii magni bella civilia paucis ramis eminentibus; inventum sibyllinis libris internicionem hominum fore, tantoque eam maiorem, quanto propius ab urbe postea facta esset. sunt prodigia et cum alienis locis enascuntur, ut in capitibus statuarum vel aris, et cum in arboribus ipsis alienae. ficus in lauro nata est cyzici ante obsidionem. simili modo trallibus palma in basi caesaris dictatoris circa bella civilia eius. nec non et romae in capitolio in ara iovis bello persei enata palma victoriam triumphosque portendit. hac tempestatibus prostrata eodem loco ficus enata est m. messalae c. cassii censorum lustro, a quo tempore pudicitiam subversam piso gravis auctor prodidit. super omnia, quae umquam audita sunt, erit prodigium in nostro aevo neronis principis ruina factum in agro marrucino, veti marcelli e primis equestris ordinis oliveto universo viam publicam transgresso arvisque inde e contrario in locum oliveti profectis.

nunc expositis arborum morbis consentaneum est dicere et remedia. ex his quaedam sunt communia omnium, quaedam propria quarundam. communia ablaqueatio, adcumulatio, adflari radices aut cooperiri, riguis dato potu vel ablato, fimum suco defectis, putatio levandis onere, item suco emisso quaedam veluti detractio sanguinis, circumrasio corticis, vitium extenuatio et domitura palmitum, gemmarum, si frigus retorridas hirtasque fecerit, repumicatio et quaedam politura. arborum his aliae magis, aliae minus gaudent, veluti cupressus et aquas aspernatur et fimum et circumfossuram amputationemque et omnia remedia odit, quin etiam necatur riguis, vitis et punicae praecipue aluntur. ficus arbor ipsa riguis alitur, pomum vero eius marcescit. amygdalae, si colantur fossione, florem amittunt. nec insitas circumfodere oportet, priusquam validae ferre coeperint poma. plurimae autem amputari sibi volunt onerosa ac supervacua, sicut nos ungues et capillum. reciduntur veteres totae ac rursus a stolone aliquo resurgunt, sed non omnes nec nisi quarum naturam pati diximus.

rigua aestivis vaporibus utilia, hieme inimica, autumno varie et e natura soli, quippe cum vindemiator hispaniarum stagnante solo uvas demetat. cetero

maiore in parte orbis etiam pluvias autumnus aquas derivare convenit. circa canis ortum rigua maxime prosunt ac ne tum quidem nimia, quoniam inebriatis radicibus nocent. et aetas modum temperat, novellae enim minus sitiunt. desiderant autem maxime rigari quae adsuevere, contra siccis locis genita non expetunt umorem nisi necessarium.

asperiora vina rigari utique cupiunt in sulmonense italiae agro, pago fabiano, ubi et arva rigant. mirumque, herbae aqua illa necantur, fruges aluntur, et riguus pro sarculo est. in eodem agro bruma - tanto magis, si nives iaceant geletve - , ne frigus vites adurat, circumfundunt riguis, quod ibi tepidare vocant, memorabili natura in amne solis, eodem aestate vix tolerandi rigoris.

carbunculi ac robiginum remedia demonstrabimus volumine proximo. interim est et scariphatio quaedam in remediis, cum macie corticis ex aegritudine adstringente se iustoque plus vitalia arborum comprimente exacutam falcis aciem utraque manu inprimentes perpetuis incisuris diducunt ac veluti cutem laxant. salutare id fuisse argumento sunt dilatatae cicatrices et internato corpore expletae, magna ex parte similis hominum medicina et arborum est, quando earum quoque terebrantur ossa. amygdalae ex amaris dulces fiunt, si circumfosso stipite et ab ima parte circumforato defluens pituita abstergeatur. et ulmis detrahitur sucus inutilis, supra terram foratis usque ad medullam, in senecta aut cum alimento nimio abundare sentiuntur. idem et ficorum turgido cortice incisuris in oblicum levibus emittitur. ita fit, ne decidant fructus. pomiferis, quae germinant nec ferunt fructum, fissa radice inditur lapis fertilesque fiunt, hoc idem in amygdalis e robore cuneo adacto, in piris sorbisque e taeda ac cinere et terra cooperto. etiam radices circumcidisse prodest vitium luxuriantium ficorumque et circumcisis cinerem addidisse. fici serotinae fiunt, si primae grossi, cum fabae magnitudinem excessere, detrahantur. subnascuntur enim quae serius maturescunt. eadem, cum frondere incipiunt, si cacumina rami cuiusque detrahantur, firmiores fertilioresque fiunt, nam caprificatio maturat.

in ea culices nasci e grossis manifestum, quoniam, cum evolavere, non inveniuntur intus grana, quae in eos versa apparet. exeundi tanta est aviditas, ut plerique aut pede relicto aut pinnae parte erumpant. est et aliud genus culicum, quos vocant centrinas, fucis apium similes ignavia malitiaque cum pernicie verorum et utilium; interemunt enim illos atque ipsi commoriuntur. vexant et tineae semina ficorum, contra quas remedium in eodem scrobe defodere taleam lentisci inversa parte, quae fuerit a cacumine. uberrimas autem ficus rubrica amurca diluta et cum fimo infusa radicibus frondere incipientium facit. caprificorum laudantur maxime nigrae et in petrosis, quoniam frumenta plurima habeant. caprificatio ipsa post imbrem.

in primis autem cavendum, ne ex remediis vitia fiant, quod evenit nimia aut intempestiva medicina. interlucatio arboribus prodest, sed omnium annorum trucidatio inutilissima. vitis tantum tonsuram annuam quaerit, alternam vero myrtus, punicae, oleae, quia celeriter frutescunt. ceterae rarius tondeantur,

nulla autumno, ac ne radantur quidem nisi vere. putatione plaga ad vitalia ... sunt omnia, quaecumque non supervacua.

similis fimi ratio. gaudent eo, sed cavendum, ne in fervore solis admoveatur, ne in maturum, ne validius quam opus sit. urit vineas suillum nisi quinquennio interposito, praeterquam si riguis diluatur, et e coriariorum sordibus nisi admixta aqua, item largius. iustum existimant in denos pedes quadratos iii modios. id quidem soli natura decernet.

columbino ac suillo plagis quoque arborum medentur. si mala punica acida nascantur, ablaqueatis radicibus fimum suillum addi iubent. eo anno vinolenta, proximo dulcia futura. alii urina hominis aqua mixta riganda censent quater anno, singulis amphoris, aut cacumina spargi vino lasere diluto; si findantur in arbore, pediculum intorqueri; ficis utique amurcam adfundi, ceteris arboribus aegris faecem vini, aut lupinum circum radices earum seri. aqua quoque lupini decocti circumfusa pomis prodest. fici, cum volcanalibus tonuit, cadunt. remedium est, ut ante stipula hordeacea areae stringantur. cerasos praecoces facit cogitque maturescere calx admota radicibus. et haec autem, ut omnia poma, intervelli melius est, ut quae relictas sint grandescant.

quaedam poena emendantur aut morsu excitantur, ut palmae ac lentisci; salsis enim aquis aluntur. salis vim et cineres, sed leniorem, habent; ideo ficis adsparguntur rutaeque, ne fiant verminosae neve radices putrescant. quin et vitium radicibus aquam salsam iubent adfundi, si sint lacrimosae; si vero fructus earum decidant, cinerem aceto conspergi ipsasque inlini aut sandaraca, si putrescat uva; si vero fertiles non sint, aceto acri subacto cinere rigari atque oblini; quod si fructum non maturent prius inarescentem, praecisarum ad radices plagam fibrasque aceto acri et urina vetusta madefacere atque eo luto obruere, saepe fodere. olearum, si parum promissere fructus, nudatas radices hiberno frigori opponunt, eaque castigatione proficiunt. omnia haec annua caeli ratione constant et aliquando serius poscuntur, aliquando celerius. nec non ignis aliquis prodest, ut harundini. ambusta namque densior mitiorque surgit. cato et medicamenta quaedam componit, mensurae quoque distinctione, ad maiorum arborum radices amphoram, ad minorum urnam, amurcae et aquae portione aequa, ablaqueatis prius radicibus paulatim, adfundi iubens, in olea hoc amplius stramentis ante circumpositis, item fico; huius praecipue vere terram adaggerari radicibus; ita futurum, ut non decidant grossi maiorque fecunditas nec scabra proveniat. simili modo, ne convolvulus fiat in vinea, amurcae congios duos decoqui in crassitudinem mellis, rursusque cum bituminis tertia parte et sulphuris quarta sub diu coqui, quoniam exardescat sub tecto. hoc vites circa capita ac sub brachiis ungui; ita non fore convolvolum. quidam contenti sunt fumo huius mixturae suffire vineas secundo flatu continuo triduo. plerique non minus auxilii et alimenti arbitrantur in urina quam cato in amurca, addita modo pari aquae portione, quoniam per se noceat. aliqui volucre appellant animal praerodens pubescentes uvas. quod ne accidat, falces, cum sint exacutae, fibrina pelle detergent atque ita putant aut sanguine ursino linunt post putationem easdem. sunt arborum pestes et

formicae. has abigunt rubrica ac pice liquida perunctis caudicibus, nec non et pisce suspenso iuxta in unum locum congregant aut lupino trito cum oleo radices linunt. multi et has et talpas amurca necant, contraque urucas et, ne mala putrescant, lacerti viridis felle tangi cacumina iubent, privatim autem contra urucas ambiri arbores singulas a muliere incitati mensis, nudis pedibus, recincta. item ne quod animal pastu malefico decerpat frondem, fimo boum diluto spargi folia, quotiens imber interveniat, quoniam abluatur ita virus medicaminis, mira quaedam excogitante sollertia humana, quippe cum averti grandines carmine credant plerique, cuius verba inserere non equidem serio ausim, quamquam a catone proditis contra luxata membra iungenda harundinum fissurae. idem arbores religiosas lucosque succidi permisit, sacrificio prius facto, cuius rationem precationemque eodem volumine tradidit.

LIBER XVIII

sequitur natura frugum hortorumque ac florum quaeque alia praeter arbores aut frutices benigna tellure proveniunt, vel per se tantum herbarum inmensa contemplatione, si quis aestimet varietatem, numerum, flores, odores coloresque et sucos ac vires earum, quas salutis aut voluptatis hominum gratia gignit. qua in parte primum omnium patrocinari terrae et adesse cunctorum parenti iuvat, quamquam inter initia operis defensae. quoniam tamen ipsa materia accedimus ad reputationem eiusdem parientis et noxia: nostris eam criminibus urgemus nostramque culpam illi inputamus. genuit venena. set quis invenit illa praeter hominem cavere ac refugere alitibus ferisque satis est. atque cum arbore exacuant limentque cornua elephantum et uri, saxo rhinoceros, utroque apri dentium sicas, sciantque ad nocendum praeparare se animalia, quod tamen eorum excepto homine et tela sua venenis tinguunt nos et sagittas tinguimus ac ferro ipsi nocentius aliquid damus, nos et flumina inficimus et rerum naturae elementa, ipsumque quo vivitur in perniciem vertimus. neque est, ut putemus ignorari ea ab animalibus; quae praepararent contra serpentium dimicationes, quae post proelium ad medendum excogitarent, indicavimus. nec ab ullo praeter hominem veneno pugnatur alieno. fateamur ergo culpam ne iis quidem, quae nascuntur, contenti; etenim quanto plura eorum genera humana manu fiunt! quid non et homines quidem ut venena nascuntur atra ceu serpentium lingua vibrat tabesque animi contacta adurit culpantium omnia ac dirarum alitum modo tenebris quoque suis et ipsarum noctium quieti invidentium gemitu, quae sola vox eorum est, ut inauspicatarum animantium vice obvii quoque vetent agere aut prodesse vitae. nec ullum aliud abominati spiritus praemium novere quam odisse omnia. verum et in hoc eadem naturae maiestas. quanto plures bonos genuit ut fruges! quanto fertilior in his, quae iuvent alantque! quorum aestimatione et gaudio nos quoque, relictis exustioni suae istis hominum rubis, pergemus excolere vitam eoque constantius, quo operae nobis maior quam famae gratia expetitur. quippe sermo circa rura est agrestesque usus, sed quibus vita constet honosque apud priscos maximus fuerit.

arvorum sacerdotes romulus in primis instituit seque duodecimum fratrem appellavit inter illos acca larentia nutrice sua genitos, spicea corona, quae vitta alba colligaretur, sacerdotio ei pro religiosissimo insigni data; quae prima apud romanos fuit corona, honosque is non nisi vita finitur et exules etiam captosque comitatur. bina tunc iugera p. r. satis erant, nullique maiorem modum adtribuit, quo servorum paulo ante principis neronis contento huius spatii viridiariis piscinas iuvat maiores habere, gratumque, si non aliquem culinas. numa instituit deos fruge colere et mola salsa supplicare atque, ut auctor est hemina, far torrere, quoniam tostum cibo salubrius esset, id uno modo consecutus, statuendo non esse purum ad rem divinam nisi tostum. is et fornacalia instituit farris torrendi ferias et aequae religiosas terminis agrorum.

hos enim deos tum maxime noverant, seiamque a serendo, segestam a segetibus appellabant, quarum simulacra in circo videmus - tertiam ex his nominare sub tecto religio est - , ac ne degustabant quidem novas fruges aut vina, antequam sacerdotes primitias libassent.

iugum vocabatur, quod uno iugo boum in die exarari posset; actus, in quo boves agerentur cum aratro uno impetu iusto. hic erat cxx pedum duplicatusque in longitudinem iugerum faciebat. dona amplissima imperatorum ac fortium civium quantum quis uno die plurimum circumaravisset, item quartarii farris aut heminae, conferente populo. cognomina etiam prima inde: pilumni, qui pilum pistrinis invenerat, pisonis a pisendo, iam fabiorum, lentulorum, ciceronum, ut quisque aliquod optime genus sereret. iuniorum e familia bubulcum nominarunt, qui bubus optime utebatur. quin et in sacris nihil religiosius confarreationis vinculo erat, novaeque nuptae farreum praeferebant. agrum male colere censorium probrum iudicabatur, atque, ut refert cato, cum virum bonum laudantes bonum agricolam bonumque colonum dixissent, amplissime laudasse existimabantur. hinc et locupletes dicebant loci, hoc est agri, plenos. pecunia ipsa a pecore appellabatur. etiam nunc in tabulis censoriis pascua dicuntur omnia, ex quibus populus redditus habet, quia diu hoc solum vectigal fuerat. multatio quoque non nisi ovium boumque inpendio dicebatur, non omittenda priscarum legum benivolentia: cautum quippe est, ne bovem prius quam ovem nominaret, qui indiceret multam. ludos boum causa celebrantes bubetios vocabant. servius rex ovium boumque effigie primum aes signavit. frugem quidem aratro quaesitam furtim noctu pavisse ac secuisse puberi xii tabulis capital erat, suspensumque cereri necari iuebant gravius quam in homicidio convictum, inpubem praetoris arbitrato verberari noxiamve duplionemve decerni. iam distinctio honosque civitatis ipsius non aliunde erat. rusticae tribus laudatissimae eorum, qui rura haberent, urbanae vero, in quas transferri ignominia esset, desidiae probro. itaque quattuor solae erant, a partibus urbis, in quis habitabant, suburana, palatina, collina, esquilina. nundinis urbem revisitabant et ideo comitia nundinis habere non licebat, ne plebes rustica avocaretur. quies somnusque in stramentis erat. gloriam denique ipsam a farris honore adoriam appellabant. equidem ipsa etiam verba priscae significationis admiror; ita enim est in commentariis pontificum: “augurio canario agendo dies constituentur, priusquam frumenta vaginis exeant nec antequam in vaginas perveniant.”

ergo his moribus non modo sufficebant fruges nulla provinciarum pascente italiam, verum etiam annonae vilitas incredibilis erat. manius marcius aedilis plebis primum frumentum populo in modios assibus datavit. l. minucius augurinus, qui spurium maelium coarguerat, farris pretium in trinis nundinis ad assem redegit undecimus plebei tribunus, qua de causa statua ei extra portam trigeminam a populo stipe conlata statuta est. seius in aedilitate assibus populo frumentum praestitit, quam ob causam et ei statuae in capitolio ac palatio dicatae sunt, ipse supremo die populi umeris portatus in rogum est.

quo vero anno mater deum advecta romam est, maiorem ea aestate messem quam antecedentibus annis decem factam esse tradunt. M. Varro auctor est, cum l. metellus in triumpho plurimos duxit elephantos, assibus singulis farris modios fuisse, item vini congios ficique siccae pondo xxx, olei pondo x, carnis pondo xii. nec e latifundiis singulorum contingebat arcentium vicinos, quippe etiam lege stolonis licini incluso modo quingentorum iugerum, et ipso sua lege damnato, cum substituta filii persona amplius possideret. luxuriantis iam rei p. fuit ista mensura. mani quidem curi post triumphos inmensumque terrarum adiectum imperio nota contio est: perniciosum intellegi civem, cui septem iugera non essent satis. haec autem mensura plebei post exactos reges adsignata est. quanam ergo tantae ubertatis causa erat ipsorum tunc manibus imperatorum colebantur agri, ut fas est credere, gaudente terra vomere laureato et triumphali aratore, sive illi eadem cura semina tractabant, qua bella, eademque diligentia arva disponebant, qua castra, sive honestis manibus omnia laetius proveniunt, quoniam et curiosius fiunt. serentem invenerunt dati honores serranum, unde ei et cognomen. aranti quattuor sua iugera in vaticano, quae prata quintia appellantur, cincinnato viator attulit dictaturam et quidem, ut traditur, nudo, plenoque nuntius morarum: “vela corpus,” inquit, “ut perferam senatus populiue romani mandata.” tales tum etiam viatores erant, quod ipsum nomen inditum est subinde ex agris senatum ducesque arcessentibus. at nunc eadem illa vincti pedes, damnatae manus inscriptique vultus exercent, non tam surda tellure, quae parens appellatur colique dicitur et ipso honore his absumpto, ut non invita ea et indignante credatur id fieri. et nos miramur ergastulorum non eadem emolumenta esse, quae fuerint imperatorum!

igitur de cultura agri praecipere principale fuit etiam apud externos, siquidem et reges fecere, hiero, philometor, attalus, archelaus, et duces, xenophon et poenus etiam mago, cui quidem tantum honorem senatus noster habuit carthagine capta, ut, cum regulis africae bibliothecas donaret, unius eius duodetriginta volumina censeret in latinam linguam transferenda, cum iam m. cato praecepta condidisset, peritisque punicae dandum negotium, in quo praecessit omnes vir clarissimae familiae d. silanus. sapientiae vero auctores et carminibus excellentes quique alii illustres viri composuissent, quos sequeremur, praetexuimus hoc in volumine, non in grege nominando M. Varrone, qui lxxxi vitae annum agens de ea re prodendum putavit.

apud romanos multo serior vitium cultura esse coepit, primoque, ut necesse erat, arva tantum coluere, quorum a nobis nunc ratio tractabitur, non vulgari modo, verum, ut adhuc fecimus, et vetustis et postea inventis omni cura perquisitis causaque rerum et ratione simul eruta. dicemus et sidera siderumque ipsorum terrestria signa dabimus indubitata, quandoquidem qui adhuc diligentius ea tractavere, quibusvis potius quam agricolis scripsisse possunt videri. ac primum omnium oraculis maiore ex parte agemus, quae non in alio vitae genere plura certiorave sunt. cur enim non videantur oracula, a certissimo deo maximeque veridico, usu, profecta

principium autem a catone sumemus: “fortissimi viri et milites strenuissimi ex agricolis gignuntur minimeque male cogitantes. - praedium ne cupide emas.” in re rustica “operae ne parcas, in agro emendo” minime. quod male emptum est, semper paenitet. agrum paraturos ante omnia intueri oportet “aquam, viam, vicinum.” singula magnas interpretationes habent nec dubias. cato in conterminis hoc amplius aestimari iubet, quo pacto niteant. “in bona enim,” inquit, “regione bene nitent.” atilius regulus ille punico bello bis consul aiebat neque fecundissimis locis insalubrem agrum parandum neque effetis saluberrimum. salubritas loci non semper incolarum colore detegitur, quoniam adsueti etiam in pestilentibus durant. praeterea sunt quaedam partibus anni salubria, nihil autem salutare est, nisi quod toto anno salubre. malus est ager, cum quo dominus luctatur.

cato inter prima spectari iubet, ut solum sua virtute valeat qua dictum est positione, ut operariorum copia prope sit oppidumque validum, ut navigiorum evectus vel itinerum, ut bene aedificatus et cultus. in quo falli plerosque video; segnitiam enim prioris domini pro emptore esse arbitrantur. nihil est damnosius deserto agro. itaque cato, de bono domino melius emi, nec temere contemnendam alienam disciplinam, agroque ut homini, quamvis quaestuosus sit, si tamen et sumptuosus, non multum superesse. ille in agro quaestuosissimam iudicat vitem, non frustra, quoniam ante omnia de inpensae ratione cavit; proxime hortos irriguos, nec id falso, si sub oppido sint; et prata antiqui parata dixere, idemque cato interrogatus, quis esset certissimus quaestus, respondit: “si bene pascas;” qui proximus: si “sat bene.” summa omnium in hoc spectando fuit, ut fructus is maxime probaretur, qui quam minimo incendio constaturus esset. hoc ex locorum occasione aliter alibi decernitur. eodemque pertinet, quod agricolam vendacem esse oportere dixit, fundum in adulescentia conserendum sine cunctatione, aedificandum non nisi consito agro, tunc quoque cunctanter, optimumque est, ut volgo dixere, aliena insania frui, sed ita, ut villarum tutela non sit oneri. eum tamen, qui bene habitet, saepius ventitare in agrum, frontemque domini plus prodesse quam occipitium non mentiuntur.

modus hic probatur, ut neque fundus villam quaerat neque villa fundum, non, ut fecere iuxta diversis in eadem aetate exemplis l. lucullus et q. scaevola, cum villa scaevolae fructus non caperet, villam luculli ager, quo in genere censoria castigatio erat minus arare quam verrere. nec hoc sine arte quadam est. novissimus villam in misenensi posuit c. marius vii cos., sed peritia castra metandi sic, ut comparatos ei ceteros etiam sulla felix caecos fuisse diceret. convenit neque iuxta paludes ponendam esse neque adverso amne, quamquam homerus omnino e flumine semper antelucanas auras insalubres verissime tradidit. spectare in aestuosis locis septentriones debet, meridiem in frigidis, in temperatis exortum aequinoctialem.

agri ipsius bonitas quibus argumentis iudicanda sit, quamquam de terrae genere optimo disserentes abunde dixisse possumus videri, etiamnum tamen traditas notas subsignabimus catonis maxime verbis: “ebulum vel prunus

silvestris vel rubus, bulbus minutus, trifolium, herba pratensis, quercus, silvestris pirus malusque frumentarii soli notae, item nigra terra et cinerei coloris. omnis creta coquet, nisi permacra, sabulumque, nisi id etiam pertenuis est, et multo campestribus magis quam clivosis respondent eadem.”

modum agri in primis servandum antiqui putare, quippe ita censebant, satius esse minus serere et melius arare; qua in sententia et vergilium fuisse video. verumque confitentibus latifundia perdidere italiam, iam vero et provincias - sex domini semissem africae possidebant, cum interfecit eos nero princeps - , non fraudando magnitudine hac quoque sua cn. pompeio, qui numquam agrum mercatus est conterminum. agro empto domum vendendam inclementer atque non ex utilitate publici status mago censuit, hoc exordium praecepta pandere ingressus, ut tamen appareat assiduitatem desideratam ab eo.

dehinc peritia vilicorum in cura habenda est, multaque de his cato praecepit. nobis satis sit dixisse, quam proximum domino corde esse debere et tamen sibimet ipsi non videri. coli rura ab ergastulis pessimum est, ut quidquid agitur a desperantibus. temerarium videatur unam vocem antiquorum posuisse, et fortassis incredibile, nisi penitus aestimetur, “nihil minus expedire, quam agrum optime colere.” l. tarius rufus infima natalium humilitate consulatum militari industria meritis, antiquae alias parsimoniae, circiter [30m]30 hs liberalitate Divi Augusti congestum usque ad detractationem heredis exhausit agros in piceno coemendo colendoque in gloriam. internicionem ergo famemque censemus immo, hercules, modum iudicem rerum omnium utilissimum. bene colere necessarium est, optime damnosum, praeterquam subole sua colono aut pascendis alioqui colente. domino aliquas messes colligere non expedit, si computetur inpendium operae, nec temere olivam, nec quasdam terras diligenter colere, sicut in sicilia tradunt, itaque decipi advenas.

quonam igitur modo utilissime colentur agri ex oraculo scilicet: “malis bonis.” sed defendi aequum est abavos, qui praeceptis suis prospexere vitae. namque cum dicerent “malis”, intellegere voluere vilissimos, summumque providentiae illorum fuit, ut quam minimum esset inpendii. praecipiebant enim ista, qui triumphales denas argenti libras in supellectile crimini dabant, qui mortuo vilico relinquere victorias et reverti in rura sua postulabant, quorum heredia colenda suscipiebat res p., exercitusque ducebant senatu illis vilicante. inde illa reliqua oracula: “nequam agricolam esse quisquis emeret quod praestare ei fundus posset; malum patrem familias quisquis interdum faceret, quod noctu posset, nisi in tempestate caeli; peiorem qui profestis diebus ageret, quod feriatis deberet; pessimum qui sereno die sub tecto potius operaretur quam in agro.” nequeo mihi temperare, quo minus unum exemplum antiquitatis adferam, ex quo intellegi possit, apud populum etiam de culturis agendi morem fuisse qualiterque defendi soliti sint illi viri. c. furius cresimus e servitute liberatus, cum in parvo admodum agello largiores multo fructus perciperet, quam ex amplissimis vicinitas, in invidia erat magna,

ceu fruges alienas perliceret veneficiis. quamobrem ab spurio albino curuli aedile die dicta metuens damnationem, cum in suffragium tribus oporteret ire, instrumentum rusticum omne in forum attulit et adduxit familiam suam validam atque, ut ait piso, bene curatam ac vestitam, ferramenta egregie facta, graves ligones, vomeres ponderosos, boves saturos. postea dixit: “veneficia mea, quirites, haec sunt, nec possum vobis ostendere aut in forum adducere lucubrationes meas vigiliasque et sudores.” omnium sententiis absolutus itaque est. profecto opera, non impensa, cultura constat, et ideo maiores fertilissimum in agro oculum domini esse dixerunt.

reliqua praecepta reddentur suis locis, quae propria generum singulorum erunt. interim communia, quae succurrunt, non omittemus, et in primis catonis humanissimum utilissimumque: id agendum, ut diligant vicini. causas reddit ille, nos existimamus nulli esse dubias. - inter prima idem cavet, ne familiae male sit. - nihil sero faciendum in agricultura omnes censent, iterumque suo quaeque tempore facienda, et tertio praecepto praetermissa frustra revocari. - de terra cariosa execratio catonis abunde indicata est, quamquam praedicere non cessantis. - quidquid per asellum fieri potest, vilissime constat. - filex biennio moritur, si frondem agere non patiaris. id efficacissime contingit germinantis ramis baculo decussis; sucus enim ex ipsa defluens necat radices. aiunt et circa solstitium avolsas non renasci nec harundine sectas aut exaratas vomeri harundine inposita. similiter et harundinem exarari filice vomeri inposita praecipiunt. - iuncosus ager verti pala debet aut in saxoso bidentibus. frutecta igni optime tolluntur. umidiorem agrum fossis concidi atque siccari utilissimum est, fossas autem cretosis locis apertas relinqui, in solutiore terra saepibus firmari vel proclivibus ac supinis lateribus procumbere; quasdam obcaecari et in alias dirigi maiores patentioresque et, si sit occasio, silice vel glarea sterni, ora autem earum binis utrimque lapidibus statuminari et alio superintegi. silvae extirpandae rationem democritus prodidit, lupini flore in suco cicutae uno die macerato sparsisque radicibus.

et quoniam praeparatus est ager, nunc indicabitur natura frugum. sunt autem duo prima earum genera: frumenta, ut triticum, hordeum, et legumina, ut faba, cicer. differentia notior, quam ut indicari deceat.

frumenti ipsius totidem genera per tempora satu divisa: hiberna, quae circa vergiliarum occasum sata terra per hiemem nutriuntur, ut triticum, hordeum; aestiva, quae aestate ante vergiliarum exortum seruntur, ut milium, panicum, sesama, horminum, irio, italiae dumtaxat ritu. alioquin in graecia et in asia omnia a vergiliarum occasu seruntur, quaedam autem utroque tempore in italia, ex his quaedam et tertio veris. aliqui verna milium, panicum, lentem, cicer, alicam appellant, sementiva autem triticum, hordeum, fabam, rapam. et in tritici genere pars aliqua pabuli est quadripedum causa sati, ut farrago, et in leguminibus, ut vicia; ad communem quadripedum hominumque usum lupinum.

legumina omnia singulas habent radices praeter fabam, easque surculosas, quia non in multa dividuntur, altissimas autem cicer. frumenta multis

radicantur fibris sine ramis. erumpit a primo satu hordeum die septimo, legumen quarto vel, cum tardissime, septimo, faba a xv ad xx, legumina in aegypto tertio die. ex hordeo alterum caput grani in radicem exit, alterum in herbam, quae et prior floret. radicem crassior pars grani fundit, tenuior florem, ceteris seminibus eadem pars et radicem et florem.

frumenta hieme in herba sunt, verno tempore fastigantur in stipulam quae sunt hiberni generis, at milium et panicum in culmum geniculatum et concavum, sesama vero in ferulaceum. omnium satorum fructus aut spicis continetur, ut tritici, hordei, muniturque vallo aristarum contra aves et parvas quadripedes, aut includitur siliquis, ut leguminum, aut vasculis, ut sesamae ac papaveris. milium et panicum tantum pro indiviso et parvis avibus expositum est; indefensum quippe membranis continetur.

panicum a paniculis dictum, cacumine languide nutante, paulatim extenuato culmo paene in surculum, praedensis acervatur granis, cum longissima, pedali phoba. milio comae granum complexae fimbriato capillo curvantur. sunt et panico genera mammosa, e pano parvis racemata paniculis, et cacumine gemino; quin et colore distinguuntur candido, nigro, rufo, etiam purpureo. panis multifariam et e milio fit, e panico rarus; sed nullum ponderosius frumentum est aut quod coquendo magis crescat. lx pondo panis e modio reducunt modiumque pultis ex tribus sextariis madidis. milium intra hos x annos ex india in italiam invectum est nigrum colore, amplum grano, harundineum culmo. adolescit ad pedes altitudine vii, praegrandibus comis - iubas vocant - , omnium frugum fertilissimum. ex uno grano sextarii terni gignuntur. seri debet in umidis.

frumenta quaedam in tertio genu spicam incipiunt concipere, quaedam in quarto, sed etiamnum occultam. genicula autem sunt tritico quaterna, farri sena, hordeo octona. sed non ante supra dictum geniculorum numerum conceptus est spicae, qui ut spem sui fecit, iiii aut v tardissime diebus florere incipiunt totidemque aut paulo pluribus deflorescunt, hordea vero, cum tardissime, diebus vii. Varro quater novenis diebus fruges absolvi tradit et mense nono meti.

fabae in folia exeunt ac deinde caulem emittunt nullis distinctum internodiis. reliqua legumina surculosa sunt. ex his ramosa cicer, ervum, lens. quorundam caules sparguntur in terram, si non habeant adminiculum; at pisa scandunt, si habuere, aut deteriora fiunt. leguminum unicaulis faba sola, unus et lupino, sed ... , ceteris ramosis praetenui surculo, omnibus vero fistulosis. folium quaedam ab radice emittunt, quaedam a cacumine, ut frumentum et hordeum. utrumque et quidquid in stipula est in cacumine unum folium habet - sed hordeo scabra sunt, ceteris levia - , multifolia contra faba, cicer, pisum. frumentis folium harundinaceum, fabae rotunda et magnae leguminum parti, longiora erviliae et piso, phasiolis venosa, sesamae et irioni sanguinea. cadunt folia lupino tantum et papaveri. legumina diutius florent, et ex his ervum ac cicer, sed diutissime faba, xl diebus, non autem singuli scapi tamdiu, quoniam alio desinente alius incipit, nec tota seges, sicut frumenti, pariter. siliquantur

vero omnia diversis diebus et ab ima primum parte, paulatim flore subeunte.

frumenta cum defloruere, crassescunt maturanturque, cum plurimum, diebus xl, item faba, paucissimis cicer. id enim a sementi diebus xl perficitur. milium et panicum et sesama et omnia aestiva xl diebus maturantur a flore, magna terrae caelique differentia. in aegypto enim hordeum sexto a satu mense, frumenta septimo metuntur, in hellade vii hordeum, in peloponneso octavo, et frumenta etiamnum tardius. grana in stipula crinito textu spicantur. in faba leguminibusque alternis lateribus siliquantur. fortiora contra hiemes frumenta, legumina in cibo.

tunicae frumento plures. hordeum maxime nudum et arinca, set praecipue avena. calamus altior frumento quam hordeo, arista mordacior hordeo. in area exteruntur triticum et siligo et hordeum. sic et seruntur pura, qualiter moluntur, quia tosta non sunt. e diverso far, milium, panicum purgari nisi tosta non possunt. itaque haec cum suis folliculis seruntur cruda. et far in vaginulis suis servant ad satus atque non torrent.

levissimum ex his hordeum raro excedit xv libras et faba xxii. ponderosius far magisque etiamnum triticum. far in aegypto ex olyra conficitur. tertium genus spicae hoc ibi est. galliae quoque suum genus farris dedere, quod illic bracem vocant, apud nos scandalam, nitidissimi grani. est et alia differentia, quod fere quaternis libris plus reddit panis quam far aliud. populum romanum farre tantum e frumento ccc annis usum verius tradit.

tritici genera plura, quae fecere gentes. italico nullum equidem comparaverim candore ac pondere, quo maxime decernitur. montanis modo comparetur italiae agris externum, in quo principatum tenuit boeotia, dein sicilia, mox africa. tertium pondus erat thracio, syrio, deinde et aegyptio, athletarum cum decreto, quorum capacitas iumentis similis quem diximus ordinem fecerat. graecia et ponticum laudavit, quod in italiam non pervenit. ex omni autem genere grani praetulit dracontian et strangian et selinusium argumento crassissimi calami. itaque pingui solo haec genera adsignabat. levissimum et maxime inane speudian, tenuissimi calami, in umidis seri iubebat, quoniam multo egeret alimento. haec fuere sententiae alexandro magno regnante, cum clarissima fuit graecia atque in toto orbe terrarum potentissima, ita tamen ut ante mortem eius annis fere cxlv sophocles poeta in fabula triptolemo frumentum italicum ante cuncta laudaverit, ad verbum tralata sententia: “et fortunatam italiam frumento serere candido.” quae laus peculiaris hodieque italico est; quo magis admiror posteros graecorum nullam mentionem huius fecisse frumenti.

nunc ex his generibus, quae romam invehuntur, levissimum est gallicum atque chersonneso advectum, quippe non excedunt modii vicens libras, si quis granum ipsum ponderet. sardum adicit selibram, alexandrinum et trientem - hoc et siculi pondus - , baeticum totam libram addit, africanum et dodrantem. in transpadana italia scio vicens quinas libras farris modios pendere, circa clusium et senas. lex certa naturae, ut in quocumque genere pani militari tertia portio ad grani pondus accedat, sicut optimum frumentum

esse, quod in subactum congium aquae capiat. quibusdam generibus per se pondus, sicut baliarico: modio tritici panis p. xxxv reddit; quibusdam binis mixtis, ut cyprio et alexandrino xx prope libras non excedentibus. cyprium fuscum est panemque nigrum facit, itaque miscetur alexandrinum candidum, redeuntque xxv pondo. thebaicum libram adicit. marina aqua subigi, quod plerique in maritimis locis faciunt occasione lucrandi salis, inutilissimum. non alia de causa opportuniore morbis corpora existunt. galliae et hispaniae frumento in potum resoluta quibus diximus generibus spuma ita concreta pro fermento utuntur, qua de causa levior illis quam ceteris panis. est differentia et calami, crassior quippe melioris est generis. plurimis tunicis thracium triticum vestitur ob nimia frigora illi plagae exquisitum. eadem causa et trimenstre invenit detinentibus terras nivibus, quod tertio fere a satu mense, cum et in reliquo orbe, metitur. totis hoc alpebus notum, et hiemalibus provinciis nullum hoc frumento laetius, unicalamum praeterea nec usquam capax, seriturque non nisi tenui terra. est et bimestre circa thraciae aenum, quod xl die, e quo satum est, maturescit, mirumque nulli frumento plus esse ponderis et furfuribus carere. utitur eo et sicilia et achaia, montuosis utraque partibus, euboea quoque circa carystum. in tantum fallitur columella, qui ne trimestris quidem proprium genus existimaverit esse, cum sit antiquissimum. graeci setanion vocant. tradunt in bactris grana tantae magnitudinis fieri, ut singula spicas nostras aequent.

primum ex omnibus frumentis seritur hordeum. dabimus et dies serendo cuique generi natura singulorum exposita. hordeum indis sativum et silvestre, ex quo panis apud eos praecipuus et alica. maxime quidem oryza gaudent, ex qua tisanam conficiunt, quam reliqui mortales ex hordeo. oryzae folia carnosa, porro similia, sed latiora, altitudo cubitalis, flos purpureus, radix gemmeae rotunditatis.

antiquissimum in cibus hordeum, sicut atheniensium ritu menandro auctore apparet et gladiatorum cognomine, qui hordearii vocabantur. polentam quoque graeci non aliunde praeferunt. pluribus fit haec modis. graeci perfusum aqua hordeum siccant nocte una ac postero die frigunt, dein molis frangunt. sunt qui vehementius tostum rursus exigua aqua adspargant et siccent, priusquam molant. alii vero virentibus spicis decussum hordeum recens purgant madidumque in pila tundunt atque in corbis eluunt ac siccatum sole rursus tundunt et purgatum molunt. quocumque autem genere praeparato vicinis hordei libris ternas seminis lini et coriandri selibram salisque acetabulum, torrentes omnia ante, miscent in mola. qui diutius volunt servare, cum polline ac furfuribus suis condunt novis fictilibus. italia sine perfusione tostum in subtilem farinam molit, isdem additis atque etiam milio.

panem ex hordeo antiquis usitatum vita damnavit, quadripedumque fere cibus est, cum tisanae inde usus validissimus saluberrimusque tanto opere probetur. unum laudibus eius volumen dicavit hippocrates e clarissimis medicinae scientia. tisanae bonitas praecipua uticensi. in aegypto vero est quae fiat ex hordeo, cui sunt bini anguli. in baetica et africa genus, ex quo fiat,

hordei glabrum appellat turranius. idem olyran et oryzan eandem esse existimat. tisanæ conficiendæ volgata ratio est.

simili modo e tritici semine tragus fit, in campania dumtaxat et aegypto, amyllum vero ex omni tritico ac siligine, sed optimum e trimestri. inventio eius chio insulae debetur; et hodie laudatissimum inde. est appellatum ab eo quod sine mola fiat. proximum trimestri quod e minime ponderoso tritico. madescit dulci aqua in ligneis vasis, ita ut integatur quinquies in die mutata; melius, si et noctu, ita ut misceatur pariter. emollitum priusquam acescat, linteo aut sportis saccatum tegulae infunditur inlitæ fermento, atque ita in sole densatur. post chium maxime laudatur creticum, mox aegyptium - probatur autem levore et levitate atque ut recens sit - , iam et catoni dictum apud nos.

hordei farina et ad medendum utuntur, mirumque in usu iumentorum ignibus durato ac postea molito offisque humana manu demissis in alvum maiores vires torosque corporis fieri. spicae quaedam binos ordines habent, quaedam plures usque ad senos. grano ipsi aliquot differentiae: longius leviusque aut brevius ac rotundius, candidius nigriusve, cui purpura est opimo ad polentam. contra tempestates candido maxima infirmitas. hordeum frugum omnium mollissimum est. seri non volt nisi in sicca et soluta terra ac nisi laeta. palea ex optimis, stramento vero nullum comparatur. hordeum ex omni frumento minime calamitosum, quia ante tollitur quam triticum occupet rubigo - itaque sapientes agricolae triticum cibariis tantum serunt, hordeum sacco seri dicunt - , propterea celerrime redit, fertilissimumque quod in hispaniae carthagine aprili mense collectum est. hoc seritur eodem mense in celtiberia, eodemque anno bis nascitur. rapitur omne a prima statim maturitate festinantius quam cetera. fragili enim stipula et tenuissima palea granum continetur. meliorem etiam polentam fieri tradunt, si non excocta maturitate tollatur.

frumenti genera non eadem ubique nec, ubi eadem sunt, isdem nominibus. volgatissima ex his atque pollentissima far, quod adorem veteres appellaverunt, siligo, triticum. haec plurimis terris communia. arinca galliarum propria, copiosa et italiae est, aegypto autem ac syriae ciliciaeque et asiae ac graeciae peculiares zea, oryza, tiphe. aegyptus similaginem conficit e tritico suo nequaquam italicae parem. qui zea utuntur non habent far. est et haec italiae, in campania maxime, semenque appellatur. hoc habet nomen res praeclara, ut mox docebimus, propter quam homerus $\zeta\epsilon\iota\delta\omega\rho\omicron\varsigma$ $\acute{\alpha}\rho\upsilon\rho\alpha$ dixit, non, ut aliqui arbitrantur, quoniam vitam donaret. amyllum quoque ex ea fit priore crassius; haec sola differentia est. ex omni genere durissimum far et contra hiemes firmissimum. patitur frigidissimos locos et minus subactos vel aestuosos sitientesque. primus antiquis latii cibus, magno argumento in adoriae donis, sicuti diximus. pulte autem, non pane, vixisse longo tempore romanos manifestum, quoniam et pulmentaria hodieque dicuntur et ennius, antiquissimus vates, obsidionis famem exprimens offam eripuisse plorantibus liberis patres commemorat. et hodie sacra prisca atque natalium pulte fitilla conficiuntur, videturque tam puls ignota graeciae fuisse quam italiae polenta.

tritici semine avidius nullum est nec quod plus alimenti trahat. siliginem proprie dixerim tritici delicias candore sive virtute sive pondere. conveniens umidis tractibus, quales italiae sunt et galliae comatae, sed trans alpes in allobrogum tantum remorumque agro pertinax, in ceteris ibi partibus biennio in triticum transit. remedium, ut gravissima quaeque grana eius serantur. e siligine lautissimus panis pistrinarumque opera laudatissima. praecellit in italia, si campana pisis natae misceatur. rufior illa, at pisana candidior ponderosiorque cretacea. iustum est e grano campanae, quam vocant castratam, e modio redire sextarios iv siliginis vel e gregali sine castratura sextarios v, praeterea floris semodium et cibarii, quod secundarium vocant, sextarios iv, furfuris sextarios totidem, e pisana autem siliginis sextarios v, cetera paria sunt. clusina arretinaque etiamnum sextarios siliginis adiciunt, in reliquis pares. si vero pollinem facere libeat, xvi pondo panis redeunt et cibarii iii furfurumque semodius. molae discrimine hoc constat. nam quae sicca moluntur, plus farinae reddunt, quae salsa aqua sparsa, candidiorem medullam, verum plus retinent in furfure. farinam a farre dictam nomine ipso apparet. siligineae farinae modius gallicae xx libras panis reddit, italicae duabus tribusve amplius in artopticio pane. nam furnaceis binas adiciunt libras in quocumque genere.

similiago e tritico fit, laudatissima ex africo. iustum est e modiis redire semodios et pollinis sextarios v - ita appellant in tritico quod florem in siligine; hoc aerariae officinae chartariaeque utuntur - , praeterea secundarii sextarios iv furfurumque tantundem, panis vero e modio similaginis p. xxii, e floris modio p. xvi. pretium huic annona media in modios farinae xl asses, similagini octonis assibus amplius, siligini castratae duplum. est et alia distinctio semel ... pollinatam xvii p. panis reddere, bis xviii, ter xix cum triente et secundarii panis quinas selibras, totidem cibarii et furfurum sextarios vi.

siligo numquam maturescit pariter, nec ulla segetum minus dilationem patitur propter teneritatem, iis quae maturuere protinus granum dimittentibus. sed minus quam cetera frumenta in stipula periclitatur, quoniam semper rectam habet spicam nec rorem continet, qui robiginem faciat. ex arinca dulcissimus panis. ipsa spissior quam far, et maior spica, eadem et ponderosior. raro modius grani non xvi libras implet. exteritur in graecia difficulter, ob id iumentis dari ab homero dicta. haec enim est quam olyram vocat. eadem in aegypto facilis fertilisque.

far sine arista est, item siligo, excepta quae laconica appellatur. adiciuntur his genera bromos et tragos, externa omnia, ab oriente invectae oryzae similia. tiphe et ipsa eiusdem est generis, ex qua fit in nostro orbe oryza. apud graecos est et zea, traduntque eam ac tiphen, cum sint degeneres, redire ad frumentum, si pistae serantur, nec protinus, sed tertio anno.

tritico nihil est fertilius - hoc ei natura tribuit, quoniam eo maxime alebat hominem - , utpote cum e modio, si sit aptum solum, quale in byzacio africae campo, centeni quinquageni modii reddantur. misit ex eo loco Divo Augusto

procurator eius ex uno grano, vix credibile dictu, cccc paucis minus germina, exstantque de ea re epistulae. misit et neroni similiter ccclx stipulas ex uno grano. cum centesimo quidem et leontini siciliae campi fundunt aliique et tota baetica et in primis aegyptus. fertilissima tritici genera ramosum ac quod centigranium vocant. inventus est iam et scapus unus centum fabis onustus.

aestiva frumenta diximus sesamam, milium, panicum. sesama ab indis venit. ex ea et oleum faciunt; colos eius candidus. huic simile est in asia graeciaque erysimum, idemque erat, nisi pinguius esset, quod apud nos vocant irionem, medicaminibus adnumerandum potius quam frugibus. eiusdem naturae et horminum graecis dictum, sed cumino simile; seritur cum sesama. hac et irione nullum animal vescitur virentibus.

pistura non omnium facilis, quippe etruria spicam farris tosti pisente pilo praeferrato fistula serrata et stella intus denticulata, ut, si intenti pisant, concidantur grana ferrumque frangatur. maior pars italiae nudo utitur pilo, rotis etiam, quas aqua verset, obiter et mola. de ipsa ratione pisendi magonis proponemus sententiam: triticum ante perfundi aqua multa iubet, postea evalli, dein sole siccatum in pila repeti, simili modo hordeum. huius sextarios xx spargi ii sextariis aquae. lentem torreri prius, dein cum furfuribus leviter pisi aut addito in sextarios xx lateris crudi frusto et harenae semodio. erviliam iisdem modis, quibus lentem. sesamam in calida maceratam exporrigi, dein confricari et frigida mergi, ut paleae fluctuentur, iterumque exporrigi in sole super lintea, quod nisi festinato peragatur, lurido colore mucescere. et ipsa autem, quae evalluntur, variam pistrinarum rationem habent. acus vocatur, cum per se pisitur spica tantum, aurificum ad usus, si vero in area teritur cum stipula, palea, in maiore terrarum parte ad pabula iumentorum. mili et panici et sesamae purgamenta adpludam vocant et alibi aliis nominibus.

milio campania praecipue gaudet pultemque candidam ex eo facit. fit et panis praedulcis. sarmatarum quoque gentes hac maxime pulte aluntur et cruda etiam farina, equino lacte vel sanguine e cruris venis admixto. aethiopes non aliam frugem quam mili hordeique novere.

panico et galliae quidem, praecipue aquitania utitur, sed et circumpadana italia addita faba, sine qua ... ponticae gentes nullum panico praeferrunt cibum. - cetera aestiva frumenta riguis magis etiam quam imbris gaudent, milium et panicum aquis minime, cum in folia exeunt. vetant ea inter vites arboresve frugiferas seri, terram emaciari hoc satu existimantes.

mili praecipuus ad fermenta usus e musto subacti in annum tempus. simile fit e tritici ipsius furfuribus minutis et optimis e musto albo triduo maceratis, subactis ac sole siccatis. inde pastillos in pane faciendo dilutos cum similagine seminis fervefaciunt atque ita farinae miscent, sic optimum panem fieri arbitantes. graeci in binos semodios farinae satis esse bessem fermenti constituere. et haec quidem genera vindemiis tantum fiunt; quo libeat vero tempore ex aqua hordeoque bilibres offae ferventi foco vel fictili patina torrentur cinere et carbone, usque dum rubeant. postea operiuntur in vasis, donec acescant. hinc fermentum diluitur. cum fieret autem panis hordeacius,

ervi aut cicerulae farina ipse fermentabatur; iustum erat ii librae in v semodios. nunc fermentum fit ex ipsa farina, quae subigitur, priusquam addatur sal, ad pultis modum decocta et relictā, donec acescat. vulgo vero nec suffervefaciunt, sed tantum pridie adservata materia utuntur, palamque est naturam acore fermentari, sicut evalidiora esse corpora, quae fermentato pane alantur, quippe cum apud veteres ponderosissimo cuique tritico praecipua salubritas perhibita sit.

panis ipsius varia genera persequi supervacuum videtur, alias ab opsoniis appellati, ut ostrearii, alias a deliciis, ut artolagani, alias a festinatione, ut speustici, nec non a coquendi ratione, ut furnacei vel artopticii aut in clibanis cocti, non pridem etiam e parthis invecto quem aquaticum vocant, quoniam aqua trahitur ad tenuem et spongiosam inanitatem, alii parthicum. summa laus siliginis bonitate et cribri tenuitate constat. quidam ex ovis aut lacte subigunt, butyro vero gentes etiam pacatae, ad operis pistorii genera transeunte cura. durat sua piceno in panis inventione gratia ex alicae materia. eum novem diebus maceratum decumo ad speciem tractae subigunt uvae passae suco, postea in furnis ollis inditum, quae rumpantur ibi, torrent. neque est ex eo cibus nisi madefacto, quod fit lacte maxime mulso.

pistores romae non fuere ad persicum usque bellum annis ab urbe condita super dlxxx. ipsi panem faciebant quirites, mulierumque id opus maxime erat, sicut etiam nunc in plurimis gentium. artoptas iam plautus appellat in fabula, quam aululariam inscripsit, magna ob id concertatione eruditorum, an is versus poetae sit illius, certumque fit atei capitonis sententia cocos tum panem lautioribus coquere solitos, pistoresque tantum eos, qui far pisebant, nominatos. nec cocos vero habebant in servitiis, eosque ex macello conducebant. cribrorum genera galliae saetis equorum invenere, hispaniae lino excussoria et pollinaria, aegyptus papyro atque iunco.

sed inter prima dicatur et alicae ratio praestantissimae saluberrimaeque, quae palma frugum indubitata italiae contingit. fit sine dubio et in aegypto, sed admodum spemenda, in italia vero pluribus locis, sicut veronensi pisanoque agro, in campania tamen laudatissima. campus est subiacens montibus nimborum, totus quidem [xl] p. planities. terra eius, ut protinus soli natura dicatur, pulvereā summa, inferior bibula et pumicis vice fistulosa quoque. montium culpa in bonum cedit. crebros enim imbres percolat atque transmittit, nec dilui aut madere voluit propter facilitatem culturae, eadem acceptum umorem nullis fontibus reddit, sed temperate concoquens intra se vice suci continet. seritur toto anno, panico semel, bis farre. et tamen vere segetes, quae interquievere, fundunt rosam odoratiorem sativa. adeo terra non cessat parere, unde volgo dictum, plus apud campanos unguenti quam apud ceteros olei fieri. quantum autem universas terras campus campanus antecedit, tantum ipsum pars eius, quae leboriae vocantur, quem phlegraeum graeci appellant. finiuntur leboriae via ab utroque latere consulari, quae a puteolis et quae a cumis capuam ducit.

alica fit e zea, quam semen appellavimus. tunditur granum eius in pila

ligna, ne lapidis duritia conterat, mobili, ut notum est, pilo victorum poenali opera. primori inest pyxis ferrea. excussis inde tunicis iterum isdem armamentis nudata conciditur medulla. ita fiunt alicae tria genera: minimum ac secundarium, grandissimum vero aphaerema appellant. nondum habent candorem suum, quo praecellunt, iam tamen alexandrinae praeferuntur. postea, mirum dictu, admiscetur creta, quae transit in corpus coloremque et teneritatem adfert. invenitur haec inter puteolos et neapolim in colle leucogaeo appellato, extatque Divi Augusti decretum, quo annua ducena milia neapolitanis pro eo numerari iussit e fisco suo, coloniam deducens capuam, adiecitque causam adserendi, quoniam negassent campani alicam confici sine eo metallo posse. - (in eodem reperitur et sulphur, emicantque fontes araxi oculorum claritati et vulnerum medicinae dentiumque firmitati.) -

alica adulterina fit maxime quidem e zea, quae in africa degenerat. latiores eius spicae nigrioresque et brevi stipula. pisunt cum harena et sic quoque difficulter deterunt utriculos, fitque dimidia nudi mensura, posteaque gypsi pars quarta inspargitur atque, ut cohaesit, farinario cribro subcernunt. quae in eo remansit, excepticia appellatur et grandissima est. rursus, quae transit, artiore cernitur et secundaria vocatur, item cribraria, quae simili modo in tertio remansit cribro angustissimo et tantum harenas transmittente. alia ratio ubique adulterandi ex tritico: candidissima et grandissima eligunt grana ac semicocta in ollis postea arefaciunt sole ad dimidium rursusque leviter adpersa molis frangunt. ex zea pulchrius quam e tritico fit tragus, quamvis id alicae vitium sit. candorem autem ei pro creta lactis incocti mixtura confert.

sequitur leguminum natura, inter quae maxime honos fabae, quippe ex qua temptatus sit etiam panis. lomentum appellatur farina ex ea, adgravaturque pondus illa et omni legumine, iam vero et pabulo, in pane venali. fabae multiplex usus omnium quadripedum generi, praecipue homini. frumento etiam miscetur apud plerasque gentes, et maxime panico solida ac delicatius fracta. quin et prisco ritu puls fabata suae religionis diis in sacro est. praevalens pulmentari cibo, set hebetare sensus existimata, insomnia quoque facere, ob haec pythagoricae sententiae damnata, ut alii tradidere, quoniam mortuorum animae sint in ea, qua de causa parentando utique adsumitur. Varro et ob haec flaminem ea non vesci tradit et quoniam in flore eius litterae lugubres reperiantur. in eadem peculiaris religio, namque fabam utique ex frugibus referre mos est auspici causa, quae ideo referiva appellatur. et auctionibus adhibere eam lucrosam putant. sola certe frugum etiam exesa repletur crescente luna. aqua marina aliave salsa non percoquitur. seritur ante vergiliarum occasum leguminum prima, ut antecedit hiemem. vergilius eam per ver seri iubet circumpadanae italiae ritu, sed maior pars malunt fabalia maturae sationis quam trimestrem fructum. eius namque siliquae caulesque gratissimo sunt pabulo pecori. aquas in flore maxime concupiscit, cum vero defloruit, exiguas desiderat. solum, in quo sata est, laetificat stercoris vice. ideo circa macedoniam thessaliamque, cum florere coepit, vertunt arva. nascitur et sua sponte plerisque in locis, sicut septentrionalis oceani insulis,

quas ob id nostri fabarias appellant, item in mauretania silvestris passim, sed praedura et quae percoqui non possit. nascitur et in aegypto spinoso caule, quae de causa crocodili oculis timentes refugiunt. longitudo scapo quattuor cubitorum est amplissima, crassitudo digiti. nisi genicula abessent, molli calamo similis; caput papaveri, colore roseo, in eo fabae non supra tricenae; folia ampla, fructus ipse amarus et odore, sed radix perquam grata incolarum cibis, cruda et omni modo cocta, harundinum radicibus similis. nascitur et in syria ciliciaque et in toronae chalcidices lacu.

ex leguminibus autumnus vereve seruntur lens et in graecia pisum. lens amat solum tenue magis quam pingue, caelum utique siccum. duo genera eius aegypto, alterum rotundius nigriusque, alterum sua figura, unde vario usu tralatum est in lenticulas nomen. invenio apud auctores aequanimitatem fieri vescentibus ea. pisum in apricis seri debet frigoribus inpatientissimum. ideo in italia et in austeriore caelo non nisi verno tempore terra facili, soluta.

ciceris natura est gigni cum salsilagine, ideo solum urit nec nisi madefactum pridie seri debet. differentiae plures, magnitudine, colore, figura, sapore. est enim arietino capiti simile, unde ita appellatur, album nigrumque; est et columbinum, quod alii venerium appellant, candidum, rotundum, leve, arietino minus, quod religio pervigiliis adhibet. est et cicercula minuti ciceris, inaequalis, angulosi, veluti pisum, dulcissimum autem id quod ervo simillimum, firmiusque quod nigrum et rufum quam quod album.

siliquae rotundae ciceri, ceteris leguminum longae et ad figuram seminis latae, piso cylindratae. passiolorum cum ipsis manduntur granis. serere eos qua velis terra licet ab idibus octobr. in kal. novembris. legumina, cum maturescere coeperunt, rapienda sunt, quoniam cito exiliunt latentque, cum decidere, sicut et lupinum. quamquam prius de rapis dixisse conveniat - in transcurso ea attingere nostri, paulo diligentius graeci, et ipsi tamen inter hortensia - si iustus ordo fiat, a frumento protinus aut certe faba dicendis, quando alius usus praestantior ab iis non est.

ante omnia namque cunctis animalibus nascuntur, nec in novissimis satiant ruris alitum quoque genera, magisque si decoquantur aqua. quadrupes et fronde eorum gaudent, et homini non minore rapiciorum suis horis gratia quam cymarum, flavidorum quoque et in horreis enecatorum vel maiore quam virentium. ipsa vero durant et in sua terra servata et postea passa paene ad alium proventum, famemque sentiri prohibent. a vino atque messe tertius hic transpadanis fructus. terram non morose eligit, paene ubi nihil aliud seri possit. nebulis et pruinis ac frigore ultro aluntur, amplitudine mirabili; vidi xl libras excedentia. in cibis quidem nostris pluribus modis commendantur, durantque ad alia sinapis acrimonia domita, etiam coloribus picta praeter suum sex aliis, purpureo quoque. neque aliud in cibis tingui decet. genera eorum graeci duo prima fecere, masculinum femininumque, et ea serendi modo ex eodem semine: densiore enim satu masculinescere, item in terra difficili. semen praestantius quo subtilius. species vero omnium tres. aut enim in latitudinem fundi, aut in rotunditatem globari. tertiam speciem silvestrem

appellavere, in longitudinem radice procurrente, raphani similitudine et folio anguloso scabroque, suco acri, qui circa messem exceptus oculos purget medeaturque caligini admixto lacte mulierum. frigore dulciora fieri existimantur et grandiora. tepore in folia exeunt. palma in nursino agro nascentibus - taxatio in libras sesterti singuli et in penuria bini - , proxima in algido natis, napis vero amiterni. quorum eadem fere natura: gaudent aequae frigidis. seruntur et ante kalendas martias, in iugero sextarii iiii. diligentiores quinto sulco napum seri iubent, rapa quarto, utrumque stercoreato, rapa laetiora fieri, si cum palea semen inaretur. serere nudum volunt precantem sibi et vicinis serere se. satus utrique generi iustus inter duorum numinum dies festos, neptuni atque volcani, feruntque subtili observatione, quota luna praecedente hieme nix prima ceciderit, si totidem luminum die intra praedictum temporis spatium serantur, mire provenire. seruntur et vere in calidis atque umidis.

lupino usus proximus, cum sit et homini et quadripedum generi ungulas habenti communis. remedium eius, ne metentes fugiat exiliendo, ut ab imbre tollatur. nec ullius quae seruntur natura ad sensum ... terraeque mirabilior est. primum omnium cotidie cum sole circumagitur horasque agricolis etiam nubilo demonstrat. ter praeterea floret. terram amat terraque operiri non vult. et unum hoc seritur non arato. quaerit maxime sabulosa et sicca atque etiam harenosa. coli utique non vult. tellurem adeo amat, ut, quamvis fructuoso solo coiectum inter folia vepresque, ad terram tamen radice perveniat. pinguescere hoc satu arva vineasque diximus; itaque adeo non eget fimo, ut optimi vicem repraesentet, nihilque aliud nullo impendio constat, ut quod ne serendi quidem gratia opus sit adferre: protinus seritur ex area ac ne spargi quidem postulat decidens sponte. primumque omnium seritur, novissimum tollitur, utrumque septembri fere mense, quia, si non antecessit hiemem, frigoribus obnoxium est. inpune praeterea iacet, vel derelictum etiam, si non protinus secuti obruant imbres, ab omnibus animalibus amaritudine sua tutum, plerumque tamen levi sulco integunt. ex densiore terra rubricam maxime amat. ad hanc alendam post tertium florem verti debet, in sabulo post secundum. cretosa tantum limosaeque odit et in his non provenit. maceratum calida aqua homini quoque in cibo est. nam bovem unum modii singuli satiant validumque praestant, quando etiam inpositum puerorum ventribus pro remedio est. condi in fumo maxime convenit, quoniam in umido vermiculi umbilicum eius in sterilitatem castrant. si depastum sit in fronde, inarari protinus solum opus est.

et vicia pinguescunt arva, nec ipsa agricolis operosa. uno sulco sata non saritur, non stercoreatur nec aliud quam deoccurtur. sationis eius tria tempora: circa occasum arcturi, ut decembri mense pascat. tum optime seritur in semen. aequae namque fert depasta. secunda satio mense ianuario est, novissima martio, tum ad frondem utilissima. siccitatem ex omnibus, quae seruntur, maxime amat. non aspernatur etiam umbrosa. ex semine eius, si lecta matura est, palea ceteris praefertur. vitibus praeripit sucum, languescuntque, si in arbusto seratur.

nec ervi operosa cura est. hoc amplius quam vicia runcatur, et ipsum medicaminis vim optinens, quippe cum Divom Augustum curatum epistulis ipsius memoria exstet. sufficiunt singulis boum iugis modi quini sati. martio mense satum noxium esse bobus aiunt, item autumnno gravedinosum, innoxium autem fieri primo vere satum.

et silicia, hoc est fenum graecum, scariphatione seritur, non altiore quattuor digitorum sulco, quantoque peius tractatur, tanto provenit melius. rarum dictu esse aliquid, cui prosit neglegentia. id autem, quod secale ac farrago appellatur, occari tantum desiderat.

secale taurini sub alpibus asiam vocant, deterrimum et tantum ad arcendam famem, fecunda, sed gracili stipula, nigritia triste, pondere praecipuum. admiscetur huic far, ut mitiget amaritudinem eius, et tamen sic quoque ingrattissimum ventri est. nascitur qualicumque solo cum centesimo grano, ipsumque pro laetamine est.

farrago ex recrementis farris praedensa seritur, admixta aliquando et vicia. eadem in africa fit ex hordeo. omnia haec pabularia, degeneransque ex leguminibus quae vocatur cracca, in tantum columbis grata, ut pastas ea negent fugitivas illius loci fieri.

apud antiquos erat pabuli genus, quod cato ocinum vocat, quo sistebant alvom bubus. id erat e pabuli segete viride desectum, antequam generaret. sura mamilius aliter id interpretatur et tradit fabae modios x, viciae ii, tantundem erviliae in iugero autumnno misceri et seri solitos, melius et avena graeca, cui non cadit semen, admixta. hoc vocitatum ocinum boumque causa seri solitum. Varro appellatum a celeritate proveniendi e graeco, quod ὠκείως dicunt.

medica externa etiam graeciae est, ut a medis advecta per bella persarum, quae darius intulit, sed vel in primis dicenda tanta dos est cum ex uno satu amplius quam tricenis annis duret. similis est trifolio caule foliisque, geniculata. quidquid in caule adsurgit, folia contrahuntur. unum de ea et cytiso volumen amphilochns composuit. solum, in quo seratur, elapidatum purgatumque subigitur autumnno, mox aratum et occatum integitur crate iterum ac tertium, quinis diebus interpositis et fimo addito. poscit autem siccum sucosumque vel riguum. ita praeparato seritur mense maio, alias pruinis obnoxia. opus est densitate seminis omnia occupari internascentesque herbas excludi - id praestant in iugera modi iii - et cavendum ne adurat sol, terraque protinus integri debet. si sit umidum solum herbosumve, vincitur et desciscit in pratum. ideo protinus altitudine unciali herbis omnibus liberanda est, manu potius quam sarculo. secatur incipiens florere et quotiens reffloruit. id sexies evenit per annos, cum minimum, quater. in semen maturescere prohibenda est, quia pabulum utilius est usque ad trimatum. verno sariri debet liberarique ceteris herbis, ad trimatum marris ad solum radi. ita reliquae herbae intereunt sine ipsius damno propter altitudinem radicum. si evicerint herbae, remedium unicum in aratro, saepius vertendo, donec omnes aliae radices intereant. dari non ad satietatem debet, ne deplere sanguinem necesse sit. et viridis utilior

est. arescit surculose ac postremo in pulverem inutilem extenuatur. de cytiso, cui et ipsi principatus datur in pabulis, adfatim diximus inter frutices. et nunc frugum omnium natura peragenda est, cuius in parte de morbis quoque dicatur.

primum omnium frumenti vitium avena est, et hordeum in eam degenerat sic, ut ipsa frumenti sit instar, quippe cum germaniae populi serant eam neque alia pulte vivant. soli maxime caelique umore hoc evenit vitium. sequentem causam habet inbecillitas seminis, si diutius retentum est terra, priusquam erumpat. eadem ratio et si cariosum fuit, cum sereretur. prima autem statim eruptione agnoscitur, ex quo apparet in radice esse causam. est et aliud ex vicino avenae vitium, cum amplitudine inchoata granum, sed nondum matura, prius quam roboret corpus, adflatu noxio cassum et inane in spica evanescit quodam abortu.

venti autem tribus temporibus nocent frumento et hordeo: in flore aut protinus cum defloruere vel maturescere incipientibus. tum enim exinaniunt grana, prioribus causis nasci prohibent. nocet et sol creber ex nube. nascuntur et vermiculi in radice, cum sementem imbribus secutis inclusit repentinus calor umorem. gignuntur et in grano, cum spica e pluviis calore infervescit. est et cantharis dictus scarabaeus parvus, frumenta erodens. omnia ea animalia cum cibo deficiunt. oleum, pix, adips contraria seminibus, cavendumque ne contacta eis serantur. imber in herba utilis a partu, florentibus autem frumento et hordeo nocet, leguminibus innocuus praeterquam ciceri. maturescentia frumenta imbre laeduntur et hordeum magis. nascitur et herba alba, panico similis, occupans arva, pecori quoque mortifera. nam lolium et tribulos et carduos lappasque non magis quam rubos inter frugum morbos potius quam inter ipsius terrae pestes numeraverim. caeleste frugum vinearumque malum nullo minus noxium est robigo. frequentissima haec in roscido tractu convallibusque ac perflatum non habentibus; e diverso carent ea ventosa et excelsa. inter vitia segetum et luxuria est, cum oneratae fertilitate procumbunt. commune autem omnium satorum vitium uricae, etiam ciceris, cum salsilaginem eius abluendo imber dulcius id facit.

est herba, quae cicer enecat et ervum circumligando se; vocatur orobanche. tritico simili modo aera, hordeo festuca, quae vocatur aegilops, lenti herba securiclata, quam graeci a similitudine pelecinum vocant; et hae complexu necant. circa philippos ateramum nominant in pingui solo herbam, qua faba necatur, teramum, qua in macro, cum udam quidam ventus adflavit. aerae granum minimum est in cortice aculeato. cum est in pane, celerrime vertigines facit, aiuntque in asia et graecia balneatores, cum velint turbam pellere, carbonibus id semen inicere. nascitur et phalangion in ervo, bestiola aranei generis, si hiems aquosa sit. limaces nascuntur in vicia et aliquando e terra, cocleae minutae, mirum in modum erodentes eam. et morbi quidem fere hi sunt.

remedia eorum, quaecumque pertinent ad herbas, in sarculo et, cum semen iactatur, cinere. quae vero in semine et circa radicem consistunt, praecedente

cura caventur. vino ante semina perfusa minus aegrotare existimant. vergilius nitro et amurca perfundi iubet fabam; sic etiam grandescere promittit. quidam vero, si triduo ante satum urina et aqua maceretur, praecipue adolescere putant; ter quidem saritam modium fractae e modio solidae reddere. reliqua semina, cupressi foliis tuis si misceantur, non esse vermiculis obnoxia, nec si interlunio serantur. multi ad mili remedia rubetam noctu arvo circumferri iubent, priusquam sariatur, defodique in medio inclusam fictili. ita nec passerem nec vermes nocere, sed eruendam, priusquam metatur; alioquin amarum fieri. quin et armo talpae contacta semina uberiora esse. democritus suco herbae, quae appellatur aizoum, in tegulis nascens, et ab aliis aesum, latine vero sedum aut digitillum, medicata seri iubet omnia semina. vulgo vero, si dulcedo noceat et vermes radicibus inhaereant, remedium est amurca pura ac sine sale spargere, dein sarire, si in articulum seges ire coeperit, runcare, ne herbae vincant. pestem a milio atque panico, sturnorum passerumve agmina, scio abigi herba, cuius nomen ignotum est, in quattuor angulis segetis defossa, mirum dictu, ut omnino nulla avis intret. mures abiguntur cinere mustelae vel felis diluto et semine sparso vel decoctarum aqua. sed redolet virus animalium eorum etiam in pane. ob id felle bubulo semina attingi utilius putant. rubigo quidem, maxima segetum pestis, lauri ramis in arvo defixis transit in ea folia ex arvis. luxuria segetum castigatur dente pecoris in herba dumtaxat, et depastae quidem vel saepius nullam in spica iniuriam sentiunt. retonsarum etiam semel omnino certum est granum longius fieri et inane cassumque ac satum non nasci. babylone tamen bis secant, tertium depascunt; alioquin folia tantum fierent. sic quoque cum quinquagesimo fenore messes reddit eximia fertilitas soli, diligentioribus vel cum centesimo. neque est cura difficilis quam diutissime aqua rigandi, ut praepinguis et densa ubertas diluatur. limum autem non invehunt euphrates tigrisque sic ut in aegypto nilus, nec terra ipsa herbas gignit. ubertas tamen tanta est, ut sequente anno sponte restibilis fiat seges inpressis vestigio seminibus. quae tanta soli differentia admonet terrae genera in fruges describere.

igitur catonis haec sententia est: in agro crasso et laeto frumentum seri, si vero nebulosus sit idem, rapa, raphanos, milium, panicum. in frigido, aquoso prius serendum, postea in calido, in solo autem rubricoso vel pullo vel harenoso, si non sit aquosum, lupinum; in creta et rubrica et aquosiore agro adoreum; in sicco et non herboso nec umbroso triticum; in solo valido fabam; viciam vero quam minime aquoso herbidoque; siliginem et triticum in loco aperto, edito, qui sole quam diutissime torreatur; lentem in rudecto et rubricoso, qui non sit herbidus; hordeum in novali et in arvo, quod restibile possit fieri; trimestre, ubi sementem maturam facere non possis et cuius crassitudo sit restibilis.

subtilis et illa sententia: serenda ea in tenuiore terra, quae non multo indigent suco, ut cytissus et cicere excepto legumina quae velluntur e terra, non subsecantur - unde et legumina appellata, quia ita leguntur - , in pingui autem

quae cibi sunt maioris, ut olus, triticum, siligo, linum. sic ergo tenue solum hordeo dabitur - minus enim alimenti radix poscit - , laetior terra densiorque tritico. in loco umidiore far adorem potius quam triticum seretur, temperato et triticum et hordeum. colles robustius, sed minus reddunt triticum. far, siligo et cretosum et uliginosum solum patiuntur.

ex frugibus ostentum semel, quod equidem invenerim, accidit p. aelio cn. cornelio cos., quo anno superatus est Hannibal. in arboribus enim tum nata produntur frumenta.

et quoniam de frugum terraeque generibus abunde diximus, nunc de arandi ratione dicemus, ante omnia aegypti facilitate commemorata. nilus ibi coloni vice fungens evagari incipit, ut diximus, a solstitio ac nova luna, primo lente, dein vehementius, quamdiu in leone sol est. mox pigrescit in virginem transgresso atque in libra residit. si xii cubita non excessit, fames certa est, nec minus si xvi exsuperavit. tanto enim tardius decedit, quanto abundantius crevit, et sementem arcet. vulgo credebatur a decessu eius serere solitos, mox sues inpellere vestigiis semina deprimentes in madido solo, et credo antiquitus factitatum, nunc quoque non multo graviore opera; sed tamen inarari certum est abiecta prius semina in limo degressi amnis. hoc fit novembri mense incipiente, postea pauci runcant - botanismon vocant - , reliqua pars non nisi cum falce arva visit paulo ante kal. apriles. peragitur autem messis mense maio, stipula numquam cubitali, quippe sabulum subest granumque limo tantum continetur. excellentius thebaidis regioni frumentum, quoniam palustris aegyptus. similis ratio, sed felicitas maior babyloniae seleucia, euphrate atque tigri restagnantibus, quoniam rigandi modus ibi manu temperatur. syria quoque tenui sulco arat, cum multifariam in italia octoni boves ad singulos vomeres anhelent. in omni quidem parte culturae, sed in hac maxime valet oraculum illud: “quid quaeque regio patiatur.”

vomerum plura genera: culter vocatur inflexus praedensam, priusquam proscindatur, terram secans futurisque sulcis vestigia praescribens incisuris, quas resupinus in arando mordeat vomer. alterum genus est volgare rostrati vectis. tertium in solo facili, nec toto porrectum dentali, sed exigua cuspidem in rostro. latior haec quarto generi et acutior in mucronem fastigata eodemque gladio scindens solum et acie laterum radices herbarum secans. non pridem inventum in raetia galliae duas addere tali rotulas, quod genus vocant plaumorati. cuspis effigiem palae habet. serunt ita non nisi culta terra et fere nova. latitudo vomeris caespites versat. semen protinus iniciunt cratesque dentatas supertrahunt. nec sarienda sunt hoc modo sata, sed protelis binis ternisque sic arant. uno boum iugo censi anno facilis soli quadragena iugera, difficilis tricena iustum est.

in arando magnopere servandum est catonis oraculum: “quid est bene agrum colere bene arare. quid secundum arare. quid tertium stercorare. sulco vario ne ares. tempestive ares.” tepidioribus locis a bruma proscindi arva oportet, frigidioribus ab aequinoctio verno, et maturius sicca regione quam umida, maturius densa terra quam soluta, pingui quam macra. ubi siccae et

graves aestates, terra cretosa aut gracilis, utilius inter solstitium et autumnum aequinoctium aratur; ubi leves aestus, frequentes imbres, pingue herbosumque solum, ibi mediis caloribus. altum et grave solum etiam hieme moveri placet, tenue valde et aridum paulo ante sationem.

sunt et huic suae leges: lutosam terram ne tangito. vi omni arato. prius quam ares proscindito. hoc utilitatem habet, quod inverso caespite herbarum radices necantur. quidam utique ab aequinoctio verno proscindi volunt. - quod vere semel aratum est, a temporis argumento vervactum vocatur. hoc in novali aequae necessarium est. novale est quod alternis annis seritur. - araturos boves quam artissime iungi oportet, ut capitibus sublatis arent - sic minime colla contundunt - ; si inter arbores vitesque aretur, fiscellis capistrari, ne germinum tenera praecerpant; securiculam in stiva pendere, qua intercendantur radices - hoc melius quam convelli aratro bovesque luctari - ; in arando versum peragi nec strigare in actu spiritus. iustum est proscindi sulco dodrantali iugerum uno die, iterari sesquijugerum, si sit facilitas soli; si minus, proscindi semissem, iterari assem, quando et animalium labori natura leges statuit. omne arvum rectis sulcis, mox et obliquis subigi debet. in collibus traverso tantum monte aratur, sed modo in superiora modo in inferiora rostrante vomere, tantumque est laboris homini, ut etiam boum vice fungatur. certe sine hoc animali montanae gentes sarculis arant. arator nisi incurvus praevaricatur. inde tralatum hoc crimen in forum. ibi utique caveatur, ubi inventum est. purget vomerem subinde stimulus cuspidatus ralio. scamna inter duos sulcos cruda ne relinquantur, glabrae ne exultent. male aratur arvum, quod satis frugibus occidendum est. id demum recte subactum erit, ubi non intellegitur, utro vomer ierit. in usu est et collicias interponere, si ita locus poscat, ampliore sulco, quae in fossas aquam educant.

aratione per traversum iterata occasio sequitur, ubi res poscit, crate vel rastro, et sato semine iteratur haec quoque, ubi consuetudo patitur, crate contenta vel tabula aratro adnexa - quod vocant lirare - operiente semina; ni operiantur, quae primum appellata, deliratio est. quarto seri sulco vergilius existimatur voluisse, cum dixit optimam esse segetem, quae bis soles, bis frigora sensisset. spissius solum, sicut plerumque in italia, quinto sulco seri melius est, in tuscis vero nono. at fabam et viciam non proscisso serere sine damno compendium operae est.

non omitemus unam etiamnum arandi rationem in transpadana italia bellorum iniuria excogitatam. salassi cum subiectos alpis depopularentur agros, panicum miliumque iam excrescens temptavere. postquam respuebat natura, inararunt. at illae messes multiplicatae docuere quod nunc vocant artrare, id est aratrare, ut credo, tunc dictum. hoc fit vel incipiente culmo, cum iam se ad bina ternave emisit folia. nec recens subtrahemus exemplum in treverico agro tertio ante hunc annum conpertum. nam cum hieme praegelida captae segetes essent, reseverunt etiam campos mense martio uberrimasque messes habuerunt.

nunc reliqua cultura tradetur per genera frugum.

siliginem, far, triticum, semen, hordeum occato, sarito, runcato quibus dictum erit diebus. singulae operae cuique generi in iugero sufficient. sarculatio induratum hiberno rigore soli tristitiam laxat temporibus vernis novosque soles admittit. qui sariet, caveat ne frumenti radices subfodiat. triticum, semen, hordeum, fabam bis sarire melius. runcatio, cum seges in articulum exiit, evolsis inutilibus herbis, frugum radices vindicat segetemque discernit a caespite. leguminum cicer eadem quae far desiderat. faba runcari non gestit. quoniam evincit herbas lupinum, occatur tantum. milium et panicum occatur et saritur, non iteratur, non runcatur. silicia et phasioli occantur tantum. sunt genera terrae, quorum ubertas pectinari segetem in herba cogat - cratis et hoc genus dentatae stilis ferreis - , eademque nihilominus et depascuntur. quae depasta sunt, sarculo iterum excitari necessarium. at in bactris, africa, cyrenis omnia haec supervacua fecit indulgentia caeli, et a semente non nisi messibus in arva redeunt, quia siccitas coercet herbas, fruges nocturno tantum rore nutriens. vergilius alternis cessare arva suadet - si patiantur ruris spatia, utilissimum procul dubio est - ; quod si neget condicio, far serendum, unde lupinum aut vicia aut faba sublata sint et quae terram faciant laetiores. inprimisque et hoc notandum, quaedam propter alia seri obiter, si parum provenire, ut priore diximus volumine, ne eadem saepius dicantur; plurimum enim refert soli cuiusque ratio.

civitas africae in mediis harenis petentibus syrtis leptimque magnam vocatur tacape, felici super omne miraculum riguo solo. ternis fere milibus passuum in omnem partem fons abundat, largus quidem, sed certis horarum spatiis dispensatur inter incolas. palmae ibi praegrandi subditur olea, huic ficus, fico punica, illi vitis, sub vite seritur frumentum, mox legumen, deinde olus, omnia eodem anno, omniaque aliena umbra aluntur. quaterna cubita eius soli in quadratum, nec ut a porrectis metiantur digitis, sed in pugnum contractis, quaternis denariis venundantur. super omnia est bifera vite bis anno vindemiare. et nisi multiplici partu exinaniatur ubertas, pereant luxuria singuli fructus. nunc vero toto anno metitur aliquid, constatque fertilitati non occurrere homines. aquarum quoque differentia magna riguis. est in narbonensi provincia nobilis fons orgae nomine. in eo herbae nascuntur in tantum expetita bubus, ut mersis capitibus totis eas quaerant. sed illas in aqua nascentes certum est non nisi imbribus ali. ergo suam quisque terram aquamque noverit.

si fuerit illa terra, quam appellavimus teneram, poterit sublato hordeo seri milium, eo condito rapae, his sublatis hordeum rursus vel triticum, sicut in campania, satisque talis terra aratur, cum saritur. alius ordo ut, ubi adorem fuerit, cesset quattuor mensibus hibernis et vernam fabam recipiat. ante hiemalem ne cesset. nimis pinguis alternari potest ita, ut frumento sublato legumen tertio seratur. gracilior et in annum tertium cesset. frumentum seri quidam vetant nisi in ea, quae proximo anno quieverit.

maximam huius loci partem stercorationis optinet ratio, de qua et priore diximus volumine. hoc tantum nemini inconpertum est, nisi stercoreto seri

non oportere, quamquam et huic leges sunt propriae. milium, panicum, rapa, napus nisi in stercoreato ne seritor. non stercoreato frumentum potius quam hordeum seritor. item in novalibus, tametsi in illis fabam seri volunt, eandem ubicumque quam recentissime stercoreato solo. autumno aliquid saturus septembri mense fimum in agro acervet, post imbrem utique. si verno erit saturus, per hiemem fimum disponat. iustum est vehes xviii iugero tribui, dispergere caveto, priusquam ares. at iacto semine, si haec omissa sit stercoreatio, sequens est, priusquam sarias, ut fimi ex aviariis seminis vice spargas ante pulverem. quod ut hanc quoque curam determinemus, iustum mense singulas vehes fimi redire in singulas pecudes minores, in maiores denas. nisi contingat hoc, male substravisse pecori colonum appareat. sunt qui optime stercoreari putent sub diu retibus inclusa pecorum mansione. ager si non stercoretur, alget; si nimium stercoreatus est, aduritur, satiusque est id saepe quam supra modum facere. quo calidius solum est, eo minus addi stercoreis ratio est.

semen optimum anniculum, bimum deterius, trimum pessimum, ultra sterile; etenim omnium definita generatio est. quod in ima area subsedit, ad semen reservandum est; id enim optimum, quoniam gravissimum, neque alio modo utilius discernitur. quae spica intervallata semina habebit, abicietur. optimum granum, quod rubet et dentibus fractum eundem habet colorem; deterius, cui plus intus albi est. certum terras alias plus seminis recipere, alias minus, religiosumque inde et primum colonis augurium, cum avidius accipiat: esurire creditur et comesse semen. sationem locis umidis celerius fieri ratio est, ne semen imbre putrescat; siccis serius, ut pluviae sequantur nec diu iacens atque non concipiens evanescat; itemque festinata satione densum spargi semen, quia tarde concipiat, serotina rarum, quia densitate nimia necetur. artis quoque cuiusdam est aequaliter spargere. manus utique congruere debet cum gradu semperque cum dextro pede. fit quoque quorundam occulta ratione, quod sors genialis atque fecunda est. non transferendum est ex frigidis locis semen in calida, neque ex praecocibus in serotina nihilque in contrarium, ut praecepere quidam falsa diligentia.

serere in iugera temperato solo iustum est tritici aut siliginis modios v, farris aut seminis, quod frumenti genus ita appellamus, x, hordei vi, fabae quinta amplius quam tritici, viciae vii, ciceris et cicerculae et pisi iii, lupini x, lentis iii - sed hanc cum fimo arido seri volunt - , ervi vi, siliciae vi, passiolorum iiii, pabuli xx, milli, panici sextarios iiii, pingui solo plus, gracili minus. est et alia distinctio: in denso aut cretoso aut uliginoso tritici aut siliginis modios vi, in soluta terra et sicca et laeta iiii. macie enim solum, nisi rarum culmum habeat, spicam minutam facit et inanem; pingua arva ex uno semine fruticem numerosum fundunt densamque segetem ex raro semine emittunt. ergo inter quattuor et sex modios, pro natura soli quinta minus seri plusve praecipiunt; item in consito aut clivoso, ut in macro. hoc pertinet oraculum illud magno opere custodiendum: "segetem ne defrudes." adiecit his attius in praxidica, ut sereretur, cum luna esset in ariete, geminis, leone, libra,

aquario, zoroastres sole scorpionis duodecim partes transgresso, cum luna esset in tauro.

sequitur huc dilata et maxima indigens cura de tempore fruges serendi quaestio magna ex parte rationi siderum conexas; quamobrem sententias omnium in primis ad id pertinentes exponemus. hesiodus, qui princeps hominum de agricultura praecepit, unum tempus serendi tradidit a vergiliarum occasu. scribebat enim in boeotia helladis, ubi ita seri diximus. inter diligentissimos convenit, ut in alitum quadripedumque genitura, esse quosdam ad conceptum impetus et terrae. hoc graeci ita definiunt, cum sit calida et umida. vergilius triticum et far a vergiliarum occasu seri iubet, hordeum inter aequinoctium autumnii et brumam, viciam vero et passiolos et lentem boote occidente. quo fit, ut horum siderum aliorumque exortus et occasus digerendi sint in suos dies. sunt qui et ante vergiliarum occasum seri iubeant, dumtaxat in arida terra calidisque provinciis; custodiri enim semen, corrumpente umore, et a proximo imbri uno die erumpere; alii statim ab occasu vergiliarum - sequi imbres a septimo fere die - ; aliqui in frigidis ab aequinoctio autumnii, in calidis serius, ne ante hiemem luxurient. inter omnes autem convenit circa brumam serendum non esse, magno argumento, quoniam hiberna semina, cum ante brumam sata sint, septimo die erumpant; si post brumam, vix quadragesimo. sunt qui properent atque ita pronuntient, festinatam sementem saepe decipere, serotinam semper. e contrario alii vel vere potius serendum quam malo autumnio atque, ubi fuerit necesse, inter favonium et vernum aequinoctium. quidam omissa caelesti subtilitate temporibus definiunt: vere linum et avenam et papaver atque, uti nunc etiam transpadani servant, usque in quinquatrus, fabam, siliginem novembri mense, far septembri extremo usque in idus octobres, alii post hunc diem in kal. novembres. ita his nulla naturae cura est, illis nimia, et ideo caeca subtilitas, cum res geratur inter rusticos litterarumque expertes, non modo siderum. et confitendum est caelo maxime constare ea, quippe vergilio iubente praedisci ventos ante omnia ac siderum mores neque aliter quam navigantibus servari. spes ardua, immensa, misceri posse caelestem divinitatem inperitiae rusticae, sed temptanda iam grandi vitae emolumento. prius tamen sideralis difficultas, quam sensere etiam periti, subicienda contemplationi est, quo deinde laetior mens discedat a caelo et facta sentiat, quae futura praenosci non possint.

primum omnium dierum ipsorum anni solisque motus prope inexplicabilis ratio est, ad cccxv adiciendo anno intercalario diei noctisque quadrantibus. ita fit, ut tradi non possint certa siderum tempora. accedit confessa rerum obscuritas, nunc praecurrente nec paucis diebus tempestatum significato, quod προχειμάζειν graeci vocant, nunc postveniente, quod ἐπιχειμάζειν, et plerumque alias celerius, alias tardius caeli effectum ad terram deciduo: vulgo serenitate reddita confectum sidus audimus. praeterea cum omnia haec statis sideribus caeloque adfixis constent, interveniunt motus stellarum, grandinum, imbrum, et ipsi non levi effectum, ut docuimus, turbantque conceptae spei ordinem. idque, ne nobis tantum putemus accidere, et reliqua fallit animalia

sagaciora circa hoc, ut quo vita eorum constet, aestivasque alites praeposteri aut praeproperi rigores necant, hibernas aestus. ideo vergilius errantium quoque siderum rationem ediscendam praecipit, admonens observandum frigidae saturni stellae transitum. sunt qui certissimum veris indicium arbitrentur ob infirmitatem animalis papiliones. sed eo ipso anno, cum commentaremur haec, notatum est, proventum eorum ter repetito frigore extinctum advenasque volucres a. d. vi. kal. febr. spem veris adtulisse mox saevissima hieme conflictatas. res anceps primum omnium a caelo peti legem, deinde eam argumentis esse quaerendam. super omnia est mundi convexitatis terrarumque globi differentia, eodem sidere alio tempore aliis aperiente se gentibus, quo fit, ut causa eius non isdem diebus ubique valeat. addidere difficultatem et auctores diversis in locis observando, mox etiam in isdem diversa prodendo. tres autem fuere sectae, chaldaea, aegyptia, graeca. his addidit quartam apud nos caesar dictator annos ad solis cursum redigens singulos sosigene perito scientiae eius adhibito; et ea ipsa ratio postea conperto errore correctae est ita, ut duodecim annis continuis non intercalaretur, quia coeperat ad sidera annus morari, qui prius antecederat. et sosigenes ipse trinis commentationibus - quamquam diligentior ceteris, non cessavit tamen addubitare ipse semet corrigendo - et auctores prodidere ea, quos praetexuimus volumini huic, raro ullius sententia cum alio congruente. minus hoc in reliquis mirum, quos diversi excusaverint tractus. eorum, qui in eadem regione discedere, unam discordiam ponemus exempli gratia: occasum matutinum vergiliarum hesiodus - nam huius quoque nomine exstat astrologia - tradidit fieri, cum aequinoctium autumnii conficeretur, thales xxv die ab aequinoctio, anaximander xxxi, euctemon xliiii, eudoxus xlviii. nos sequimur observationem caesaris maxime; haec erit italiae ratio. dicemus autem et aliorum placita, quoniam non unius terrae, sed totius naturae interpretes sumus, non auctoribus positis - id enim verbosum est - , sed regionibus. legentes tantum meminerint brevitatis gratia, cum attica nominata fuerit, simul intellegere cycladas insulas; cum macedonia, magnesiam, threciam; cum aegyptus, phoenicen, cyprum, ciliciam; cum boeotia, locridem, phocidem et finitimos semper tractus; cum hellespontus, chersonesum et continentia usque atho montem; cum ionia, asiam et insulas asiae; cum peloponnesus, achaiam et ad vesperam iacentes terras. chaldaei assyriam et babyloniam demonstrabunt. africanas, hispanias, gallias sileri non erit mirum; nemo enim observavit in iis, qui proderet siderum exortus. non tamen difficili ratione dinoscuntur in illis quoque terris digestionem circularum, quam in sexto volumine fecimus, qua cognatio caeli non gentium modo, verum urbium quoque singularum intellegitur. ergo ex iis terris, quas nominavimus, sumpta convexitate circuli pertinentis ad quas quisque quaeret terras, iidem erunt siderum exortus per omnium circularum pares umbras. indicandum et illud, tempestates ipsas cardines suos habere quadrennis annis, et easdem non magna differentia reverti ratione solis, octonis vero augeri easdem, centesima revolvente se luna.

omnis autem ratio observata est tribus modis, exortu siderum occasuque et ipsorum temporum cardinibus. exortus occasusque binis modis intelleguntur. aut enim adventu solis occultantur stellae et conspici desinunt aut eiusdem abscessu proferunt se, ut emersum hoc melius quam exortum consuetudo dixisset et illud occultationem potius quam occasum. alio modo, quo die incipiunt apparere vel desinunt oriente sole aut occidente, matutini vespertinive cognominati, prout alteruter eorum mane vel crepusculo contingit. dodrantes horarum, cum minimum, intervalla ea desiderant ante solis ortum vel post occasum, ut aspici possint. praeterea bis quaedam exoriuntur et occidunt, omnisque sermo de iis est stellis, quas adhaerere caelo diximus.

cardines temporum quadripertita anni distinctione constant per incrementa lucis. augetur haec a bruma et aequatur noctibus verno aequinoctio diebus xc horis tribus, dein superat noctes ad solstitium diebus xciiii horis xii; ... usque ad aequinoctium autumnii, et tum aequata diei procedit nox ex eo ad brumam diebus lxxxviii horis tribus - horae nunc in omni accessione aequinoctiales, non cuiuscumque diei, significantur - , omnesque eae differentiae fiunt in octavis partibus signorum, bruma capricorni a. d. viii kal. ian. fere, aequinoctium vernum arietis, solstitium cancri, alterumque aequinoctium librae, qui et ipsi dies raro non aliquos tempestatum significatus habent. rursus hi cardines singulis etiamnum articulis temporum dividuntur, per media omnes dierum spatia, quoniam inter solstitium et aequinoctium autumnii fidiculae occasus autumnum inchoat die xlvi, ab aequinoctio eo ad brumam vergiliarum matutinus occasus hiemem die xliiii, inter brumam et aequinoctium die xlv flatus favoni vernum tempus, ab aequinoctio verno initium aestatis die xlviii vergiliarum exortus matutinus. nos incipiemus a sementibus frumenti, hoc est vergiliarum occasu matutino. nec deinde parvorum siderum mentione concidenda ratio est et difficultas rerum augenda, cum sidus vehemens orionis isdem diebus longo decedat spatio.

sementibus tempora plerique praesumunt et ab xi die autumnalis aequinoctii fruges serunt, novem a coronae exortu continuis diebus certo prope imbrium promisso, xenophon non antequam deus signum dederit. hoc cicero noster imbre fieri interpretatus est, cum sit vera ratio non prius serendi quam folia coeperint decidere. hoc ipso vergiliarum occasu fieri putant aliqui a. d. iiii idus novembris, ut diximus, servantque id sidus etiam vestis institores, et est in caelo notatu facillimum. ergo ex occasu eius de hieme augurantur quibus est cura insidiandi, negotiatores avari. ita nubilo occasu pluviosam hiemem denuntiat, statimque augent lacernarum pretia; sereno asperam, et reliquarum vestium accendunt. sed ille indocilis caeli agricola hoc signum habeat inter suos vepres humumque suam aspiciens: cum folia viderit decidua. sic iudicetur anni temperies, alibi tardius, alibi maturius. ita enim sentitur, ut caeli locique adficit natura, idque in hac ratione praecellit, quod eadem et in mundo publica est et unicuique loco peculiaris. miretur hoc qui non meminerit ipso brumali die puleium in carnariis florere. adeo nihil occultum esse natura

voluit. et serendi igitur hoc dedit signum. haec est vera interpretatio argumenta naturae secum adferens, quippe sic terram peti suadet promittitque quandam stercoris vicem et contra rigores terram satusque operiri a se nuntiat ac monet festinare.

Varro in fabae utique satu hanc observationem custodiri praecepit. alii plena luna serendam, lentim vero a vicesima quinta ad tricesimam, viciam quoque iisdem lunae diebus. ita demum sine limacibus fore. quidam pabuli causa sic iubent seri, seminis autem vere.

est et alia manifestior ratio mirabiliore naturae providentia, in qua ciceronis sententiam ipsius verbis subsignabimus:

“iam vero semper viridis semperque gravata

lentiscus triplici solita est grandescere fetu

ter fruges fundens tria tempora monstrat

arandi.” ex his unum hoc erit idem et lino ac papaveri serendo. cato de papavere ita tradit: “virgas et sarmenta, quae tibi usioni supererunt, in segete comburito. ubi eas combusseris, ibi papaver serito.” silvestre in miro usu est melle decoctum ad faucium remedia, visque somnifera etiam sativo. et hactenus de hiberna semente. verum ut pariter omnis culturae quoddam brevium peragatur, eodem tempore conveniet arbores stercorare, adcumulare item vineas - sufficit in iugerum opera - et, ubi patietur loci ratio, arbusta ac vineas putare, solum seminariis bipalio praeparare, incilia aperire, aquam de agro pellere, torcular lavare et recondere. a kal. novemb. gallinis ova supponere nolito, donec bruma conficiatur. in eum diem ternadena subicito aestate tota, hieme pauciora, non tamen infra novena. democritus talem futuram hiemem arbitratur, qualis fuerit brumae dies et circa eum terni; item solstitio aestatem. circa brumam plerisque bis septeni halcyonum feturae ventorum quiete molliunt caelum. sed et in his et in aliis omnibus ex eventu significationum intellegi sidera debebunt, non ad dies utique praefinitos expectari tempestatum vadimonia.

per brumam vitem ne colito. vina tum defaecari vel etiam diffundi hyginus suadet a confecta ea septimo die, utique si septima luna conpetat; cerasa circa brumam seri. bubus glandem tum adspergi convenit in iuga singula modios. largior valetudinem infestat, et quocumque tempore detur, si minus xxx diebus continuis data sit, narrant verna scabie poenitere. materiae caedendae tempus hoc dedimus. reliqua opera nocturna maxime vigilia constent, cum sint noctes tanto ampliores, qualos, crates, fiscinas texere, faces incidere, ridicas praeparare interdum xxx, palos lx et in lucubratione vespertina ridicas v, palos x, totidem antelucana.

a bruma in favonium caesari nobilia sidera significant, iii kal. ian. matutino canis occidens, quo die atticae et finitimis regionibus aquila vesperi occidere traditur. pridie nonas ian. caesari delphinus matutino exoritur et postero die fidicula, quo aegypto sagitta vesperi occidit. item ad vi idus ian. eiusdem delphini vespertino occasu continui dies hiemant italiae, et cum sol in aquarium sentiatur transire, quod fere xvi kal. feb. evenit. viii kal. stella regia

appellata tuberoni in pectore leonis occidit matutina, et pridie nonas feb. fidicula vespera. huius temporis novissimis diebus, ubicumque patietur caeli ratio, terram ad rosaria et vineae satum vertere bipalio oportet - iugero operae lxx sufficiunt - , fossas purgare aut novas facere, antelucanis ferramenta acuere, manubria aptare, dolia quassa sarcire, ovium tegimenta concinnare ipsarumque lanas scabendo purgare.

a favonio in aequinoctium vernum caesari significat, xiiii kal. mart. triduum varie, et viii kal. hirundinis visu et postero die arcturi exortu vespertino, item iii non. mart. - caesar cancri exortu id fieri observavit, maior pars auctorum vindemitoris emersu - viii idus aquilonii piscis exortu et postero die orionis. in attica miluum apparere servatur. caesar et idus mart. ferales sibi notavit scorpionis occasu, xv kal. vero april. italiae miluum ostendi, xii kal. equum occidere matutino.

hoc intervallum temporis vegetissimum agricolis maximeque operosum est, in quo praecipue falluntur. neque enim eo die vocantur ad munia, quo favonius flare debeat, sed quo coeperit. hoc acri intentione servandum est; hoc illo mense signum dies habet observatione minime fallaci aut dubia, si quis attendant. unde autem spiret is ventus quaque parte veniat, diximus secundo volumine et dicemus mox paulo operosius. interim ab eo die, quisquis ille fuerit, quo flare coeperit - non utique vi id. feb., sed sive ante, quando praevernat, sive postea, quando hiemat post diem hunc - , innumera rusticos cura distringat et prima quaeque peragantur, quae differri nequeunt. trimestria serantur, vites putentur qua diximus ratione, oleae curentur, poma serantur inseranturque, vineae pastinentur, seminaria digerantur, instaurentur alia, harundines, salices, genistae serantur caedanturque, serantur vero ulmi, populi, platani, uti dictum est. tum et segetes convenit purgare, sarcire hibernas fruges maximeque far. lex certa in eo, cum quattuor fibrarum esse coeperit, faba vero non antequam trium foliorum, tunc quoque levi sarculo purgare verius quam fodere, florentem utique xv primis diebus non attingere. hordeum nisi sicco ne sarito. putationem aequinoctio peractam habeto. vineae iugerum quaternae operae putant, alligant in arbusto singulae operae arbores xv. eodem hoc tempore hortorum rosariorumque cura est, quae separatim proximis voluminibus dicetur, eodem et topiarii. tum optime scrobes fiunt. terra in futurum proscinditur vergilio maxime auctore, ut glaebas sol coquat. utilior sententia, quae non nisi temperatum solum medio vere arari iubet, quoniam in pingui statim sulcos occupent herbae, gracili insecuti aestus exsiccant omnemque sucum venturis seminibus auferant. talia autumnio melius arari certum est.

cato verna opera sic definit: "scrobes fieri, seminaria ... propagari, in locis crassis et umidis ulmos, ficos, poma, oleas seri, prata stercore luna sitiente; quae rigua non erunt, a flatu favoni defendi et purgari, herbas malas radicitus erui, ficos interputari, seminaria fieri et vetera sarciri: haec antequam vineam fodere incipias." idemque: "piro florente arare incipito macra harenosaeque. postea uti quaeque gravissima et aquosissima, ita postremo arato." ergo haec

aratio has habebit notas: lentisci primum fructum ostendentis ac piri florentis. erit et tertia in bulborum satu scillae, item in coronamentorum narcissi, namque et haec ter florent primoque flore primam arationem ostendunt, medio secundam, tertio novissimam, quando inter sese alia aliis notas praebent. ac non in novissimis cavetur, ne fabis florentibus attingatur hedera; id enim noxium et exitiale ei est tempus. quaedam vero et suas habent notas, sicuti ficus. cum folia pauca in cacumine acetabuli modo germinent, tunc maxime serendas ficus.

aequinocmium vernum a. d. viii kal. april. peragi videtur. ab eo ad vergiliarum exortum matutinum caesari significant kal. april. iii non. april. in attica vergiliae vesperi occultantur, eadem postridie in boeotia, caesari autem et chaldaeis nonis, aegypto orion et gladius eius incipiunt abscondi. caesari vi idus significatur imber librae occasu. xiiii kal. mai. aegypto suculae occidunt vesperi, sidus vehemens et terra marique turbidum. xvi atticae, xv caesari continuo quadriduo significat, assyriae autem xii kal. hoc est vulgo appellatum sidus parilicium, quoniam xi kal. mai. urbis romae natalis, quo fere serenitas redditur, claritatem observationi dedit, nimborum argumento hyadas appellantibus graecis eas stellas quod nostri a similitudine cognominis graeci, propter sues inpositum arbitantes, inperitia appellavere suculas. caesari et viii kal. notatur dies. vii kal. aegypto haedi exoriuntur, vi boeotiae et atticae canis vesperi occultatur, fidicula mane oritur. v kal. assyriae orion totus absconditur, iiii autem canis. vi non. mai. caesari suculae matutino exoriuntur et viii id. capella pluvialis, aegypto autem eodem die canis vesperi occultatur. sic fere in vi id. mai., qui est vergiliarum exortus, decurrunt sidera.

in hoc temporis intervallo xv diebus primis agricolae rapienda sunt quibus peragendis ante aequinocmium non suffecerit, dum sciat inde natam exprobrationem foedam putantium vites per imitationem cantus alitis temporariae, quam cuculum vocant. dedecus enim habetur obprobriumque meritum, falcem ab illa volucre in vite deprehendi, et ob id petulantiae sales, etiam cum primo vere, laudantur, auspicio tamen detestabiles videntur. adeo minima quaeque in agro naturalibus trahuntur argumentis.

extremo autem hoc tempore panici miliiue satio est. iustum haec seri maturato hordeo. atque etiam in eodem arvo signum illius maturitati et horum sationi commune lucentes vespere per arva cicindela - ita appellant rustici stellantes volatus, graeci vero lampyridas - incredibili benignitate naturae. iam vergilias in caelo notabiles caterva fecerat, non tamen his contenta terrestres fecit alias veluti vociferans: 'cur caelum intuearis, agricola cur sidera quaeras, rustice iam te brevior somno fessum premunt noctes. ecce tibi inter herbas tuas spargo peculiares stellas easque vespera et ab opere disiungenti ostendo ac, ne possis praeterire, miraculo sollicito. videsne ut fulgor igni similis alarum compressu obtegatur, secumque lucem habeat et nocte dedi tibi herbas horarum indices et, ut ne sole quidem oculos tuos a terra avoces, heliotropium ac lupinum circumaguntur cum illo. cur etiamnum altius spectes ipsumque caelum scrutere habes ante pedes tuos ecce vergilias.' incertis hae diebus

proveniunt durantque, sed esse sideris huiusce partum eas certum est. proinde quisquis aestivos fructus ante illas severit, ipse frustrabitur sese. hoc intervallo et apicula procedens fabam florere indicat, fabaque florens eam evocat. dabitur et aliud finiti frigoris indicium: cum germinare videris morum, iniuriam postea frigoris timere nolit.

ergo opera: taleas olivarum ponere ipsasque oleas interrare, rigare prata aequinoctii diebus primis, cum herba creverit in festucam, arcere aquas, vineam pampinare - et huic lex sua: cum pampini iiii digitos longitudine expleverint; pampinat una opera iugerum - , segetes iterare. saritur diebus xx. ab aequinoctio sartura nocere et vineae et segeti existimatur. et oves lavandi hoc idem tempus est.

a vergiliarum exortu significant caesari postridie arcturi occasus matutinus, iiii id. mai. fidiculae exortus, xii kal. iun. capella vesperi occidens et in attica canis. xi kal. caesari orionis gladius occidere incipit, iiii non. iun. caesari et assyriae aquila vesperi oritur, vii id. arcturus matutino occidit italiae, iiii delphinus vesperi exoritur. xvii kal. iul. gladius orionis exoritur, quod in aegypto post quatrimum. xi kal. eiusdem orionis gladius caesari occidere incipit. viii kal. vero iul. longissimus dies totius anni et nox brevissima solstitium conficiunt. in hoc temporis intervallo vineae pampinantur, curatur ut vinea vetus semel fossa sit, bis novella. oves tondentur, lupinum stercorandi causa vertitur, terra proscinditur, vicia in pabulum secatur, faba metitur, dein cuditur.

prata circa kal. iun. caeduntur, quorum facillima agricolis cura ac minimi impendii haec de se postulat dici. relinqui debent in laeto solo vel umido vel riguo, eaque aqua pluvia rigari aut publica. utilissimum, si malae herbae, arare, dein cratire, sarire, florem ex fenilibus atque e praesepibus feno delapsum spargere, priusquam cratiantur, nec primo anno rigari, nec pasci ante secunda fenisechia, ne herbae vellantur obtrituque hebetentur. senescunt prata restituique debent faba in iis sata vel rapis vel milio, mox insequente anno frumento, rursusque inarata tertio relinqui, praeterea quotiens secta sint siciliri, hoc est quae fenisece praeterierunt secari. est enim in primis inutile enasci herbas sementaturas. herba optima in prato trifoli, proxima graminis, pessima nummuli siliquam etiam diram ferentis. invisae et equisetae est, a similitudine equinae saetae. secandi tempus, cum spica deflorescere coepit atque roborari. secandum, antequam inarescat. cato: "fenum," inquit, "ne sero secas: prius quam semen maturum sit." quidam pridie rigant. ubi non sunt riguae, noctibus roscidis secari melius. quaedam partes italiae post messem secant. fuit hoc quoque maioris impendii apud priores, creticis tantum transmarinisque cotibus notis nec nisi oleo aciem falcis excitantibus; igitur cornu propter oleum ad crus ligato fenisech incedebat. italia aquarias cotes dedit limae vice imperantes ferro, set aquariae protinus virent. falcium ipsarum duo genera: italicum brevius ac vel inter vepres quoque tractabile, galliarum latifundia maioribus ... compendia, quippe medias caedunt herbas brevioresque praetereunt. italus fenisech dextra una manu secat. iustum est una

opera in die iugerum desecari, alligareque manipulos mccc quaterna pondo. sectum verti ad solem nec nisi siccum construi oportet. ni fuerit observatum hoc diligenter, exhalare matutino nebulam quandam metas, mox sole accendi et conflagrare certum est. rursus rigari desecta oportet, ut secetur autumnale fenum, quod vocant cordum. interamnae in umbria quater anno secantur, etiam non rigua; rigua vero ter plerisque in locis, et postea in ipso pabulo non minus emolumenti est quam e feno. armentorum ideo cura iumentorumque progeneratio suum cuique consilium dabit, opimo maxime quadrigarum quaestu.

solstitium peragi in octava parte cancri et viii kal. iul. diximus. magnus hic anni cardo, magna res mundi. in hoc usque a bruma crescunt dies creverunt sex mensibus, sol ipse ad aquilonem scandens ac per ardua enisus ab ea meta incipit flecti ac degredi ad austrum, aucturus noctes aliis sex mensibus ablaturusque diei mensuram. ex hoc deinde rapiendi convehendique fructus alios atque alios tempus, et praeparandi se contra saevam feramque hiemem, decebatque hoc discrimen indubitatis notis signasse naturam. quam ob rem eas manibus ipsis agricolarum ingessit vertique iussit ipsa die folia et esse confecti sideris signum, nec silvestrium arborum remotarumque, ut in saltus devios montesque eundum esset quaerentibus signa, non rursus urbanarum quaeque topiario tantum coluntur, quamquam his et in villa visendis. vertit oleae ante pedes satae, vertit tiliae ad mille usus petendae, vertit populi albae etiam vitibus nuptae. adhuc parum est. 'ulmum, inquit, vite dotatam habes: et huius vertam. pabulo folia eius stringis aut deputas: aspice et tenes sidus. alia parte caelum respiciunt quam qua spectavere pridie. salice omnia alligas, humillima arborum, ipse toto capite altior: et huius circumagam. quid te rusticum quereris non stat per me, quo minus caelum intellegas et caelestia scias. dabo et auribus signum: palumbium utique exaudi gemitus. transisse solstitium caveto putes, nisi cum incubantem videris palumbem.' ab solstitio ad fidiculae occasum vi kal. iul. caesari orion exoritur, zona autem eius iiii non. assyriae, aegypto vero procyon matutino aestuosus, quod sidus apud romanos non habet nomen, nisi caniculam hanc volumus intellegi, hoc est minorem canem, ut in astris pingitur, ad aestum magno opere pertinens, sicut paulo mox docebimus. iiii non. chaldaeis corona occidit matutino, atticae orion totus eo die exoritur. prid. id. iul. aegyptiis orion desinit exoriri, xvi kal. aug. assyriae procyon exoritur, dein post triduum fere ubique confessum inter omnes sidus ingens, quod canis ortum vocamus, sole partem primam leonis ingresso. hoc fit post solstitium xxiii die. sentiunt id maria et terrae, multae vero et ferae, ut suis locis diximus. neque est minor ei veneratio quam discriptis in deos stellis, accenditque solem et magnam aestus obtinet causam. xiii kal. aegypto aquila occidit matutino etesiarumque prodromi flatus incipiunt, quod caesar x kal. sentire italiam existimavit. aquila atticae matutino occidit, iii kal. regia in pectore leonis stella matutino caesari emergit. viii id. aug. arcturus medius occidit, iii id. fidicula occasu suo autumnum inchoat, ut is adnotavit, sed vera ratio id fieri invenit vi id. easdem.

in hoc temporis intervallo res summa vitium agitur decretorio uvis sidere illo, quod caniculam appellavimus, unde carbunculare dicuntur ut quodam uredinis carbone exustae. non comparantur huic malo grandines, procellae quaeque umquam annonae intulere caritatem. agrorum quippe mala sunt illa, carbunculus autem regionum late patentium, non difficili remedio, nisi calumniari naturam rerum homines quam sibi prodesse mallent. ferunt democritum, qui primus intellexit ostenditque caeli cum terris societatem, spernentibus hanc curam eius opulentissimis civium, praevisa olei caritate futura ex vergiliarum ortu qua diximus ratione ostendemusque iam planius, magna tum vilitate propter spem olivae coemisse in toto tractu omne oleum, mirantibus qui paupertatem quietemque doctrinarum ei sciebant in primis cordi esse, atque ut apparuit causa et ingens divitiarum cursus, restituisse mercedem anxiae et avidae dominorum poenitentiae, contentum probavisse opes sibi in facili, cum vellet, fore. hoc postea sextius e romanis sapientiae adsectatoribus athenis fecit eadem ratione. tanta litterarum occasio est. quas equidem miscebo agrestibus negotiis quam potero dilucide atque perspicue.

plerique dixere rorem inustum sole acri frugibus robiginis causam esse et carbunculi vitibus, quod ex parte falsum arbitror omnemque uredinem frigore tantum constare sole innoxio. id manifestum fiet adtendentibus. nam primum omnium non hoc evenire nisi noctibus et ante solis ardorem deprehenditur totumque lunari ratione constat, quoniam talis iniuria non fit nisi interlunio plenave luna, hoc est praevalente. utroque enim habitu plena est, ut saepius diximus, sed interlunio omne lumen, quod a sole accepit, caelo regerens. differentia utriusque habitus magna, sed manifesta. namque interlunio aestate calidissima est, hieme gelida. e diverso in plenilunio aestate frigidas facit noctes, hieme tepidas. causa evidens, sed alia quam redditur a fabiano graecisque auctoribus. aestate enim interlunio necesse est cum sole proximo nobis circulo currat, igne eius comminus recepto candens, eadem interlunio absit hieme, quoniam abscedit et sol; item in plenilunio aestivo procul abeat adversa soli, hieme autem ad nos per aestivum circulum accedat. ergo per se roscida, quotiens alget, infinitum quantum illo tempore cadentes pruinas congelat.

ante omnia autem duo genera esse caelestis iniuriae meminisse debemus: unum quod tempestates vocamus, in quibus grandines, procellae ceteraque similia intelleguntur, quae cum acciderint, vis maior appellatur. haec ab horridis sideribus exeunt, ut saepius diximus, veluti arcturo, orione, haedis. alia sunt illa, quae silente caelo serenisque noctibus fiunt, nullo sentiente nisi cum facta sunt. publica haec et magnae differentiae a prioribus, aliis robiginem, aliis uredinem, aliis carbunculum appellantibus, omnibus vero sterilitatem. de his nunc dicemus a nullo ante nos prodita, priusque causas reddemus.

duae sunt praeter lunarem paucisque caeli locis constant. namque vergiliae privatim attinent ad fructus, ut quarum exortu aestas incipiat, occasu hiems, semestri spatio intra se messes vindemiasque et omnium maturitatem

complexae. est praeterea in caelo qui vocatur lacteus circulus, etiam visu facilis huius defludio velut ex ubere aliquo sata cuncta lactescunt duorum siderum observatione, aquilae in septentrionali parte et in austrina caniculae, cuius mentionem suo loco fecimus. ipse circulus fertur per sagittarium atque geminos, solis centro bis aequinoctialem circulum secans, commissuras eorum optinente hinc aquila illinc canicula. ideo effectus utriusque ad omnes frugiferas pertinent terras, quoniam in his tantum locis solis terraeque centra congruunt. igitur horum siderum diebus si purus atque mitis aether genitalem illum lacteumque sucum transmisit in terras, laeta adulescunt sata; si luna qua dictum est ratione roscidum frigus aspersit, admixta amaritudo ut in lacte puerperium necat. modus in terris huius iniuriae, quem fecit in quacumque convexitate comitatus utriusque causae, et ideo non pariter in toto orbe sentitur, ut nec dies. aquilam diximus in italia exoriri a. d. xiii kal. ian., nec patitur ratio naturae quicquam in satis ante eum diem spei esse certae. si vero interlunium incidat, omnes hibernos fructus et praecoces laedi necesse est.

rudis fuit priscorum vita atque sine litteris. non minus tamen ingeniosam fuisse in illis observationem apparebit quam nunc esse rationem. tria namque tempora fructibus metuebant, propter quod instituerunt ferias diesque festos, robigalia, floralia, vinalia. robigalia numa constituit anno regni sui xi, quae nunc aguntur a. d. vii kal. mai., quoniam tunc fere segetes robigo occupat. hoc tempus Varro determinavit sole tauri partem x obtinente, sicut tunc ferebat ratio. sed vera causa est, quod post dies undeviginti ab aequinoctio verno per id quadriduum varia gentium observatione in iiii kal. mai. canis occidit, sidus et per se vehemens et cui praeoccidere caniculam necesse sit. itaque iidem floralia iiii kal. easdem instituerunt urbis anno dxvi ex oraculis sibyllae, ut omnia bene deflorescerent. hunc diem Varro determinat sole tauri partem xiiii obtinente. ergo si in hoc quadriduum inciderit plenilunium, fruges et omnia, quae florebunt, laedi necesse erit. vinalia priora, quae ante hos dies sunt viiii kal. mai. degustandis vinis instituta, nihil ad fructus attinent, nec quae adhuc diximus ad vites oleasque, quoniam earum conceptus exortu vergiliarum incipit a. d. vi id. mai., ut docuimus. aliud hoc quadriduum est, quo neque rore sordidas velim - exurit enim frigidum sidus arcturi postridie occidens - , et multo minus plenilunium incidere. iiii non. iun. iterum aquila exoritur vesperi, decretorio die florentibus oleis vitibusque, si plenilunium in eum incidat. equidem et solstitium viii kal. iul. in simili causa duxerim et canis ortum post dies a solstitio xxiii, sed interlunio accidente, quoniam vapore constat culpa acinique praecocuntur in callum. rursus plenilunium nocet a. d. iiii non. iul., cum aegypto canicula exoritur, vel certe xvi kal. aug., cum italiae, item xiii kal. aug., cum aquila occidit, usque in x kal. easdem. extra has causas sunt vinalia altera, quae aguntur a. d. xiiii kal. sept. Varro ea fidicula incipiente occidere mane determinat, quod vult initium autumnus esse et hunc diem festum tempestatibus leniendis institutum. nunc fidiculam occidere a. d. vi id. aug. servatur.

intra haec constat caelestis sterilitas, neque negaverim posse ea permutari

algentium locorum et aestuantium natura. set a nobis rationem demonstratam esse satis est; reliqua observatione cuiusque constabunt. alterutrum quidem fore in causa, hoc est plenilunium aut interlunium, non erit dubium. et in hoc mirari benignitatem naturae succurrit: iam primum hanc iniuriam omnibus annis accidere non posse propter statos siderum cursus, nec nisi paucis noctibus anni, idque quando sit futurum facile nosci ac, ne per omnes menses timeretur, earum quoque lege divisum: aestate interlunia praeterquam biduo secura esse, hieme plenilunia, nec nisi aestivis brevissimisque noctibus metui, diebus non idem valere; praeterea tam facile intellegi, ut formica, minimum animal, interlunio quiescat, plenilunio operetur etiam noctibus; avem parram oriente sirio ipso die non apparere et donec occidat, e diverso chlorionem prodire ipso die solstitii; neutrum vero lunae statum noxium esse, ne noctibus quidem nisi serenis et omni aura quiescente, quoniam neque in nube neque in flatu cadunt rores, sic quoque non sine remedio. sarmenta aut palearum acervos et evulsas herbas frutesque per vineas camposque, cum timebis, incendito: fumus medebitur hic; e paleis et contra nebulas auxiliatur, ubi nebulae nocent. quidam tres cancos vivos cremari iubent in arbustis, ut carbunculus ne noceat; alii siluri carnem leniter uri a vento, ut per totam vineam fumus dispergatur. Varro auctor est, si fidiculae occasu, quod est initium autumnii, uva picta consecratur inter vites, minus nocere tempestates. archibius ad antiochum syriae regem scripsit, si fictili novo obruatur rubeta rana in media segete, non esse noxias tempestates.

opera rustica huius intervalli: terram iterare, arbores circumfodere aut, ubi aestuosa regio poscat, adcumulare - germinantia nisi in solo luxurioso fodienda non sunt - , seminaria purgare sarculo, messem hordeaciam facere, aream messi praeparare, catonis sententia amurca temperatam, creta vergili operosius. maiore ex parte aequant tantum et fimo bubulo dilutiore inlinunt. id satis ad pulveris remedium videtur.

messis ipsius ratio varia. galliarum latifundis valli praegrandes, dentibus in margine insertis, duabus rotis per segetem inpelluntur, iumento in contrarium iuncto; ita dereptae in vallum cadunt spicae. stipulae alibi mediae falce praeciduntur, atque inter duas mergites spica destringitur. alibi ab radice caeduntur, alibi cum radice velluntur, quique id faciunt, proscindi ab se obiter agrum interpretantur, cum extrahant sucum. differentia haec: ubi stipula domos contegunt, quam longissimam servant; ubi feni inopia, e stramento paleam quaerunt. panici culmo non tegunt, milli culmum fere inurunt, hordei stipulam bubus gratissimam servant. panicum et milium singillatim pectine manuali legunt galliae.

messis ipsa alibi tribulis in area, alibi equarum gressibus exteritur, alibi perticis flagellatur. triticum quo serius metitur, copiosius invenitur; quo celerius vero, hoc speciosius ac robustius. lex aptissima: “antequam granum indurescat et cum iam traxerit colorem;” oraculum vero: “biduo celerius messem facere potius quam biduo serius.” siliginis et tritici eadem ratio in area horreoque. far, quia difficulter excutitur, convenit cum palea sua condi, et

stipula tantum et aristis liberatur. palea plures gentium pro feno utuntur. melior ea, quo tenuior minutiorque et pulveri propior; ideo optima e milio, proxima ex hordeo, pessima ex tritico, praeterquam iumentis opere laborantibus. culmum saxosis locis, cum inaruit, baculo frangunt substraturi animalibus. si palea defecit, et culmus teritur. ratio haec: maturius desectus, muria dura sparsus, dein siccatus in manipulos convolvitur atque ita pro feno bubus datur. sunt qui accendant in arvo et stipulas, magno vergili praeconio. summa autem eius ratio, ut herbarum semen exurant. ritus diversos magnitudo facit messium et caritas operarum.

conexa est ratio frumenti servandi. horrea operose tripedali crassitudine parietis laterici exaedificari iubent aliqui, praeterea superne impleri nec adflatus admittere aut fenestras habere ullas; alii ab exortu tantum aestivo aut septentrione, eaque sine calce construi, quoniam sit frumento inimicissima; nam quae de amurca praeciperentur indicavimus. alibi contra suspendunt granaria lignea columnis et perflari undique malunt, atque etiam a fundo. alii omnino pendente tabulato extenuari granum arbitrantur et, si tegulis subiaceat, confervescere. multi ventilare quoque vetant; curculionem enim non descendere infra quattuor digitos, nec amplius periclitari. columella et favonium ventum confecto frumento praedicit, quod miror equidem, siccissimum alioqui. sunt qui rubeta rana in limine horrei pede e longioribus suspensa invehere iubeant. nobis referre plurimum tempestivitas condendi videbitur. nam si parum tostum atque robustum collectum sit aut calidum conditum, vitia innasce necesse est.

diuturnitatis causae plures: aut in ipsius grani corio, cum est numerosius, ut milio, aut suci pinguedine, qui pro umore sufficiat tantum, ut sesimae, aut amaritudine, ut lupino et cicerculis. in tritico maxime nascuntur animalia, quoniam spissitate sua concalescit et furfure crasso vestitur. tenuior hordeo palea, exilis et legumini; ideo non generant. faba crassioribus tunicis operitur; ob hoc effervescit. quidam ipsum triticum diuturnitatis gratia adspargunt amurca, mille modios quadrantali, alii chalcidica aut carica creta aut etiam absinthio. est et olynthi ac cerinthi euboeae terra, quae corrumpi non sinat. nec fere condita in spica laeduntur, utilissime tamen servantur in scrobibus, quos siros vocant, ut in cappadocia ac thracia et hispania, africa, et ante omnia ut sicco solo fiant curatur, mox ut palea substernantur; praeterea cum spica sua conduntur ita frumenta. si nullus spiritus penetret, certum est nihil maleficum nasci. Varro auctor est, sic conditum triticum durare annis 1, milium vero c, fabam et legumina in oleariis cadis oblita cinere longo tempore servari. idem fabam a pyrrhi regis aetate in quodam specu ambraciae usque ad piraticum pompeii magni bellum durasse annis circiter cxx. ciceri tantum nullae bestiolae in horreis innascuntur. sunt qui urceis cinere substratis et inlitis, acetum habentibus, leguminum acervos superingerant, ita non nasci maleficia credentes, alii qui in salsamentariis cadis gypso inlinant, alii qui lentem aceto laserpiciato respergant siccataeque oleo unguant. sed brevissima observatio, quod vitiis carere velis, interlunio legere. quare plurimum refert,

condere quis malit an vendere. crescente enim luna frumenta grandescunt.

sequitur ex divisione temporum autumnus a fidiculae occasu ad aequinoctium ac deinde vergiliarum occasum initiumque hiemis. in his intervallis significant prid. id. aug. atticae equus oriens vespera, aegypto et caesari delphinus occidens. xi kal. sept. caesari et assyriae stella, quae vindemitor appellatur, exoriri mane incipit vindemiae maturitatem promittens. eius argumentum erunt acini colore mutati. assyriae v kal. et sagitta occidit et etesia desinunt. vindemitor aegypto nonis exoritur, atticae arcturus matutino, et sagitta occidit mane. v id. sept. caesari capella oritur vesperi, arcturus vero medius prid. id. vehementissimo significato terra marique per dies quinque. ratio eius haec traditur: si delphino occidente imbres fuerint, non futuros per arcturum. signum orientis eius sideris servetur hirundinum abitus; namque deprehensae intereunt. xvi kal. oct. aegypto spica, quam tenet virgo, exoritur matutino etesiaequae desinunt. hoc idem caesari xiiii kal., xiii assyriae significant, et xi kal. caesari commissura piscium occidens ipsumque aequinocti sidus viii kal. oct. dein consentiunt, quod est rarum, philippus, callippus, dositheus, parmeniscus, conon, criton, democritus, eudoxus iv kal. oct. capellam matutino exoriri et iii kal. haedos. vi non. oct. atticae corona exoritur mane, asiae et caesari v heniochus occidit matutino. iv caesari corona exoriri incipit, et postridie occidunt haedi vespere. viii id. oct. caesari fulgens in corona stella exoritur, et vi id. vergiliae vesperi, idibus corona tota. xvii kal. nov. suculae vesperi exoriuntur. prid. kal. caesari arcturus occidit et suculae exoriuntur cum sole. iiii non. arcturus occidit vesperi. v id. nov. gladius orionis occidere incipit. dein iii id. vergiliae occidunt.

in his temporum intervallis opera rustica: rapa, napos serere quibus diximus diebus. vulgus agreste rapa post ciconiae discessum male seri putat, nos omnino post vulcanalia, et praecocia cum panico, a fidiculae autem occasu viciam, passiolos, pabulum. hoc silente luna seri iubent. et frondis praeparandae tempus hoc est. unus frondator quattuor frondarias fiscinas complere in die iustum habet. si decrescente luna praeparetur, non putrescit. aridam colligi non oportet.

vindemiam antiqui numquam existimavere maturam ante aequinoctium; iam passim rapi cerno. quamobrem et huius tempora notis argumentisque signentur. leges ita se habent: uvam caldam ne legito, hoc est nimia siccitate ac nisi imber intervenerit. uvam rorulentam ne legito, hoc est si ros nocturnus fuerit nec prius quam sole discutiatur. vindemiare incipito, cum ad palmitem pampinus procumbere coeperit aut cum exempto acino ex densitate intervallum non conpleri apparuerit ac iam non augeri acinos. plurimum refert, si contingat crescente luna vindemiare. pressura una culleos xx implere debet. hic est pes iustus. ad totidem culleos et lacus xx iugeribus unum sufficit torculum. premunt aliqui singulis, utilius binis, licet magna sit vastitas singulis. longitudo in his refert, non crassitudo. spatiosa melius premunt. antiqui funibus vittisque loreis ea detrahebant et vectibus. intra c annos inventa graecanica, mali rugis per cocleam ambulantis, ab aliis adfixa

arboris stella, aliis arcas lapidum adtollente secum arbore, quod maxime probatur. intra xxii hos annos inventum parvis prelis et minore torculario aedificio, brevior malo in media directo, tympana inposita vinaceis superne toto pondere urguere et super prela construere congeriem. hoc et poma colligendi tempus, observato cum aliquod maturitate, non tempestate, deciderit; hoc et faeces exprimendi, hoc et defrutum coquendi silente luna noctu aut, si interdiu, plena, ceteris diebus aut ante exortum lunae aut post occasum, nec de novella vite aut palustri, nec nisi e matura uva. si ligno contingatur vas, adustum et fumosum fieri putant. iustum vindemiae tempus ab aequinoctio ad vergiliarum occasum dies xliiii. ab eo die oraculum occurrit frigidum picari pro nihilo ducentium. sed iam et kal. ian. defectu vasorum vindemiantes vidi piscinisque musta condi aut vina effundi priora, ut dubia reciperentur. hoc non tam saepe proventu nimio evenit quam segnitia aut avaritia insidiantium caritati. civilis, aequi patrisfamilias modus est annona cuiusque anni uti. id peraeque etiam lucrosissimum. reliqua de vinis adfatim dicta sunt, item vindemia facta olivam esse rapiendam et quae ad oleum pertinent quaeque a vergiliarum casu agi debent.

his quae sunt necessaria adiciuntur de luna ventisque et praesagiis, ut sit tota sideralis ratio perfecta. namque vergilius etiam in numeros lunae digerenda quaedam putavit democriti secutus ostentationem; nos legum utilitas, quae in toto opere, in hac quoque movet parte.

omnia, quae caeduntur, carpuntur, tondentur, innocentius decrescente luna quam crescente fiunt. stercus nisi decrescente luna ne tangito, maxime autem intermenstrua dimidiaque stercoreto. verres, iuencos, arietes, haedos decrescente luna castrato. ova luna nova supponito. scrobes luna plena noctu facito. arborum radices luna plena operito. umidis locis interlunio serito et circa interlunium quadriduo. ventilari quoque frumenta ac legumina et condi circa extremam lunam iubent, seminaria, cum luna supra terram sit, fieri, calcari musta, cum luna sub terra, item materias caedi quaeque alia suis locis diximus. neque est facilior observatio ac iam dicta nobis secundo volumine, sed quod intellegere vel rustici possint: quotiens ab occidente sole cernetur prioribusque horis noctis lucebit, crescens erit et oculis dimidiata iudicabitur; cum vero occidente sole orietur ex adverso, ita ut pariter aspiciantur, tum erit plenilunium. quotiens ab ortu solis orietur prioribusque noctis horis detrahet lumen et in diurnas extendet, decrescens erit iterumque dimidia; in coitu vero, quod interlunium vocant, cum apparere desierit. supra terras autem erit, quamdiu et sol, interlunio et prima toto die, secunda horae noctis unius dextante sicilico, ac deinde tertia et usque xv multiplicatis horarum isdem portionibus. xv tota supra terras nocte erit eademque sub terris toto die. xvi ad primae horae nocturnae dextantem sicilicum sub terra aget easdemque portiones horarum per singulos dies adiciet usque ad interlunium, et quantum primis partibus noctis detraxerit, quod sub terris aget, tantundem novissimis ex die adiciet supra terram. alternis autem mensibus xxx implebit numeros, alternis vero detrahet singulos. haec erit ratio lunaris; ventorum paulo

scrupulosior.

observato solis ortu quocumque die libeat stantibus hora diei sexta sic, ut ortum eum a sinistro umero habeant, contra mediam faciem meridies et a vertice septentrio erit. qui ita limes per agrum curret, cardo appellabitur. circumagi deinde melius est, ut umbram suam quisque cernat; alioquin post hominem erit. ergo permutatis lateribus, ut ortus illius diei ab dextro umero fiat, occasus a sinistro, tunc erit hora sexta, cum minima umbra contra medium fiet hominem. per huius mediam longitudinem duci sarculo sulcum vel cultro liniam verbi gratia pedum xx conveniat mediamque mensuram, hoc est in decimo pede, circumscribi circulo parvo, qui vocetur umbilicus. quae pars fuerit a vertice umbrae, haec erit venti septentrionis. illo tibi, putator, arborum plagae ne spectent, neve arbusta vineaeve nisi in africa, cyrenis, aegypto. illinc flante ne arato, quaeque alia praecipiemus. quae pars liniae fuerit a pedibus umbrae meridiem spectans, haec ventum austrum dabit, quem a graecis notum diximus vocari. illinc flatu veniente materiam vinumque, agricola, ne tractes. umidus aut aestuosus italiae est, africae quidem incendia cum serenitate adfert. in hunc italiae palmites spectent, sed non plagae arborum vitiumve. hic oleae timeatur vergiliarum quadriduo, hunc caveat insitor calamis gemmisque inoculator. de ipsa regionis eius hora praemonuisse conveniat. frondem medio die, arborator, ne caedito. cum meridiem adesse senties, pastor, aestate contrahente se umbra, pecudes a sole in opaca cogito. cum aestate pasces, in occidentem spectent ante meridiem, post meridiem in orientem; aliter noxium, sicut hieme et vere in rorulentum educere: nec contra septentrionem paveris supra dictum cluduntur ita lippuntque ab adflatu et alvo cita pereunt. qui feminas concipi voles, in hunc ventum spectantes iniri cogito.

diximus ut in media linia designaretur umbilicus. per hunc medium transversa currat alia. haec erit ab exortu aequinoctiali ad occasum aequinoctialem, et limes, qui ita secabit agrum, decumanus vocabitur. ducantur deinde aliae duae liniae in decussis obliquae, ita ut ab septentrionis dextra laevaque ad austri dextram ac laevam descendant. omnes per eundem currant umbilicum, omnes inter se pares sint, omnium intervalla paria. quae ratio semel in quoque agro ineunda erit vel, si saepius libeat uti, e ligno facienda, regulis paribus in tympanum exiguum, sed circinatum adactis. ratione, qua doceo occurrendum ingeniis quoque inperitorum esse, meridiem excuti placet, quoniam semper idem est, sol autem cotidie ex alio caeli momento quam pridie oritur, ne quis forte ad exortum capiendam putet liniam.

ita caeli exacta parte quod fuerit liniae caput septentrioni proximum a parte exortiva, solstitialem habebit exortum, hoc est longissimi diei, ventumque aquilonem, borean graecis dictum. in hunc ponito arbores vitesque. sed hoc flante ne arato, frugem ne serito, semen ne iacito. praestringit animam atque praegelat hic radicibus arborum, quas positurus adferes. praedoctus esto: alia robustis prosunt, alia infantibus. - (nec sum oblitus in hac parte ventum

graecis poni, quem caecian vocant. sed idem aristoteles, vir immensae subtilitatis, qui id ipsum fecit, rationem convexitatis mundi reddit, quae contrarius aquilo africo flat). - nec tamen eum toto anno in praedictis timeto agricola. mollitur sidere aestate media mutatque nomen - etesias vocatur - ; ergo cum frigidum senties, caveto, ad quaecumque aquilo praedicetur: tanto perniciosior septentrione est. in hunc asiae, graeciae, hispaniae, maritimae italiae, campaniae, apuliae arbusta vineaeque spectent. qui mares concipi voles, in hunc pascito, ut sic ineuntem ineat. ex adverso aquilonis ab occasu brumali africanus flabit, quem graeci liba vocant. in hunc ad coitum cum se pecus circumegerit, feminas conceptas esse scito.

tertia a septentrione linia, quam per latitudinem umbrae duximus et decumanam vocavimus, exortum habebit aequinoctialem ventumque subsolanum, graecis aphelioten dictum. in hunc salubribus locis villae vineaeque spectent. ipse leniter pluvius tamen est, siccior favonius, ex adverso eius ab aequinoctiali occasu, zephyrus graecis nominatus. in hunc spectare oliveta cato iussit. hic ver inchoat aperitque terras tenui frigore saluber, hic vites putandi frugesque curandi, arbores serendi, poma inserendi, oleas tractandi ius dabit adflatuque nutrimentum exercebit. quarta a septentrione linia, eadem austro ab exortiva parte proxima, brumalem habebit exortum ventumque volturum, eorum graecis dictum, sicciores et ipsum tepidioremque. in hunc apiaria et vineae italiae galliarumque spectare debent. ex adverso volturini flabit corus, ab occasu solstitiali et occasu lateris septentrionis, graecis dictus argestes, ex frigidissimis et ipse, sicut omnes qui a septentrionis parte spirant. hic et grandines infert, cavendus et ipse non secus ac septentrio. volturinus si a serena caeli parte coeperit flare, non durabit in noctem, at subsolanus in maiorem partem noctis extenditur. quisquis erit ventus, si fervidus sentietur, pluribus diebus permanebit. aquilonem praenuntiat terra siccescens repente, austrum umescens rore occulto.

etenim praedicta ventorum ratione, ne saepius eadem dicantur, transire convenit ad reliqua tempestatum praesagia, quoniam et hoc placuisse vergilio magno opere video, siquidem in ipsa messe saepe concurrere proelia ventorum damnosa imperitis refert. tradunt eundem democritum metente fratre eius damaso ardentissimo aestu orasse, ut reliquae segeti parceret raperetque desecta sub tectum, paucis mox horis saevo imbri vaticinatione adprobata. quin immo et harundinem non nisi independente pluvia seri iubent et fruges insecuturo imbri. quamobrem et haec breviter attingemus, scrutati maxime pertinentia, primumque a sole capiemus praesagia.

purus oriens atque non fervens serenum diem nuntiat, at hibernam pallidus grandinem. si et occidit pridie serenus et oritur, tanto certior fides serenitatis. concavus oriens pluvias praedicat; idem ventos, cum ante exorientem eum nubes rubescunt; quod si et nigrae rubentibus intervenerint, et pluvias; cum occidentis aut orientis radii videntur coire, pluvias. si circa occidentem rubescent nubes, serenitatem et futuri diei spondent. si in exortu spargentur partim ad austrum, partim ad aquilonem, pura circa eum serenitas sit licet,

pluviam tamen ventosque significabunt; si in ortu aut in occasu contracti cernentur radii, imbrem. si in occasu eius pluuet aut radii nubem in se trahent, asperam in proximum diem tempestatem significabunt. cum oriente radii non inlustres eminebunt, quamvis circumdatae nubes non sint, pluviam portendent. si ante exortum nubes globabuntur, hiemem asperam denuntiabunt; si ab ortu repellentur et ad occasum abibunt, serenitatem. si nubes solem circumcludent, quanto minus luminis relinquent, tanto turbidior tempestas erit; si vero etiam duplex orbis fuerit, eo atrocior. quod si in exortu aut in occasu fiet, ita ut rubescant nubes, maxima ostendetur tempestas. si non ambibunt, sed incumbent, a quocumque vento fuerint, eum portendent; si a meridie, et imbrem. si oriens cingetur orbe, ex qua parte is se ruperit, expectetur ventus. si totus defluerit aequaliter, serenitatem dabit. si in exortu longe radios per nubes porriget et medius erit inanis, pluviam significabit; si ante ortum radii se ostendent, aquam et ventum; si circa occidentem candidus circulus erit, noctis lenem tempestatem; si nebula, vehementiorem; si candente sole, ventum; si ater circulus fuerit, ex qua regione is ruperit se, ventum magnum.

proxima sint iure lunae praesagia. quartam eam maxime observat aegyptus. si splendens exorta puro nitore fulsit, serenitatem; si rubicunda, ventos; si nigra, pluvias portendere creditur in xv. cornua eius obtusa pluviam, erecta et infesta ventos semper significant, quarta tamen maxime. cornu superius acuminatum septentrionalem atque rigidum illum praesagit ventum, inferius austrum, utraque erecta noctem ventosam. si quartam orbis rutilus cinget, et ventos et imbres praemonebit. apud Varronem ita est: “si quarto die luna erit directa, magnam tempestatem in mari praesagiet, nisi si coronam circa se habebit et eam sinceram, quoniam illo modo non ante plenam lunam hiematurum ostendit. si plenilunio per dimidium pura erit, dies serenos significabit; si rutila, ventos; nigrescens imbres. si caligo orbisve nubium incluserit, ventos, qua se ruperit; si gemini orbes cinxerint, maiorem tempestatem, et magis, si tres erunt aut nigri, interrupti atque distracti. nascens luna si cornu superiore obatrato surget, pluvias decrescens dabit; si inferiore, ante plenilunium; si in media nigritia illa fuerit, imbrem in plenilunio. si plena circa se habebit orbem, ex qua parte is maxime splendeat, ex ea ventum ostendet; si in ortu cornua crassiora fuerint, horridam tempestatem. si ante quartam non apparuerit vento favonio flante, hiemalis toto mense erit. si xvi vehementius flammea apparuerit, asperas tempestates praesagiet.” sunt et ipsius lunae viii articuli, quotiens in angulos solis incidat, plerisque inter eos tantum observantibus praesagia eius, hoc est iii, vii, xi, xv, xviii, xxiii, xxvii et interlunium.

tertio loco stellarum observationem esse oportet. discurrere hae videntur interdum, ventique protinus sequuntur, in quorum parte ita praesagiere. caelum cum aequaliter totum erit splendidum articulis temporum, quos proposuimus, autumnum serenum praestabit et frigidum. si ver et aestas non sine refrigerio aliquo transierint, autumnum serenum ac densum minusque

ventosum facient. autumnī serenitas ventosam hiemem facit. cum repente stellarum fulgor obscuratur et id neque nubilo nec caligine, pluvia aut graves denuntiantur tempestates. si volitare plures stellae videbuntur, quo ferentur albescentes, ventos ex is partibus nuntiabunt aut. si coruscabunt, certos, si id in pluribus partibus fiet, inconstantes ventos et undique. si stellarum errantium aliquam orbis incluserit, imbrem. sunt in signo cancri duae stellae parvae aselli appellatae, exiguum inter illas spatium obtinente nubecula, quam praesepia appellant. haec cum caelo sereno apparere desiit, atrox hiems sequitur. si vero alteram earum, aquiloniam, caligo abstulit, auster saevit; si austrinam, aquilo. arcus cum sunt duplices, pluvias nuntiant, a pluviis serenitatem non perinde certam; circulus nubis circa sidera aliqua pluviam.

cum aestate vehementius tonuit quam fulsit, ventos ex ea parte denuntiat, contra si minus tonuit, imbrem. cum sereno caelo fulgetrae erunt et tonitrua, hiemabit, atrocissime autem, cum ex omnibus quattuor partibus caeli fulgurabit; cum ab aquilone tantum, in posterum diem aquam portendet; cum a septentrione, ventum eum. cum ab austro vel coro aut favonio nocte serena fulgurabit, ventum et imbrem ex isdem regionibus demonstrabit. tonitrua matutina ventum significant, imbrem meridiana.

nubes cum sereno in caelum ferentur, ex quacumque parte id fiet, venti expectentur. si eodem loco globabuntur adpropinquanteque sole discutientur et hoc ab aquilone fiet, ventos; si ab austro, imbres portendent. sole occidente si ex utraque parte eius caelum petent, tempestatem significabunt. vehementius atrae ab oriente in noctem aquam minantur, ab occidente in posterum diem. si nubes ut vellera lanae spargentur multae ab oriente, aquam in triduum praesagient. cum in cacuminibus montium nubes consident, hiemabit. si cacumina pura fient, disserenabit. nube gravida candicante, quod vocant tempestatem albam, grando imminebit. caelo quamvis sereno nubecula quamvis parva flatum procellosum dabit.

nebulae montibus descendentes aut caelo cadentes vel in vallibus sidentes serenitatem promittent.

ab his terreni ignes proxime significant. pallidi namque murmurantesque tempestatum nuntii sentiuntur, pluviae etiam, si in lucernis fungi, si flexuose volitet flamma. ventum nuntiant lumina, cum ex sese flammās elidunt aut vix accenduntur; item cum in ae+no pendente scintillae coacervantur, vel cum tollentibus ollas carbo adhaerescit, aut cum contextus ignis e se favillam discutit scintillamve emittit, vel cum cinis in foco concrescit et cum carbo vehementer perlucet.

est et aquarum significatio: mare si tranquillum in portu cursitabit murmurabitve intra se, ventum praedicet; si id hieme, et imbrem; litora ripaeque si resonabunt tranquillo, asperam tempestatem, item maris ipsius tranquillo sonitus spumaeve dispersae aut aquae bullantes. pulmones marini in pelago plurium dierum hiemem portendunt. saepe et silentio intumescit inflatumque altius solito iam intra se esse ventos fatetur.

et quidam et montium sonitus nemorumque mugitus praedicunt et sine

aura, quae sentiatur, folia ludentia, lanugo populi aut spinae volitans aquisque plumae innatantes, atque etiam in campanis venturam tempestatem praecedens suus fragor. caeli quidem murmur non dubiam significationem habet.

praesagiunt et animalia: delphini tranquillo mari lascivientes flatum, ex qua venient parte, item spargentes aquam, iidem turbato tranquillitatem. loligo volitans, conchae adhaerentes, echini adfigentes sese aut harena saburrantes tempestatis signa sunt. ranae quoque ultra solitum vocales et fulicae matutino clangore, item mergi anatesque pinnas rostro purgantes ventum, ceteraeque aquaticae aves concursantes, grues in mediterranea festinantes, mergi, gaviae maria aut stagna fugientes. grues silentio per sublime volantes serenitatem, sicut noctua in imbre garrula - at sereno tempestatem - , corvique singultu quodam latrantes seque concutientes, si continuabunt, serenum diem; si vero carptim vocem resorbebunt, ventosum imbrem. graculi sero a pabulo recedentes hiemem, et albae aves cum congregabuntur et cum terrestres volucres contra aquam clangores dabunt perfundentque sese, sed maxime cornix, hirundo tam iuxta aquam volitans, ut pinna saepe percutiat, quaeque in arboribus habitant, fugitantes in nidos suos, et anseres continuo clangore intempestivi, ardea in mediis harenis tristis.

nec mirum aquaticas aut in totum volucres praesagia aeris sentire: pecora exultantia et indecora lascivia ludentia easdem significationes habent, et boves caelum olfactantes seque lambentes contra pilum, turpesque porci alienos sibi manipulos faeni lacerantes, et apes operantes segniter vel contra industriam suam absconditae, vel formicae concursantes aut ova progerentes, item vermes terreni erumpentes.

trifolium quoque inhorrescere et folia contra tempestatem subrigere certum est. nec non et in cibis mensisque nostris vasa, quibus esculentum additur, sudorem repositoriis relinquentia diras tempestates praenuntiant.

LIBER XIX

siderum quoque tempestatumque ratio vel imperitis facili atque indubitato modo demonstrata est, vereque intelligentibus non minus conferunt rura deprehendendo caelo quam sideralis scientia agro colendo. proximam multi hortorum curam fecere; nobis non protinus transire ad ista tempestivum videtur, miramurque aliquos scientiae gratiam eruditionisve gloriam ex his petentes tam multa praeterisse, nulla mentione habita tot rerum sponte curave provenientium, praesertim cum plerisque earum pretio usuque vitae maior etiam quam frugibus perhibeatur auctoritas. atque, ut a confessis ordiamur utilitatibus quaeque non solum terras omnes, verum etiam maria replevere, seritur ac dici neque inter fruges neque inter hortensia potest linum, sed in qua non occurrit vitae parte quodve miraculum maius, herbam esse quae admoveat aegyptum italiae in tantum, ut galerius a freto siciliae alexandriam septimo die pervenerit, balbillus sexto, ambo praefecti, aestate vero post xv annos valerius marianus ex praetoriis senatoribus a puteolis nono die lenissimo flatu herbam esse quae gadis ab herculis columnis septimo die ostiam adferat et citeriorem hispaniam quarto, provinciam narbonensem tertio, africanam altero, quod etiam mollissimo flatu contigit c. flavio legato vibii crispi procos.? audax vita, scelerum plena! aliquid seri, ut ventos procellasque capiat, et parum esse fluctibus solis vehi, iam vero nec vela satis esse maiora navigiis, sed, quamvis amplitudini antemnarum singulae arbores sufficiant, super eas tamen addi velorum alia vela, praeterque in proris et alia in puppibus pandi, ac tot modis provocari mortem, denique tam parvo semine nasci quod orbem terrarum ultro citro portet, tam gracili avena, tam non alte a tellure tolli, neque id viribus suis necti, sed fractum tunsumque et in mollitiem lanae coactum iniuria, ac summa audacia pervehi mare! nulla execratio sufficit contra inventorem (dictum suo loco nobis), cui satis non fuit hominem in terra mori, nisi periret et insepultus. ac nos priore libro imbres et flatus cavendos frugum causa victusque praemonebamus: ecce seritur hominis manu, metitur eiusdem hominis ingenio, quod ventos in mari optet. propterea, ut sciamus favisse poenas, nihil gignitur facilius; ut sentiamus nolente seri natura, urit agrum deterioremqve etiam terram facit.

seritur sabulosis maxime unoque sulco, nec magis festinat aliud. vere satum aestate vellitur, et hanc quoque terrae iniuriam facit. ignoscat tamen aliquis aegypto serenti, ut arabiae indiaeque merces inportet. itane et galliae censentur hoc reditu montesque mari oppositos esse non est satis et a latere oceani obstare ipsum, quod vocant inane cadurci, caleti, ruteni, bituriges ultimique hominum existimati morini, immo vero galliae universae vela texunt, iam quidem et transrhenani hostes, nec pulchriorem aliam vestem eorum feminae novere. qua admonitione succurrit quod M. Varro tradit, in serranorum familia gentilicium esse feminas lintea veste non uti. in germania autem defossae atque sub terra id opus agunt. similiter etiam in italiae regione

aliana inter padum ticinumque amnes, ubi a saetabi tertia in europa lino palma; secundam enim in vicino alianis capessunt retovina et in aemilia via faventina. candore alianis semper crudis faventina praeferuntur; retovinis tenuitas summa densitasque, candor qui faventinis, sed lanugo nulla, quod apud alios gratiam, apud alios offensionem habet. nervositas filo aequalior paene quam araneis tinnitusque, cum dente libeat experiri. ideo duplex quam ceteris pretium. et ab his hispania citerior habet splendorem lini praecipuum torrentis, in quo politur, natura, qui adluit tarraconem. et tenuitas mira ibi primum carbasis repertis. non dudum ex eadem hispania zoelicum venit in italiam plagis utilissimum; civitas ea gallaeciae et oceano propinqua. est sua gloria et cumano in campania ad piscium et alitum capturas. eadem et plagis materia - neque enim minores cunctis animalibus insidias quam nobismet ipsis lino tendimus - , sed cumanae plagae concidunt apro saetas et vel ferri aciem vincunt, vidimusque iam tantae tenuitatis, ut anulum hominis cum epidromis transirent uno portante multitudinem, qua saltus cingerentur. nec id maxime mirum, singula earum stamina centeno quinquageno filo constare, sicut paulo ante iulio lupo, qui in praefectura aegypti obiit. mirentur hoc ignorantes in aegypti quondam regis, quem amasim vocant, thorace in rhodiorum insula lindi in templo minervae cccclxv filis singula fila constare, quod se expertum nuperrime prodidit mucianus ter cos. parvasque iam reliquias eius superesse hac experientium iniuria. italia et paelignis etiamnum linis honorem habet, sed fullonum tantum in usu. nullum est candidius lanaeve similis, sicut in culcitis praecipuam gloriam cadurci obtinent. galliarum hoc et tomenta pariter inventum. italiae quidem mos etiam nunc durat in appellatione stramenti. aegyptio lino minimum firmitatis, plurimum lucri. quattuor ibi genera: taniticum, pelusiacum, buticum, tentyriticum regionum nominibus, in quibus nascuntur. superior pars aegypti in arabiam vergens gignit fruticem, quem aliqui gossypion vocant, plures xylon et ideo lina inde facta xyлина. parvus est similemque barbatae nucis fructum defert, cuius ex interiore bombyce lanugo netur. nec ulla sunt cum candore molliora pexiorave. vestes inde sacerdotibus aegypti gratissimae. quartum genus et othoninum appellant. fit e palustri velut harundine, dumtaxat panicula eius. asia e genista facit lina ad retia praecipue in piscando durantia, frutice madefacto x diebus, aethiopes indique e malis, arabes e curcurbitis in arboribus, ut diximus, genitis.

apud nos maturitas eius duobus argumentis intellegitur, intumescente semine aut colore flavescente. tum evolsum et in fasciculos manuales colligatum siccatur in sole pendens conversis superne radicibus uno die, mox v aliis contrariis in se fascium cacuminibus, ut semen in medium cadat. inter medicamina huic vis, et in quodam rustico ac praedulci italiae transpadanae cibo, sed iam pridem sacrorum tantum, gratia. deinde post messem triticiam virgae ipsae merguntur in aquam solibus tepefactam, pondere aliquo depressae; nulli enim levitas maior. maceratas indicio est membrana laxatior, iterumque inversae, ut prius, sole siccantur, mox arefactae in saxo tunduntur stuppario malleo. quod proximum cortici fuit, stuppa appellatur, deterioris

lini, lucernarum fere luminibus aptior; et ipsa tamen pectitur ferreis aculeis, donec omnis membrana decorticetur, corticesque decussi clibanis et furnis praebent usum. medullae numerosior distinctio candore, mollitia. linumque nere et viris decorum. est ars depectendi digerendique: iustum e quinquagenis fascium libris quinas denas carminari. iterum deinde in filo politur, inlissum crebro silici ex aqua, textumque rursus tunditur clavis, semper iniuria melius.

inventum iam est etiam quod ignibus non absumeretur. vivum id vocant, ardentisque in focis convivorum ex eo vidimus mappas sordibus exustis splendescentes igni magis quam possent aquis. regum inde funebres tunicae corporis favillam ab reliquo separant cinere. nascitur in desertis adustisque sole indiae, ubi non cadunt imbres, inter diras serpentes, adsuescitque vivere ardendo, rarum inventu, difficile textu propter brevitem. rufus de cetero colos splendescit igni. cum inventum est, aequat pretia excellentium margaritarum. vocatur autem a graecis ὀσβέστινον ex argumento naturae. anaxilaus auctor est linteo eo circumdatam arborem surdis ictibus et qui non exaudiantur caedi. ergo huic lino principatus in toto orbe. proximus byssino, mulierum maxime deliciis circa elim in achaia genito; quaternis denariis scripula eius permutata quondam ut auri reperio. linteorum lanugo, e velis navium maritimarum maxime, in magno usu medicinae est, et cinis spodii vim habet. est et inter papavera genus quoddam, quo candorem lintea praecipuum trahunt.

temptatum est tingui linum quoque, ut vestium insaniam acciperet, in alexandri magni primum classibus indo amne navigantis, cum duces eius ac praefecti certamine quodam variassent insignia navium, stupueruntque litora flatu versicoloria pellente vela. purpureo ad actum cum m. antonio cleopatra venit eodemque fugit. hoc fuit imperatoriae navis insigne.

postea in theatris tantum umbram fecere, quod primus omnium invenit q. catulus, cum capitolium dedicaret. carbasina deinde vela primus in theatro duxisse traditur lentulus spinther apollinaribus ludis. mox caesar dictator totum forum romanum intexit viamque sacram ab domo sua et clivum usque in capitolium, quod munere ipso gladiatorio mirabilius visum tradunt. deinde et sine ludis marcellus octavia Augusti sorore genitus in aedilitate sua, avunculi xi consulatu, a kal. aug. velis forum inumbravit, ut salubrius litigantes consisterent, quantum mutati a moribus catonis censorii, qui sternendum quoque forum muricibus censuerat! vela nuper et colore caeli, stellata, per rudentes iere etiam in amphitheatris principis neronis. rubent in cavis aedium et muscum ab sole defendunt. cetero mansit candori pertinax gratia. honor ei iam et troiano bello. cur enim non et proeliis intersit ut naufragiis thoracibus lineis paucos tamen pugnasse testis est homerus. hinc fuisse et navium armamenta apud eundem interpretantur eruditiores, quoniam, cum σπαρτὰ dixit, significaverit sata.

sparti quidem usus multa post saecula coeptus est, nec ante poenorum arma, quae primum hispaniae intulerunt. herba et haec, sponte nascens et quae non queat seri, iuncusque proprie aridi soli, uni terrae data vitio. namque id

malum telluris est, nec aliud ibi seri aut nasci potest. in africa exiguum et inutile gignitur. carthaginiensis hispaniae citerioris portio, nec haec tota, sed quatenus parit, montes quoque sparto operit. hinc strata rusticis eorum, hinc ignes facesque, hinc calceamina et pastorum vestes. animalibus noxium praeterquam cacuminum teneritate. ad reliquos usus laboriose evellitur ocreatis cruribus manumque textis manicis convoluta, osseis iligneisque conamentis, nunc iam in hiemem iuxta, facillime tamen ab idibus mais in iunias. hoc maturitatis tempus.

volsum fascibus in acervo alligatum biduo, tertio resolutum spargitur in sole siccaturque et rursus in fascibus redit sub tecta. postea maceratur, aqua marina optime, sed et dulci, si marina desit, siccatumque sole iterum rigatur. si repente urgeat desiderium, perfusum calida in solio ac siccatum stans compendium operae fatetur. hoc autem tunditur, ut fiat utile, praecipue in aquis marique invictum. in sicco praeferunt e cannabi funes, set spartum aliter etiam demersum, veluti natalium sitim pensans. est quidem eius natura interpolis, rursusque quam libeat vetustum novo miscetur. verumtamen complectatur animo qui volet miraculum aestimare, quanto sit in usu omnibus terris navium armamentis, machinis aedificationum aliisque desideriis vitae. ad hos omnes usus quae sufficiant, minus [xxx] passuum in latitudinem a litore carthaginis novae minusque [c] in longitudinem esse reperientur. longius vehi impendia prohibent.

iunco graecos ad funes usos nomini credamus, quo herbam eam appellant, postea palmarum foliis philuraque manifestum est. inde translatum a poenis sparti usum perquam simile veri est.

theophrastus auctor est esse bulbi genus circa ripas amnium nascens, cuius inter summum corticem eamque partem, qua vescuntur, esse laneam naturam, ex qua inpilia vestesque quaedam conficiantur. sed neque regionem, in qua id fiat, nec quicquam diligentius praeterquam eriophoron id appellari in exemplaribus, quae equidem invenerim, tradit, neque omnino ullam mentionem habet sparti cuncta magna cura persecutus cccxc annis ante nos, ut iam et alio loco diximus, quo apparet post id temporis spatium in usum venisse spartum.

et quoniam a miraculis rerum coepimus, sequemur eorum ordinem, in quibus vel maximum est aliquid nasci ac vivere sine ulla radice. tubera haec vocantur undique terra circumdata nullisque fibris nixa aut saltem capillamentis, nec utique extuberante loco, in quo gignuntur, aut rimas sentiente. neque ipsa terrae cohaerent, cortice etiam includuntur, ut plane nec terram esse possimus dicere neque aliud quam terrae callum. siccis haec fere et sabulosis locis frutectosisque nascuntur. excedunt saepe magnitudinem mali cotonei, etiam librali pondere. duo eorum genera: harenosa dentibus inimica, in altero sincera. distinguuntur et colore, rufo nigroque et intus candido, laudatissima africae. crescant anne vitium id terrae - neque enim aliud intellegi potest - ea protinus globetur magnitudine, qua futurum est, et vivat necne, non facile arbitror intellegi posse. putrescendi enim ratio communis est

cum ligno. lartio licinio praetorio viro iura reddenti in hispania carthagine paucis his annis scimus accidisse mordenti tuber, ut deprehensus intus denarius primos dentes inflecteret, quo manifestum erit terrae naturam in se globari. quod certum est, ex his erunt, quae nascantur et seri non possint.

simile est et quod in cyrenaica provincia vocant misy, praecipuum suavitate odoris ac saporis, sed carnosius, et quod in threcia iton et quod in graecia geranion.

de tuberibus haec traduntur peculiariter: cum fuerint imbres autumnales ac tonitrua crebra, tunc nasci et maxime tonitribus, nec ultra annum durare, tenerrima autem verno esse. quibusdam locis accepta tantum riguis feruntur, sicut mytilenis negant nasci nisi exundatione fluminum invento semine ab tiaris. est autem is locus, in quo plurima nascuntur. asiae nobilissima circa lamsacum et alopeconnesum, graeciae vero circa elim.

sunt et in fungorum genere graecis dicti pezicae, qui sine radice aut pediculo nascuntur.

ab his proximum dicitur auctoritate clarissimum laserpicium, quod graeci silphion vocant, in cyrenaica provincia repertum, cuius sucus laser vocatur, magnificum in usu medicamentisque et ad pondus argentei denarii repensum. multis iam annis in ea terra non invenitur, quoniam publicani, qui pascua conducunt, maius ita lucrum sentientes depopulantur pecorum pabulo. unus omnino caulis nostra memoria repertus neroni principi missus est. si quando incidit pecus in spem nascentis, hoc deprehenditur signo: ove, cum comederit, dormiente protinus, capra sternuente crebrius. diuque iam non aliud ad nos invehitur laser, quam quod in perside aut media et armenia nascitur large, sed multo infra cyrenaicum, id quoque adulteratum cummi aut sacopenio aut faba fracta; quo minus omittendum videtur c. valerio m. herennio cos. cyrenis advecta romam publice laserpicii pondo xxx, caesarem vero dictatorem initio belli civilis inter aurum argentumque protulisse ex aerario laserpicii pondo md.

id apud auctores graeciae certissimos invenimus natum imbre piceo repente madefacta tellure circa hesperidum hortos syrtimque maiorem septem annis ante oppidum cyrenarum, quod conditum est urbis nostrae anno cxliii, vim autem illam per [iiii] stadium africae valuisse. in ea laserpicium gigni solitum, rem feram ac contumacem et, si coleretur, in deserta fugientem, radice multa crassaque, caule ferulaceo ac simili crassitudine. huius folia maspetum vocabant, apio maxime similia. semen erat foliaceum, folium ipsum vere deciduum. vesci pecora solita primoque purgari, mox pinguescere, carne mirabilem in modum iucunda. post folia amissa caule ipso et homines vescebantur modis omnibus decocto, elixo assoque, eorum quoque corpora xl primis diebus purgante. sucus duobus modis capiebatur, e radice atque caule, et haec duo erant nomina, rhizias atque caulias, vilior illo ac putrescens. radici cortex niger. ad mercis adulteria sucum ipsum in vasa coiectum admixto furfure subinde concutiendo ad maturitatem perducebant, ni ita fecissent, putrescentem. argumentum erat maturitatis colos siccitasque sudore finito. alii

tradunt laserpicii radicem fuisse maiorem cubitali, tuberque in ea supra terram. hoc inciso profluere solitum sucum ceu lactis, supernato caule, quem magydarim vocarunt. folia aurei coloris pro semine fuisse, cadentia a canis ortu austro flante. ex his laserpicium nasci solitum, annuo spatio et radice et caule consummantibus sese. hi et circumfodi solitum prodidere, nec purgari pecora, sed aegra sanari aut protinus mori, quod in paucis accidere. persico silphio prior opinio congruit.

alterum genus eius est, quod magydaris vocatur, tenerius et minus vehemens, sine suco, quod circa syriam nascitur, non proveniens in cyrenaica regione. gignitur et in parnaso monte copiosum, quibusdam laserpicium vocantibus. per quae omnia adulteratur rei saluberrimae utilissimaeque auctoritas. probatio sinceri prima in colore modice rufo et, cum frangatur, intus candido, mox tralucente gutta quaeque saliva celerrime liquescat. usus in multis medicaminibus.

sunt etiamnum duo genera non nisi sordido nota volgo, cum quaestu multum polleant, in primis rubia, tinguendis lanis et coriis necessaria. laudatissima italica et maxime suburbana, et omnes paene provinciae scatent ea. sponte provenit seriturque, similitudine erviliae, verum spinosis foliis et caule. geniculatus hic est quinque circa articulos in orbe foliis. semen eius rubrum, postremo nigrum, radix rubra est. quos in medicina usus habeat dicemus suo loco.

at quae vocatur radícula lavandis demum lanis sucum habet, mirum quantum conferens candori mollitiaeque. nascitur sativa ubique, sed sponte praecipua in asia syriaque, saxosis et asperis locis, trans euphraten tamen laudatissima, caule ferulaceo, tenui et ipso, cibus indigenarum expetito et unguentis, quicquid sit cum quo decoquatur, folio oleae. struthion graeci vocant. floret aestate, grata aspectu, verum sine odore, spinosae caule lanuginis. semen ei nullum, radix magna, quae conciditur ad quem dictum est usum.

ab his superest reverti ad hortorum curam et suapte natura memorandam et quoniam antiquitas nihil prius mirata est, quam hesperidum hortos ac regum adonidis et alcinoi itemque pensiles, sive illos semiramis sive assyriae rex syrus fecit, de quorum opere alio volumine dicemus. romani quidem reges ipsi coluere; quippe etiam superbus nuntium illum saevum atque sanguinarium filio remisit ex horto. in xii tabulis legum nostrarum nusquam nominatur villa, semper in significatione ea hortus, in horti vero heredium; quam ob rem comitata est et religio quaedam, hortoque et foro tantum contra invidentium effascinationes dicari videmus in remedio saturica signa, quamquam hortos tutelae veneris adsignante plauto. iam quidem hortorum nomine in ipsa urbe delicias agros villasque possident. primus hoc instituit athenis epicurus otii magister; usque ad eum moris non fuerat in oppidis habitari rura.

romae quidem per se hortus ager pauperis erat. ex horto plebei macellum, quanto innocentiore victu! mergi enim, credo, in profunda satius est et ostrearum genera naufragio exquiri, aves ultra phasim amnem peti ne fabuloso

quidem terrore tutas, immo sic pretiosiores, alias in numidiam atque aethiopiae sepulchra, aut pugnare cum feris mandique capientem quod mandat alius. at, hercules, quam vilia haec, quam parata voluptati satietatique, nisi eadem, quae ubique, indignatio occurreret! ferendum sane fuerit exquisita nasci poma, alia sapore, alia magnitudine, alia monstro pauperibus interdicta, inveterari vina saccisque castrari, nec cuiquam adeo longam esse vitam, ut non ante se genita potet, e frugibus quoque quondam alicam sibi excogitasse luxuriam ac medulla tantum earum superque pistrinarum operibus et caelaturis vivere, alio pane procerum, alio volgi, tot generibus usque ad infimam plebem descendente annona. etiamne in herbis discrimen inventum esse, opesque differentiam facere in cibo etiam uno asse venali in his quoque aliqua sibi nasci tribus negant, caule in tantum saginato, ut pauperis mensa non capiat. silvestres fecerat natura corrudas, ut passim quisque demeteret. ecce altiles spectantur asparagi, et ravenna ternos libris rependit. heu prodigia ventris! mirum esset non licere pecori carduis vesci: non licet plebei! aquae quoque separantur, et ipsa naturae elementa vi pecuniae discreta sunt. hi nives, illi glaciem potant poenasque montium in voluptatem gulae vertunt. servatur rigor aestibus, excogitaturque ut alienis mensibus nix algeat. decocunt alii aquas, mox et illas hiemant. nihil utique homini sic, quomodo rerum naturae, placet. etiamne herba aliqua diviti tantum pascitur nemo sacros aventinosque montes et iratae plebis secessus circumspexerit macellum certe aequabit quos pecunia separaverit. itaque, hercules, nullum macelli vectigali maius fuit romae clamore plebis incusantis apud omnes principes, donec remissum est portorium mercis huius, conpertumque non aliter quaestuosius censum haberi aut tutius ac minore fortunae iure: cum credatur pensio ea pauperrumis, in solo sponsor est et sub die redditus superficiesque caelo quocumque gaudens.

hortorum cato praedicat caules. hinc primum agricolae aestimabant prisci et sic statim faciebant iudicium, nequam esse in domo matrem familias - etenim haec cura feminae dicebatur - , ubi indiligens esset hortus, quippe e carnario aut macello vivendum esse. nec caules, ut nunc maxime, probabant, damnantes pulmentaria quae egerent alio pulmentario: id erat oleo parcere, nam gari desideria etiam in exprobratione erant. horti maxime placebant quae non egerent igni parcerentque ligno, expedita res et parata semper, unde et acetaria appellantur, facilia concoqui nec oneratura sensus cibo et quae minime accenderent desiderium panis. pars eorum ad condimenta pertinens fatetur domi versuram fieri solitam atque non indicum piper quaesitum quaeque trans maria petimus. iam in fenestris suis plebs urbana imagine hortorum cotidiana oculis rura praebebant, antequam praefigi prospectus omnes coegit multitudinis innumerae saeva latrocinatio. quamobrem sit aliquis et his honos, neve auctoritatem rebus vilitas adimat, cum praesertim etiam cognomina procerum inde nata videamus lactucinosque in valeria familia non puduisse appellari, et contingat aliqua gratia operae curaeque nostrae vergilio quoque confesso, quam sit difficile verborum honorem tam

parvis perhibere.

hortos villae iungendos non est dubium riguosque maxime habendos, si contingat, praefluo amne, si minus, e puteo rota organisve pneumaticis vel tollenonum haustu rigatos. solum proscindendum a favonio in autumnum praeparantibus post xiiii dies iterandumque ante brumam. viii iugerum operis palari iustum est, fimum iii pedes alte cum terra misceri, areis distingui easque resupinis pulvinorum toris, ambiri singulas tramitum sulcis, qua detur accessus homini scatebrisque decursus.

in hortis nascentium alia bulbo commendantur, alia capite, alia caule, alia folio, alia utroque, alia semine, alia cartilagine, alia carne aut utroque, alia cortice aut cute et cartilagine, alia tunicis carnosis.

aliorum fructus in terra est, aliorum et extra, aliorum non nisi extra. quaedam iacent crescuntque, ut cucurbitae et cucumis; eadem pendent, quamquam graviora multo etiam iis, quae in arboribus gignuntur. sed cucumis cartilagine et carne constat, cucurbita cortice et cartilagine; cortex huic uni maturitate transit in lignum. terra conduntur raphani napique et rapa, atque alio modo inulae, siser, pastinacae. quaedam vocabimus ferulacea, ut anetum, malvas. namque tradunt auctores in arabia malvas septimo mense arborescere baculorumque usum praebere. exemplo est arbor malvae in mauretania lixi oppidi aestuario, ubi hesperidum horti fuisse produntur, cc passibus ab oceano iuxta delubrum herculis antiquius gaditano, ut ferunt. ipsa altitudinis pedum xx, crassitudinis quam circumplecti nemo possit. in simili genere habebitur et cannabis. nec non et carnosa aliqua appellabimus, ut spongeas in umore pratorum enascentes. fungorum enim callum in ligni arborumque natura diximus et alio genere tuberum paulo ante.

cartilaginum generis extraque terram est cucumis, mira voluptate tiberio principi expetitus. nullo quippe non die contigit ei, pensiles eorum hortos promoventibus in solem rotis olitoribus rursusque hibernis diebus intra specularium munimenta revocantibus. quin et lacte mulso semine eorum biduo macerato apud antiquos graeciae auctores scriptum est seri oportere, ut dulciores fiant. crescunt qua coguntur forma. in italia virides et quam minimi, in provinciis quam maximi et cerini aut nigri placent. copiosissimi africae, grandissimi moesiae. cum magnitudine excessere, pepones vocantur. vivunt hausti in stomacho in posterum diem nec perfici queunt in cibus, non insalubres tamen plurimum. natura oleum odere mire nec minus aquas diligunt, desecti quoque. ad eas modice distantes adrepunt, contra oleum refugiunt aut, si quid obstat vel si pendeant, curvantur intorquenturque. id vel una nocte deprehenditur, si vas cum aqua subiciatur, a quattuor digitorum intervallo descendentibus ante posterum diem, at si oleum eodem modo sit, in hamos curvatis. iidem in fistulam flore demisso mira longitudine crescunt. ecce cum maxime nova forma eorum in campania provenit mali cotonei effigie. forte primo natum ita audio unum, mox semine ex illo genus factum, melopeponas vocant. non pendent hi, sed humi rotundantur, colore aureo. mirum in his praeter figuram coloremque et odorem, quod maturitatem adepti,

quamquam non pendentes, statim a pediculo recedunt. columella suum tradit commentum, ut toto anno contingant, fruticem rubi quam vastissimum in apricum locum transferre et recidere duum digitorum relicta stirpe circa vernalis aequinoctium. ita in medulla rubi semine cucumeris insito terra minuta fimoque circumaggeratas resistere frigori radices. cucumerum graeci tria genera fecere, laconicum, scytalicum, boeotium; ex his tantum laconicum aqua gaudere. sunt qui herba, nomine quae vocatur culix, trita semen eorum maceratum seri iubeant, ut sine semine nascantur.

similis et cucurbitis natura, dumtaxat in nascendo. aequae hiemem odere, amant rigua ac fimum. seruntur ambo semine in terra sesquipedali fossura, inter aequinoctium vernalis et solstitium, parilibus tamen aptissime; aliqui malunt ex kal. mart. cucurbitas et nonis, cucumis et per quinquatrus serere. simili modo reptantibus flagellis scandentis parietum aspera in tectum usque natura sublimitatis avida. vires sine adminiculo standi non sunt, velocitas pernix, levi umbra camaras ac pergulas operiens. inde haec prima duo genera, camararium et plebeium, quod humi crescit; in priore mire tenui pediculo libratur pondus immobile aurae. cucurbita quoque omni modo fastigatur, vaginis maxime vitilibus, coniuncta in eas postquam defloruit, crescitque quae cogitur forma, plerumque et draconis intorti figura. libertate vero pensili concessa iam visa est viiii pedum longitudinis. particulatim cucumis floret, sibi ipse superflorescens, et sicciores locos patitur, candida lanugine obductus magisque, dum crescit.

cucurbitarum numerosior usus. et primus caulis in cibo, atque ex eo in totum natura diversa. nuper in balnearum usum venere urceorum vice, iam pridem vero etiam cadorum ad vina condenda. cortex viridi tener, deraditur nihilominus in cibis. cibus saluber ac lenis pluribus modis, ex his tamen, qui perfici humano ventre non queant, sed non intumescant. semina, quae proxima collo fuerunt, proceras pariunt, item ab imis, sed non comparandas supra dictis; quae in medio, rotundas; quae in lateribus, crassas brevioresque. siccantur in umbra et, cum libeat serere, in aqua macerantur. cibis quo longiores tenuioresque, eo gratiores, et ob id salubriores quae pendendo crevere, minimumque seminis tales habent, duritia eius in cibis gratiam terminante. eas, quae semini servantur, ante hiemem praecidi non est mos, postea fumo siccantur condendis hortensiorum seminibus, rusticae suppellectili. inventa est ratio, qua cibus quoque servarentur - eodemque modo cucumis - usque ad alios paene proventus; et id quidem muria fit. sed et scrobe opaco in loco harena substrato fenoque sicco operto ac deinde terra virides servari tradunt. sunt et silvestres in utroque genere et omnibus fere hortensiiis. sed et his medica tantum natura est, quam ob rem differentur in sua volumina.

reliqua cartilaginum naturae terra occultantur omnia. in quibus de rapis abunde dixisse poteramus videri, nisi medici masculini sexus facerent in his rotunda, latiora vero et concava feminini, praestantiora suavitate et ad condiendum faciliora; saepius sata transeunt in marem. iidem naporum

quinque genera fecere, corinthium, cleonaeum, liothasium, boeotium et quod per se viride dixerunt. ex his in amplitudinem adolescit corinthium, nuda fere radice. solum enim hoc genus superne tendit, non, ut cetera, in terram. liothasium quidam thracium appellant, frigorum patientissimum. ab eo boeotium dulce est, rotunditate etiam brevi notabile, neque, ut cleonaeum, praelongum. in totum quidem quorum levia folia, ipsi quoque dulciores; quorum scabra et angulosa et horrida, amariores. est praeterea genus silvestre, cuius folia sunt erucae similia. palma romae amiterinis datur, dein nursinis, tertia nostratibus. cetera de satu eorum in rapis dicta sunt.

cortice et cartilagine constant raphani, multisque eorum cortex crassior etiam quam quibusdam arborum. amaritudo plurima illis est pro crassitudine corticis - cetera quoque aliquando lignosa - et vis mira colligendi spiritum laxandique ructum. ob id cibus inliberalis, utique si proxime olus mandatur; si vero ipse cum olivis druppis, rarior ructus fit minusque faetidus. aegypto mire celebratur olei propter fertilitatem, quod e semine eius faciunt. hoc maxime cupiunt serere, si liceat, quoniam et quaestus plus quam e frumento et minus tributi est nullumque ibi copiosius oleum. genera raphani graeci fecere tria foliorum differentia: crispis atque levis et tertium silvestre. atque huic levia quidem, sed breviora ac rotunda copiosaque ac fruticosa, sapor autem asper et medicamenti instar ad eliciendas alvos. et in prioribus tamen differentia semine, quoniam aliqua peius, aliqua admodum exiguum ferunt. haec vitia non cadunt nisi in crispa folia. nostri alia fecere genera: algidense a loco, longum atque tralucidum, alterum rapi figura, quod vocant syriacum, suavissimum fere ac tenerimum hiemisque patiens praecipue. verum tamen e syria non pridem advectum apparet, quoniam apud auctores non reperitur; id autem tota hieme durat. etiamnum unum silvestre graeci cerain vocant, pontici armon, alii leucen, nostri armoraciam, fronde copiosius quam corpore. in omnibus autem probandis maxime spectantur caules, ininitium enim rotundiores crassioresque ac longis canalibus; folia ipsa tristiora et angulis horrida.

seri vult raphanus terra soluta, umida. fimum odit palea contentus. frigore adeo gaudet, ut in germania infantium puerorum magnitudinem aequet. seritur post id. feb., ut vernus sit, iterumque circa vulcanalia, quae satio melior. multi et martio et aprili serunt et septembri. incipiente incremento confert alterna folia circumobruere, ipsos vero adcumulare, nam qui extra terram emersit, durus fit atque fungosus. aristomachus detrahi folia per hiemem iubet et, ne lacunae stagnet, accumulari; ita in aestatem grandescere. quidam prodidere, si palo adacto caverna palea insternatur sex digitorum altitudine, deinde in semen fimumque et terra congeratur, ad magnitudinem scrobis crescere. praecipue tamen salsis aluntur; itaque etiam talibus aquis rigantur et in aegypto nitro sparguntur, ubi sunt suavitate praecipui. in totum quoque salsugine amaritudo eorum eximitur, fiuntque coctis similes. namque et cocti dulcescunt et in naporum vicem transeunt. crudos medici suadent ad colligenda acria viscerum cum sale ieiunis esse, atque ita vomitionibus

praeparant meatum. tradunt et praecordiis necessarium hunc sucum, quando φθειρίασιν cordi intus inhaerentem non alio potuisse depelli conpertum sit in aegypto, regibus corpora mortuorum ad scrutandos morbos insecantibus. atque, ut est graeca vanitas, fertur in templo apollinis delphis adeo ceteris cibis praelatus raphanus, ut ex auro dicaretur, beta ex argento, rapum e plumbo. scires non ibi genitum m'. curium imperatorem, quem hospitum legatis aurum repudiaturum adferentibus rapum torrentem in foco inventum annales nostri prodidere. scripsit et moschion graecus unum de raphano volumen. utilissimi in cibis hiberno tempore existimantur, iidemque dentibus semper inimici, quoniam adterant; ehora certe poliunt. odium is cum vite maximum, refugitque iuxta satos.

lignosiora sunt reliqua in cartilaginum genere a nobis posita, mirumque omnibus vehementiam saporis esse. ex his pastinacae unum genus agreste sponte provenit, alterum graeciae seritur radice vel semine vere primo vel autumno, ut hygino placet, februario, augusto, septembri, octobri, solo quam altissime refosso. annicula utilis esse incipit, bima utilior, gratior autumno patinisque maxime, et sic quoque virus intractabile illi est. hibiscum a pastinaca gracilitate distat, damnatum in cibis, sed medicinae utile. est et quartum genus in eadem similitudine pastinacae, quam nostri gallicam vocant, graeci vero daucon, cuius genera etiam quattuor fecere, inter medicamenta dicendum.

siser et ipsum tiberius princeps nobilitavit flagitans omnibus annis e germania. gelduba appellatur castellum rheno inpositum, ubi generositas praecipua, ex quo apparet frigidis locis convenire. inest longitudine nervus, qui decoctis extrahitur, amaritudinis tamen magna parte relictæ, quae mulso in cibis temperata etiam in gratiam vertitur. nervus idem et pastinacae maiori, dumtaxat anniculae. siseris satus mensibus februario, martio, aprili, augusto, septembri, octobri.

brevior his est et torosior amariorque inula per se stomacho inimicissima, eadem dulcibus mixtis saluberrima. pluribus modis austeritate victa gratiam invenit. namque et in pollinem tunditur arida liquidoque dulci temperatur, et decocta posca aut adservata vel macerata pluribus modis et tunc mixta defruto aut subacta melle uvisve passis aut pinguibus caryotis. alio rursus modo cotoneis malis vel sorbis aut prunis, aliquando pipere aut thymo variata defectus praecipue stomachi excitat, inlustrata maxime iuliae augustae cotidiano cibo. supervacuum eius semen, quoniam oculis ex radice ex radice excisis, ut harundo, seritur, et haec autem et siser et pastinaca utroque tempore, vere et autumno, magnis seminum intervallis, inula ne minus quam ternorum pedum, quoniam spatiose fruticat. siser transferre melius.

proxima hinc est bulborum natura, quos cato in primis serendos praecipit celebrans megaricos. verum nobilissima est scilla, quamquam medicamini nata exacuendoque aceto. nec ulli amplitudo maior, sicuti nec vis asperior. duo genera medicae, masculae albis foliis, feminae nigris. set tertium genus est cibis gratum, epimenidu vocatur, angustius folio ac minus asperum.

seminis plurimum omnibus; celerius tamen proveniunt satae bulbis circa latera natis et, ut crescant, folia, quae sunt his ampla, deflexa circa obruuntur; ita sucum omnem in se trahunt capita. sponte nascuntur copiosissimae in baliaribus ebusoque insulis ac per hispanias. unum de eis volumen condidit pythagoras philosophus, colligens medicas vires, quas proximo reddemus libro. reliqua genera bulborum differunt colore, magnitudine, suavitate, quippe cum quidam crudi mandantur, ut in cherroneso taurica. post hos in africa nati maxime laudantur, mox apuli. genera graeci haec fecere: bolbinen, setanion, opitiona, cyica, aegilopa, sisyrinchion. in hoc mirum imas eius radices crescere hieme, verno autem, cum apparuerit viola, minui ac contrahi, tunc deinde bulbum pinguescere. est inter genera et quod in aegypto aron vocant, scillae proximum amplitudine, foliis lapathi, caule recto duum cubitorum, baculi crassitudine, radice mollioris naturae, quae estur et cruda. effodiuntur bulbi ante ver aut deteriores illico fiunt. signum maturitatis est folia inarescentia ab imo, vetustioresque improbant, item longos ac parvos; contra rubicundis rotundioribusque laus et grandissimis. amaritudo plerisque in vertice est, media eorum dulcia. bulbos non nasci nisi e semine priores tradiderunt, sed in praenestinis campis sponte nascuntur ac sine modo etiam in remorum arvis.

hortensiis omnibus fere singulae radices, ut raphano, betae, apio, malvae, amplissima autem lapathio, ut quae descendat ad tria cubita - silvestri minor - , et umida effossa quoque diu vivit. quibusdam tamen capillatae, ut apio, malvae, quibusdam surculosae, ut ocimo, aliis carnosae, ut betae, ut magis etiamnum croco; aliquis ex cortice et carne constant, ut raphano, rapis; quorundam geniculatae sunt, ut graminis. quae rectam non habent radicem, statim plurimis nituntur capillamentis, ut atriplex et blitum. scilla autem et bulbi et cepae et alium non nisi in rectum radicanter. sponte nascentium quaedam numerosiora sunt radice quam folio, ut spalax, perdicium, crocum. florent confertim serpullum, habrotonum, napi, raphani, menta, ruta, et cetera quidem, cum coepere, deflorescunt, ocimum autem particulatim et ab imo incipit, qua de causa diutissime floret. hoc et in heliotropio herba evenit. flos aliis candidus, aliis luteus, aliis purpureus. folia cadunt a cacuminibus origano, inulae et aliquando rutae iniuria laesae. maxime concava sunt cepae, getio.

alium cepasque inter deos in iureiurando habet aegyptus. cepae genera apud graecos sarda, samothracia, alsidena, setania, schista, ascalonia, ab oppido iudaeae nominata. omnibus etiam odor lacrimosus et praecipue cypriis, minime cnidiis. omnibus corpus totum pingui tunicarum cartilagine. e cunctis setania minima, excepta tusculana, sed dulcis. schista autem et ascalonia condiuntur. schistam hieme cum coma sua relincunt, vere folia detrahunt, et alia subnascuntur iisdem divisuris, unde et nomen. hoc exemplo reliquis quoque generibus detrahi iubent, ut in capita crescant potius quam in semen. ascaloniarum propria natura. etenim velut steriles sunt ab radice, et ob id semine seri illas, non deponi iussere graeci, praeterea serius circa ver, at

cum germinent, transferri, ita crassescere et properare cum praeteriti temporis pensitatione. festinandum autem in iis est, quoniam maturae celeriter putrescunt. si deponantur, caulem emittunt et semen ipsaeque evanescent. est et colorum differentia; in isso enim et sardibus candidissimae proveniunt. sunt in honore et creticae, de quibus dubitant, an eadem sint quae ascaloniae, quoniam satis capita crassescunt, depositis caulibus et semen. distant sapore tantum dulci. apud nos duo prima genera: unum condimentariae, quam illi getion, nostri pallacanam vocant, seritur mensibus martio, aprili, maio, alterum capitatae, quae ab aequinoctio autumnii vel a favonio. genera eius austeritatis ordine: africana, gallica, tusculana, ascalonia, amiterquina, optima autem quae rotundissima. item rufa acrior quam candida, et sicca quam viridis, et cruda quam cocta sicut quam condita. seritur amiterquina frigidis et umidis locis, et sola alii modo capite, reliquae semine proximaque aestate nullum semen emittunt, sed caput tantum, quod increscit. sequenti autem anno permutata ratione semen gignitur, caput ipsum corrumpitur. ergo omnibus annis separatim semen cepae causa seritur, separatim cepa seminis. servantur autem optime in paleis. getium paene sine capite est, cervicis tantum longae et ideo totum in fronde, saepiusque resecatur, ut porrum. ideo et illud serunt, non deponunt. cetero cepas ter fosso seri iubent extirpatis radicibus herbarum, in iugera denas libras, intermisceri satureiam, quoniam melius proveniat, runcari praeterea et sariri, si non saepius, quater. ascaloniam mense februario serunt nostri. semen ceparum nigrescere incipiens, antequam inarescat, metunt.

et de porro in hac cognatione dici conveniat, praesertim cum sectivo auctoritatem nuper fecerit princeps nero vocis gratia ex oleo statis mensum omnium diebus nihilque aliud ac ne pane quidem vescendo. seritur semine ab aequinoctio autumnii, si sectivum facere libuit, densius. in eadem area secatur, donec deficiat, stercoreaturque semper, si nutriatur in capita, antequam secetur. cum increvit, in aliam aream transfertur, summis foliis leviter recisis ante medullam et capitibus retractis tunicisque extremis. antiqui silice vel testa subiecta capita dilatabant - hoc item in bulbis - , nunc sarculo leviter convelluntur radices, ut delumbatae alant neque distrahant. insigne quod, cum fimo laetoque solo gaudeat, rigua odit. et tamen proprietate quaedam soli constant: laudatissimum aegypto, mox ostiae atque ariciae. sectivi duo genera: herbaceum folio, incisuris eius evidentibus, quo utuntur medicamentarii, alterum genus flavidioris folii rotundiorisque, levioribus incisuris. fama est melam equestris ordinis, reum ex procuratione a tiberio principe accersitum, in summa desperatione suco porri ad trium denariorum argenteorum pondus hausto confestim expirasse sine cruciatu. ampliorem modum negant noxium esse.

alium ad multa ruris praecipue medicamenta prodesse creditur. tenuissimis et quae spernantur universum velatur membranarum, mox pluribus coagmentatur nucleis, et his separatim vestitis, asperi saporis; quo plures nuclei fuere, hoc est asperius. taedium huic quoque halitu, ut cepis, nullum tamen coctis. generum differentia in tempore - praecox maturescit lx diebus - , tum in

magnitudine. ulpicum quoque in hoc genere graeci appellavere alium cyprium, alii ἄντισκόροδον, praecipue africae celebratum inter pulmentaria ruris, grandius alio. tritum in oleo et aceto mirum quantum increscit spuma. quidam ulpicum et alium in plano seri vetant, castellatimque grumulis inponi distantibus inter se pedes ternos. inter grana digiti iiii interesse debent, simul atque tria folia eruperunt, sariri. grandescunt, quo saepius sariuntur. maturescentium caules depressi in terram obruuntur; ita cavetur, ne in frondem luxurient. in frigidis utilius vere seri quam autumnis. cetero ut odore careant, omnia haec iubentur seri, cum luna sub terra sit, colligi, cum in coitu. sine his menander e graecis auctor est alium edentibus, si radicem betae in pruna tostam superederint, odorem extingui. sunt qui et alium et ulpicum inter compitalia ac saturnalia seri aptissime putent. alium et semine provenit, sed tarde. primo enim anno porri crassitudinem capite efficit, sequenti dividitur, tertio consummatur, pulchriusque tale existimant quidam. in semen exire non debet, sed intorqueri caulis satus gratia, ut caput validius fiat. quod si diutius alium cepamque inveterare libeat, aqua salsa tepida capita unguenda sunt; ita diuturniora fient melioraque usui et in satu sterilia. alii contenti sunt primo super prunas suspendisse abundeque ita profici arbitrantur, ne germinent, quod facere alium cepamque extra terram quoque certum est et cauliculo acto evanescere. aliqui et alium palea servari optime putant. alium est et in arvis sponte nascens - alium vocant - , quod adversus improbitatem alium depascentium semina coctum, ne renasci possit, abicitur, statimque quae devoravere aves stupentes manu capiuntur et, si paulum commorere, sopitae. est et silvestre, quod ursinum vocant, odore simili, capite praetenui, foliis grandibus.

in horto satorum celerrime nascuntur ocimum, blitum, napus, eruca. tertio enim die erumpunt, anetum quarto, lactuca quinto, raphanus sexto, cucumis, cucurbita septimo - prior cucumis - , nasturtium, sinapi quinto, beta aestate sexto, hieme decimo, atriplex octavo, cepae xviii aut xx, gethyum x aut duodecimo, contumacius coriandrum, cunila quidem et organum post xxx diem, omnium autem difficillime apium. xl enim die cum celerrime, l maiore ex parte emergit. aliquid et seminum aetas confert, quoniam recentia maturius gignunt in porro, gethyo, cucumi, cucurbita, ex vetere autem celerius proveniunt apium, beta, cardamum, cunila, organum, coriandrum. mirum in betae semine: non enim totum eodem anno gignit, sed aliquid sequenti, aliquid et tertio; itaque ex copia seminis modice nascitur. quaedam anno tantum suo pariunt, quaedam saepius, sicut apium, porrum, gethyum; haec enim semel sata pluribus annis restibili fertilitate proveniunt.

semina plurimis rotunda, aliquis oblonga, paucis foliacea et lata, ut atriplici, quibusdam angusta et canaliculata, ut cumino. differunt et colore nigro, candidiore, item duritia surculacea. in folliculo sunt raphanis, sinapi, rapo. nudum semen est coriandri, aneti, feniculi, cumini, cortice obductum bliti, betae, atriplicis, ocimi, at lactucis in lanugine. nihil ocimo fecundius. cum maledictis ac probis serendum praecipiant, ut laetius proveniat; sato pavitur

terra. et cuminum qui serunt, precantur ne exeat. quae in cortice sunt, difficillime inarescunt maximeque ocimum, et ideo siccantur omnia ac sunt fecunda. utique meliora nascuntur acervatim sato semine quam sparso. ita certe porrum et apium serunt in laciniis colligatum, apium etiam paxillo caverna facta ac fimo ingesto. nascuntur autem omnia aut semine aut avolsione, quaedam semine et surculo, ut ruta, origanum, ocimum - praecidunt enim et hoc, cum pervenit ad palmum altitudinis - , quaedam et semine et radice, ut cepa, alium, bulbi et si quorum radices anniferorum relinquuntur. eorum vero, quae a radice nascuntur, radix diuturna et fruticosa est, ut bulbi, gethyi, scillae. fruticant alia et non capitata, ut apium et beta. caule reciso fere quidem omnia regerminant exceptis quae non scabrum caulem habent, et in usum vero ocimum, raphanus, lactuca; hanc etiam suaviorem putant a regerminatione. raphanus utique iucundior detractis foliis, antequam decaulescat. hoc et in rapis. nam et eadem dereptis foliis cooperta terra crescunt durantque in aestatem.

singula genera sunt ocimo, lapathio, blito, nasturtio, erucae, atriplici, coriandro, aneto. haec enim ubique eadem sunt, neque aliud alio melius usquam. rutam furtivam tantum provenire fertilius putant, sicut apes furtivas pessime. nascuntur autem etiam non sata mentastrum, nepete, intubum, puleium. contra plura genera sunt eorum, quae diximus dicemusque, et in primis apio. id enim, quod sponte in umidis nascitur, helioselinum vocatur, uno folio nec hirsutum, rursus in siccis hipposelinum, pluribus foliis, simile helioselino. tertium est oreoselinum, cicutae foliis, radice tenui, semine aneti, minutiore tantum. et sativi autem differentiae in folio denso, crispo aut rariore et leviori, item caule tenuiore aut crassiore, et caulis aliorum candidus est, aliorum purpureus, aliorum varius.

lactucae graeci tria fecere genera: unum lati caulis, adeo ut ostiola olitoria ex iis factitari prodiderint - folium his paulo maius herbaceo et angustissimum, ut alibi consumpto incremento - , alterum rotundi caulis, tertium sessile, quod laconicum vocant. alii colore et tempore satus genera discrevere; esse enim nigras, quarum semen mense ianuario seratur, albas, quarum martio, rubentes, quarum aprili, et omnium earum plantas post binos menses differri. diligentiores plura genera faciunt: purpureas, crispas, cappadocias, graecas, longioris has folii caulisque lati, praeterea longi et angusti, intubis similis. pessimum autem genus cum exprobratione amaritudinis appellavere *πικριδα*. est etiamnum alia distinctio albae, quae *μικωνις* vocatur a copia lactis soporiferi, quamquam omnes somnum parere creduntur. apud antiquos italiae hoc solum genus earum fuit, et ideo lactucis nomen a lacte. purpuream maximae radice caecilianam vocant, rotundam vero ac minima radice, latis foliis *ἀστυριδα* quidamque *εὐβουχέϊον*, quoniam haec maxime refragetur veneri. est quidem natura omnibus refrigeratrix et ideo aestate gratia. stomacho fastidium auferunt cibique adpetentiam faciunt. divus certe augustus lactuca conservatus in aegritudine fertur prudentia musae medici, cum prioris c. aemili religio nimia eam negaret, in tantum recepta

commendatione, ut servari etiam in alienos menses eas oxymeli tum repertum sit. sanguinem quoque augere creduntur. est etiamnum quae vocatur caprina lactuca, de qua dicemus inter medicas, et ecce cum maxime coepit inreperere sativis admodum probata quae cilicia vocatur, folio cappadociae, ni crispum latiusque esset.

neque ex eodem genere possint dici neque ex alio intubi, hiemis hi patientiores virusque praeferentes, sed caule non minus grati. seruntur ab aequinoctio verno, plantae eorum ultimo vere transferuntur. est et erraticum intubum, quod in aegypto cichorium vocant, de quo plura alias.

inventum omnes thyrsos vel folia lactucarum prorogare urceis conditos et recentes in patinis coquere. seruntur lactucae anno toto laetis et irriguis stercoratisque, binis mensibus inter semen plantamque et maturitatem. legitimum tamen a bruma semen iacere, plantam favonio transferre aut semen favonio, plantam aequinoctio verno. albae maxime hiemem tolerant. umore omnia hortensia gaudent et stercore, praecipue lactucae et magis intubi. seri etiam radices inlitas fimo interest et repleti ablaqueatas humo. quidam et aliter amplitudinem augent, recisis, cum ad semipedem excreverint, fimoque suillo recenti inlitis. candorem vero putant contingere his dumtaxat, quae sint seminis albi, si harena de litore a primo incremento congeratur in medias atque increscentia folia contra ipsa religuntur.

beta hortensiorum levissima est. eius quoque a colore duo genera graeci faciunt, nigrum et candidius, quod praeferunt - parcissimi seminis - appellantque siculum, candoris sane discrimine praeferentes et lactucam. nostri betae genera vernum et autumnale faciunt a temporibus satus. quamquam et iunio seritur; transfertur autumnio planta. hae quoque et oblini fimo radices suas locumque similiter madidum amant. usus his et cum lenti ac faba idemque qui oleris, et praecipuus, ut lenitas excitetur acrimonia sinapis. medici nocentiorum quam olus esse iudicavere, quamobrem adpositas non nemini degustare etiam religio est, ut validis potius in cibo sint. gemina iis natura, et oleris et capite ipso exilientis bulbi, species summa in latitudine. ea contingit, ut in lactucis, cum coeperint colorem trahere inposito levi pondere. neque alii hortensiorum latitudo maior; in binos pedes aliquando se pandunt, multum et soli natura conferente, siquidem in circeiensi agro amplissimae proveniunt. sunt qui betas punico malo florente optime seri existiment, transferri autem, cum v foliorum esse coeperint. mira differentia, si vera est, candidis alvum elici, nigris inhiberi, et cum brassica corrumpatur in dolio vini sapor, eodem betae foliis demersis restitui.

olus caulesque, quibus nunc principatus hortorum, apud graecos in honore fuisse non reperio, sed cato brassicae miras canit laudes, quas in medendi loco reddemus. genera eius facit: extentis foliis, caule magno, alteram crispo folio, quam apiacam vocant, tertiam minutis caulibus, lenem, teneram minimeque probat. brassica toto anno seritur, quoniam et toto secatur, utilissime tamen ab aequinoctio autumnii, transferturque, cum v foliorum est. cymam a prima satione praestat proximo vere. hic est quidam ipsorum caulium delicatior

teneriorque cauliculus, apici luxuriae et per eum druso caesari fastiditus, non sine castigatione tiberi patris. post cymam ex eadem brassica contingunt aestivi autumnalesque cauliculi, mox hiberni, iterumque cymae, nullo aeque genere multifero, donec fertilitate sua consumatur. altera satio ab aequinoctio verno est, cuius planta extremo vere plantatur, ne prius cyma quam caule pariat. tertia circa solstitium, ex qua, si umidior locus sit, aestate, si siccior, autumnus plantatur. umor fimumque si defuere, maior saporis gratia est; si abundavere, laetior fertilitas. fimum asininum maxime convenit.

est haec quoque res inter opera ganeae, quapropter non pigebit verbosius persequi. praecipuus fit caulis sapore ac magnitudine, primum omnium si in repastinato seras, dein si terram fugientes cauliculos sequare terra adtollentesque se proceritate luxuriosa exaggerando aliam accumules ita, ne plus quam cacumen emineat. tritanum hoc genus vocatur bis computabili incendio taedioque. cetera genera complura sunt: cumanum sessile folio, capite patulum; aricinum altitudine non excelsius, folio numerosius quam tenerius; hoc utilissimum existimatur, quia sub omnibus paene foliis fruticat cauliculis peculiaribus. pompeianum procerius, caule ab radice tenui, intra folia crassescit; rariora haec angustioraque, sed teneritas in dote est. frigora non tolerat, quibus etiam aluntur bruttiani praegrandes foliis, caule tenues, sapore acuti. sabellico usque in admirationem crispa sunt folia, quorum crassitudo caulem ipsum extenuet, sed dulcissimi perhibentur ex omnibus. nuper subiere lacuturnenses ex convalle aricina, capite praegrandes, folio innumeri, alii in orbem conlecti, alii in latitudinem torosi; nec plus ullis capitibus post tritianum, cui pedale aliquando conspicitur, et cyma nullis serior. cuicumque autem generi pruinae plurimum suavitatis conferunt, at nisi obliquo vulnere defendatur medulla, plurimum nocent. semini destinati non secantur. est etiam sua gratia numquam plantae habitum excedentibus; ἄλμυριδιὰ vocant, quoniam nisi in maritimis non proveniunt. aiunt navigatione quoque longinqua virides adservari, si statim desecci ita, ne humum attingant, in cados olei quam proxime siccatos opturatosque condantur omni spiritu excluso. sunt qui plantam in transferendo alga subdita pediculo nitrive triti quod tribus digitis capiatur celeriore ad maturitatem fieri putent. sunt qui semen trifolii nitrumque simul tritum adspargant foliis. nitrum in coquendo etiam viriditatem custodit, ut et apiciana coctura, oleo ac sale, priusquam coquantur, maceratis. est inter herbas genus inserendi praecisis germinibus caulis et in medullam semine ex aliis addito. hoc et in cucumere silvestri. nec non olus quoque silvestre est, triumpho divi iuli carminibus praecipue iocisque militaribus celebratum; alternis quippe versibus exprobravere lapsana se vixisse aput dyrrachium, praemiorum parsimoniam cavillantes. est autem id cyma silvestris.

omnium in hortis rerum lautissima cura asparagis. de origine eorum et silvestribus corrudis abunde dictum et quomodo eas iuberet cato in harundinetis seri. est et aliud genus incultius asparago, mitius corruda, passim etiam in montibus nascens, refertis superioris germaniae campis, non inficeto

ti. caesaris dicto, herbam ibi quandam nasci simillimam asparago. nam quod in neside campaniae insula sponte nascitur, longe optimum existimatur. hortensium seritur spongeis. est enim plurimae radice altissimeque germinat. viret thyrso primum emicante, qui caulem educens tempore ipso fastigatur in toros striatos. potest et semine seri.

nihil diligentius comprehendit cato, novissimumque libri est, ut appareat rem repentem ac noviciam fuisse. locum subigi iubet umidum aut crassum, semipedali undique intervallo seri, ne calcetur, praeterea ad lineam grana bina aut terna paxillo demitti - videlicet semine tum tantum serebantur - , id fieri secundum aequinoctium vernalis, stercore satiari, crebro purgari, cavere ne cum herbis evellatur asparagus; primo anno stramento ab hieme protegi, vere aperiri, sariri, runcari, tertio incendi vernalis. quo maturius incensus est, hoc melius provenit. itaque harundinetis maxime convenit, quae festinant incendi. sariri iubet idem non antequam asparagus natus fuerit, ne in sariendo radices vexentur. ex eo velli asparagum ab radice, nam si defringatur, stirpescere et intermori; velli, donec in semen eat - id autem maturescere ad ver - , incendi ac rursus, cum apparuerit asparagus, sariri ac stercoreari. ac post annos viii, cum iam vetus sit, digeri subacto stercore atque, tum spongeis seri singulorum pedum intervallo. quin et ovillo fimo nominatim uti, quoniam aliud herbas creet. nec quicquam postea temptatum utilius apparuit, nisi quod circa id. feb. defosso semine acervatim parvulis scrobibus serunt, plurimum maceratum fimo. biennio dein nexis inter se radicibus spongeas factas post aequinoctium autumnalis disponunt pedibus intervallis, fertilitate in denos annos durante. nullum gratius his solum quam ravennatium hortorum indicavimus. corrodam - hunc enim intellego silvestrem asparagum, quem graeci ὄπμινον aut μυάκωνθον vocant aliisque nominibus - invenio nasci et arietis cornibus tunsis atque defossis.

poterant videri dicta omnia, quae in pretio sunt, ni restaret res maximi quaestus non sine pudore dicenda. certum est quippe carduos apud carthaginem magnam cordubamque praecipue sestertium sena milia e parvis reddere areis, quoniam portenta quoque terrarum in ganeam vertimus serimusque etiam ea, quae refugiunt cunctae quadrupes. carduos ergo duobus modis, autumnis planta et semine ante nonas martias, plantaeque ex eo disponuntur ante id. novemb. aut in locis frigidis circa favonium. stercoreantur etiam, si dis placet, laetiusque proveniunt. condiuntur quoque aceto melle diluto addita laseris radice et cumino, ne quis dies sine carduo sit.

cetera in transcurso dici possunt. ocimum parilibus optime seri ferunt, quidam et autumnis iubentque, cum in hiemem seratur, aceto semen perfundi. eruca quoque et nasturtium vel aestate vel hieme facillime nascuntur. eruca praecipue frigoribus contemptrix diversae est quam lactuca naturae concitatrixque veneris. idcirco iungitur illi fere in cibis, ut nimio frigori par fervor inmixtus temperamentum aequet. nasturtium nomen accepit a narium tormento, et inde vigoris significatio proverbio usurpavit id vocabulum veluti torporem excitantis. in arabia mirae amplitudinis dicitur gigni.

ruta quoque seritur favonio et ab aequinoctio autumnii. odit hiemem et umorem ac fimum, apricis gaudet ac siccis terraque quam maxime lateraria, cinere vult nutriri. hic et semini miscetur, ut careat urucis. auctoritas ei peculiaris apud antiquos fuit. invenio mulsum rutatum populo datum a cornelio cethego, in consulatu collega quinti flaminii, comitiis peractis. amicitia ei cum fico tanta, ut nusquam laetior proveniat quam sub hac arbore. seritur et surculo, melius in perforatam fabam indito, quae suco nutrit comprehendendo surculum. serit et se ipsa, namque incurvato cacumine alicuius rami cum attigit terram, statim radicitur. eadem et ocimo natura, nisi quod difficilius arescit semen. ruta runcatur non sine difficultate, pruritivis ulceribus, ni munitis manibus id fiat oleo defensis. condiuntur autem et eius folia servanturque fasciculis.

ab aequinoctio verno seritur apium semine paulum in pila pulsato. crispus sic putant fieri aut si satum calcetur cylindro pedibusve. proprium ei, quod colorem mutat. honos in achaia coronare victores sacri certaminis nemeae.

eodem tempore seritur menta planta vel, si nondum germinet, spongia. non minus haec umido gaudet. aestate viret, hieme flavescit. genus eius silvestre mentastrum; ex hoc propagatur ut vitis vel si inversi rami serantur. mentae nomen suavis odoris apud graecos mutavit, cum alioqui mintha vocaretur, unde veteres nostri nomen declinaverunt; nunc autem coepit dici ἡδύσμον. grata tomento mensas odore percurrit in rusticis dapibus. semel sata diutina aetate durat. congruit puleio, cuius natura in carnariis reflorescens saepius dicta est. haec quoque servantur simili genere, mentam dico puleiumque et nepetam. condimentorum tamen omnium, quae fastidiis ... , cuminum amicissimum. nascitur in summa tellure vix haerens et in sublime tendens in putribus et calidis maxime locis, medio serendum vere. alterum eius genus silvestre, quod rusticum vocant, alii thebaicum, si tritum ex aqua potetur, in dolore stomachi prodest. in carpetania nostri orbis maxime laudatur, alioqui aethiopico africoque palma est; quidam in hoc aegyptium praeferunt.

sed praecipue olusatrum mirae naturae est. hipposelinum graeci vocant, alii zmyrnum. e lacrima caulis sui nascitur. seritur et radice. sucum eius qui colligunt, murrae saporem habere dicunt, auctorque est theophrastus murra sata natum. hipposelinum veteres praeceperunt in locis incultis, lapidosis iuxta maceriam seri - nunc et repastinato seritur et a favonio post aequinoctium autumnum - , quippe cum capparis quoque seratur sic, siccis maxime, area ideo fossa inclusa ripisque undique circumstructis lapide; alias evagatur per agros et cogit solum sterilesce. floret aestate, viret usque ad vergiliarum occasum, sabulosis familiarissimum. vitia eius, quod trans maria nascitur, diximus inter peregrinos fructes.

peregrinum et careum gentis suae nomine appellatum, culinis principale. in quacumque terra seri vult ratione eadem, qua olusatrum, laudatissimum tamen in caria, proximum phrygia.

ligusticum silvestre est in liguriae suae montibus; seritur etiam ubique. suavius sativum, sed sine viribus. panacem aliqui vocant. crateas apud

graecos cunilam bubulam eo nomine appellat, ceteri vero conyzam, id est cunilaginem, thymbram vero quae sit cunila. haec aput nos habet vocabulum et aliud, satureia dicta in condimentario genere. seritur mense februario. origano aemulo nusquam utrumque additur, quippe similis effectus. sed cunilae aegyptium origanum tantum praefertur.

peregrinum fuit et lepidium. seritur a favonio, dein, cum fruticavit, iuxta terram praeciditur, tunc runcatur stercoreaturque. per biennium hoc postea, iisdem fruticibus, utuntur, si non saevitia hiemis ingruat, quando inpatientissimum est frigorum. exit et in cubitalem altitudinem, foliis lauri, sed mollius. usus eius non sine lacte.

git pistrinis, anesum et anetum culinis et medicis nascuntur; sacopenium, quo laser adulteratur, et ipsum in hortis quidem, sed medicinae tantum.

sunt quaedam comitantia aliorum satus; papaver namque cum brassica seritur ac porcillaca, et eruca cum lactuca. papaveris sativi tria genera: candidum, cuius semen tostum in secunda mensa cum melle apud antiquos dabatur; hoc et panis rustici crustae inspergitur, adfuso ovo inhaerens, ubi inferiorem crustam apium gitque cereali sapore condiunt. alterum genus est papaveris nigrum, cuius scapo inciso lacteus sucus excipitur. tertium genus rhoean vocant graeci, id nostri erraticum; sponte quidem, sed in arvis cum hordeo maxime nascitur, erucae simile, cubitali altitudine, flore rufo et protinus deciduo, unde et nomen a graecis accepit. de reliquis generibus papaveris sponte nascentis dicemus in medicinae loco. fuisse autem in honore apud romanos semper indicio est tarquinius superbus, qui legatis a filio missis decutiendo papavera in horto altissima sanguinarium illud responsum hac facti ambage reddidit.

rursus alio comitatu aequinotio autumnu seruntur coriandrum, anetum, atriplex, malva, lapathum, caerefolium, quod paederota graeci vocant, et acerrimum sapore igneique effectus ac saluberrimum corpori sinapi, nulla cultura, melius tamen planta tralata. quin e diverso vix est sato semel eo liberare locum, quoniam semen cadens protinus viret. usus eius etiam pro pulmentario in patellis decocto, citra intellectum acrimoniae. cocuntur et folia, sicut reliquorum olerum. sunt autem trium generum: unum gracile, alterum simile rapi foliis, tertium erucae. semen optimum aegyptium. athenienses napy appellaverunt, alii thlaspi, alii saurion.

serpyllo et sisymbrio montes plerique scatent, sicut threciae. itaque deferunt ex his avulsos ramos seruntque, item sicyone ex suis montibus et athenis ex hymetto. simili modo et sisymbrium serunt. laetissimum nascitur in puteorum parietibus et circa piscinas ac stagna.

reliqua sunt ferulacei generis, ceu feniculum anguibus, ut diximus, gratissimum, ad condienda plurima, cum inaruit, eique perquam similis thapsia, de qua diximus inter externos frutices; deinde utilissima funibus cannabis. seritur a favonio; quo densior est, eo tenerior. semen eius, cum est maturum, ab aequinotio autumnu destringitur et sole aut vento aut fumo siccatur. ipsa cannabis vellitur post vindemiam ac lucubrationibus decorticata

purgatur. optima alabandica, plagarum praecipue usibus. tria eius ibi genera: inprobatur cortici proximum aut medullae; laudatissima est e medio quae mesa vocatur. secunda mylasea. quod ad proceritatem quidem attinet, rosea agri sabini arborum altitudinem aequat. ferulae duo genera in peregrinis fruticibus diximus. semen eius in italia cibus est; conditur quippe duratque in urceis vel anni spatio. duo ex ea genera, caules et racemi. corymbian hanc vocant corymbosque quos condiunt.

morbos hortensia quoque sentiunt sicut reliqua terra sata. namque et ocimum senectute degenerat in serpyllum, et sisymbrium in zmintham, et ex semine brassicae vetere rapa fiunt, atque invicem. et necatur cuminum αἰμοδῶρῳ, nisi repurgetur; est autem unicaule, radice bulbo simili, non nisi in gracili solo nascens. alius privatim cumini morbus scabies. et ocimum sub canis ortu pallescit. omnia vero accessu mulieris menstrualis flavescunt. bestiarum quoque genera innascuntur, napis pulices, raphano urucae et vermiculi, item lactucis et oleri, utrisque hoc amplius limaces et cocleae, porro vero privata animalia, quae facillime stercore iniecto capiuntur condentia in id se. ferro quoque non expedire tangi rutam, cunilam, mentam, ocimum auctor est sabinus tiro in libro κηπουρικῶν, quem maecenati dicavit.

idem contra formicas, non minimum hortorum exitium, si non sint rigui, remedium monstravit limum marinum aut cinerem obturandis earum foraminibus. sed efficacissime heliotropio herba necantur. quidam et aquam diluto latere crudo inimicam his putant. naporum medicina ervi aliquid una seri, sicut olerum cicer; arcet enim urucas. quo si omisso enatae sint, remedio est absinthii sucus decocti inspersus vel sedi; genus hoc herbae, quam alii ἀειζων vocant, diximus. semen olerum si suco eius madefactum seratur, olera nulli animalium obnoxia futura tradunt; in totum vero necari urucas, si palo inponantur in hortis ossa capitis ex equino genere, feminae dumtaxat. adversus urucas et cancrum fluviatilem in medio horto suspensum auxiliari narrant. sunt qui sanguineis virgis tangant ea, quae nolint iis obnoxia esse. infestant et culices riguos hortos, praecipue si sint arbusculae aliquae. hi galbano accenso fugantur.

nam quod ad permutationem seminum attinet, quibusdam ex his firmitas maior est, ut coriandro, betae, porro, nasturtio, sinapi, erucae, cunilae et fere acribus; infirmiora autem sunt atriplici, ocimo, cucurbitae, cucumi, et aestiva omnia hibernis magis; minime autem durat gethyum. sed ex his, quae sunt fortissima, nullum ultra quadrimatum utile est, dumtaxat serendo, culinis et ultra tempesta sunt.

peculiaris medicina raphano, betae, rutae, cunilae in salsis aquis, quae et alioqui plurimum suavitati et fertilitati conferunt. ceteris dulcium aquarum rigua prosunt. utilissimae ex his quae frigidissimae et quae potu suavissimae. minus utiles e stagno et quas elices inducunt, quoniam herbarum semina invehunt. praecipue tamen imbres alunt, nam et bestiolae innascentes necantur.

his horae rigandi matutino atque vespera, ne infervescat aqua sole, ocimo

tantum et meridie; nam etiam satum celerrime erumpere putant inter initia ferventi aqua aspersum. omnia autem tralata meliora grandioraque fiunt, maxime porri napique. in tralatione et medicina est, desinuntque sentire iniurias, ut gethyum, porrum, raphani, apium, lactucae, rapa, cucumis. omnia autem fere silvestria sunt et foliis minora et caulibus, suco acriora, sicut cunila, origanum, ruta. solum vero ex omnibus lapathum silvestre melius. hoc in sativis rumix vocatur, omnium, quae seruntur nascunturque, fortissimum; tradunt certe semel satum durare nec vinci umquam a terra, maxime iuxta aquas. usus eius cum tisana tantum in cibis; leniorem gratioremque saporem praestat. silvestre ad multa medicamina utile est. - (adeoque nihil omisit cura, ut carmine quoque comprehensum reperiam, fabis caprini fimi singulis cavatis, si porri, erucae, lactucae, apii, intubi, nasturtii semina inclusa serantur, mire provenire. - quae sunt et silvestria, eadem sativis sicciora intelleguntur et acriora.) -

namque et sucorum saporumque dicenda differentia est, vel maior in his quam in pomis. sunt autem acres cunilae, organi, nasturti, sinapis, amari absinthi, centaurei; aquatiles cucumeris, cucurbitae, lactucae; acuti thymi, cunilae; acuti et odorati apii, aneti, feniculi. salsus tantum e saporibus non nascitur; aliquando extra insidit pulveris modo, et cicerculis tantum.

atque ut intellegatur vana ceu plerumque vitae persuasio, panax piperis saporem reddit et magis etiam siliquastrum, ob id piperitidis nomine accepto, libanotis odorem turis, zmyrnium murræ. de panace abunde dictum est. libanotis locis putribus et macris ac roscidis seritur semine. radicem habet olusatri, nihil ture differentem. usus eius post annum stomacho saluberrimus. quidam eam nomine alio rosmarinum appellant. zmyrnium olus seritur iisdem locis murræque radice resipit. eadem et siliquastro satio. reliqua a ceteris et odore et sapore differunt, ut anetum, tantaque est diversitas atque vis, ut non solum aliud alio mutetur, sed etiam in totum auferatur. apio eximunt coqui obsoniis acetum, eodem cellarii in saccis odorem vino gravem.

et hactenus hortensia dicta sint, ciborum gratia dumtaxat. maximum quidem opus in iisdem naturae restat, quoniam proventus tantum adhuc summasque quasdam tractavimus, vera autem cuiusque natura non nisi medico effectu pernosci potest, opus ingens occultumque divinitatis et quo nullum reperiri possit maius. ne singulis id rebus contexeremus, iusta fecit ratio, cum ad alios medendi desideria pertinerent, longis utriusque dilationibus futuris, si miscuissemus. nunc suis quaeque partibus constabunt poteruntque a volentibus iungi.

LIBER XX

maximum hinc opus naturae ordiemur et cibos suos homini narrabimus faterique cogemus ignota esse per quae vivat. nemo id parvum ac modicum existimaverit, nominum vilitate deceptus. pax secum in his aut bellum naturae dicitur, odia amicitiaeque rerum surdarum ac sensu carentium et, quo magis miremur, omnia ea hominum causa. quod graeci sympathiam et antipathiam appellavere, quibus cuncta constant, ignes aquis restinguentibus, aquas sole devorante, luna pariente, altero alterius iniuria deficiente sidere atque, ut a sublimioribus recedamus, ferrum ad se trahente magnete lapide et alio rursus abigente a sese, adamanta, rarum opum gaudium, infragilem omni cetera vi et invictum, sanguine hircino rumpente, quaeque alia in suis locis dicemus paria vel maiora miracula. tantum venia sit a minimis, sed a salutaribus ordienti primumque ab hortensiis.

cucumin silvestrem esse diximus, multo infra magnitudinem sativi. ex eo fit medicamentum, quod vocatur elaterium, suco expresso semini, cuius causa nisi maturius incidatur, semen exilit oculorum etiam periculo. servatur autem decerptus una nocte, postero die inciditur harundine, semenque cinere conditur ad coercendam suci abundantiam, qui expressus suscipitur aqua caelesti atque subsidit, deinde sole cogitur in pastillos ad magnos mortalium usus, obscuritates et vitia oculorum, genarum ulcera. tradunt hoc suco tactis radicibus vitium non attingi uvas ab avibus. radix autem ex aceto cocta podagris inlinitur sucoque dentium dolori medetur, arida cum resina inpetiginem et scabiem quaeque psoram et lichenas vocant, parotidas, panos sanat et cicatricibus colorem reddit, et foliorum sucus auribus surdis cum aceto instillatur.

elaterio tempestivus est autumnus, nec ullum ex medicamentis longiore aevo durat. incipit a trimatu. si quis recentiore uti velit, pastillos in novo fictili igni lento in aceto domet. melius quo vetustius, fuitque iam cc annis servatum, ut auctor est theophrastus, et usque ad quinquagesimum lucernarum lumina extinguit. hoc enim veri experimentum est, si admotum, priusquam extinguat, scintillare sursum ac deorsum cogat. pallidum ac leve herbaceo ac scabro melius ac leniter amarum.

putant conceptus adiuvari adalligato semine, si terram non adtigerit, partus vero, si in arietis lana alligatum inscientis lumbis fuerit, ita ut protinus ab enixu rapiatur extra domum. ipsum cucumin qui magnificent, nasci praecipuum in arabia, mox in arcadia; cyrenis alii tradunt similem heliotropio cucumin inter folia et ramos provenire magnitudine nucis iuglandis, semen autem esse ad speciem scorpionum caudae reflexum, sed candidum. aliqui etiam ab scorpione cucumim vocant, efficacissimo contra scorpionum ictus et semine et elaterio. est ad purgandam utrimque alvum modus pro portione virium ab dimidio obolo ad solidum; copiosius necat. sic et contra phthiriasim bibitur et hydropicis. inlitum anginas et arterias cum melle aut oleo vetere

sanat.

multi hunc esse apud nos, qui anguinus vocetur, ab aliis erraticus, arbitrantur, quo decocto sparsa mures non adtingunt. iidem podagris eum et articulariis morbis decoctum in aceto inlinunt praesentaneo remedio, lumborum vero dolores semine sole siccato, dein trito, #1108 xx pondere in hemina aquae dato sanant, tumores subitos inlito cum lacte mulierum. purgat eas elaterium, sed gravidis abortum facit. suspiriosis prodest, morbo vero regio in nares coniectum. lentigines ac maculas e facie tollit in sole inlitum.

multi eadem omnia sativis adtribuunt, magni etiam sine is momenti. namque et eorum semen quantum tres digiti adprehenderint cum cumino tritum potumque in vino tussientibus auxiliatur, et phreneticis in lacte mulieris, et dysintericis acetabuli mensura, purulenta autem expuentibus cum cumino pari pondere, et iocineris vitiis in aqua mulsa. urinam movet ex vino dulci, et in renium dolore clysteribus simul cum cumino infunditur.

ei, qui pepones vocantur, refrigerant maxime in cibo et emolliunt alvum. caro eorum epiphoris oculorum aut doloribus inponitur. radix sanat ulcera concreta in modum favi, quae ceria vocant. eadem concitat vomitiones; siccatur, in farinam tunsa datur quattuor obolis in aqua mulsa, ita ut qui biberit quingentos passus postea ambulet. haec farina et in smegmata adicitur. cortex quoque vomitionem movet, faciem purgat. hoc et folia cuiuscumque sativi inlita. eadem cum melle et epinyctidas sanant, cum vino canis morsus, item multipedae; sepa graeci vocant, oblongam, pilosis pedibus, pecori praecipue nocivam; morsum tumor insequitur et putrescit locus. ipse cucumis odore defectum animi refovet. - (coctos deraso cortice ex oleo et aceto ac melle iucundiores esse certum est.) -

cucurbita quoque silvestris invenitur, σομφὸς a graecis appellata, intus inanis, unde et nomen, digitali crassitudine, non nisi in saxosis nascens. huius conmanducatae sucus stomacho admodum prodest.

colocynthis vocatur alia, ipsa plena semine, sed minor quam sativa. utilior pallida quam herbacea. arefacta per se inanit alvum. infusa quoque clysteribus intestinorum omnibus vitiis medetur et renium et lumborum et paralyti. eiecto semine aqua mulsa in ea decoquitur ad dimidias; sic tutissimo infunduntur oboli quattuor. prodest stomacho et farinae aridae pilulis cum decocto melle sumptis. in morbo regio semina eius vii sumuntur et protinus aqua mulsa. carnes eius cum absinthio ac sale dentium dolorem tollunt, sucus vero cum aceto calefactus mobiles sistit. item spinae et lumborum ac coxendicum dolores, cum oleo si infricetur. praeterea, mirum dictu, semina eius, si fuerint pari numero, in linteo adalligata febribus liberare dicuntur, quas graeci periodicas vocant. sativae quoque derasae sucus tepefactus auribus medetur; caro eius interior sine semine clavis pedum et suppurationibus, quae graeci vocant ἀποστήματα. decoctae autem universae sucus dentium motus stabilis et dolores inhibet; vinum cum ea fervefactum oculorum etiam impetus. folia eius cum recentibus cupressi contusa et inposita, ipsa quoque tosta in argilla ac trita cum adipe anseris vulneribus medetur. nec non ramentis corticis recentis

podagras refrigerat et ardores capitis, infantium maxime, et ignes sacros vel iisdem strigmentis inpositis vel seminibus. sucus ex strigmentis inlitus cum rosaceo et aceto febrium ardores refrigerat. aridae cinis inpositus mire combusta sanat. chrysippus medicus damnavat eas in cibis, sed omnium consensu stomacho utilissimae iudicantur et interaneorum vesicarumque exulcerationibus.

est et rapo vis medica. perniones fervens inpositum sanat, item frigus pellit e pedibus. aqua decocti eius fervens podagris etiam frigidis medetur, et crudum tusum cum sale cuicumque vitio pedum. semen inlitum et potum in vino contra serpentes et toxica salutare esse proditur, a multis vero antidoti vim habere in vino et oleo. democritus in totum ea abdicavit in cibis propter inflationes, diocles magnis laudibus tulit, etiam venerem stimulari ab iis professus, item dionysius, magisque si eruca condirentur; tosta quoque articulorum dolori cum adipe prodesse.

silvestre rapum in arvis maxime nascitur, fruticosum, semine candido, duplo maiore quam papaver. hoc ad levigandam cutem in facie totoque corpore utuntur mixta farina pari mensura ervi, hordei et tritici et lupini. radix ad omnia inutilis.

naporum duas differentias et in medicina graeci servant. angulosis foliorum caulibus, flore aneti, quod bunion vocant, purgationibus feminarum et vesicae et urinae utile decoctum, potum ex aqua mulsa vel suci drachma; semen dysintericis tostum tritumque in aquae calidae cyathis quattuor. sed urinam inhibet, si non lini semen una bibatur. alterum genus buniada appellant, et raphano et rapo simile, seminis praeclari contra venena. ob id et in antidotis utuntur illo.

raphanum et silvestrem esse diximus. laudatissimus in arcadia, quamquam et alibi nascitur, utilior urinae dumtaxat ciendae, cetero aestuosus. in italia et armoraciam vocant.

et sativi vero praeter ea, quae circa eos dicta sunt, stomachum purgant, pituitam extenuant, urinam concitant, bilem detrahunt. praeterea cortices in vino decocti mane poti ad ternos cyathos conminuunt et eiciunt calculos. iidem in posca decocti contra serpentium morsus inlinuntur. ad tussim etiam mane ieiunis raphanos prodest esse cum melle, semen eorum tostum ipsumque conmanducatum, adligato raphano aquam foliis eius decoctis bibere vel sucum ipsius cyathis binis contra phthiriasis, phlegmoni ipsos inlinere tusos, livori vero recenti corticem cum melle, veteriosis autem quam acerrimos mandere, semenque tostum, dein contritum cum melle suspiriosis. iidem et contra venena prosunt, cerastis et scorpionibus adversantur - vel ipso vel semine infectis manibus inpune tractaveris, inpositoque raphano scorpiones moriuntur - , salutare et contra fungorum aut hyoscyami venena atque, ut nicander tradit, et contra sanguinem tauri. contra viscum quoque dari apollodori duo iubent, sed citieus semen ex aqua tritum, tarentinus sucum. lienem item extenuant, iocineri prosunt et lumborum doloribus, hydropicis quoque ex aceto aut sinapi sumpti et lethargicis et comitialibus et

melancholicis. praxagoras et iliosis dandos censet, plisticus et coeliacis. intestinorum etiam ulcera sanant ac purulenta praecordiorum, si cum melle edantur. quidam ad haec coquere eos luto inlitos malunt; sic et feminas purgari. ex aceto et melle sumpti intestinorum animalia detrahunt, iidem ad tertias decocto eorum potio cum vino enterocelicis prosunt; sanguinem quoque inutilem sic extrahunt. medius ad haec et sanguinem excreantibus coctos dari iubet, et puerperis ad lactis copiam augendam, hippocrates capitis mulierum defluvia perfricari raphanis, et super umbilicum inponi contra tormenta volvae. reducunt et cicatrices ad colorem. semen quoque ex aqua inpositum sistit ulcera, quae phagedaenas vocant. democritus venerem hoc cibo stimulari putat, ob id fortassis voci nocere aliqui tradiderunt. folia, quae in oblongis dumtaxat nascuntur, excitare oculorum aciem dicuntur. ubi vero acrior raphani medicina admota sit, hysopum dari protinus imperant; haec antipathia est. et aurium gravitati sucum raphani instillant. nam vomituris summo cibo esse eos utilissimum est.

pastinacae simile hibiscum, quod molochen agrian vocant et aliqui *πλειστολοχείαν*, ulceribus, cartilagini et ossibus fractis medetur. folia eius ex aqua pota alvum solvunt; serpentes abigunt, apium, vesparum, crabronum ictibus inlita medentur. radicem eius ante solis ortum erutam involvunt lana coloris, quem nativum vocant, praeterea ovis, quae feminam peperit, strumisque vel suppuratis alligant. quidam ad hunc usum auro effodiendam censent cavendumque, ne terram attingat. celsus et podagris, quae sine tumore sint, radicem eius in vino decoctam inponi iubet.

alterum genus est staphylinus, quod pastinacam erraticam vocant. eius semen contritum et in vino potum tumentem alvum et suffocationes mulierum doloresque lenit in tantum, ut vulvas corrigat. inlitum quoque e passo ventri earum prosit; et viris vero prosit cum panis portione aequa tritum ex vino potum contra ventris dolores. pellit et urinam, et phagedaenas ulcerum sistit recens cum melle inpositum vel arida farina inspersa. radicem eius dieuches contra iocineris aut lienis ac lumborum et renium vitia ex aqua mulsa dari iubet, clephantus et dysintericis veteribus. philistio in lacte coquit et ad stranguriam dat radicis uncias quattuor, ex aqua hydropicis, similiter et opisthotonicis et pleuriticis et comitialibus. habentes eam feriri a serpentibus negantur aut, qui ante gustaverint, non laedi; percussis inponitur cum axungia. folia contra cruditates manduntur. orpheus amatorium inesse staphylyno dixit, fortassis quoniam venerem stimulari hoc cibo certum est. ideo conceptus adiuvari aliqui prodiderunt. ad reliqua et sativa pollet, efficacior tamen silvestris magisque in petrosis nata. semen sativae quoque contra scorpionum ictus ex vino aut posca salutare est. radice eius circumscalpti dentes dolore liberantur.

syria, in hortis operosissima - utique in proverbio graecis “multa syrorum olera - ,” simillimam staphylyno herbam serit, quam alii gingidion vocant, tenuius tantum et amarius eiusdemque effectus. estur coctum crudumque stomachi magna utilitate; siccatur enim ex alto omnes eius umores.

siser erraticum sativo simile est et effectus: stomachum excitat, fastidium absterget ex aceto laserpiciato sumptum aut ex pipere et mulso vel ex garo. urinam ciet, ut ophion credit, et venerem. in eadem sententia est et diocles; praeterea cordi convenire convalescentium aut post multas vomitiones perquam utile. heraclides contra argentum vivum dedit et venerem subinde offensantem aegrisque se recolligentibus. hicesius ideo stomacho inutile videri dixit, quoniam nemo tres siseres edendo continuaret, esse tamen utile convalescentibus ad vinum transeuntibus. sativi privatim sucus cum lacte caprino potus sistit alvum.

et quoniam plerosque similitudo nominum graecorum confundit, conteximus et de sili sed hoc est vulgatae notitiae. optimum massiliense, lato enim grano et fulvo est, secundum aethiopicum nigrius, creticum odoratissimum omnium. radix iucundi odoris est. semen esse et vultures dicuntur. prodest homini ad tussim veterem, rupta, convulsa in vino albo potum, item opisthotonicis et iocinerum vitiis et torminibus et stranguriae duarum aut trium lingularum mensura. sunt et folia utilia, ut quae partus adiuvent etiam quadripedum; hoc maxime pasci dicuntur cervae pariturae. inlinuntur et igni sacro. multumque in summo cibo concoctionibus confert vel folio vel semine. quadripedum quoque alvum sistit sive tritum potui infusum sive mandendo commendatum sale. boum morbis sic tritum infunditur.

inula quoque a ieiunis commanducata dentes confirmat. si, ut eruta est, terram non attingat, condita tussim emendat; radicis vero decoctae sucus taenias pellit, siccatae autem in umbra farina tussi et convulsis et inflationibus et arteriis medetur. venenatorum morsus abigit. folia ex vino lumborum dolori inlinuntur.

cepaе silvestres non sunt. sativae olfactu ipso et delacrimatione caligini medentur, magis vero suci inunctione. somnum etiam facere traduntur et ulcera oris sanare commanducatae cum pane, et canis morsus virides ex aceto inlitaе aut siccae cum melle ... et vino, ita ut post diem tertium solvantur. sic et attrita sanant. coctam in cinere et epiphoris multi inposuere cum farina hordeacia et genitalium ulceribus. suco et cicatrices oculorum et albugines et argema inunxere et serpentium morsus et omnia vulnera cum melle; item auricularum ... cum lacte mulierum et in iisdem sonitum aut gravitatem emendantes cum adipe anserino aut cum melle stillavere. et ex aqua bibendum dederunt repente obmutescentibus. in dolore quoque ad dentes conluendos instillavere et plagis bestiarum omnium, privatim scorpionum. alopecias fricuere et psoras tuis cepis. coctas dysintericis vescendas dedere et contra lumborum dolores, purgamenta quoque earum cremata in cinerem inlinentes ex aceto serpentium morsibus, ipsasque multipedae ex aceto. reliqua inter medicos mira diversitas. proximi inutiles esse praecordiis et concoctioni inflationemque et sitim facere dixerunt. asclepiadis schola ad colorem quoque validum profici hoc cibo et, si ieiuni cotidie edant, firmitatem valetudinis custodiri, stomacho utiles esse, spiritus agitatione ventrem mollire, haemorrhoidas aperire subditas pro balanis; sucum cum suco feniculi contra

incipientes hydropises mire proficere, item contra anginas cum rutae et melle; excitari eodem lethargicos. (Varro quae sale et aceto pista est arefactaque, vermiculis non infestari auctor est). -

porrum sectivum profluvia sanguinis sistit naribus contrito eo obturatis vel gallae mixto aut mentae, item ex abortu profluvia potu suco. cum lacte mulieris tussi etiam veteri et pectoris ac pulmonis vitiis medetur. inlitis foliis sanantur vari et ambusta et epinyctides - ita vocatur ulcus, quae et syce, in angulo oculi perpetuo umore manans; quidam eodem nomine appellant pusulas liventes ac noctibus inquietantes - et alia ulcera cum melle tritis, vel bestiarum morsus ex aceto, item serpentium aliorumque venenatorum, aurium vero vitia cum felle caprino vel pari mensura mulsi, stridores cum lacte mulieris, capitis dolores, si in nares fundatur dormituris vel in aures duobus suci coclearibus, uno mellis. sucus et ad serpentium scorpionumque ictus bibitur cum mero et ad lumborum dolores cum vini hemina potus. sanguinem vero excreantibus et phthisicis et destillationibus longis vel sucus vel ex ipso cibus prodest, item morbo regio vel hydropicis et ad renum dolores, cum tisanæ suco acetabuli mensura. idem modus cum melle vulvas purgat. estur vero et contra fungorum venena, inponitur et vulneribus, venerem stimulat, sitim sedat, ebrietates discutit, sed oculorum aciem hebetare traditur, inflationes quoque facere, quae tamen stomacho non noceant ventremque molliant. voci splendorem adfert.

capitato maiores ad eadem effectus. sanguinem reicientibus sucus eius cum galla aut turis farina vel acacia datur. hippocrates et sine alia mixtura dari iubet vulvasque contractas aperire se putat, fecunditatem etiam feminarum hoc cibo augeri. contritum ex melle ulcera purgat. tussim et destillationes thoracis, pulmonis et arteriae vitia sanat, datum in sorbitione tisanæ vel crudum praeter capita sine pane, ita ut alternis diebus sumatur, vel si pura excreentur. sic et voci et veneri somnoque multum confert. capita bis aqua mutata cocta alvum emolliunt ... sistit fluxiones veteres; cortex decoctus inlitisque inficit canos.

alio magna vis, magnae utilitates contra aquarum et locorum mutationes. serpentes abigit et scorpiones odore atque, ut aliqui tradidere, bestias omnes. ictibus medetur potu vel cibo vel inlitu, privatim contra haemorrhoidas cum vino redditum vomitu. ac, ne contra araneos mures venenati morsus valere miremur, aconitum, quod alio nomine pardalianches vocatur, debellat, item hyoscyamum, canum morsus, in quae vulnera cum melle inponitur. ad serpentium quidem ictus tostum cum restibus suis efficacissime ex oleo inlinitur, adtritisque corporum partibus, vel si in vesicas intumuerint. quin et suffito eo evocari secundas partus existimat hippocrates, cinere eius cum oleo capitis ulcera manantia sanitati restituens. suspiriosis coctum, aliqui crudum id dedere; diocles hydropicis cum centaurio aut in fico duplici ad evacuandam alvum, quod efficacius praestat viride cum coriandro in mero potum; suspiriosis aliqui et tritum in lacte dederunt. praxagoras et contra morbum regium vino miscuit et contra ileum in oleo et pulte, sic inlinens strumis

quoque. antiqui et insanientibus dabant crudum, diocles phreneticis elixum. contra anginas tritum in posca gargarizari prodest. dentium dolorem tribus capitibus in aceto tritis inminuit, vel si decocti aqua conluantur addaturque ipsum in cava dentium. auribus etiam instillatur sucus cum adipe anserino. phthiriasis et porrigines potum, item infusum cum aceto et nitro conpescit, destillationes cum lacte coctum vel tritum permixtumve caseo molli, quo genere et raucitatem extenuat vel in pisi aut fabae sorbitione. in totum autem coctum utilius est crudo elixumque tosto; sic et voci plus confert. taenias et reliqua animalia interaneorum pellit in aceto mulso coctum; tenesmo in pulve medetur; temporum doloribus inlinitur elixum et pusulis coctum, dein cum melle tritum; tussi cum adipe vetusto decoctum vel cum lacte aut, si sanguis etiam excreetur vel pura, sub pruna tostum et cum mellis pari modo sumptum; convulsis, ruptis cum sale et oleo. item cum adipe tumores suspectos sanat. extrahit fistulis vitia cum sulphure et resina, etiam harundines cum pice; lepras, lichenas, lentigines exulcerat sanatque cum origano, vel cinis eius ex oleo et garo inlitus; sic et sacros ignes; suggillata aut liventia ad colorem reducit combustum ex melle. credunt et comitiale morbum sanari, si quis eo in cibus utatur ac potione; quartanas quoque excutere potum caput unum cum laserpici obolo in vino austero, - (tussim et alio modo ac pectorum suppurationes quantaslibet sanat fractae incoctum fabae atque ita in cibo sumptum, donec sanitatem restituat. facit et somnos, atque in totum rubicundiora corpora) - venerem quoque stimulare cum coriandro viridi tritum potumque e mero. vitia eius sunt quod oculos hebetat, inflationes facit, stomachum laedit copiosius sumptum, sitim gignit. cetero contra pituitam et gallinaceis prodest mixtum farre in cibo. iumenta urinam reddere atque non torqueri tradunt, si trito natura tangatur.

lactucae sponte nascentis primum genus est eius, quam caprinam vocant, qua pisces in mare deiecta protinus necantur, qui sunt in proximo. huius lac spissatum mox in aceto pondere obolorum duum adiecto aquae uno cyatho hydropicis datur. caule et foliis contusis, asperso sale, nervi incisi sanantur. eadem trita ex aceto conluta matutinis bis mense dentium dolorem prohibent. alterum est genus quod graeci caesapon vocant. huius folia trita et cum polenta inlita ulceribus medentur. haec in arvis nascuntur; tertium genus in silvis nascens ῥαῖτιν vocant. huius folia trita cum polenta vulneribus prosunt. quarto infectores lanarum utuntur. simile id erat lapathio silvestri foliis, nisi plura haberet et nigriora. sanguinem sistit, phagedaenas et putrescentia ulcera aut quae serpunt sanat, item tumores ante suppurationem, ignem sacrum radice vel foliis. prodest vel ad lienes potu. haec propria singulis.

communia autem sponte nascentibus candor, caulibus interdum cubitali longitudine, in thyrsis et foliis scabritia. ex iis rotunda folia et brevia habentem sunt qui hieracium vocant, quoniam accipitres scalpendo eam sucoque oculos tinguendo obscuritatem, cum sensere, discutiant. sucus omnibus candidus, viribus quoque papaveri similis; carpitur per messes inciso caule, conditur fictili novo, ad multa praeclarus. sanat omnia oculorum vitia cum lacte

mulierum, argema, nubiculas, cicatrices adustionesque omnes, praecipue caligines. inponitur etiam oculis in lana contra epiphoras. idem sucus alvum purgat in posca potus ad duos obolos. serpentium ictibus medetur in vino potus. et folia thyrsique triti ex aceto bibuntur, vulneri inlinuntur, maxime contra scorpionum ictus, contra vero phalangia commixto vino et aceto. aliis quoque venenis resistunt, exceptis quae strangulando necant aut his quae vesicae nocent, item psimithio excepto. inponuntur et ventri ex melle atque aceto ad detrahenda vitia alvi. urinae difficultates sucus emendat. crateuas eum et hydropicis obolis duobus in aceto et cyatho vini dari iubet. quidam et e sativis colligunt sucum minus efficacem. peculiare earum effectus - praeter iam dictos somnum faciendi veneremque inhibendi, aestum refrigerandi, stomachum purgandi, sanguinem augendi - non pauci restant, quoniam et inflationes discutiunt ructusque lenes faciunt, concoctiones adjuvant, cruditates ipsae numquam faciunt. nec ulla res in cibis magis aviditatem incitat inhibetque eadem. in causa alterutraque modus est: sic et alvum copiosiores solvunt, modicae sistunt. lentitiam pituitae digerunt atque, ut aliqui tradiderunt, sensus purgant, stomachis dissolutis utilissimae. adjuvantur in eos usus et oxypori obolis, asperitatem addito dulci ad intinctum aceti temperantes, si crassior pituita sit, scillite aut vino absinthite, si et tussis sentiatur, hysopite admixto. dantur coeliacis cum intubo erratico et ad duritiam praecordiorum. dantur et melancholicis candidae copiosiores et ad vesicae vitia. praxagoras et dysintericis dedit. ambustis quoque prosunt recentibus, priusquam pusulae fiant, cum sale inlitae. ulcera etiam, quae serpunt, coercent, initio cum aphronitro, mox in vino. tritae igni sacro inlinuntur. convulsa et luxata caulibus tritis cum polenta ex aqua frigida leniunt, eruptiones papularum ex vino et polenta. in cholera quoque coctas patinis dederunt, ad quod utilissimae quam maximi caulis et amarae. quidam et lacte infundunt. defervefacti hi caules et stomacho utilissimi traduntur, sicut somno aestiva maxime lactuca et amara lactensque, quam meconidem vocavimus. hoc lacte et oculorum claritati cum muliebri lacte utilissimum esse praecipitur, dum tempestivo capite inunguntur oculi, et ad vitia, quae frigore in his facta sint. miras et alias invenio laudes: thoracis vitiis prodesse non secus quam habrotonum cum melle attico; purgari et feminas hoc cibo; semen sativarum contra scorpiones dari; semine trito ex vino poto et libidinum imaginationes in somno conpesci; temptantes aquas non nocere lactucam edentibus. quidam tamen frequentiores in cibo officere claritati oculorum tradiderunt.

nec beta sine remediis est utraque: sive candidae sive nigrae radix recens et madefacta suspensa funiculo contra serpentium morsus efficax esse dicitur; candida beta cocta et cum alio crudo sumpta contra taenias; nigrae radices in aqua coctae porriginem tollunt, atque in totum efficacior esse traditur nigra. sucus eius capitis dolores veteres et vertigines, item sonitum aurium sedat infusus iis. ciet urinam, medetur dysintericis iniecta et morbo regio, dolores quoque dentium sedat. inlitus sucus et contra serpentium ictus valet, sed hoc

radici dumtaxat expressus. ipsa vero decocta pernionibus occurrit. alba epiphoras sedat fronti inlita, aluminis parvo admixto ignem sacrum sine oleo trita. sic et adustis medetur. et contra eruptiones papularum, coctaque eadem contra ulcera, quae serpunt, inlinitur, et alopeciis cruda et ulceribus, quae in capite manant. sucus eius cum melle naribus inditus caput purgat. coquitur et cum lenticula addito aceto, ut ventrem molliat. validius cocta fluxiones stomachi et ventris sistit.

est et beta silvestris quam limonium vocant, alii neuroidem, multum minoribus foliis tenuioribusque ac densioribus; undecim saepe cauli uni. huius folia ambustis utilia gustantium os adstringunt. semen acetabuli mensura dysintericis prodest. aqua betae radice decocta maculas vestium elui dicunt, item membranarum.

intubi quoque non extra remedia sunt. sucus eorum cum rosaceo et aceto capitis dolores lenit idemque cum vino potus iocineris et vesicae; et epiphoris inponitur. erraticum apud nos quidam ambubaia appellavere. in aegypto cichorium vocant quod silvestre est, sativum autem serim, quod est minus et venosius.

cichorium refrigerat in cibo sumptum vel inlitum collectiones; sucus decocti ventrem solvit, iocineri et renibus et stomacho prodest. item, si in aceto decoquatur, urinae tormina discutit, item morbum regium e mulso, si sine febris sit. vesicam adiuvat. mulierum quidem purgationibus decoctum in aqua adeo prodest, ut emortuos partus trahat. adiciunt magi suco totius cum oleo perunctos favorabiliores fieri et quae velint facilius impetrare. quamquam idem propter singularem salubritatem aliqui chreston appellant, alii pancration.

est et silvestre genus alterum - hedypnoida vocant - , latioris folii. stomachum dissolutum adstringit cocta, crudaque sistit alvum. et dysintericis prodest, magis cum lente. rupta et convulsa utroque genere iuvantur, item genitura quibus valetudinis morbo effluat.

seris et ipsa, lactucae simillima, duorum generum est silvestris: melior nigra et aestiva, deterior hiberna et candidior. utraque amara, stomacho utilissima; praecipue quemumor vexet cum aceto in cibo refrigerant vel inlita, discutuntque et alios quam stomachi. cum polenta silvestrium radices stomachi causa sorbentur, et cardiacis inlinuntur super sinistram mammam et ex aceto. omnes hae et podagricis utiles et sanguinem reicientibus, item quibus genitura effluat, alterno dierum potu. petronius diodotus, qui ἀνθολογοῦμενα scripsit, in totum damnavit serim multis modis arguens, sed aliorum omnium opinio resistit.

brassicae laudes longum est exsequi, cum et chrysippus medicus privatim volumen ei dicaverit per singula membra hominis digestum et dieuches, ante omnes autem pythagoras, et cato non parcius celebraverit, cuius sententiam vel eo diligentius persequi par est, ut noscatur, qua medicina usus sit annis de populus romanus. in tres species divisere eam graeci antiquissimi: crispam, quam selinada vocaverunt a similitudine apii foliorum, stomacho utilem,

alvum modice mollientem; alteram heliam, latis foliis e caule exeuntibus, unde caulodem quidam vocavere, nullius in medicina momenti. tertia est proprie appellata crambe, tenuioribus foliis et simplicibus densissimisque, amarior, sed efficacissima. cato crispam maxime probat, dein levem grandibus foliis, caule magno. prodesse tradit capitis doloribus, oculorum caligini scintillationique, stomacho, praecordiis crudam ex aceto ac melle, coriandro, ruta, menta, laseris radícula sumptam acetabulis duobus matutino, tantamque esse vim, ut qui terat haec, validiorem fieri se sentiat. ergo vel cum his tritam sorbendam vel ex hoc instinctu sumendam, podagrae autem morbisque articulariis inlini cum ruta et coriandro et salis mica et hordei farina; aqua quoque eius decocta nervos articulosque mire iuvare, si foveantur. vulnera et recentia et vetera, etiam carcinomata, quae nullis aliis medicamentis sanari possint, foveri prius calida aqua iubet ac bis die tritam inponi. sic etiam fistulas et luxata et tumores, quos evocari quosque discuti opus sit. insomnia etiam vigiliasque tollere decoctam, si ieiuni edint quam plurimam ex oleo et sale; tormina, si decocta iterum decoquatur addito oleo, sale, cumino, polenta. si ita sumatur sine pane, magis profuturam. inter reliqua bilem detrahi per vinum nigrum pota. quin et urinam eius, qui brassicam esitaverit, adservari iubet, calefactamque nervis remedio esse. verba ipsius subiciam ad exprimendam sententiam: “pueros pusillos, si laves ea urina, numquam debiles fieri.” auribus quoque ex vino sucum brassicae tepidum instillari suadet idque etiam tarditati audientium prodesse adseverat, et inpetigines eadem sanari sine ulcere.

graecorum quoque opiniones iam et catonis causa poni convenit, in his dumtaxat, quae ille praetermiserit. biles trahere non percoctam putant, item alvum solvere eandemque bis coctam sistere. vino adversari ut inimicam vitibus, antecedente in cibis caveri ebrietatem, postea sumpta crapulam discuti. hunc cibum et oculorum claritati conferre multum, sucum vero crudae vel angulis tantum tactis cum attico melle plurimum. facillime concoqui, ciboque eo sensus purgari. erasistrati schola clamat nihil esse utilius stomacho nervisque, ideo paralyticis et tremulis dari iubet et sanguinem excreantibus. hippocrates coeliacis et dysintericis bis coctam cum sale, item ad tenesnum et renium causa, lactis quoque ubertatem puerperis hoc cibo fieri iudicans et purgationem feminis. crudus quidem caulis si mandatur, partus quoque emortuos pelli. apollodorus adversus fungorum venena semen aut sucum bibendum censet, philistion opisthotonicis sucum ex lacte caprino cum sale et melle. invenio et podagra liberatos edendo eam decoctaeque ius bibendo, hoc et cardiacis datum et comitialibus morbis addito sale, item splenicis in vino albo per dies xl et ictericis nec non et phreneticis. raucis crudae sucum gargarizandum bibendumque demonstrat, contra vero singultus cum coriandro et aneto et melle ac pipere ex aceto. inlitam quoque prodesse inflationibus stomachi, item serpentium ictibus et sordidis ulceribus ac vetustis, vel aqua ipsa cum hordeacia farina, sucum ex aceto vel cum feno graeco. sic aliqui et articulis podagrisque inponunt. epinyctidas et, quidquid aliud serpit in

corpore, inposita levat, item repentinas caligines, has et si mandatur ex aceto; suggillata vero et alios livores pura inlita, lepras et psoras cum alumine rotundo ex aceto. sic et fluentes capillos retinet. epicharmus testium et genitalium malis hanc utilissime inponi, efficacius eandem cum faba trita, item convolsis, cum ruta contra ardores febrium et stomachi vitia, cum rutae semine ad secundas et muris aranei morsus. foliorum aridorum farina alterutra parte exinanit.

ex omnibus brassicae generibus suavissima est cyma, at inutilis habetur, difficilis in coquendo et renibus contraria. illud quoque non est omittendum, aquam decoctae ad tot usus laudatam faetere humi effusam. stirpium brassicae aridorum cinis inter caustica intellegitur ad coxendicum dolores cum adipe vetusto, ac cum lasere et aceto inter psilotra: evulsis inlitis pilis nasci alios prohibet. bibitur et cum oleo subfervefactus vel per se elixus ad convolsa et rupta intus lapsoque ex alto. nulla ergo sunt crimina brassicae immo vero apud eosdem animae gravitatem facere, dentibus et gingivis nocere. et in aegypto propter amaritudinem non estur.

silvestris sive errticae inmenso plus effectus laudat cato, adeo ut aridae quoque farinae in olfactorio collectae vel odore tantum naribus raptio vitia earum graveolentiamque sanari adfirmet. hanc alii petraeam vocant, inimicissimam vino, quam praecipue vitis fugiat aut, si non possit fugere, moriatur. folia habet tenuia, rotunda, parva, levia, plantis oleris similior, candidior sativa et hirsutior. hanc inflationibus mederi, melancholicis quoque ac vulneribus recentibus cum melle, ita ne solvatur ante diem septimum, strumis, fistulis in aqua contritam chrysippus auctor est. alii vero conpescere mala corporis, quae serpant - nomas vocant - , item excrescentia absumere, cicatrices ad planum redigere, oris ulcera et tonsillas manducatam et coctam suco gargarizato cum melle tollere, item psoras et lepras veteres, ipsius tribus partibus cum duabus aluminis in aceto acri inlitis. epicharmus satis esse eam contra canis rabiosi morsum inponi; melius, si cum lasere et aceto acri; necari quoque canes ea, si detur ex carne. semen eius tostum auxiliatur contra serpentes, fungos, tauri sanguinem. folia cocta splenicis in cibo data et cruda inlita cum sulphure et nitro prosunt, item mammarum duritiae. radicum cinis uvae in faucibus tumentis tactu medetur et parotidas cum melle inlitis reprimat, serpentium morsus sanat. virium brassicae unum et magnum argumentum addemus ac mirabile: crustae occupant intus vasa omnia, in quibus aquae fervent, ita ut non sit avellere eas; si brassica in his decoquatur, abscedunt.

inter silvestres brassicas et lapsana est, pedalis altitudine, hirsutis foliis, sinapi similis, nisi candidior esset flore. coquitur in cibo, alvum leniter mollit.

marina brassica vehementissime ex omnibus alvum ciet. coquitur propter acrimoniam cum pingui carne, stomacho inimicissima.

scillarum in medicina albae et feminae nigrae; quae candidissima fuerit, utilissima erit. huic aridis tunicis direptis quod relicum e vivo est, consectum suspenditur lino modicis intervallis. postea arida frusta in cadum aceti quam asperissimi penduntia inmerguntur, ita ne ulla parte vas contingant. gypso

deinde oblitus cadus ponitur sub tegulis totius diei solem accipientibus. hoc fit ante solstitium, diebus xlviii. post eum numerum dierum tollitur vas, scilla eximitur, acetum transfunditur. hoc clariorem oculorum aciem facit, salutare est stomachi, laterum doloribus ieiunis sumptum. sed tanta vis est, ut avidius haustum exstinctae animae momento aliquo speciem praebeat. prodest et gingivis et dentibus vel per se commanducata. taenias et reliqua ventris animalia pellit ex aceto et melle sumpta. linguae quoque recens subiecta praestat, ne hydropici sitiant. coquitur pluribus modis: in olla, quae coiciatur in clibanum aut furnum, vel adipe aut luto inlita, vel frustatim in patinis. et cruda siccatur, deinde conciditur coquiturque in aceto, cum serpentium ictibus inponitur. tosta quoque purgatur et medium eius iterum in aqua coquitur. usus sic coctae ad hydropicos, ad urinam ciendam tribus obolis cum melle et aceto potae, item splenicis et stomachicis, si non sentiant ulcus, quibus innatet cibus, ad tormina, regiones morbos, tussim veterem cum suspirio. discutit et foliis strumas quadrinis diebus soluta, furfures capitis et ulcera manantia inlita ex oleo cocta. coquitur et in melle cibi gratia, maxime uti concoctionem faciat. sic et interiora purgat. rimas pedum sanat in oleo cocta et mixta resinae. semen eius lumborum dolori ex melle inponitur. pythagoras scillam in limine quoque ianuae suspensam contra malorum medicamentorum introitum pollere tradit.

ceteri bulbi ex aceto et sulphure ulceribus in facie medentur, per se vero triti nervorum contractioni et ex vino porrigini, cum melle canum morsibus; erasistrato placet cum pice. idem sanguinem sistere eos tradit inlitos cum melle. alii, si e naribus fluat, coriandrum et farinam adiciunt. theodorus et lichenas ex aceto bulbis curat, erumpentia in capite cum vino austero aut ovo. et bulbos epiphoris idem inlinit et siccae lippitudini media eorum. vitia, quae sunt in facie, rubentes maxime in sole inliti cum melle et nitro emendant, lentiginem cum vino aut cum aceto. vulneribus quoque mire prosunt per se aut, ut damion, ex mulso, si quinto die solvantur. iisdem et auriculas fractas curat et testium pituitas; in articularum doloribus miscet et farinam. in vino cocti inliti ventri duritiam praecordiorum emolliunt. dysintericis in vino ex aqua caelesti temperato dantur, ad convulsa intus cum silphio pilulis fabae magnitudine. ad sudorem tusi inlinuntur. nervis utiles, ideo et paralyticis dantur. luxata in pedibus, qui sunt rufi ex iis, citissime sanant cum melle et sale. venerem maxime megarici stimulant, hortensii partum cum sapa aut passo sumpti, silvestres interaneorum plagas et vitia cum silphio pilulis devoratis sedant. illorum semen contra phalangia bibitur in vino. ipsi ex aceto inlinuntur contra serpentium ictus. semen antiqui bibendum insanientibus dabant. flos bulborum tritus crurum maculas varietatesque igni factas emendat. diocles hebetari oculos ab his putat. elixos assis minus utiles esse adicit et difficile concoqui ex vi uniuscuiusque naturae.

bolbinen graeci vocant herbam porraceis foliis, rubicundo bulbo. haec traditur vulneribus mire utilis, dumtaxat recentibus. bulbus, quem vomitorium vocant ab effectu, folia habet nigra, ceteris longiora.

inter utilissimos stomacho cibos asparagi traduntur. cumino quidem addito inflationes stomachi colique discutiunt, iidem oculis claritatem adferunt, ventrem leniter molliunt, pectoris et spinae doloribus intestinorumque vitiis prosunt, vino, cum coquantur, addito. ad lumborum et renium dolores semen obolorum trium pondere, pari cumini bibitur. venerem stimulant, urinam cient utilissime, praeterquam vesica exulcerata, radice quoque plurimorum praedicatione. trita et in vino albo pota calculos quoque exturbat, lumborum et renium dolores sedat. quidam et ad vulvae dolorem radicem cum vino dulci propinant. eadem in aceto decocta contra elephantiasim proficit. asparago trito ex oleo perunctum pungi ab apibus negant.

silvestrem asparagum aliqui libycum vocant, attici orminum. huius ad supra dicta omnia efficacior vis, et candidiori maior. morbum regium extenuant. veneris causa aquam eorum decoctam bibi iubent ad heminam. idem et semen valet cum aneto ternis utriusque obolis. datur et ad serpentium ictus sucus decoctus; radix miscetur radici marathri inter efficacissima auxilia. si sanguis per urinam reddatur, semen et asparagi et apii et cumini ternis obolis in vini cyathis duobus chrysippus dari iubet. set id hydropicis contrarium esse, quamvis urinam moveat, docet, item veneri, vesicae quoque nisi decoctum; quae aqua si canibus detur, occidi eos. in vino decoctae radicis sucum, si ore contineatur, dentibus mederi.

apio gratia in volgo est. namque rami lactis potionibus per rura innatant et in condimentis peculiarem gratiam habent. praeterea oculis inlitum cum melle, ita ut subinde foveantur ferventi suco decocti, aliisque membrorum epiphoris per se tritum aut cum pane vel polenta inpositum mire auxiliatur. pisces quoque, si aegrotent in piscinis, apio viridi recreantur. verum apud eruditos non aliud erutum terra in maiore sententiarum varietate est. distinguitur sexu. chrysippus feminam esse dicit crispioribus foliis et duris, crasso caule, sapore acri et fervido; dionysius ... nigriorem, brevem, radicis ... , vermiculos gignentem; ambo neutrum ad cibos admittendum, immo omnino nefas, namque id defunctorum epulis feralibus dicatum esse - visus quoque claritati inimicum - caule feminae vermiculos gigni ideoque eos, qui ederint, sterilesce, mares feminasve; in puerperiis vero ab eo cibo comitiales fieri qui ubera hauriant; innocentior tamen esse marem. eaque causa est, ne inter nefastos frutex damnetur. mammaram duritiam inpositis foliis emollit. suaviores aquas potui incoctum praestat. suco maxime radicis cum vino lumborum dolores mitigat, eodem iure instillato gravitatem aurium. semine urinam ciet, menstrua ac secundas partus et si foveantur semine decocto. suggillata reddit colori cum ovi albo inlitum. at ex aqua coctum potumque renibus medetur, in frigida tritum oris ulceribus. semen cum vino vel radix cum vetere vino vesicae calculos frangunt. semen datur et arquatis ex vino albo.

apiastrum hyginus quidem melissophyllum appellat, sed in confessa damnatione est venenatum in sardinia. contexenda enim sunt omnia ex eodem nomine apud graecos pendentia.

olusatrum, quod hipposelinum vocant, adversatur scorpionibus. potō semine torminibus et interaneis medetur; item difficultatibus urinae semen eius decoctum ex mulso potum. radix in vino decocta calculos pellit et lumborum ac lateris dolores. canis rabiosi morsibus potum et inlitum medetur. sucus eius algentes calefacit potus. quartum genus ex eodem aliqui faciunt oreoselinum, palmum alto frutice recto, semine cumino simili, urinae et menstruis efficacax. heleoselino vis privata contra araneos; eo et oreoselino feminae purgantur e vino.

alio genere petroselinum quidam appellant in saxis natum, praecipuum ad vomicas, coclearibus binis suci additis in cyathum marrubii suci atque ita calidae aquae tribus cyathis. adiecere quidam buselinum, differens brevitate caulis a sativo et radicis colore rufo, eiusdem effectus, praevalere contra serpentes potu et inlitu.

ocimum quoque chrysippus graviter increpuit inutile stomacho, urinae, oculorum quoque claritati, praeterea insaniam facere et lethargos et iocineris vitia, ideoque capras id aspernari, hominibus quoque fugiendum censens. addunt quidam tritum, si operiatur lapide, scorpionem gignere, commanducatum et in sole positum vermes; afri vero, si eo die feriatu quispiam a scorpione, quo ederit ocimum, non posse servari. quin immo tradunt aliqui, manipulo ocimi cum cancris x marinis vel fluviatilibus trito convenire ad id scorpiones ex proximo omnes. diodorus in empiricis etiam pediculos facere ocimi cibum. secuta aetas acriter defendit, nam id esse capras, nec cuiquam mentem motam, et scorpionum terrestrium ictibus marinorumque venenis mederi ex vino addito aceti exiguo. usu quoque conpertum deficientibus ex aceto odoratu salutare esse, item lethargicis et inflammatis refrigeratione, inlitum capitis doloribus cum rosaceo aut myrteo et aceto, item oculorum epiphoris inpositum ex vino. stomacho quoque utile, inflationes ructu dissolvere ex aceto sumptum, alvum sistere inpositum, urinam ciere; sic et morbo regio et hydropicis prodesse, etiam in choleris destillationes stomachi inhiberi. ergo etiam coeliacis philistio dedit et coctum dysintericis, et contra ... plistonius, aliqui et in tenesmo et sanguinem excreantibus in vino, duritia quoque praecordiorum. inlinitur mammis exinanitque lactis proventum. auribus utilissimum infantium, praecipue cum adipe anserino. semen tritum et haustum naribus sternumenta compescit et destillationes quoque capitis inlitum, vulvas purgat in cibo ex aceto. verrucas mixto atramento sutorio tollit. venerem stimulat, ideo etiam equis asinisque admissurae tempore ingeritur.

silvestri ocimo vis efficacior ad eadem omnia, peculiaris ad vitia, quae vomitionibus crebris contrahuntur, vomicasque volvae, contra bestiarum morsus e vino radice efficacissima.

eruae semen scorpionum venenis et muris aranei medetur, bestiolas omnes innascentes corpori arcet, vitia cutis in facie cum melle inlitum, lentigines ex aceto, cicatrices nigras reducit ad candorem cum felle bubulo. aiunt verbera subituris potum ex vino duritiam quandam contra ea sensus

induere. in condiendis opsoniis tanta est suavitas, ut graeci euzomon appellaverint. putant, subtrita eruca si foveantur oculi, claritatem restitui, ... tussim infantium sedari. radix eius in aqua decocta fracta ossa extrahit ... - nam de venere stimulanda diximus - tria folia silvestris erucae sinistra manu decerpta et trita in aqua mulsa si bibantur.

e contrario nasturtium venerem inhibet, animum exacuit, ut diximus. duo eius genera. alvum purgat, detrahit bilem potum #1108 pondere in aquae vii, strumis cum lomento inlitum opertumque brassica praeclare medetur. alterum est nigrius, quod capitis vitia purgat visum compurgat, commotas mentes sedat ex aceto sumptum, lienem ex vino potum vel cum fico sumptum, tussim, ex melle si cotidie ieiuni sumant. semen ex vino omnia intestinorum animalia pellit, efficacius addito mentastro. prodest et contra suspiria et tussim cum origano et vino dulci, pectoris doloribus decoctum in lacte caprino. panos discutit cum pice extrahitque corpori aculeos et maculas inlitum ex aceto; contra carcinomata adicitur ovorum album. et lienibus inlinitur ex aceto, infantibus vero e melle utilissime. sextius adicit ustum serpentes fugare, scorpionibus resistere, capitis dolores contrito, alopecias emendari addito sinapi, gravitatem aurium trito inposito auribus cum fico, dentium dolores infuso in aures suco, porriginem et ulcera capitis cum adipe anserino. furunculos concoquit cum fermento. carbunculos ad suppurationem perducit et rumpit, phagedaenas ulcerum expurgat cum melle. coxendicibus et lumbis cum polenta ex aceto inlinitur, item licheni, unguibus scabris, quippe natura eius caustica est. optimum autem babylonium; silvestri ad omnia ea effectus maior.

in praecipuis autem medicaminibus ruta est. latiora sativae folia, rami fruticosiores; silvestris horrida ad effectum est et ad omnia acrior. sucus exprimitur tunsae aspersa modice aqua et in pyxide cypria adservatur. hic copiosior datus veneni noxiam obtinet, in macedonia maxime iuxta flumen aliacmonem; mirumque, cicutae suco extinguitur: adeo etiam venenorum venena sunt. cicutae sucus prodest et manibus colligentium rutam. cetero inter prima miscetur antidotis, praecipueque galatica; quaecumque autem ruta et per se pro antidoto valet foliis tritis ex vino sumptis, contra aconitum maxime et viscum, item fungos, sive in potu detur sive in cibo; simili modo contra serpentium ictus, utpote cum mustelae dimicaturae cum his rutam prius edendo muniant se. valent et contra scorpionum et contra araneorum, apium, crabronum, vesparum aculeos et cantharidas ac salamandras canisve rabiosi morsus. acetabuli mensura sucus e vino bibitur, et folia trita vel commanducata inponuntur cum melle ac sale vel cum aceto et pice decocta. suco perunctos, etiam habentes negant feriri ab his maleficis, serpentesque, si uratur ruta, nidorem fugere. efficacissima tamen est silvestris radix cum vino sumpta; eandem adiciunt efficaciorum esse sub diu potam.

pythagoras et in hac marem minoribus herbaceisque coloris foliis a femina discrevit, et eam laetioribus foliis et colore. idem oculis noxiam putavit; falsum, quoniam scalptores et pictores hoc cibo utuntur oculorum causa cum

pane vel nasturtio, caprae quoque silvestres propter visum, ut aiunt. multi suco eius cum melle attico inuncti discusserunt caligines vel cum lacte mulieris puerum enixae vel puro suco angulis oculorum tactis. epiphoras cum polenta inposita lenit; item capitis dolores pota cum vino aut cum aceto et rosaceo inlita, si vero sit cephalaea, cum farina hordeacia et aceto. eadem cruditates discutit, mox et inflationes, dolores stomachi veteres. vulvas aperit corrigitque conversas inlita in melle toto ventre et pectore; hydropicis cum fico et decocta ad dimidias partes potaque ex vino. sic bibitur et ad pectoris dolores laterumque et lumborum, tusses, suspiria, pulmonum, iocinerum, renium vitia, horrores frigidos, crapulae gravedines. decocuntur folia poturis; et in cibo vel cruda vel decocta aut condita prodest; item torminibus in hysopo decocta et cum vino pota. sic et sanguinem sistit interiorem et narium indita iis; sic et conlutis dentibus prodest. auribus quoque in dolore sucus infunditur, custodito, ut diximus, modo in silvestri, contra tarditatem vero sonitusque cum rosaceo vel cum laureo oleo aut cum vino et melle. sucus et phreneticis ex aceto tritae instillatur in tempora et cerebrum. adiecerunt aliqui et serpyllum et laurum, inlinentes capita et colla. dederunt et lethargicis ex aceto olfaciendum et comitialibus bibendum decoctae sucum in cyathis iiii; ante accessiones, quarum frigus intolerabile est, alsiosisque et crudam in cibo. urinam quoque vel cruentam pellit, feminarum etiam purgationes secundasque et iam emortuos partus, ut hippocrati videtur, ex vino dulci nigro pota. itaque inlitam et vulvarum causa et suffire iubet. diocles et cardiacis inponit ex aceto et melle cum farina hordeacia et contra ileum decocta farina in oleo velleribus collecta. multi vero et contra purulentas excreationes siccae drachmas duas, sulphuris unam et dimidiam sumi censent, et contra cruentas ramos iii decoctos in vino. datur et dysintericis cum caseo in vino contrita. dederunt et cum bitumine infriatam potioni propter anhelitum, ex alto lapsis seminis iii uncias olei libra vinique sextario. inlinitur cum oleo coctis foliis partibus, quas frigus adusserit. si urinam movet, ut hippocrati videtur, mirum est, quosdam dare velut inhibentem potui contra incontinentiam urinae. psoras et lepras cum melle et alumine inlita emendat, item vitiligines, verrucas, strumas et similia cum trychno et adipe suillo ac taurino sebo, ignem sacrum ex aceto et oleo vel psimithio, carbunculum ex aceto; nonnulli laserpicium una inlini iubent, sine quo epinyctidas pusulas curant. inponunt et mammis turgentibus decoctam et pituitae eruptionibus cum cera, testium vero epiphoris cum ramis lauri teneris, adeo peculiari in visceribus his effectum, ut silvestri ruta cum axungia vetere inlitos ramices sanari prodant, fracta quoque membra semine trito cum cera inposito. radix rutae sanguinem oculis suffusum et toto corpore cicatrices aut maculas inlita emendat. ex reliquis, quae traduntur, mirum est, cum ferventem rutae naturam esse conveniat, fasciculum eius in rosaceo decoctum addita aloes uncia perunctis sudorem reprimere, itemque generationem inpediri hoc cibo. ideo in profluvio genitali datur et venerem crebro per somnia imaginantibus. praecavendum est gravidis abstineant hoc cibo, necari enim partus invenio. eadem ex omnibus satis quadripedum quoque morbis in

maximo usu est, sive difficile spirantibus sive contra maleficorum animalium ictus, infusa per nares ex vino aut, si sanguisugam hauserint, ex aceto et quocumque in simili morborum genere, ut in homine, temperata.

mentastrum silvestris menta est, differens specie foliorum, quae sunt figura ocimi, pulei odore, propter quod quidam silvestre puleium vocant. his commanducatis et inpositis sanari elephantiasin magni pompeii aetate fortuito cuiusdam experimento, propter pudorem facie inlita, conpertum est. eadem inlinuntur bibunturque adversus serpentium ictus drachmis duabus in vini cyathis duobus, adversus scorpionum cum sale, oleo, aceto, item adversus scolopendras ius decocti. adversus omnia venena servantur folia arida ad farinae modum. substratum vel accensum fugat etiam scorpiones. potum feminas purgat, sed partus necat. ruptis, convulsis, orthopnoicis, torminibus, choleris efficacissimum, item lumbis, podagris inpositum. sucus auribus verminosis instillatur. in regio morbo bibitur, strumis inlinitur, somnia veneris inhibet, taenias pellit ex aceto potum, contra porriginem ex aceto infunditur capiti in sole.

mentae ipsius odor animum excitat et sapor aviditatem in cibus, ideo embammatum mixturae familiaris. ipsa acescere aut coire densarique lac non patitur; quare lactis potionibus additur, et his, qui coagulati potu strangulentur, data in aqua aut mulso. eadem vi resistere et generationi creditur cohibendo genitalia densari. aequè maribus ac feminis sistit sanguinem et purgationes feminarum inhibet, cum amylo ex aqua pota coeliacorum impetus. exulcerationem et vomicas vulvae curant illita, iocinerum vitia ternis obolis ex mulso datis, item sanguinem excreantibus in sorbitione. ulcera in capite infantium mire sanat, arterias umidas siccatur, siccas adstringit, pituitas corruptas purgat in mulso et aqua. voci suco utilis, sub certamine dumtaxat, qui et gargarizatur uva tumente adiecta ruta et coriandro ex lacte; utilis et contra tonsillas cum alumine, linguae asperae cum melle et convulsis intus per se vitiisque pulmonis. singultus et vomitiones sistit cum suco granati, ut democritus monstrat. recentis sucus narium vitia spiritu subductus emendat; ipsa trita choleras, in aceto quidem pota, sanguinis fluctiones intus, ileum etiam inposita cum polenta et si mammae tendantur. inlinitur et temporibus in capitis dolore, sumitur et contra scolopendras et scorpiones marinos et ad serpentes. epiphoris inlinitur et omnibus in capite eruptionibus, item sedis vitiis. intertrigines quoque, vel si teneatur tantum, prohibet. auribus instillatur cum mulso. aiunt et lienem mederi eam in horto gustatam ita, ne vellatur, si is, qui mordeat, dicat se lienem mederi, per dies viii; aridae quoque farinam tribus digitis adprehensam et stomachi dolorem sedare in aqua et similiter aspersa potione ventris animalia expellere.

magna societas cum hac ad recreandos defectos animo puleio, cum surculis suis in ampullas vitreas aceti utrisque deiectis. qua de causa dignior e puleio corona Varroni quam e rosa cubiculis nostris pronuntiata est; nam et capitis dolores inposita dicitur levare, quin et olfactu capita tueri contra frigorum aestusque iniuriam et ab siti traditur, neque aestuare eos, qui duos e puleio

surculos inpositos auribus in sole habeant. inlinitur etiam in doloribus cum polenta et aceto, femina efficacius. est autem haec flore purpureo, mas candidum habet. item nausias cum sale et polenta in frigida aqua pota inhibet; sic et pectoris dolorem, stomachi autem ex aqua. item rosiones sistit et vomitiones cum aceto et polenta, alvum solvit ex sale et aceto et polenta. intestinorum vitia melle decocta et nitro sanat, urinam pellit ex vino et, si ammineum sit, et calculos et interiores omnes dolores. ex melle et aceto sedat menstrua et secundas, vulvas conversas corrigit, defunctos partus eicit. semen obmutescentibus olfactu admovetur. comitialibus in aceto cyathi mensura datur. si aquae insalubres bibendae sint, tritum aspergitur. lassitudines corporis, si omnino tractetur, minuit, nervorum causa et in contractione cum sale et aceto, e melle infricatur in opisthotono. bibitur ad serpentium ictus decoctum, ad scorpionum in vino tritum, maxime quod in siccis nascitur. ad oris exulcerationes, ad tussim efficax habetur. flos recentis incensus pulices necat odore. xenocrates pulei ramum lana involutum in tertianis ante accessionem olfactandum dari aut stragulis subici et ita collocari aegrum inter remedia tradit.

silvestri ad eadem vis efficacior. simile est origano, minoribus foliis quam sativum, et a quibusdam dictamnus vocatur. gustatum a pecore caprisque balatum concitat, unde quidam graeci littera mutata blechonem vocaverunt. natura tam fervens est, ut inlitas partes exulceret. tuso in perfrictione fricari ante balinea convenit et ante accessionum horrorem. convulsis et torminibus, podagris mire prodest, spasticis cum melle et sale bibendum datur, pulmonum vitia excreabilia facit. ad lienem cum sale utile est et vesicae et suspiriis et inflationibus; decoctum suco aequaliter et vulvas corrigit et contra scolopendram terrestrem vel marinam, item scorpiones valet privatimque contra hominis morsum. radix contra increscentia ulcera recens potentissima, arida vero cicatricibus decorem adfert.

item puleio est nepetaeque societas. decocta in aqua ad tertias discutunt frigora mulierumque menstruis prodest et aestate sedant calores. nepeta quoque vires contra serpentes habet; fenum ex ea nidoremque fugiunt, quin et substernere in metu eo dormituris utile est. tusa aegilopis inponitur et capitis doloribus recens cum tertia parte panis temperata aceto inlinitur. sucus eius instillatus naribus supinis profluvium sanguinis sistit; item radix, quae cum myrti semine in passo tepido gargarizata anginis medetur.

cuminum est et silvestre, praetenu, quaternis aut quinque foliis veluti serratis, sed ut sativo magnus usus, in stomachi praecipue remediis. discutit pituitas, inflationes tritum et cum pane sumptum vel potum ex aqua vinoque, tormina quoque et intestinorum dolores. verumtamen omne pallorem gignit bibentibus. ita certe ferunt porci latronis, clari inter magistros dicendi, adsectatores similitudinem coloris studiis contracti imitatos, et paulo ante iulium vindicem, adsertorem illum a nerone libertatis, captationi testamenti sic lenocinatum. narium sanguinem pastillis inditum vel ex aceto recens sistit, et oculorum epiphoris per se inpositum, tumentibus cum melle prodest.

infantibus inponi in ventre satis est. morbo regio in vino albo a balineis datur; ... is aethiopicum maxime in posca et in ecligmate cum melle. africano privatim urinae incontinentiam cohiberi putant. sativum datur ad iocineris vitia tostum tritum in aceto, item ad vertiginem, iis vero, quos acrior urina mordeat, in dulci tritum, ad vulvarum vitia in vino praeterque inpositis vellere foliis, testium tumoribus tostum tritumque cum melle aut cum rosaceo et cera. silvestre ad omnia eadem efficacius, praeterea ad serpentes cum oleo, ad scorpiones, scolopendras. sistit et vomitionem nausiasque ex vino quantum adprehenderint tres digiti. propter colum quoque bibitur inliniturque in penicillo fervens, adprimitur fasciis. strangulationes vulvae potum in vino aperit tribus drachmis in tribus cyathis vini. auribus instillatur ad sonitus atque tinnitus cum sebo vitulino vel melle. suggillatis inlinitur cum melle et uva passa et aceto, lentigini nigrae ex aceto.

est cumino simillimum quod graeci vocant ami. quidam vero aethiopicum cuminum id esse existimant. hippocrates regium appellavit, videlicet quia efficacius aegyptio iudicavit. plerique alterius naturae in totum putant, quoniam sit exilius et candidius. similis autem et huic usus. namque et panibus alexandrinis subditur et condimentis interponitur. inflationes et tormina discutit, urinas et menstrua ciet, suggillata oculorum, epiphoras mitigat, cum lini semine scorpionum ictus in vino potum drachmis duabus privatimque cerastarum cum pari portione myrrae. colorem quoque bibentium similiter mutat in pallorem. suffitum cum uva passa aut resina vulvam purgat. tradunt facilius concipere eas, quae odorentur id per coitum.

de cappari satis diximus inter peregrinos frutices. non utendum transmarino, innocentius est italicum. ferunt eos, qui cotidie id edint, paralysi non periclitari nec lienis doloribus. radix eius vitilignes albas tollit, si trita in sole fricentur. splenicis prodest in vino potus radicis cortex duabus drachmis, dempto balinearum usu, feruntque xxxv diebus per urinam et alvum totum lienem emitti. bibitur in lumborum doloribus ac paralysi. dentium dolores sedat tritum ex aceto vel semen decoctum vel manducata radix. infunditur et aurium dolori decoctum oleo. ulcera, quae phagedaenas vocant, folia et radix recens cum melle sanant. sic et strumas discutit radix, parotidas vermiculosque cocta in aqua. iocineris doloribus tusa cum farina hordeacea inponitur. vesicae quoque malis medetur. dant et ad taenias in aceto et melle. oris exulcerationes in aceto decocta tollit. stomacho inutile esse inter auctores convenit.

ligusticum - aliqui panaces vocant - stomacho utile est, item convulsionibus, inflationibus. sunt qui et cunilam bubulam appellaverint, uti diximus, falso.

cunilae praeter sativam plura sunt in medicina genera. quae bubula appellatur, semen pulei habet, utile ad vulnera commanducatum inpositum, ut quinto post die solvatur. et contra serpentes in vino bibitur ac tritum plagae inponitur. vulnera ab his facta perfricant, item testudines cum serpentibus pugnaturae; quidamque in hoc usu panaceam vocant. sedat et tumores et

virilium mala sicca vel foliis tritis, in omni usu mire congruens vino.

est alia cunila, gallinacea appellata nostris, graecis origanum heracleoticum. prodest oculis trita addito sale; tussim quoque emendat et iocinerum vitia, laterum dolores cum farina, oleo et aceto sorbitione temperata, praecipue vero serpentium morsus.

tertium genus est eius, quae a graecis mascula, a nostris cunilago vocatur, odoris foedi, radicis lignosae, folio aspero. vires eius vehementissimas in omnibus generibus earum tradunt; manipulo quoque eius abiecto omnes e tota domo blattas convenire ad eam, privatim adversus scorpiones ex posca pollere, foliis tribus ex oleo peruncto homine fugari serpentes.

e contrario quae mollis vocatur, pilosioribus ramis et aculeatis, trita mellis odorem habet, digitis tactu eius cohaerescens, altera turis, quam libanotida appellavimus. medetur utraque contra serpentes ex vino vel aceto, pulices etiam contritae cum aqua sparsae necant.

sativa quoque suos usus habet. sucus eius cum rosaceo auriculas iuvat, ipsa ad ictus bibitur. fit ex ea montana, serpyllo similis, efficax contra serpentes. urinam movet, purgat a partu mulieres. concoctionem mire adiuvat et aviditatem ad cibos utraque vel in cruditate ieiunis in potione aspersa; luxatis quoque utilis, contra vesparum et similes ictus ex farina hordeacia et posca utilissima. libanotidis alia genera suis locis dicentur.

piperitis, quam et siliquastrum appellavimus, contra morbos comitiales bibitur. castor et aliter demonstrabat: caule rubro et longo, densis geniculis, foliis lauri, semine albo, tenui, gustu piperis, utilem gingivis, dentibus, oris suavitati et ructibus.

origanum, quod vi saporem cunilae aemulatur, ut diximus, plura genera in medicina habet. onitin alii prasion appellant, non dissimile hysopo. privatim eius usus contra rosiones stomachi in tepida aqua et contra cruditates, araneos scorpionesque in vino albo, luxata et incussa in aceto et oleo et lana.

tragoriganum similis est serpyllo silvestri. urinam ciet, tumores discutit, contra viscum potum viperaeque ictum efficacissimum, stomacho acida ructanti et praecordiis. tussientibus quoque cum melle datur et pleuriticis et peripneumonicis.

heraclium quoque tria genera habet: nigrius latioribus foliis, glutinosum, alterum exilioribus, mollius, sampsucho non dissimile, quod aliqui prasion vocare malunt. tertium est inter haec medium, set minus quam cetera efficax. optimum autem creticum, nam et iucunde olet, proximum zmyrnaeum durius, heracleoticum ad potum utilius, quod onitin vocant. communis autem usus serpentes fugare, percussis esui dari et decoctum potui, urinam ciere, ruptis, convulsis mederi cum panacis radice, hydropicis cum fico aut cum hysopo acetabuli mensuris decoctum ad sextam; item ad scabiem, pruriginem, psoras in descensione balinearum. sucus auribus infunditur cum lacte mulieris. tonsillis quoque et uvis medetur, capitis ulceribus. venena opii et gypsi extinguit decoctum, si cum cinere e vino bibatur. alvum mollit acetabuli mensura, suggillatis inlinitur, item dentium dolori, quibus et candorem facit,

cum melle et nitro. sanguinem narium sistit. ad parotidas decoquitur cum hordeacia farina, ad arterias asperas cum galla et melle teritur, ad lienem folia cum melle et sale. crassiores pituitas et nigras extenuat coctum cum aceto et sale sumptum paulatim. regio morbo tritum cum oleo in nares infunditur. lassi perunguntur ex eo ita, ne venter attingatur. epinyctidas cum pice sanat, furunculos aperit cum fico tosta, strumas cum oleo et aceto et farina hordeacia, lateris dolores cum fico inlitum, fluxiones sanguinis in genitalibus tusum ex aceto inlitum, reliquias purgationum a partu.

lepidium inter urentia intellegitur. sic et in facie cutem emendat exulcerando, ut tamen cera et rosaceo facile sanetur. sic et lepras et psoras tollit semper facile et cicatricum ulcera. tradunt in dolore dentium adalligatum brachio, qua doleat, convertere dolorem.

git ex graecis alii melanthium, alii melaspermon vocant. optimum quam excitatissimi odoris et quam nigerrimum. medetur serpentium plagis et scorpionum; inlini ex aceto ac melle reperio incensoque serpentes fugari. bibitur drachma una et contra araneos. destillationem narium discutit tusum in linteolo olefactum, capitis dolores inlitum ex aceto, et infusum naribus cum irino oculorum epiphoras et tumores, dentium dolores coctum cum aceto, ulcera oris tritum aut commanducatum; item lepras et lentigines ex aceto, difficultates spirandi addito nitro potum, duritias tumoresque veteres et suppurationes inlitum. lacte mulierum auget aliquot continuis diebus sumptum. colligitur succus eius ut hyoscyami similiterque largior venenum est, quod miremur, cum semen gratissime panes etiam condat. oculos quoque purgat, urinam et menses ciet. quin immo linteolo deligatis tantum granis xxx secundas trahi reperio. aiunt et clavis in pedibus mederi tritum in urina, culices suffitu necare, item muscas.

et anesum adversus scorpiones ex vino habetur, pythagorae inter pauca laudatum sive crudum sive decoctum; item viride aridumve omnibus, quae condiuntur quaeque intinguntur, desideratum, panis etiam crustis inferioribus subditum. saccis quoque additum cum amaris nucibus vina commendat. quin ipsum oris halitum iucundiores facit faectoremque tollit manducatum matutinis cum zmyrnio et melle exiguo, mox vino collutum. vultum iuniorem praestat. insomnia levat suspensum in pulvino, ut dormientes olefaciant. adpetentiam ciborum praestat, quando id quoque inter artificia deliciae fecere, ex quo labor desiit cibos poscere. ob has causas quidam anicetum id vocare.

laudatissimum est creticum, proximum aegyptium. hoc ligustici vicem praestat in condimentis. dolores capitis levat suffitum naribus. epiphoris oculorum euenor radicem eius tusam inponit, iollas ipsum cum croco pari modo et vino, et per se cum polenta ad magnas fluxiones extrahendisque si qua in oculos inciderint. narium quoque carcinodes consumit inlitum ex aqua. sedat anginas cum hysopo ac melle ex aceto gargarizatum, auribus infunditur cum rosaceo, thoracis pituitas purgat tostum cum melle sumptum. melius cum acetabulo anesi nuces amaras l purgatas terere in melle ad tussim; facillime vero anesi drachmae tres, papaveris duae miscentur melle ad fabae

magnitudinem et ternae diebus sumuntur. praecipuum autem est ad ructus; ideo stomachi inflationibus et intestinorum torminibus et coeliacis medetur. singultus et olfactum potumque decoctum inhibet. foliis decoctis digerit cruditates. sucus decocti cum apio olfactus sternumenta inhibet. potum somnos conciliat, calculos pellit, vomitiones cohibet et praecordiorum tumores, et pectorum vitiis, nervis quoque, quibus succinctum est corpus, utilissimum. prodest et capitis doloribus instillari sucum cum oleo decocti. non aliud utilius ventri et intestinis putant; ideo dysintericis et in tenesmo datur tostum. aliqui addunt et opium, pilulis in die ternis lupini magnitudine in vini cyatho dilutis. dieuches et ad lumborum dolores suco usus est, semen hydropicis et coeliacis dedit tritum cum menta, euenor radicem et ad renes. dalion herbarius parturientibus ex eo cataplasma inposuit cum apio, item vulvarum dolori deditque bibendum cum aneto parturientibus. phreneticis quoque inlinunt vel recens cum polenta; sic et infantibus comitialia vitium aut contractiones sentientibus. pythagoras quidem negat corripi vitio comitiali in manu habentes, ideo quam plurimum domi serendum; parere quoque facilius olfactantes, et statim a partu dandum potui polenta aspersa. sosimenes contra omnes duritias ex aceto usus est eo et contra lassitudines in oleo decoquens addito nitro. semine eius poto lassitudinis auxilium viatoribus spopondit. heraclides ad inflationes stomachi semen tribus digitis cum castorei obolis duobus ex mulso dedit, similiter ad ventris aut intestinorum inflationes et orthopnoicis quod ternis digitis prenderet seminis, tantundem hyoscyami cum lacte asinino. multi vomituris acetabula eius et folia lauri decem trita in aqua bibenda inter cenam suadent. strangulatus vulvae, si manducetur et linatur calidum vel si bibatur cum castoreo in aceto et melle, sedat; vertigines a partu cum semine cucumeris et lini pari mensura ternum digitorum, vini albi tribus cyathis discutit. tlepolemus ad quartanas ternis digitis seminis anesi et feniculi usus est in aceto et mellis cyatho uno. lenit articulares morbos cum amaris nucibus inlitum. sunt qui et aspidum venenis adversari naturam eius putent. urinam ciet, sitim cohibet, venerem stimulat, cum vino sudorem leniter praestat, vestes quoque a tineis defendit. efficacius semper recens et quo nigrius, stomacho tamen inutile est praeterquam inflato.

anetum quoque ructus movet et tormina sedat, alvum sistit. epiphoris radices inlinuntur ex aqua vel vino. singultus cohibet semen fervens olfactu; sumptum ex aqua sedat cruditates. cinis eius uvam in faucibus levat, oculos et genituram hebetat.

sacopenium, quod apud nos gignitur, in totum transmarino alienatur. illud enim hammoniacy lacrimae simile sagapemon vocatur. prodest laterum et pectoris doloribus, convulsis, tussibus vetustis excreationibusque, praecordiorum tumoribus. sanat et vertigines, tremulos, opisthotonicos, lienes, lumbos, perfrictiones. datur olfactandum ex aceto in strangulatu vulvae; ceteris et potui datur et cum oleo infricatur. prodest et contra mala medicamenta.

papaveris sativi tria diximus genera, et sponte nascentis alia promissimus. e

sativis albi calix ipse teritur et e vino bibitur somni causa. semen elephantias medetur. e nigro papavere sopor gignitur scapo inciso, ut diagoras suadet, cum turgescit, ut iollas, cum deflorescit, hora sereni diei tertia, hoc est cum ros in eo exaruerit. incidi iubent sub capite et calice, nec in alio genere ipsum inciditur caput. sucus et hic et herbae cuiuscumque lana excipitur aut, si exiguus sit, ungue pollicis, ut lactucis, et postero die magis, quod inaruit, papaveris vero largus densatus et in pastillos tritus in umbra siccatur, non vi soporifera modo, verum, si copiosior hauriatur, etiam mortifera per somnos. opium vocant. sic scimus interemptum p. licini caecinae praetorii viri patrem in hispania bavili, cum valetudo inpetibilis odium vitae fecisset; item plerosque alios. qua de causa magna concertatio extitit. diagoras, erasistratus in totum damnavere ut mortiferum, infundi vetantes praeterea, quoniam visui noceret. addidit andreas, ideo non protinus excaecari eo, quoniam adulteraretur alexandriae. sed postea usus eius non inprobatus est medicamento nobili, quod διὰ κωδύων vocant. semine quoque eius trito in pastillos e lacte utuntur ad somnum, item ad capitis dolores cum rosaceo; cum hoc et aurium dolori instillatur. podagris inlinitur cum lacte mulierum - sic et foliis ipsis utuntur - , item ad ignes sacros et vulnera ex aceto. ego tamen damnaverim collyriis addi, multoque magis quas vocant ληξιπυρέτους quasque pepticas et coeliacas. nigrum tamen coeliacis in vino datur. sativum omne maius. rotunda ei capita, at silvestri longa ac pusilla, sed ad omnes effectus valentiora. decoquitur et bibitur contra vigilias, eademque aqua foveant ora. optimum in siccis et ubi raro pluatur. cum capita ipsa et folia decocuntur, sucus meconium vocatur, multum opio ignavior. experimentum opii est primum in odore - sincerum enim perpeti non est - , mox in lucernis, ut pura luceat flamma et ut extinctum demum oleat, quae in fucato non eveniunt. accenditur quoque difficilius et crebro extinguitur. est sinceri experimentum et in aqua, quoniam ut nubecula innatat, fictum in pusulas coit. sed maxime mirum est aestivo sole deprehendi; sincerum enim sudat et se diluit, donec suco recenti simile fiat. mnesides optime servari putat hyoscyami semine adiecto, alii in faba.

inter sativa et silvestria medium genus, quoniam in arvis, sed sponte nasceretur, rhoeam vocavimus et erraticum. quidam id decerptum protinus cum toto calice mandunt. alvum exinanit. capita quinque decocta in vini tribus heminis pota et somnum faciunt.

silvestrium unum genus ceratitim vocant, nigrum, cubitali altitudine, radice crassa et corticosa, calyculo inflexo ut corniculo. folia minora et tenuiora quam ceteris silvestribus. semen exile tempestivum est messibus; alvum purgat dimidio acetabulo in mulso. folia trita cum oleo argema iumentorum sanant. radix acetabuli mensura cocta in duobus sextariis ad dimidias datur ad lumborum vitia et iocineris. carbunculis medentur ex melle folia. quidam hoc genus glaucion vocant, alii paralium. nascitur enim in adflatu maris aut nitroso loco.

alterum e silvestribus genus heraclium vocatur, ab aliis aphrodes, foliis, si

procul intuearis, speciem passerum praebentibus, radice in summa terrae cute, semine spumoso. ex hoc lina splendorem trahunt. aestate tunditur in pila. comitialibus morbis acetabulo seminis in vino albo - vomitionem enim facit - , item medicamento, quod διὰ κωδῦν et arteriace vocatur, utilissimum. fit autem huius papaveris aut cuiuscumque silvestris capitibus cxx in aquae caelestis sextariis tribus biduo maceratis in eademque discocitis, deinde suco siccato iterumque cum melle decocto ad dimidias partes vapore tenui. addidere postea drachmas senas croci, hypocisthidis, turis, acaciae et passi cretici sextarium. haec ostentatione, simplex quidem et antiqua illa salubritas papavere et melle constat.

tertium genus est tithymalon - mecona vocant, alii paralion - folio lini, flore albo, capite magnitudinis fabae. colligitur uva florente, siccatur in umbra. semen potum purgat alvum dimidio acetabulo in mulso. cuiuscumque autem papaveris caput viride vel siccum inlitum epiphoras oculorum lenit. opium ex vino meraculo si protinus detur, scorpionum ictibus resistit. aliqui hoc tantum nigro tribuunt, si capita eius vel folia terantur.

est et porcillaca, quam peplin vocant, non multum sativa efficacior, cuius memorabiles usus traduntur: sagittarum venena et serpentium haemorrhoidum et presterum restingui pro cibo sumpta et plagis inposita extrahi, item hyoscyami pota e passo expresso suco. cum ipsa non est, semen eius simili effectu prodest. resistit et aquarum vitiiis, capitis dolori ulceribusque in vino tusa et inposita, reliqua ulcera commanducata cum melle sanat. sic et infantium cerebro inponitur umbilicoque prociduo, in epiphoris vero omnium fronti temporibusque cum polenta, sed ipsis oculis e lacte et melle; eadem, si procidant oculi, foliis tritis cum corticibus fabae, pusulis cum polenta et sale et aceto. ulcera oris tumoremque gingivarum commanducata cruda sedat, item dentium dolores, tonsillarum ulcera sucus decoctae; quidam adiecere paulum murrae. nam mobiles dentes stabilis commanducata cruda sedat vocemque firmat et sitim arcet. cervicis dolores cum galla et lini semine et melle pari mensura sedat, mammarum vitia cum melle aut cimolia creta, salutaris et suspiriosis semine cum melle hausto. stomachum in acetariis sumpta corroborat. ardenti febris inponitur cum polenta, et alias manducata refrigerat etiam intestina. vomitiones sistit. dysenteriae et vomiciis estur ex aceto vel bibitur cum cumino, tenesmis autem cocta. comitialibus cibo vel potu prodest, purgationibus mulierum acetabuli mensura in sapa, podagris calidis cum sale inlita et sacro igni. sucus eius potus renes iuvat ac vesicas, ventris animalia pellit. ad vulnere dolores ex oleo cum polenta inponitur. nervorum duritias emollit. metrodorus, qui ἔπτομήν ῥιζοτομουμένων scripsit, purgationibus a partu dandam censuit. venerem inhibet venerisque somnia. praetorii viri pater est, hispaniae princeps, quem scio propter inpetibiles uvae morbos radicem eius filo suspensam e collo gerere praeterquam in balineis, ita liberatum incommodo omni. quin etiam inveni apud auctores caput inlitum ea destillationem anno toto non sentire. oculos tamen hebetare putatur.

coriandrum inter silvestria non invenitur. praecipuum esse constat

aegyptium. valet contra serpentium genus unum, quod amphisbaenas vocant, potum inpositumque. sanat et alia vulnera, epinyctidas pusulas tritum; sic et omnes tumores collectionesque cum melle aut uva passa, panos vero ex aceto tritum. seminis grana tria in tertianis devorari iubent aliqui ante accessionem vel plura inlini fronti. sunt qui et ante solis ortum cervicalibus subici efficaciter putent. vis magna ad refrigerandos ardores viridi. ulcera quoque, quae serpunt, sanat cum melle vel uva passa, item testes, ambusta, carbunculos, aures, cum lacte mulieris epiphoras oculorum, ventris et intestinorum fluctiones semen ex aqua potum. bibitur et in choleris cum ruta. pellit animalia interaneorum cum mali punici suco et oleo semen potum. xenocrates tradit rem miram, si vera est, menstrua contineri uno die, si unum granum biberint feminae, biduo, si duo, et totidem diebus quot grana sumpserint, M. Varro coriandro subtrito et cumino acetoque carnem omnem incorruptam aestate servari putat.

atriplex et silvestre est, accusatum pythagorae, tamquam faceret hydropicos morbosque regio et pallorem, concoqueretur difficillime; ac ne in hortis quidem iuxta id nasci quicquam nisi languidum culpavit. addidere dionysius et diocles plurimos gigni ex eo morbos, nec nisi mutata saepe aqua coquendum, stomacho contrarium esse, lentigines et papulas gignere. miror quare difficulter in italia nasci tradiderit id solo smyrnaeus. hippocrates vulvarum vitiis infundit id cum beta. lycus neapolitanus contra cantharidas bibendum dedit, panos, furunculos incipientes, duritias omnes vel cocto vel crudo utiliter inlini putavit, item ignem sacrum cum melle, aceto, nitro, similiter podagras. ungues scabros detrahare dicitur sine ulcere. sunt qui et morbo regio dent semen eius cum melle, arterias et tonsillas nitro addito perfricent, alvum moveant cocto vel per se vel cum malva aut lenticula. concitant et vomitiones. silvestri capillos tingunt et ad supra scripta utuntur.

e. contrario in magnis laudibus malva est utraque et sativa et silvestris. duo genera earum amplitudine folii discernuntur. maiorem graeci malopem vocant in sativis, alteram ab emolliendo ventre dictam putant malachen. at e silvestribus, cui grande folium et radices albae, althaea vocatur, ab excellentia effectus a quibusdam plistolochia. omne solum, in quo seruntur, pinguius faciunt. contra omnes aculeatos ictus efficaces, praecipue scorpionum, vesparum similiumque et muris aranei. quin et trita cum oleo qualibet earum peruncti ante vel habentes eas non feriuntur. folium inpositum scorpionibus torporem adfert. valent et contra psimithi venena. aculeos omnes extrahunt inlitaе crudae cum aphronitro, potae vero decoctae cum radice sua leporis marini venenum restingunt, ut quidam dicunt, si vomatur. de iisdem mira et alia traduntur, sed maxime, si quis cotidie suci ex qualibet earum sorbeat cyathum dimidium, omnibus morbis cariturum. ulcera manantia in capite sanant in urina putrefactae, lichenas et ulcera oris cum melle; radix decocta furfures capitis et dentium mobilitates. eius, quae unum caulem habet, radice circa dentem, qui doleat, pungunt, donec desinat dolor; eadem strumas et parotidas, panos addita hominis saliva purgat citra vulnus. semen in vino

nigro potum pituita et nauseis liberat. radix mammarum vitiis occurrit adalligata in lana nigra, tussim in lacte cocta et sorbitionis modo sumpta quinis diebus emendat. stomacho inutiles sextius niger dicit, olympias thebana abortivas esse cum adipe anseris, aliqui purgari feminas foliis earum manus plenae mensura in oleo et vino sumptis. utique constat parturientes foliis substratis celerius solvi; protinus a partu revocanda, ne vulva sequatur. dant et sucum bibendum parturientibus ieiunis in vino decoctae hemina. quin et semen adalligant brachio genitale non continentium, adeoque veneri nascuntur, ut semen unicaulis adpersum curationi feminarum aviditates augere ad infinitum xenocrates tradat itemque tres radices iuxta adalligatas. tenesmo, dysintericis utilissime infundi, item sedis vitiis, vel si foveantur. melancholicis quoque sucus datur cyathis ternis tepidus et insanientibus quaternis, decoctae comitialibus heminae suci. hic et calculosis et inflatione et torminibus aut opisthotonico laborantibus tepidus inlinitur. et sacris ignibus et ambustis decocta in oleo folia inponuntur, et ad vulnerum impetus cruda cum pane. sucus decoctae nervis prodest et vesicae et intestinorum rosionibus, vulvas et cibo et infusione emollit. alvo sucus decoctae permeatus suaves facit.

althaeae in omnibus supra dictis efficacior radix, praecipue convulsis ruptisque. cocta in aqua alvum sistit, ex vino albo strumas et parotidas et mammarum inflammationes; et panos in vino folia decocta et inlita tollunt; eadem arida in lacte decocta quamlibet perniciosae tussi citissime medentur. hippocrates vulneratis sitientibusque defectu sanguinis radices decoctae sucum bibendum dedit et ipsam vulneribus cum melle et resina, item contusis, luxatis, tumentibus; et musculis, nervis, articulis inposuit ut supra; spasticis, dysintericis in vino bibendam dedit. mirum aquam radice ea addita addensari sub diu atque glaciescere. efficacior autem quo recentior.

nec lapathum dissimiles effectus habet. est autem et silvestre. quod alii oxalida appellant, nostri vero rumicem, alii lapathum canterinum, sapore sativo proximum, foliis acutis, colore betae candidae, radice minima, ad strumas cum axungia efficacissimum est; et alterum genus fere oxylapathum vocant, sativo item similis et acutiore folio ac rubriore, non nisi in palustribus nascens. sunt qui et hydrolapathum tradant, in aqua natum, et aliud hippolapathum, maius sativo candidiusque ac spissius. silvestria scorpionum ictibus medentur et feriri prohibent habentes. radix aceto decocta, si colluatur sucus, dentibus auxiliatur, si vero bibatur, morbo regio. semen stomachi inextricabilia vitia sanat. hippolapathi radix et privatim ungues scabros detrahit; dysintericos semen duabus drachmis in vino potum liberat. oxylapathi semen lotum in aqua caelesti sanguinem reicientibus adiecta acacia lentis magnitudine prodest. praestantissimos pastillos faciunt ex foliis et radice addito nitro et ture exiguo. in usu aceto diluunt.

sed sativum in epiphoris oculorum inlinunt frontibus. radice lichenas et lepras curant, in vino vero decocta strumas et parotidas, set calculos pota e vino et lienes inlita, coeliacos aequae et dysintericos et tenesmos; ex eademque

ad omnia efficacius ius lapathi et ructus facit et urinam ciet et caliginem oculorum discutit, item pruritus corporis in solia balnearum additum aut prius ipsum inlitum sine oleo. firmat et commanducata radix dentes; eadem decocta cum vino sistit alvum, folia solvunt. adiecit solo, ne quid omittamus, bulapathum, radicis tantum altitudine differens et egregio ad dysintericos effectum potae ex vino.

sinapi, cuius in sativis tria genera diximus, pythagoras principatum habere ex his, quorum in sublime vis feratur, iudicavit, quoniam non aliud magis in nares et cerebrum penetret. ad serpentium ictus et scorpionum tritum cum aceto inlinitur; fungorum venena discutit. contra pituitam tenetur in ore, donec liquescat, aut gargarizatur cum aqua mulsa. ad dentium dolores manditur, ad uvam gargarizatur cum aceto et melle, stomacho utilissimum contra omnia vitia, pulmonibus excreationes faciles facit in cibo sumptum; et suspiriosis datur, item comitialibus ter die cum succo cucumerum. sensus atque sternutamentis caput purgat, alvum mollit, menstrua et urinam ciet. et hydropicis inponitur cum fico et cumino tusum ternis partibus. comitali morbo aut vulvarum conversione suffocatas excitat odore aceto mixto; item lethargicos: adicitur tordylon - est autem hoc semen ex seseli - et, si vehementior lethargus premat, cruribus aut etiam capiti inlinitur cum fico ex aceto. veteres dolores thoracis, lumborum, coxendicum, umerorum et in quacumque parte ex alto corporis vitia extrahenda sint inlitum caustica vi emendat pusulas faciendo, at in magna duritia sine fico inpositum aut, si vehementior ustio timeatur, per duplices pannos. utuntur eo ad alopecias cum rubrica, psoras, lepras, phthiriasis, tetanicos, opisthotonicos. inungunt quoque scabras genas aut caligantes oculos succo cum melle, succusque tribus modis exprimitur in fictili calescitque in eo sole modice. exit et e cauliculo succus lacteus; eius gutta, cum induruit, dentium dolori medetur. semen ac radix, cum inmaduere musto, conteruntur manusque plenae mensura sorbentur ad confirmandas fauces, stomachum, oculos, caput sensusque omnes, mulierum etiam lassitudines, saluberrimo genere medicinae. calculos quoque discutit potum in aceto. inlinitur et livoribus suggillatisque cum melle et adipe anserino aut cera cypria. fit et oleum ex eo semine madefacto in oleo expressoque, quo utuntur ad nervorum rigores lumborumque et coxendicum et perfrictiones.

sinapis naturae esse effectusque eosdem habere traditur adarca inter silvestria dicta, in cortice calamorum sub ipsa coma nascens.

marrubium plerique inter primas herbas commendavere, quod graeci prasion vocant, alii linostrophon, nonnulli philopaeda aut philochares, notius quam ut indicandum sit. huius folia semenque contrita prosunt contra serpentes, pectorum et lateris dolores, tussim veterem. et iis, qui sanguinem reiecerint, eximie utile, scopis eius cum panico aqua decoctis, ut asperitas suci mitigetur. inponitur strumis cum adipe. sunt qui viride semen, quantum duobus digitis capiant, cum farris pugillo decoctum addito exiguo olei et salis sorberi ieiunis ad tussim iubeant. alii nihil conparant in eadem causa marrubii

et feniculi sucis ad sextarios ternos expressis decoctisque ad sextarios duos, tum addito mellis sextario, rursus decocto ad sextarios duos, si coclearii mensura in die sorbeatur in aquae cyatho. virilium vitiis tusum cum melle mire prodest. lichenas purgat ex aceto, ruptis, convulsis, spasticis, nervis salutare. potum alvum solvit cum sale et aceto, item menstrua et secundas mulierum. arida farina cum melle ad tussim siccā efficacissima est, item ad gangraenas et pterygia. sucus vero auriculis, ex naribus et morbo regio minuendaeque bili cum melle prodest, item contra venena inter pauca potens. ipsa herba stomachum et excreationes pectoris purgat cum iride et melle, urinam ciet, cavenda tamen exulceratae vesicae et renium vitiis. dicitur sucus et claritatem oculorum adiuvere. castor marrubii duo genera tradit, nigrum et, quod magis probat, candidum. in ovum inane sucum addit is ipsumque ovum infundit cum melle aequis portionibus, tepefactum vomicas rumpere, purgare, persanare promittens. inlinit etiam vulneribus a cane factis tusum cum axungia vetere.

serpyllum a serpendo putant dictum, quod in silvestri evenit, in petris maxime; nam sativum non serpit, sed ad palmum altitudine increscit. pinguius voluntarium et candidioribus foliis ramisque. adversus serpentes efficax, maxime cenchrim et scolopendras terrestres ac marinas et scorpiones, decoctis ex vino ramis foliisque. fugat et odore omnes, si uratur, et contra marinorum venena praecipue valet. capitis doloribus decoctum in aceto inlinitur temporibus ac fronti cum rosaceo, item phreneticis, lethargicis. contra tormina et urinae difficultates, anginas, vomitiones drachmis quattuor ex aqua bibitur; ad iocinerum desideria folia obolis quattuor dantur, ad lienem ex aceto. ad cruentas excreationes teritur in cyathis duobus aceti et mellis.

sisymbrium silvestre, quibusdam thymbraeum appellatum, pedali non amplius altitudine. quod in riguis nascitur, simile nasturtio est, tritumque efficax adversus aculeata animalia, ut crabrones et similia; quod in sicco, odoratum est et inseritur coronis, angustiore folio. sedant utraque capitis dolorem, item epiphoras, ut philinus tradit. alii panem addunt, alii per se decocunt in vino. sanat et epinyctidas cutisque vitia in facie mulierum intra quartum diem noctibus inpositum diebusque detractum. vomitiones, singultus, tormina, stomachi dissolutiones cohibet, sive in cibo sumptum sive suco poto. non edendum gravidis nisi mortuo conceptu, quippe etiam inpositum eicit. movet urinas cum vino potum, silvestre vero et calculos. quos vigilare opus sit, excitat infusum capiti cum aceto.

lini semen cum aliis quidem in usu est, sed et per se mulierum cutis vitia emendat in facie, oculorum aciem suco adjuvat. epiphoras cum ture et aqua aut cum murra ac vino sedat, parotidas cum melle aut adipe aut cera, stomachi solutiones inspersum polentae modo, anginas in aqua et oleo decoctum et cum aneso inlitum. torretur, ut alvum sistat. coeliacis et dysintericis inponitur ex aceto. ad iocineris dolores estur cum uva passa; ad phthisim utilissime e semine fiunt ecligmata. musculorum, nervorum, articulorum, cervicium duritias, cerebri membranas mitigat farina seminis nitro aut sale aut cinere

aditis. eadem cum fico ... etidem concoquit ac maturat; cum radice vero cucumeris silvestris extrahit quaecumque corpori inhaereant; sic et fracta ossa. serpere ulcus in vino decocta prohibet, eruptiones pituitae cum melle. emendat ungues scabros cum pari modo nasturtii, testium vitia et ramices cum resina et murra et gangraenas ex aqua, stomachi dolores cum feno graeco sextariis utriusque decoctis in aqua mulsa, intestinorum, thoracis pernicioosa vitia clystere in oleo aut melle.

blitum iners videtur ac sine sapore aut acrimonia ulla, unde convicium feminis apud menandrum faciunt mariti. stomacho inutile est. ventrem adeo turbat, ut choleram faciat aliquis. dicitur tamen adversus scorpiones potum e vino prodesse, clavis pedum inlini, item lienibus et temporum dolori ex oleo. hippocrates menstrua sisti eo cibo putat.

meum in italia non nisi a medicis seritur et his admodum paucis. duo genera eius: nobilius athamanticum vel athamanicum vocant, illi tamquam ab athamante inventum, hi quoniam laudatissimum in athamania reperiatur, foliis aneto simile et caule, aliquando bipedale, radicibus multis obliquis nigris, quibusdam et altis, minus rufum quam illud alterum. urinam ciet in aqua pota radice trita vel decocta, inflationes stomachi mire discutit, item tormina et vesicae vitia vulvarumque. articulis cum melle ... infantibus cum apio inlitum imo ventri urinas movet.

feniculum nobilitavere serpentes gustatu, ut diximus, senectam exuendo oculorumque aciem suco eius reficiendo, unde intellectum, hominum quoque caliginem praecipue eo levare. colligitur hic caule turgescente et in sole siccatur inungiturque ex melle. ubique hoc est laudatissimum in hiberia lacrimis fit. et e semine recenti fit et e radicibus prima germinatione incisis.

est in hoc genere et silvestre, quod hippomarathum, alii myrsineum vocant, foliis maioribus, gustu acriore, procerius, baculi crassitudine, radice candida. nascitur in calidis et saxosis. diocles et aliud hippomarathi genus tradidit, longo et angusto folio, semine coriandri.

medicinae in sativo ad scorpionum ictus et serpentium semine in vino potu. sucus et auribus instillatur vermiculosque in his necat. ipsum condimentis prope omnibus inseritur, oxyporis etiam aptissime. quin et panis crustis subditur. semen stomachum dissolutum adstringit vel in febribus sumptum, nausiam ex aqua tritum sedat, pulmonibus et iocineribus laudatissimum. ventrem sistit, cum modice sumitur, urinam ciet et ad tormina potu. decoctum in lactis defectu potum mammas replet. radix cum tisana sumpta renes purgat sive decoctae suco ex vino sumpto. prodest et hydropicis radix ex vino pota, item convulsis. inlinuntur folia tumoribus ardentibus ex aceto, calculos vesicae pellunt, venerem stimulant. geniturae abundantiam quoquo modo haustum facit, verendis amicissimum sive ad fovendum radice cum vino decocta sive contrita in oleo inlita. multi et suggillatis cum cera inlinunt et radicem. seminis suco vel radice cum melle contra canis morsum utuntur et contra multipedam ex vino.

hippomarathum ad omnia vehementius calculos praecipue pellit, prodest

vesicae cum vino leni et feminarum menstruis haerentibus. efficacius in eo semen quam radix. modus in utroque quod duobus digitis tritum addatur in potionem. petrichus, qui ophiaca scripsit, et micion, qui rhizotomumena, adversus serpentes nihil efficacius hippomaratho putavere; sane et nicander non in novissimis posuit.

cannabis in silvis primum nata est, nigrior foliis et asperior. semen eius extinguere genituram virorum dicitur. sucus ex eo vermiculos aurium et quodcumque animal intraverit eicit, sed cum dolore capitis, tantaque vis ei est, ut aquae infusus coagulare eam dicatur; et ideo iumentorum alvo succurrit potus in aqua. radix articulos contractos emollit in aqua cocta, item podagras et similes impetus. ambustis cruda inlinitur, sed saepius mutatur, priusquam arescat.

ferula semen aneto simile habet. quae ab uno caule dividitur in cacumine, femina putatur. caules eduntur decocti commendanturque muria ac melle, stomacho utiles. sin plures sumpti, capitis dolorem faciunt. radix denarii pondere in vini cyathis duobus bibitur adversus serpentes, et ipsa radix inponitur. sic et torminibus medetur, ex oleo autem et aceto contra sudores inmodicos vel in febribus proficit. sucus ferulae alvum solvit fabae magnitudine devoratus. e viridi medulla vulvis utilis et ad omnia ea vitia. ad sanguinem sistendum decem grana seminis bibuntur in vino trita vel medulla. sunt qui comitialibus dandum putent luna iiii usque vii lingulae mensura. natura ferularum murenis infestissima est, tactae siquidem ea moriuntur. castor radice sucum et oculorum claritati conferre multum putavit.

et de carduorum satu inter hortensia diximus, quapropter et medicinam ex his non differamus. silvestrium genera sunt duo, unum fruticosius a terra statim, alterum unicaule crassius. utrique folia pauca, spinosa, muricatis cacuminibus, sed alter florem purpureum emittit inter medios aculeos celeriter canescentem et abeuntem cum aura; σκόλυμον graeci vocant. hic, antequam floreat, contusus atque expressus inlito suco alopecias replet. radix cuiuscumque ex aqua decocta potioribus sitim facere narratur. stomachum corroborat et vulvis ... si credimus, etiam conferre aliquid traditur, ut mares gignantur. ita certe glaucias scripsit, qui circa carduos diligentissimus videtur. mastiche e carduis odorem commendat oris.

et discessuri ab hortensiis unam compositionem ex his clarissimam subteximus adversus venenata animalia incisam in lapide versibus coi in aede aesculapi: serpylli duum denariorum pondus, opopanax et mei tantundem singulorum, trifolii seminis pondus denarii, anisi et feniculi seminis et ammi et apii denarium senum e singulis generibus, ervi farinae denarium xii. haec tusa cribrataque vino quam possit excellenti digeruntur in pastillos victoriati ponderum. ex his singuli dantur ex vini mixti cyathis ternis. hac theriace magnus antiochus rex adversus omnia venenata usus traditur aspide excepta.

LIBER XXI

in hortis seri et coronamenta iussit cato, inenarrabili florum maxime subtilitate, quando nulli potest facilius esse loqui quam rerum naturae pingere, lascivienti praesertim et in magno gaudio fertilitatis tam varie ludenti. quippe reliqua usus alimentique gratia genuit, ideoque saecula annosque tribuit iis, flores vero odoresque in diem gignit, magna, ut palam est, admonitione hominum, quae spectatissime floreant, celerrime marcescere. sed ne pictura quidem sufficiet imagini colorum reddendae mixturarumque varietati, sive alterni atque multiplices inter se nectantur, sive privatis generum funiculis in orbem, in oblicum, in ambitum quaedam coronae per coronas currant.

tenuioribus utebantur antiqui, stroppos appellantes, unde nata strophiola. quin et vocabulum ipsum tarde communicatum est, inter sacra tantum et bellicos honores coronis suum nomen vindicantibus. cum vero e floribus fierent, sarta a serendo serieve appellabantur, quod apud graecos quoque non adeo antiquitus placuit.

arborum enim ramis coronari in sacris certaminibus erat primum. postea variari coeptum mixtura versicolori florum, quae invicem odores coloresque accenderet, sicyone ingenio pausiae pictoris atque glycerae coronariae dilectae admodum illi, cum opera eius pictura imitaretur, illa provocans variaret, essetque certamen artis ac naturae, quales etiam nunc extant artificis illius tabellae atque in primis appellata stephaneplocos, qua pinxit ipsam. idque factum est post olympiada c. sic coronis e floribus receptis paulo mox subiere, quae vocantur aegyptiae, ac deinde hibernae, cum terra flores negat, ramento e cornibus tincto. paulatimque et romae subrepsit appellatio corollis inter initia propter gracilitatem nominatis, mox et corollariis, postquam e lamina tenui aerea inaurata aut inargentata dabantur.

Crassus dives primus argento auroque folia imitatus ludis suis coronas dedit, accesseruntque et lemnisci, quos adici ipsarum coronarum honor erat, propter etruscas, quibus iungi nisi aurei non debebant. puri diu fuere hi; caelare eos primus instituit p. claudius pulcher bratteasque etiam philyrae dedit.

semper tamen auctoritas vel ludicro quaesitarum fuit. namque ad certamina in circum per ludos et ipsi descendebant et servos suos equosque mittebant. inde illa xii tabularum lex: “qui coronam parit ipse pecuniave eius, virtutis suae ergo ditor ei.” quam servi equive meruissent, pecunia partam lege dici nemo dubitavit. quis ergo honos ut ipsi mortuo parentibusque eius, dum intus positus esset forisve ferretur, sine fraude esset inposita. alias in usu promiscuo ne ludicrae quidem erant, ingensque et hinc severitas. l. fulvius argentarius bello punico secundo cum corona rosacea interdiu e pergula sua in forum prospexisse dictus ex auctoritate senatus in carcerem abductus non ante finem belli emissus est. p. munatius cum demptam marsuae coronam e floribus capiti suo inposuisset, atque ob id duci eum in vincula triumviri iussissent,

appellavit tribunos plebei, nec intercessere illi, aliter quam athenis, ubi comissabundi iuvenes ante meridiem conventus sapientium quoque doctrinae frequentabant. apud nos exemplum licentiae huius non est aliud quam filia Divi Augusti, cuius luxuria noctibus coronatum marsuam litterae illius dei gemunt.

florum quidem populus romanus honorem scipioni tantum habuit. serapio cognominabatur propter similitudinem suarii cuiusdam negotiatoris. obierat in tribunatu plebei admodum gratus dignusque africanorum familia, nec erat in bonis funeris inpena. asses ergo contulit populus ac funus elocavit, quaque praeferebatur, flores e prospectu omni sparsit.

et iam tunc coronae deorum honos erant et larum publicorum privatorumque ac sepulchrorum et manium, summaque auctoritas pactili coronae, ut in saliorum sacris invenimus sollemnes cenae. transiere deinde ad rosaria, eoque luxuria processit, ut non esset gratia nisi mero folio sutilibus, mox petitis ab india aut ultra indos. lautissimum quippe habetur e nardi folio eas dari aut veste serica versicolori, unguentis madida. hunc habet novissime exitum luxuria feminarum.

et apud graecos quidem de coronis privatim scripserunt mnesitheus atque callimachus medici, quae nocerent capiti, quoniam et in hoc est aliqua valitudinis portio, in potu atque hilaritate praecipue odorum vi subrepente fallaciter. scelerata cleopatrae sollertia. namque in apparatu belli actiaci gratificationem ipsius reginae antonio timente nec nisi praegustatos cibos sumente fertur pavore eius lusisse extremis coronae floribus veneno inlitis ipsaque capiti inposita; mox procedente hilaritate invitavit antonium, ut coronas biberent. quis ita timeret insidias ergo conceptam in scyphum incipienti haurire opposita manu: “en ego sum,” inquit illa, “marce antoni, quam tu nova praegustantium diligentia caves; adeo mihi, si possim sine te vivere, occasio aut ratio deest!” inductam custodiam bibere iussit ilico expirantem.

de floribus ... supra dictis scripsit theophrastus apud graecos; ex nostris autem inscribere aliqui libros anthologicon, flores vero persecutus est nemo, quod equidem inveniam. nec nos nunc scilicet coronas nectemus - id enim frivolum est - , sed de floribus quae videbuntur digna memorabimus.

paucissima nostri genera coronamentorum inter hortensia novere, ac paene violas rosasque tantum. rosa nascitur spina verius quam frutice, in rubo quoque proveniens, illic etiam iucundi odoris, quamvis angusti. germinat omnis primo inclusa granoso cortice, quo mox intumescente et in virides alabastros fastigato paulatim rubescens dehiscit ac sese pandit, in calice medio staminis complexa luteos apices. usus eius in coronis prope minimus est. oleo maceratur, idque iam a troianis temporibus homero teste. praeterea in unguenta transit, ut diximus. medicas per se artes praebet. emplastris atque collyriis inseritur mordaci subtilitate, mensarum etiam deliciis perungendis, minime noxia carie.

genera eius nostri fecere celeberrima praenestinam et campanam; addidere

alii milesiam, cuius ardentissimus colos, non excedentis duodena folia, proximam et trachiniam minus rubentem, mox alabandicam viliozem, albicantibus foliis, vilissimam vero plurimis, sed minutissimis, spiniolam. differunt enim multitudine foliorum, asperitate, levore, colore, odore. paucissima quina folia, ac deinde numerosiora, cum sit genus eius, quam centifoliam vocant, quae est in campania italiae, graeciae vero circa philippos, sed ibi non suae terrae proventu: pangaeus mons in vicino fert numerosis foliis ac parvis; accolae transferentes conserunt, ipsaque plantatione proficiunt. non autem talis odoratissima nec cui latissimum maximumve folium, breviterque indicium est odoris scabritia corticis. caepio tiberii caesaris principatu negavit centifoliam in coronas addi, praeterquam extremas velut ad cardines, nec odore nec specie probabilem. est et quae graeca appellatur a nostris, a graecis lychnis, non nisi in umidis locis proveniens nec umquam excedens quina folia violaeque magnitudine, odore nullo. est et alia graecula appellata, convolutis foliorum paniculis nec dehiscens nisi manu coacta semperque nascenti similis, latissimis foliis; alia funditur e caule malvaceo folia oleae habente - mucetum vocant - , atque inter has media magnitudine autumnalis, quam coroniolam appellant, omnes sine odore praeter coroniolam et in rubo natam. tot modis adulteratur.

et alias vera quoque plurimum solo praevalet. cyrenis odoratissima est, ideoque ibi unguentum pulcherrimum, carthagine hispaniae hieme tota praecox. refert et caeli temperies, quibusdam enim annis minus odorata provenit, praeterea omnis siccis quam umidis odoratior. seri neque pinguibus vult neque argillosis locis nec riguis, contenta roribus, propriaeque ruderationum agrum amat. praecox campana est, sera milesia, novissima tamen desinit praenestina. fodiuntur altius quam fruges, levius quam vites. tardissime proveniunt semine, quod in ipso cortice est, sub ipso flore, opertum lanugine. ob id potius caule conciso inseruntur. et ocellis radices, ut harundo, unum genus inseritur pallidae, spinosae, longissimis virgis, quinquefoliae, quae graecis altera est. omnis autem recisione atque ustione proficit; tralatione quoque, ut vites, optime ocissimeque provenit surculis quaternum digitorum longitudine aut ampliore post vergiliarum occasum sata, dein per favonium translata pedibus intervallis crebroque circumfossa. qui praecocem faciunt, pedali circa radicem scrobe aquam calidam infundunt germinare incipiente calice.

lilium rosae nobilitate proximum est et quadam cognatione unguenti oleique, quod lilinum appellatur. interpositum etiam maxime rosas decet, medio proventu earum incipiens. nec ulli florum excelsitas maior, interdum cubitorum trium, languido semper collo et non sufficiente capitis oneri. candor eius eximius foris striati et ab angustis in latitudinem paulatim sese laxantis effigie calathi, resupinis per ambitum labris tenuique pilo et staminis stantibus in medio crocis. ita odor colorque duplex, et alius calicis, alius staminis, differentia angusta. in unguenti vero oleique usu et folia non spernuntur. est flos non dissimilis illi in herba, quam convolvolum vocant, nascens per

fructecta, nullo odore nec crocis intus, candorem tantum referens ac veluti naturae rudimentum lilia facere condiscuntis. alba lilia iisdem omnibus modis seruntur, quibus rosa, et hoc amplius lacrima sua, ut hipposelinum, nihilque est fecundius una radice quinquagenos saepe emittente bulbos. est et rubens lilium, quod graeci crinon vocant, alii florem eius cynorrhodon. laudatissimum in antiochia ac laudicea syriae, mox in phaselide. quantum locum optinet in italia nascens.

sunt et purpurea lilia, aliquando gemino caule, carnosiore tantum radice maiorisque bulbi, sed unius; narcissum vocant. huius alterum genus flore candido, calice purpureo. differentia a liliis et haec, quod narcissis in radice folia sunt, probatissimis in lyciae montibus. tertio generi cetera eadem, calix herbaceus. omnes serotini, post arcturum enim florent ac per aequinoctium autumnum.

inventum est in his et ratio inserendi monstrificis hominum ingeniis. colligantur namque mense iulio scapi arescentis lili atque suspenduntur in fumo; dein nudantibus se nodulis in faece nigri vini vel graeci mense martio macerantur, ut colorem percipiant, atque ita in scrobiculis seruntur heminis faecis circumfusus. sic fiunt purpurea lilia, mirumque tingui aliquid, ut nascatur infectum.

violis honos proximus, earumque plura genera, purpureae, luteae, albae, plantis omnes, ut olus, satae. ex his vero, quae sponte apricis et macris locis proveniunt, purpureae latiore folio, statim ab radice exeunti, carnoso solaeque graeco nomine a ceteris discernuntur, appellatae ia et ab his ianthina vestis. e sativis maxima auctoritas luteis; genera autem tusculana et quae marina appellatur, folio aliquanto latiore, sed minus odorata; in totum vero sine odore minutoque folio calatina, munus autumnus, ceterae veris.

proxima ei caltha est et concolori ... amplitudine. vincit numero foliorum marinam quina non excedentem; eadem odore superatur. est enim gravi caltha, non leviori quam scopam regiam appellant, quamquam folia eius olent, non flores.

baccar quoque radice tantum odoratae est, a quibusdam nardum rusticum appellatum. unguenta ex ea radice fieri solita apud antiquos aristophanes, prae cae comoediae poeta, testis est; unde quidam errore falso barbaricam eam appellabant. odor est cinnamomo proximus. gracili solo nec umido provenit. simillimum ei combretum appellatur, foliorum exilitate usque in fila adtenuata et procerius quam baccar. haec sutilia tantum. eorum quoque error corrigendus est, qui baccar rusticum nardum appellaverunt. est enim alia herba sic cognominata, quam graeci asaron vocant, cuius speciem figuramque diximus in nardi generibus. quin immo asaron invenio vocitari, quoniam in coronas non addatur.

crocum silvestre optimum. serere in italia minime expedit, ad scripula usque singula areis decoquentibus. seritur radice bulbo. sativum latius maiusque et nitidius, sed multo lenius, degenerans ubique nec fecundum etiam cyrenis, ubi semper flores laudatissimi. prima nobilitas cilicio et ibi in coryco

monte, dein lycio e monte olympto, mox centuripino siciliae. aliqui theraeo secundum locum dedere. adulteratur nihil aequae. probatio sinceri, si inposita manu crepitet veluti fragile; umidum enim, quod evenit adulteratione, sentit. altera probatio, si manu relata ad ora leniter faciem oculosque mordeat. est per se genus sativi blandissimum volgo, cum sit mediocre, dialeucon vocant. contra cyrenaico vitium, quod omni croco nigrius est et celerrime marcescit. optimum ubicumque quod pinguissimum et brevis capilli, pessimum vero quod situm redolet. mucianus auctor est, in lycia anno septimo aut octavo transferri in locum subactum atque ita degenerans renovari. usus eius in coronis nusquam; herba enim est folio angusto paene in capillamenti modum. sed vino mire congruit, praecipue dulci, tritum ad theatra replenda. floret vergiliarum occasu paucis diebus folioque florem expellit. viret bruma et colligitur; siccatur umbra, melius etiam hiberna. carnosa et illi radix vivaciorque quam ceteris. gaudet calcari et atteri pereundoque melius provenit; ideo iuxta semitas ac fontes laetissimum. troianis temporibus iam erat honos ei; hos certe flores homerus tris laudat loton, crocum, hyacinthum.

omnium autem odoramentorum atque adeo herbarum differentia est in colore et odore et suco. odorato sapor raro ulli non amarus, e contrario dulcia raro odorata; itaque et vina mustis odoratiora et silvestria magis omnia sativis. quorundam odor suavior e longinquo, propius admotus hebetatur, ut violae. rosa recens a longinquo olet, sicca propius. omnis autem verno tempore acrior et matutinis; quidquid ad meridianas horas dies vergit, hebetatur. novella quoque vetustis minus odorata; acerrimus tamen odor omnium aetate media. rosa et crocum odoratiora, cum serenis diebus leguntur, et omnia in calidis quam in frigidis; in aegypto tamen minime odorati flores, quia nebulosus et roscidus aer est a multo flumine. quorundam suavitati gravitas inest. quaedam, dum virent, non olent propter umorem nimium, ut buceras, quod est fenum graecum. aquatis odor non omnino sine suco est, ut violae, rosae, croco; quae vero ex aquatis carent suco, eorum omnium odor gravis, ut in lilio utriusque generis. habrotonum et amaracum acres habent odores. quorundam flos tantum iucundus, reliquae partes ignavae, ut violae ac rosae. hortensium odoratissima quae sicca, ut ruta, menta, apium, et quae in siccis nascantur. quaedam vetustate odoratiora, ut cotonea, eademque decerpta quam in suis radicibus. quaedam non nisi defracta aut ex adtritu olent, alia non nisi detracto cortice, quaedam vero non nisi usta, sicut tura murræque. flores triti omnes amariores quam intacti. aliqua arida diutius odorem continent, ut melilotos. quaedam locum ipsum odoratiorem faciunt, ut iris, quin et arborem totam, cuiuscumque radices adtingat. hesperis noctu magis olet, inde nomine invento. animalium nullum odoratum, nisi si de pantheris quod dictum est credimus.

illa quoque non omittenda differentia est, et odoratorum multa nihil adtinere ad coronamenta, ut irim atque saliuncam, quamquam nobilissimi odoris utramque. sed iris radice tantum commendatur, unguentis nascens et medicinae. laudatissima in illyrico, et ibi quoque non in maritimis, sed in silvestribus drinonis et naronae, proxima in macedonia, longissima haec et

candicans et exilis. tertium locum habet africana, amplissima inter omnes gustuque amarissima. illyrica quoque duorum generum est: raphanitis a similitudine, quae et melior, rhizotomos. subrufa optima, quae sternumenta tractatu movet. caulem habet cubitalem, erectum; floret versicolori specie, sicut arcus caelestis, unde et nomen. non inprobatur et pisidica. effossuri tribus ante mensibus mulsa aqua circumfusa hoc veluti placamento terrae blandiuntur, circumscriptam mucrone gladii orbe triplici cum legerunt, protinus in caelum adtollunt. natura est fervens, tractataque pusulas ambusti modo facit. praecipitur ante omnia, ut casti legant. teredines non sicca modo, verum et in terra celerrime sentit. - optimum antea irinum leucade et elide ferebatur - iam pridem enim et seritur - , nunc e pamphylia, sed cilicium maxime laudatur atque e septentrionalibus. -

saliunca folio quidem subbrevis et quod necti non possit, radici numerosas cohaeret, herba verius quam flos, densa veluti manu pressa breviterque caespes sui generis. pannonia hanc gignit et norici alpiumque aprica, urbium eporedia, tantae suavitatis, ut metallum esse coeperit. vestibis interponi eam gratissimum, sicut apud graecos polium herbam, inclutam musaei et hesiodi laudibus ad omnia utilem praedicantium superque cetera ad famam etiam ac dignitates, prorsusque miram, si modo, ut tradunt, folia eius mane candida, meridie purpurea, sole occidente caerulea aspiciuntur. duo genera eius: campestre maius; silvestre, quod minus est, quidam teuthrion vocant. folia canis hominis similia, a radice protinus, numquam palmo altiora.

et de odoratis floribus satis dictum. in quibus unguento vicisse naturam gaudens luxuria vestibis quoque provocavit eos flores, qui colore commendantur. hos animadverto tris esse principales: rubentem in cocco, qui a rosae nigrantis gratia nitido trahitur suspectu et in purpuras tyrias dibaphasque ac laconicas; amethystinum, qui a viola et ipse in purpureum, quemque ianthinum appellavimus. genera enim tractamus in species multas sese spargentia. tertius est, qui proprie conchylii intellegitur, multis modis: unus in heliotropio et in aliquo exilis, plerumque saturator; alius in malva ad purpuram inclinans; alius in viola serotina conchyliorum vegetissimus. paria nunc componuntur, et natura atque luxuria depugnant. lutei video honorem antiquissimum, in nuptialibus flammeis totum feminis concessum, et fortassis ideo non numerari inter principales, hoc est communes maribus ac feminis, quoniam societas principatum dedit.

amaranto non dubie vincimur. est autem spica purpurea verius quam flos aliquis, et ipse sine odore. mirum in eo gaudere decerpi et laetius renasci. provenit augusto mense, durat in autumnum. alexandrino palma, qui decerptus adservatur; mireque, postquam defecere cuncti flores, madefactus aqua revivescit et hibernas coronas facit. summa natura eius in nomine est, appellati, quoniam non marcescat. in nomine et cyani colos, item holochrysi.

omnes autem hi flores non fuere in usu alexandri magni aetate, quoniam proximi a morte eius auctores siluere de illis; quo manifestum est postea placuisse. a graecis tamen repertos quis dubitet, non aliter italia usurpante

nomina illorum at, hercules, petellio ipsa nomen inposuit, autumnali circaque vepres nascenti. ei tantum color est commendatus, qui est rosae silvestris, folia parva, quina; mirumque in eo flore inflecti cacumen et e nodis intorta folia nasci parvulo calice ac versicolori luteum semen includentia. luteo et bellio, pastillicantibus quinquagenis quinis barbulis. coronant pratenses hi flore; at sine usu plerique et ideo sine nominibus, quin et his ipsis alia alii vocabula inponunt. chrysocome sive chrysitis non habet latinam appellationem. palmi altitudine est, comantibus fulgore auri corymbis, radice nigra, ex austero dulci, in petrosis opacisque nascens.

et fere peractis colorum quoque celeberrimis, transit ratio ad eas coronas, quae varietate sola placent. duo earum genera, quando aliae flore constant, aliae folio. florem esse dixerim genistas, namque et his decerpitur luteus; item rhododendron, item zizipha, quae cappadocia vocantur; his odoratus similisque olearum floribus. in vepribus nascitur cyclaminum, de quo plura alias. flos eius colossinus in coronas admittitur.

folio coronantium milaces et hederæ corymbique earum optinent principatum, de quibus in fruticum loco abunde diximus. sunt et alia genera nominibus graecis indicanda, quia nostris maiore ex parte huius nomenclaturæ defuit cura; et pleraque eorum in exteris terris nascuntur, nobis tamen consecranda, quoniam de natura sermo, non de italia est.

ergo in coronamenta folio venere melotrum, spiraea, organum, cneorum, quod casiam hyginus vocat, et, quod cunilaginem, conyza, melissophyllum, quod apiastrum, melilotum, quod sertulam campanam vocamus. est enim in campania italiae laudatissima, graecis in sunio, mox chalcidica et cretica, ubicumque vero asperis et silvestribus nata. coronas ex ea antiquitus factitatas indicio est nomen sertulae, quod occupavit. odor est croco vicinus et flos, ipsa cana; placet maxime foliis brevissimis atque pinguissimis.

folio coronat et trifolium. tria eius genera: minyanthes vocant graeci, alii asphaltion, maiore folio, quo utuntur coronarii; alterum acuto oxytriphylon; tertium ex omnibus minutissimum. inter haec nervosi cauliculi quibusdam, ut maratho, hippomaratho, myophono; utuntur et ferulis, corymbis hederæ et flore purpureo et in alio genere earum silvestribus rosis simili. sed in his quoque colos tantum delectat, odor autem abest. et cneori duo genera, nigri atque candidi; hoc et odoratum, ramosa ambo. florent post aequinoctium autumnum. totidem et origani in coronamentis species, alterius enim nullum semen; id, cui odor est, creticum vocatur.

totidem et thymi, candidum ac nigricans. floret autem circa solstitia; tum et apes decerpunt, ut augurium mellis sit; proventum enim sperant apiarii large florescente eo. laeditur imbris amittitque florem. semen thymi non potest deprehendi, cum origani, perquam minutum, non tamen fallat. sed quid interest occultasse id naturam in flore ipso intellegitur satoque eo nascitur. quid non temptavere homines mellis attici in toto orbe summa laus existimatur; ergo translatum est ex attica thymum et vix flore, uti docemur, satum. sed alia ratio naturae obstitit, non durante attico thymo nisi in adflatu

maris. erat quidem haec opinio antiqua in omni thymo, ideoque non nasci in arcadia, cum oleam non putarent gigni nisi intra ccc stadia a mari. thymo quidem nunc etiam lapideos campos in provincia narbonensi refertos scimus, hoc paene solo reditu, e longinquis regionibus pecudum milibus convenientibus, ut thymo vescantur.

et conyzae duo genera in coronamentis, mas ac femina. differentia in folio: tenuius feminae et constrictius angustiusque, imbricatum. mas et ramosior. flos quoque magis splendet eius, serotinus utrique post arcturum. mas odore gravior, femina acutior et ideo contra bestiarum morsus aptior. folia feminae mellis odorem habent, masculae radix a quibusdam libanotis appellatur, de qua diximus.

etiamnum folio coronant iovis flos, amaracum, hemerocalles, habrotonum, helenium, sisymbrium, serpullum, omnia surculosa rosae modo. colore tantum placet iovis flos, odor abest, sicut et illi, qui graece phlox vocatur. et ramis autem et folio odorata sunt excepto serpullo. helenium e lacrimis helenae dicitur natum, et ideo in helene insula laudatissimum; est autem frutex humi se spargens dodrantalibus ramulis, serpullo simili folio.

habrotonum odore iucunde gravi floret aestate; flos est aurei coloris. vacuum sponte provenit, cacumine suo se propagat. seritur autem semine melius quam radice aut surculo, semine quoque non sine negotio; plantaria transferuntur - sic et adonium - , utrumque aestate. alsiosa enim admodum sunt, ut sole tamen nimio laedantur. sed ubi convaluere, rutae vice fruticant. habrotono simile odore leucanthemum est, flore albo, foliosum.

amaracum diocles medicus et sicala gens appellavere, quod aegyptus et syria sampsucum. seritur utroque genere, et semine et ramo, vivacius supra dictis et odore mollius. copiosum amaraco aequae quam habrotono semen, sed habrotono radix una et alte descendens, ceteris in summa terra leviter haerens. reliquorum satio autumnio fere incipiente, nec non et vere quibusdam locis, umbraque gaudent et aqua ac fimo.

nyctegreton inter pauca miratus est democritus, coloris hyssini, folio spinae, nec a terra se adtollentem, praecipuam in gedrosia. narrat erui post aequinoctium vernum radicitus siccarique ad lunam xxx diebus, ita lucere noctibus; magos parthorumque reges hac herba uti ad vota suscipienda. eandem vocari chenamythen, quoniam anseres a primo conspectu eius expavescant, ab aliis nyctalopa, quoniam e longinquo noctibus fulgeat.

melilotos ubique nascitur, laudatissima tamen in attica; ubicumque vero recens, nec candicans et croco quam simillima, quamquam in italia odoratior candida.

florum prima ver nuntiat viola alba, tepidioribus vero locis etiam hieme emicat; post ea, quae ion appellatur et purpurea, proxime flammeum, quod phlox vocatur, silvestre dumtaxat. cyclaminum bis anno, vere et autumnio; aestates hiemesque fugit. seriores supra dictis aliquanto narcissus et lilium trans maria, in italia quidem, ut diximus, post rosam. verum in graecia tardius etiamnum anemone; est autem haec silvestrium bulborum flos, alia quam quae

dicetur in medicis. sequitur oenanthe ac melanium et ex silvestribus heliochrysos, deinde alterum genus anemones, quae limonia vocatur, post hanc gladiolus comitatus hyacintho. novissima rosa, eademque prima deficit excepta sativa; e ceteris hyacinthus maxime durat et viola alba et oenanthe, sed haec ita, si devolsa crebro prohibeatur in semen ire. nascitur locis tepidis; odor idem ei, qui germinantibus uvis, atque inde nomen. hyacinthum comitatur fabula duplex, luctum praeferentis eius, quem apollo dilexerat, aut ex aiacis cruore editi, ita discurrentibus venis, ut graecarum litterarum figura AI legatur inscriptum. heliochrysus florem habet auro similem, folium tenue, cauliculum quoque gracilem, sed durum. hoc coronare se magi, si et unguenta sumantur ex auro, quod apyron vocant, ad gratiam quoque vitae gloriamque pertinere arbitrantur.

et verni quidem flores hi sunt; succedunt illis aestivi, lychnis et iovis flos et alterum genus lilii, item tiphyon et amaracus, quem phrygium cognominant. sed maxime spectabilis pothos. duo genera huius: unum, cui flos hyacinthi est, alter candidus, qui fere nascitur tumulis, quoniam fortius durat. et iris aestate floret. abeunt et hi marcescuntque. alii rursus subeunt autumnis: tertium genus lilii et crocum et orsini utraque genera, unum hebes, alterum odoratum, primis omnia imbribus emicantia. coronarii quidem et spinae flore utuntur, quippe cum spinae albae cauliculi inter oblectamenta quoque gulae condiantur. hic est trans maria ordo florum. in italia violis succedit rosa, huic intervenit lilium, rosam cyanus excipit, cyanum amarantus. nam vicapervica semper viret, in modum liniae foliis geniculatim circumdata, topiaria herba, inopiam tamen florum aliquando supplet. haec a graecis chamaedaphne vocatur.

vita longissima violae albae trimatu. ab eo tempore degenerat. rosa et quinquennium perfert non recisa nec adusta. illo enim modo iuvenescit. diximus et terram referre plurimum. nam in aegypto sine odore haec omnia, tantumque myrtis odor praecipuus; alioqui etiam binis mensibus antecedit germinatio omnium. rosaria a favonio fossa oportet esse iterumque solstitio, et id agendum, ut intra id tempus purgata ac pura sint.

verum hortis coronamentisque maxime alvaria et apes conveniunt, res praecipui quaestus conpendiique, cum favet. harum ergo causa oportet serere thymum, apiastrum, rosam, violas, lilium, cytisum, fabam, erviliam, cunilam, papaver, conyzam, casiam, melilotum, melissophyllum, cerinthen. ea est autem folio candido, incurvo, cubitalis, capite concavo mellis sucum habente. horum floris avidissimae sunt atque etiam sinapis, quod miremur, cum olivae florem ab his non attingi constet; ideo hanc arborem procul esse melius sit, cum aliquas quam proxime seri conveniat, quae et evolantium examina invitent nec longius abire patiantur.

cornum quoque arborem caveri oporteat. flore eius degustato alvo cito moriuntur. remedium sorba contusa e melle praebere his vel urinam hominis vel boum aut grana punici mali ammineo vino conspersa. at genistas circumseri alvariis gratissimum.

mirum est dignumque memoratu de alimentis quod conperi. hostilia vicus

adluitur pado. huius inquilini pabulo circa deficiente inponunt navibus alvos noctibusque ad quina milia passuum contrario amne subvehunt. egressae luce apes pastaeque ad naves cotidie remeant mutantes locum, donec pondere ipso pressis navibus plenae alvi intellegantur revectisque eximantur mella. et in hispania mulis provehunt simili de causa. tantumque pabulum refert, ut mella quoque venenata fiant. heracliae in ponto quibusdam annis perniciosissima existunt ab iisdem apibus facta, nec dixere auctores, e quibus floribus ea fierent! nos trademus quae conperimus. herba est ab exitio et iumentorum quidem, sed praecipue caprarum appellata aegolethron. huius flore concipiunt noxium virus aquoso vere marcescentis. ita fit, ut non omnibus annis sentiatur malum. venenati signa sunt, quod omnino non densatur, quod color magis rutilus est, odor alienus, sternumenta protinus movens, quod ponderosius innoxio. qui edere, abiciunt se humi refrigerationem quaerentes, nam et sudore diffluunt. remedia sunt multa, quae suis locis dicemus; sed quoniam statim repraesentari aliqua in tantis insidiis oportet, mulsum vetus e melle optimo et ruta, salsamenta etiam, si reiciantur, sumpta crebro. certumque est id malum per excrementa ad canes etiam pervenire similiterque torqueri eos. mulsum tamen ex eo inveteratum innocuum esse constat, et feminarum cutem nullo melius emendari cum costo, suggillata cum aloe.

aliud genus in eodem ponti situ, gente sannorum, mellis, quod ab insania, quam gignit, maenomenon vocant. id existimatur contrahi flore rhododendri, quo scatent silvae. gensque ea, cum ceram in tributa romanis praestet, mel, quoniam exitiale est, non vendit. et in perside et in mauretaniae caesariensis gaetulia, contermina massaesyliis, venenati favi gignuntur, quidamque a parte, quo nihil esse fallacius potest, nisi quod livore deprehenduntur. quid sibi voluisse naturam his arbitremur insidiis, ut ab iisdem apibus nec omnibus annis fierent aut non totis favis parum enim erat genuisse rem, in qua venenum facillime daretur etiamne hoc ipsa in melle tot animalibus dedit quid sibi voluit, nisi ut cautiores minusque avidum faceret hominem non enim et ipsis apibus iam cuspides dederat et quidem venenatas, remedio adversus has utique non differendo ergo malvae suco aut foliorum hederæ perungui salutare est vel percussos eas bibere. mirum tamen est venena portantes ore fingentesque ipsas non mori, nisi quod illa domina rerum omnium hanc dedit repugnantiam apibus, sicut contra serpentes psyllis marsisque inter homines.

aliud in creta miraculum mellis: mons est carina [viii] passuum ambitu, intra quod spatium muscae non reperiuntur, natumque ibi mel nusquam attingunt. hoc experimento singulare medicamenti eligitur.

alvaria orientem aequinoctialem spectare convenit. aquilonem evitent, nec favonium minus. alvus optima e cortice, secunda ferula, tertia vimine; multi et e speculari lapide fecere, ut operantes intus spectarent. circumlini alvos fimo bubulo utilissimum, operculum a tergo esse ambulatorium, ut proferatur intus, si magna sit alvus aut sterilis operatio, ne desperatione curam abiciant; id paulatim reduci fallente operis incremento. alvos hieme stramento operiri, crebro suffiri, maxime fimo bubulo. cognatum hoc iis innascentes bestiolas

necat, araneos, papiliones, teredines, apesque ipsas excitat. et araneorum quidem exitium facilius est; papilio, pestis maior, lucernis tollitur vere, cum maturescat malva, noctu interlunio caelo sereno accensis ante alvos. in eam flammam sese ingerunt.

si cibus sentiatur deesse apibus, uvas passas siccasse ficos tusas ad fores earum posuisse conveniat, item lanas tractas madentes passo aut defruto aut aqua mulsa, gallinarum etiam crudas carnes. quibusdam et aestatibus iidem cibi praestandi, cum siccitas continua florum alimentum abstulit. alvorum, cum mel eximatur, inlini oportet exitus melissophyllo aut genista tritis, aut medias alba vite praecingi, ne apes diffugiant. vasa mellaria et favos lavari aqua praecipiunt, hac decocta fieri saluberrimum acetum.

cera fit expressis favis, sed ante purificatis aqua ac triduo in tenebris siccatis, quarto die liquatis igni in novo fictili, aqua favos tegente, tunc sporta colatis. rursus in eadem olla coquitur cera cum eadem aqua excipiturque alia frigida, vasis melle circumlitis. optima quae punica vocatur, proxima quam maxime fulva odorisque mellei, pura, natione autem pontica, quod constare equidem miror inter venenata mella, dein cretica, plurimum enim ex propoli habet, de qua diximus in natura apium. post has corsica, quoniam ex buxo fit, habere quandam vim medicaminis putatur. punica fit hoc modo: ventilatur sub diu saepius cera fulva, dein fervet in aqua marina ex alto petita addito nitro. inde lingulis hauriunt florem, id est candidissima quaeque, transfunduntque in vas, quod exiguum frigidae habeat, et rursus marina decocunt separatim, dein vas ipsum aut aquam refrigerant. et cum hoc ter fecere, iunceae crate sub diu siccant sole lunaeque. haec enim candorem facit, sol siccet, et, ne liquefaciat, protegunt tenui linteo. candidissima vero fit post insolationem etiamnum recocta. punica medicinis utilissima. nigrescit cera addito chartarum cinere, sicut anchusa admixta rubet, variosque in colores pigmentis trahitur ad reddendas similitudines et innumeros mortalium usus parietumque etiam et armorum tutelam. cetera de melle apibusque in natura earum dicta sunt.

et hortorum quidem omnis fere peracta ratio est; secuntur herbae sponte nascentes, quibus pleraeque gentium utuntur in cibis maximeque aegyptus, frugum quidem fertilissima, sed ut prope sola iis carere possit. tanta est ciborum ex herbis abundantia. in italia paucissimas novimus, fraga, tamnum, rusum, batim marinam, batim hortensiam, quas aliqui asparagum gallicum vocant, praeter has pastinacam pratensem, lupum salictarium, eaque verius oblectamenta quam cibos.

in aegypto nobilissima est colocasia, quam cyamon aliqui vocant. hanc e nilo metunt, caule, cum coctus est, araneoso in mandendo, thyrsos autem, qui inter folia emicat, spectabili, foliis latissimis, etiam si arboreis conparentur, ad similitudinem eorum, quae personata in nostris omnibus vocamus, adeoque nili sui dotibus gaudent, ut inplexis colocasiae foliis in variam speciem vasorum potare gratissimum habeant. seritur iam haec in italia.

in aegypto proxima auctoritas cichorio est, quod diximus intubum erraticum. nascitur post vergilias, floret particulatim. radix ei lenta, quare

etiam ad vincula utuntur illa. anthalium longius a flumine nascitur, mespili magnitudine et rotunditate, sine nucleo, sine cortice, folio cyperi. mandunt igni comparatum. mandunt et oetum, cui pauca folia minimaque, verum radix magna. arachidne quidem et aracos, cum habeant radices ramosas ac multiplices, nec folium nec herbam ullam aut quicquam aliud supra terram habent. reliqua volgarium in cibis apud eos herbarum nomina: chondrylla, hypochoeris, caucalis, enthriscum, scandix, come, quae ab aliis tragopogon vocatur, foliis croco simillimis, parthenium, trychnum, corchorus et ab aequinoctio nascentes aphace, achynops. epipetron vocant quae numquam floret. at e contrario aphace subinde marcescente flore emittit alium tota hieme totoque vere usque in aestatem.

multas praeterea ignobiles habent, sed maxime celebrant cnecon italiae ignotam, ipsis autem oleo, non cibo gratam. hoc faciunt e semine eius. differentia prima: silvestris et mitior. silvestrium duae species. una mitiori similis, caule tamen rigido; itaque et colu antiquae utebantur exili, quare quidam atractylida vocant. semen eius candidum et grande, amarum. altera hirsutior, torosiore caule et qui paene humi serpat, minuto semine. aculeatarum generis haec est, quoniam distinguenda sunt et genera.

ergo quaedam herbarum spinosae sunt, quaedam sine spinis. spinosarum multae species. in totum spina est asparagus, scorpio, nullum enim folium habent. quaedam spinosa foliata sunt, ut carduus, erynge, glycyrrhiza, urtica; his enim omnibus foliis inest aculeata mordacitas. aliqua et secundum spinam habent folium, ut tribulus et anonis. quaedam in folio non habent et in caule habent, ut pheos, quod aliqui stoebeo appellavere. hippophaes spinis geniculatum. tribulo proprietates, quod et fructum spinosum habet.

ex omnibus his generibus urtica maxime noscitur acetabulis in flore purpuream lanuginem fundentibus, saepe altior binis cubitis. plures eius differentiae: silvestris, quam et feminam vocant, mitiorque; et silvestri quae dicitur canina acrior, caule quoque mordaci, fimbriatis foliis; quae vero etiam odorem fundit herculanea vocatur. semen omnibus copiosum, nigrum. mirum sine ullis spinarum aculeis lanuginem ipsam esse noxiam et tactu tantum levi pruritum pusulasque confestim adusto similes existere. notum est et remedium olei. sed mordacitas non protinus cum ipsa herba gignitur, nec nisi solibus roborata. incipiens quidem ipsa nasci vere non ingrato, multis etiam religioso in cibo est ad pellendos totius anni morbos. silvestrium quoque radix omnem carnem teneriorem facit simul cocta. quae innoxia est, morsu carens, lamium vocatur. de scorpione dicemus inter medicas.

carduus et folia et caules spinosae lanuginis habet, item acorna, leucacanthos, chalceos, cnecos, polyacanthos, onopyxos, helxine, scolymos. chamaeleon in foliis non habet aculeos. est et illa differentia, quod quaedam in his multicaulia ramosaque sunt, ut carduus, uno autem caule nec ramosum cnecos. quaedam cacumine tantum spinosa sunt, ut erynge. quaedam aestate florent, ut tetralix et helxine. scolymos quoque sero floret et diu. acorna a cneco colore tantum rufo distinguitur et pinguiore suco. idem erat atractylis

quoque, nisi candidior esset et nisi sanguineum sucum funderet, qua de causa phonos vocatur a quibusdam, odore etiam gravis, sero maturescente semine nec ante autumnum, quamquam id de omnibus spinosis dici potest. verum omnia haec et semine et radice nasci possunt. scolymus carduorum generis ab his distat, quod radix eius vescendo est decocta. mirum, quod sine intervallo tota aestate aliud floret in eo genere, aliud concipit, aliud parturit. aculei arescente folio desinunt pungere. helxine rara visu est neque in omnibus terris, a radice foliosa, ex qua media veluti malum extuberat contextum sua fronde. huius vertex summus lacrimam continet iucundi saporis, acanthicen mastichen appellatam.

et cactus quoque in sicilia tantum nascitur, suae proprietatis et ipse. in terra serpunt caules a radice emissi, lato folio et spinoso. caules vocant cactus, nec fastidiunt in cibis inveteratos quoque. unum autem caulem rectum habet, quem vocant pternica, eiusdem suavitatis, sed vetustatis inpatientem. semen ei lanuginis, quam pappum vocant, quo detracto et cortice teneritas similis cerebro palmae est. vocant ascalian.

tribulus non nisi in palustribus nascitur. dura res alibi, iuxta nilum et strymonem amnes recipitur in cibos, inclinatus in vadum, folio lato atque effigie ulmi, pediculo longo. at in reliquo orbe genera ii, uni cicerculae folia, alteri aculeata. hic et serius floret magisque saepta obsidet villarum. semen ei rotundius, nigrum, in siliqua, alteri harenaceum. spinosorum etiamnum aliud genus anonis. in ramis enim spinas habet adposito folio rutae simili, toto caule foliato in modum coronae. sequitur arata, frugibus inimica vivaxque praecipue.

aculeatarum caules aliquarum per terram serpunt, ut eius, quam coronopum vocant. e diverso stat anchusa inficiendo ligno cerisque radice aptae, stant e mitioribus anthemis et phyllanthes et anemone et aphace. caule foliato est crepis et lotos.

differentia foliorum et hic quae in arboribus, brevitate pediculi ac longitudine, angustis ipsius folii, amplitudine, iam vero angulis, incisuris, odore, flore. diuturnior hic quibusdam per partes florentibus, ut ocimo, heliotropio, aphacae, onochili. multis inter haec aeterna folia, sicut quibusdam arborum, inprimisque heliotropio, adianto, polio.

aliud rursus spicatarum genus, ex quo est achynops, alopecuros, stelephuros, - quam quidam ortygem vocant, alii plantaginem, de qua plura dicemus inter medicas - , thryallis. ex his alopecuros spicam habet mollem et lanuginem densam, non dissimilem vulpium caudis, unde et nomen. proxima ei est et stelephuros, nisi quod illa particulatim floret. cichorion et similia circa terram folia habent; germinant ab radice post vergilias.

perdicium et aliae gentes quam aegyptii edunt. nomen dedit avis id maxime eruens. crassas plurimasque habet radices. item ornithogale caule tenero, candido, semipedali molli, tribus aut quattuor agnatis, radice bulbosa; coquitur in pulte.

mirum loton herbam et aegilopa non nisi post annum e semine suo nasci.

mira et anthemidis natura, quod a summo florere incipit, cum ceterae omnes, quae particulatim florent, ab ima sui parte incipiant.

notabile et in lappa, quae adhaerescit, quod in ipsa flos nascitur non evidens, sed intus occultus, et intra se germinat velut animalia, quae in se pariunt. circa opuntem est herba etiam homini dulcis, mirumque e folio eius radicem fieri ac sic eam nasci.

iasine unum folium habet, sed ita implicatum, ut plura videantur. chondrylla amara est et acris in radice suci. amara et aphace et quae picris nominatur, et ipsa toto anno florens; nomen ei amaritudo inposuit.

notabilis et scillae crocique natura, quod, cum omnes herbae folium primum emittant, mox in caulem rotudentur, in his caulis prior intellegitur quam folium. et in croco quidem flos inpellitur caule, in scilla vero caulis exit, deinde ex eo flos emergit, eademque ter floret, ut diximus, tria tempora arationum ostendens.

bulborum generi quidam adnumerant et cypiri, hoc est gladioli, radicem. dulcis ea est et quae decocta panem etiam gratiorem faciat ponderosiorumque simul subacta. non dissimilis est et quae thesium vocatur, gustu aspera.

ceterae eiusdem generis folio differunt: asphodelus oblongum et angustum habet, scilla latum et tractabile, gladiolus simile nomini. asphodelus manditur et semine tosto et bulbo, set hoc in cinere tosto, dein sale et oleo addito, praeterea tuso cum ficis, praecipua voluptate, ut videtur hesiodo. tradunt et ante portas villarum satum remedio esse contra veneficiorum noxiam. asphodeli mentionem et homerus fecit. radix eius napis modicis similis est, neque alia numerosior lxxx simul acervatis saepe bulbis. theophrastus et fere graeci princepsque pythagoras caulem eius cubitalem et saepe duum cubitorum, foliis porri silvestris, anthericum vocavere, radicem vero, id est bulbos, asphodelum. nostri illud albucum vocant et asphodelum hastulam regiam, caulis acinosi, ac duo genera faciunt. albucum scapus cubitalis, amplus, purus levisque, de quo mago praecipit exitu mensis marti et initio aprilis, cum floruerit, nondum semine eius intumescente, demetendum findendosque scapos et quarto die in solem proferendos, ita siccati manipulos faciendos. idem oiston adicit a graecis vocari, quam inter ulvas sagittam appellamus. hanc ab idibus maiis usque in finem octobris mensis decorticari atque leni sole siccari iubet; idem et gladiolum alterum, quem cypiron vocant, et ipsum palustrem, iulio mense toto secari iubet ad radicem tertioque die in sole siccari, donec candidus fiat, cotidie autem ante solem occidentem in tectum referri, quoniam palustribus desectis nocturni rores noceant.

similia praecipit et de iunco, quem mariscum appellant, ad texendas tegetes et ipsum iunio mense eximi ad iulium medium praecipiens, cetera de siccando eadem, quae de ulva suo loco diximus. alterum genus iuncorum facit, quod marinum et a graecis oxyschoenon vocari invenio. tria genera eius: acuti, sterilis, quem marem et oxyn graeci vocant; reliqua feminini, ferentis semen nigrum: quem melancranim appellant, crassior hic et fruticosior, magisque etiamnum tertius, qui vocatur holoschoenus. ex his melancranis sine aliis

generibus nascitur, oxys autem et holoschoenus eodem caespite. utilissimus ad vitilia holoschoenus, quia mollis et carnosus est; fert fructum ovorum cohaerentium modo. nascitur autem et is, quem marem appellavimus, ex semetipso, cacumine in terram defixo, melancranis autem suo semine. alioqui omnium radices omnibus annis intermoriuntur. usus ad nassas marinas, vitilium elegantiam, lucernarum lumina, praecipua medulla, amplitudine iuxta maritimas alpes tanta, ut inciso ventre inpleant paene unciarum latitudinem, in aegypto vero cubitorum longitudinem non aliis utiliore. quidam etiamnum unum genus faciunt iunci trianguli - cyperon vocant - , multi vero non discernunt a cypiro vicinitate nominis. nos distinguemus utrumque.

cypirus est gladiolus, ut diximus, radice bulbosa, laudatissimus in insulis creta, dein naxo et postea in phoenice. cretico candor odorque vicinus nardo, naxio acrior, phoenicio exiguum spirans, nullus aegyptio, nam et ibi nascitur. discutit duritias corporum; iam remedia enim dicemus, quoniam et florum odorumque generi est magnus usus in medicina. quod ad cypiron attinet, apollodorum quidem sequar, qui negat bibendum, quamquam professus efficacissimum esse adversus calculos. os eo fovet. feminis quidem abortus facere non dubitat; mirumque, tradit barbaros suffitum huius herbae excipientes ore lienes consumere et non egredi domibus nisi ab hoc suffitu, vegetiores enim firmioresque sic etiam in die fieri; intertriginum et alarum vitiiis perfrictionibusque cum oleo inlitum non dubie mederi.

cyperos iuncus est, qualiter diximus, angulosus, iuxta terram candidus, cacumine niger pinguisque. folia ima porraceis exiliora, in cacumine minuta, inter quae semen est. radix olivae nigrae similis, quam, cum oblonga est, cyperida vocant, magni in medicina usus. laus cypero prima hammoniaco, secunda rhodio, tertia theraeo, novissima aegyptio. qui et confudit intellectum, quoniam et cypiros ibi nascitur. sed cypiros radice durissima vixque spirans, cyperis odor et ipsis nardum imitans. est et per se indica herba, quae cypira vocatur, zingiberis effigie; commanducata croci vim reddit. cypero vis in medicina psilotri. inlinitur pterygiis ulceribusque genitalium et quae in umore sunt omnibus, sicut oris ulceribus. radix adversus serpentium ictus et scorpionum praesentis remedii est. vulvas aperit pota; largiori tanta vis, ut et expellat eas. urinam ciet et calculos, ob id utilissima hydropicis. inlinitur et ulceribus, quae serpunt, sed his praecipua, quae in stomacho sunt, e vino vel aceto inlita.

iunci radix in tribus heminis aquae decocta ad tertias tussi medetur. semen tostum et in aqua potum sistit alvum et feminarum menses. capitis dolores facit. qui vocatur holoschoenus ... quae proxima sunt radici, commanducantur adversus araneorum morsus. invenio etiamnum unum iunci genus quod euripicen vocant; huius semine somnum allici, set modum servandum, ne sopor fiat.

obiter et odorati iunci medicinae dicuntur, quoniam et in ... syria coele, ut suo loco rettulimus, nascitur. laudatissimus ex nabataea cognomine teuchitis, proximus babylonius, pessimus ex africa ac sine odore. est autem rotundus,

vinosae mordacitatis ad linguam; sincerus in confricando odorem rosae emittit rubentibus fragmentis. discutit inflationes, ob id stomacho utilis bilemque reicientibus. singultus sedat, ructus movet, urinam ciet, vesicae medetur. ad muliebres usus decoquitur. opisthotonicis cum resina arida inponitur excalfactoria vi.

rosa adstringit, refrigerat. usus eius dividitur in folia et flores, capita. foliorum partes, quae sunt candidae, ungues vocantur. in flore aliud est semen, aliud capillus, in capite aliud cortex, aliud calix. folium siccatur aut tribus modis exprimitur: per se, cum ungues non detrahuntur - ibi enim umoris plurimum - , aut cum detractis unguibus reliqua pars aut oleo aut vino maceratur in sole vasis vitreis. quidam et salem admiscent, nonnulli et anchusam aut aspalathum aut iuncum odoratum, quia talis maxime prodest vulvae ac dysintericis. exprimuntur eadem folia detractis unguibus trita per linteum spissum in aereum vas, lenique igni sucus coquitur, donec fiat crassitudo mellis. ad haec eligi oportet odoratissima quaeque folia. vinum quomodo fieret e rosa, diximus inter genera vini. usus suci ad aures, oris ulcera, gingivas, tonsillas gargarizati, stomachum, vulvas, sedis vitia, capitis dolores - in febris per se vel cum aceto - , somnos, nausias. folia uruntur in calliblepharum, et siccis femina adsparguntur. epiphoras quoque arida leniunt. flos somnum facit, inhibet fluctiones mulierum, maxime albas, in posca potus et sanguinis excreationes, stomachi quoque dolores, quantum ... in vini cyathis tribus. seminis optimum crocinum nec anniculo vetustius et in umbra siccatum; nigrum inutile. dentium dolori inlinitur, urinam ciet, stomacho inponitur, item igni sacro non veteri. naribus subductum caput purgat. capita pota ventrem et sanguinem sistunt. ungues rosae epiphoris salubres sunt; ulcera enim oculorum rosa sordescunt, praeterquam initiis epiphorae ita, ut arida cum pane inponatur. folia quidem intus stomachi rosionibus et intus ventris aut intestinorum utilissima et praecordiis, vel inlita. cibo quoque lapathi modo condiuntur. cavendus in his situs celeriter insidens. et aridis aut expressis aliquis usus. diapasmata inde fiunt ad sudores coercendos ita, ut a balineis inarescant corpori, dein frigida abluantur. silvestris pilulae cum adipe ursino alopecias emendant.

lilii radices multis modis florem suum nobilitant, contra serpentium ictus ex vino potae et contra fungorum venena. propter clavos pedum in vino decoquuntur triduoque non solvuntur. cum adipe aut oleo decoctae pilos quoque adustis reddunt. e mulso potae inutilem sanguinem cum alvo trahunt, lienique et ruptis, vulsis prosunt et mensibus feminarum, in vino vero decoctae inpositaeque cum melle nervis praecisis. medentur contra lichenas et lepras, et furfures in facie emendant, erugant corpora, cutem. folia in aceto cocta vulneribus inponuntur, si testium, melius cum hyoscyamo et farina tritici. semen inlinitur igni sacro, flos et folia ulcerum vetustati, sucus qui flore expressus est - ab aliis mel vocatur, ab aliis syrium - ad emolliendas vulvas sudoresque faciendos et suppurationes concoquendas.

narcissi duo genera in usum medici recipiunt, purpureo flore et alterum

herbaceum, hunc stomacho inutilem et ideo vomitorium alvosque solventem, nervis inimicum, caput gravantem et a narce narcissum dictum, non a fabuloso puero. utriusque radix mulsei saporis est. ambustis prodest exiguo e melle, sic et vulneribus et luxatis; panis vero cum melle et aerina farina, sic et infixi corpori extrahit. in polenta tritus oleoque contusis medetur et lapide percussis. purgat vulnera permixtus farinae, nigras vitiliginis emaculat. ex hoc flore fit narcissinum oleum ad emolliendas duritias, calfacienda quae alserint, auribus utilissimum, sed et capitis dolores facit.

violae silvestres et sativae. purpureae refrigerant. contra inflammationes inlinuntur stomacho, ardenti inponuntur et capiti in fronte, oculorum privatim epiphoris et sede procidente volvave et contra suppurationes. crapulam et gravedines capitis inpositis coronis olfactuque discutunt, anginas ex aqua potae. id, quod purpureum est ex his, comitialibus medetur, maxime pueris, in aqua potum. semen violae scorpionibus adversatur. contra flos albae suppurata aperit, ipsa discutit. et alba autem et lutea extenuat menses, urinam ciet. minor vis est recentibus, ideoque aridis post annum utendum. lutea dimidio cyatho in aquae tribus menses trahit. radices eius cum aceto inlitae sedant lienem, item podagram, oculorum autem inflammationes cum murra et croco. folia cum melle purgant capitis ulcera, cum cerato rimas sedis et quae in umidis sunt, ex aceto vero collectiones sanant.

baccar in medicinae usu aliqui ex nostris perpressam vocant. auxiliatur contra serpentes, capitis dolores fervoresque, item epiphoras. inponitur mammis tumentibus a partu et aegilopiis incipientibus ignibusque sacris. odor somnum gignit. radicem decoctam bibere spasticis, eversis, convulsis, suspiriosis salutare est et in tussi vetere. rami eius tres quattuorve decocuntur ad tertias partes; haec potio mulieres ex abortu purgat. laterum punctiones tollit et vesicae calculos. tunditur et utiliter in diaspasmata. vestibus odoris gratia inseritur. combretum, quod simile ei diximus, tritum cum axungia vulnera mire sanat.

asarum iocinerum vitiis salutare esse traditur uncia sumpta in hemina mulsi mixti. alvum purgat ellebori modo, hydropicis prodest et praecordiiis vulvisque ac morbo regio. in mustum si addatur, facit vinum urinis ciendis. effoditur cum folia mittit, siccatur et conditur. in umbra situm celerrime sentit.

et quoniam quidam, ut diximus, nardum rusticum nominavere radicem baccaris, contexemus et gallici nardi remedia, in hunc locum dilata in peregrinis arboribus. ergo adversus serpentes duabus drachmis in vino succurrit, inflationibus coli vel ex aqua vel ex vino, item iocineris et renium suffusisque felle et hydropicis, per se vel cum absinthio. sistit purgationum mulierum impetus.

eius vero, quod phun eodem loco appellavimus, radix datur potui trita vel decocta ad strangulatus vel pectoris dolores vel laterum quoque. menses ciet. bibitur cum vino.

crocum melle non solvitur nulloque dulci, facillime autem vino aut aqua. utilissimum in medicina, adservatur cornea pyxide. discutit inflammationes

omnes quidem, sed oculorum maxime ex ovo; item vulvarum quoque strangulatus, stomachi exulcerationes, pectoris et renium, iocinerum, pulmonum vesicarumque, peculiariter inflammationi earum vehementer utile, item tussi et pleuriticis. tollit et pruritus, urinas ciet. qui crocum prius biberint, crapulam non sentient, ebrietati resistant. coronae quoque ex eo mulcent ebrietatem. somnum facit, caput leniter movet, venerem stimulat. flos eius igni sacro inlinitur cum creta cimolia. ipsum plurimis medicaminibus miscetur, collyrio uni etiam nomen dedit. faex quoque expressi unguento crocino, quod crocomagma appellant, habet suas utilitates contra suffusiones oculorum, urinas. magis exalfacit quam crocum ipsum. optimum quod gustatu salivam dentesque maxime inficit.

iris rufa melior quam candida. infantibus eam circumligari salutare est, dentientibus praecipue et tussientibus taeniarumve vitio laborantibus instillari. ceteri effectus eius non multum a melle differunt. ulcera purgat capitis, praecipue suppurationes veteres. alvum solvit duabus drachmis cum melle, tussim, tormina, inflationes pota, lienes ex aceto. contra serpentium et araneorum morsus ex posca valet; contra scorpiones duarum drachmarum pondere in pane vel aqua sumitur; contra canum morsus ex oleo inponitur et contra perfrictiones. sic et nervorum doloribus, lumbis vero et coxendicibus cum resina inlinitur. vis ei concalfactoria. naribus subducta sternumenta movet caputque purgat. dolori capitis cum cotoneis malis aut strutheis inlinitur. crapulas quoque et orthopnoeas discutit. vomitiones ciet duobus obolis sumpta. ossa fracta extrahit inposita cum melle. ad paronychia farina eius utuntur, in vino ad clavos et verrucas, triduoque non solvitur. halitus oris commanducata abolet alarumque vitia. suco duritias omnes emollit, somnum conciliat, sed genituram consumit. sedis rimas et condylomata omniaque in corpore excrescentia sanat. sunt qui silvestrem xyrim vocent. strumas haec vel panos vel inguina discutit. praecipitur, ut sinistra manu ad hos usus eruatur colligentesque dicant, cuius hominis vitique causa eximant. scelus herbariorum aperietur et in hac mentione: partem eius servant et quarundam aliarum herbarum, sicuti plantaginis, et si parum mercedis tulisse se arbitrantur rursusque opus quaerunt, partem eam, quam servavere, eodem loco infodiunt, credo, ut vitia, quae sanaverint, faciant rebellare. saliunca radix in vino decocta sistit vomitiones, conroborat stomachum.

polio musaeus et hesiodus perungui iubent dignationis gloriaeque avidos, polium tractari ... coli, polium contra venena haberi, contra serpentes substerni, uri, in vino decoqui recens vel aridum inlinique vel potari. medici splenicis propinant ex aceto, morbo regio in vino, et hydropicis incipientibus in vino decoctum; vulneribus quoque sic inlinunt. secundas mulierum partusque emortuos pellit, item dolores corporis. vesicas inanit, epiphoris inlinitur. nec magis alia herba convenit medicamento, quod alexipharmacum vocant. stomacho tamen inutile esse caputque eo impleri et abortum fieri puto. aliqui negant et religionem addunt, ubi inventum sit, protinus adalligandum contra oculorum suffusiones cavendumque, ne terram attingat. hi et folia eius

thymo similia tradunt, nisi quod molliora sunt et lanatiore canitie. cum ruta silvestri et si teratur ex aqua caelesti, aspidas mitigare dicitur, et non secus atque cytinus adstringit et cohibet vulnera prohibetque serpere.

holochrysos medetur stranguriae in vino, et oculorum epiphoris inlito, cum faece vero vini cremata et polenta lichenas emendat. chrysocomes radix calfacit et adstringit. datur potui ad iocinerum vitia, item pulmonum, vulvae dolores in aqua mulsa decocta. ciet menstrua et, si cruda detur, hydropicorum aquam.

melissophyllo sive melittaena si perunguntur alvi, non fugient apes; nullo enim magis flore gaudent. scopis eius examina facillime continentur. idem praesentissimum est contra ictus earum vesparumque et similium, sicut araneorum, item scorpionum, item contra volvarum strangulationes addito nitro, contra tormina e vino. folia eius strumis inlinuntur et sedis vitiis cum sale. decoctae succus feminas purgat et inflammationes discutit et ulcera sanat. articularios morbos sedat canisque morsus. prodest dysintericis veteribus et coeliacis, orthopnoicis, lienibus, ulceribus thoracis. caligines oculorum succo cum melle inungui eximium habetur.

melilotos quoque oculis medetur cum luteo ovi aut lini semine. maxillarum quoque dolores lenit et capitis cum rosaceo, item aurium e passo quaeque in manibus intumescant vel erumpant, stomachi dolores in vino decocta vel cruda tritaque. idem effectus et ad vulvas, ad testes vero et sedem prociduum quaeque et alia ibi sint vitia ... recentem ex aqua decoctam vel ex passo. adiecto rosaceo inlinuntur ad carcinomata. defervescit in vino dulci. peculiariter et contra meliceridas efficax.

trifolium scio credi praevalere contra serpentium et scorpionum ictus ex vino aut posca, seminis granis xx potis vel foliis et tota herba decocta, serpentesque numquam in trifolio aspici; praeterea a celebratis auctoribus contra omnia venena pro antidoto sufficere xxv grana eius, quod minyanthes ex eo appellavimus, tradi, multa alia praeterea in remediis eius adscribi. sed me contra sententias eorum gravissimi viri auctoritas movet, sophocles enim poeta venenatum id dicit, simos quoque ex medicis, decocti aut contriti succum infusum corpori easdem uredines facere, quas si percussis a serpente inponatur. ergo non aliter utendum eo quam contra venena censuerim. fortassis enim et his venenis inter se contraria sit natura, sicut multis aliis. item animadverto semen eius, cuius minima sint folia, utile esse ad custodiendam mulierum cutis gratiam in facie inlitum.

thymum colligi oportet in flore et in umbra siccari. duo autem sunt genera eius: candidum, radice lignosa, in collibus nascens, quod et praefertur; alterum nigrius florisque nigri. utraque oculorum claritati multum conferre existimantur et in cibo et in medicamentis; item diutinae tussi ecligmate faciles excreationes facere cum aceto et sale, sanguinem concrecere non pati e melle, longas faucium destillationes extra inlita cum sinapi extenuare, item stomachi et ventris vitia. modicis tamen utendum est, quoniam excalfaciunt; qua vi sistunt alvum, quae si exulcerata sit, denarii pondus in sextarium aceti

et mellis addi oporteat, item si lateris dolor sit, aut inter scapulas aut in thorace. praecordiis medentur ex aceto cum melle, quae potio datur et in alienatione mentis ac melancholicis. datur et comitialibus, quos correptos olfactu excitat thymum. aiunt et dormire eos oportere in molli thymo. prodest et orthopnoicis et anhelatoribus mulierumque mensibus retardatis vel si emortui sint in utero partus, decoctum in aqua ad tertias, et viris vero contra inflationes cum melle et aceto et si venter turgueat testesve aut si vesicae dolor exigat. e vino tumores et impetus inpositum tollit, item cum aceto callum et verrucas. coxendicibus inponitur cum vino, articulariis morbis et luxatis tritum ac lanae inspersum ex oleo, ambustis cum adipe suillo. dant et potioni in articulariis morbis trium obolorum pondere in tribus cyathis aceti et mellis, in fastidio tritum cum sale.

hemerocalles pallidum e viridi et molle folium habet, grandi radice odorataque, bulbosa. cum melle inposita ventri aquas pellit et sanguinem etiam inutilem. folia epiphoris oculorum mammarumque post partum inlinuntur.

helenium ab helena, ut diximus, natum favere creditur formae, cutem mulierum in facie reliquoque corpore nutrire incorruptam. praeterea putant usu eius quandam vitae gratiam his veneremque conciliari. adtribuunt et hilaritatis effectum eidem potae in vino eumque, quem habuerit nepenthes illud praedicatum ab homero, quod tristitia omnis aboleretur. est autem suci praedulcis. prodest et orthopnoicis radix eius in aqua ieiunis pota. est autem candida intus et dulcis. bibitur et contra serpentium ictus ex vino. mures quoque contrita dicitur necare.

habrotonum duorum traditur generum, campestre ac montanum. hoc feminam, illud marem intellegi volunt. amaritudo absinthii in utroque. siculum laudatissimum, dein galaticum. usus et foliis, sed maior semini ad excalfaciendum, ideo nervis utile, tussi, orthopnoeae, ruptis, convulsis, lumbis, urinae angustiis. datur bibendum manualibus fasciculis decoctis ad tertias partes; ex his quaternis cyathis bibitur. datur et semen tusum in aqua drachmae pondere. prodest et vulvae. concoquit panos cum farina hordeacia et oculorum inflammationi inlinitur cotoneo malo cocto. serpentes fugat; contra ictus earum bibitur cum vino inliniturque, efficacissimum contra ea, quorum veneno tremores et frigus accidunt, ut scorpionum et phalangiorum; et contra venena alia pota prodest et quoquo modo argentibus. vis ei et extrahendi ea, quae inhaereant corporibus. pellit et interaneorum mala. ramo eius, si subiciatur pulvino, venerem stimulari aiunt, efficacissimamque esse herbam contra omnia veneficia, quibus coitus inhibeatur.

leucanthemum suspiriosis medetur duabus partibus aceti permixtum. sampsuchum sive amaracum in cypro laudatissimum et odoratissimum scorpionibus adversatur ex aceto ac sale inlitum. menstruis quoque multum confert inpositum. minor eidem poto vis. cohibet et oculorum epiphoras cum polenta. sucus decocti tormina discutit. et urinis et hydropicis utile. movet aridum sternumenta. fit ex eo et oleum, quod sampsuchinum vocatur aut

amaracinum, ad excalfaciendos molliendosque nervos; et vulvas calfacit. folia suggillatis cum melle et luxatis cum cera prosunt.

anemonas coronarias tantum diximus, nunc reddemus et medicas. sunt qui phrenion vocent. duo eius genera: prima silvestris, altera cultis nascens, utraque sabulosis. huius plures species: aut enim phoenicium florem habet, quae et copiosissima est, aut purpureum aut lacteum. harum trium folia apio similia sunt nec temere semipedem altitudine excedunt, cacumine asparagi. flos numquam se aperit nisi vento spirante, unde et nomen accepere. silvestri amplitudo maior, latioribus durioribusque foliis, flore phoenicio. hanc errore ducti argemonen putant multi, alii rursus papaver, quod rhoean vocavimus. sed distinctio magna, quod utraque haec postea florent, nec aut sucum illarum anemonae reddunt aut calyces habent nec nisi asparagi cacumen. prosunt anemonae capitis doloribus et inflammationibus, vulvis mulierum. lacte quoque et menstrua cient cum tisana sumptae aut vellere adpositae. radix commanducata pituitam trahit, dentes sanat, decocta oculorum epiphoras et cicatrices. magi occultum quiddam iis tribuere, quae primum aspiciatur eo anno tolli iubentes dicique colligi eam tertianis et quartanis remedio, postea adligari florem panno russeo et in umbra adservari, ita, cum opus sit, adalligari. quae ex his phoenicium florem habet, radice contrita cuicumque animalium inposita ulcus facit styptica vi; et ideo expurgandis ulceribus adhibetur.

oenanthe herba nascitur in petris, folio pastinacae, radice magna, numerosa. caulis eius et folia cum melle ac vino nigro pota facilitatem pariendi praestant secundasque purgant, tussim e melle tollunt, urinam cient. radix et vesicae vitiis medetur.

heliochrysum alii chrysanthemon vocant, ramulos habet candidos, folia subalbida, habrotono similia, ad solis repercussum aureae lucis in orbem veluti corymbis dependentibus, qui numquam marcescunt; qua de causa deos coronant illo, quod diligentissime servavit ptolemaeus aegypti rex. nascitur in frutectis. ciet urinas e vino pota et menses. duritias et inflammationes discutit, ambustis cum melle inponitur. contra serpentium ictus et lumborum vitia bibitur. sanguinem concretum ventris aut vesicae absumit cum mulso. folia eius trita trium obolorum pondere sistunt profluvia mulierum in vino albo. vestes tuetur odore non inegalanti.

hyacinthus in gallia maxime provenit. hoc ibi fuco hysginum tingunt. radix est bulbacea, mangonicis venaliciis pulchre nota, quae e vino dulci inlita pubertatem coercet et non patitur erumpere. torminibus et araneorum morsibus resistit. urinam impellit. contra serpentes et scorpiones morbumque regium semen eius cum habrotono datur.

lychnis quoque flammea illa adversus serpentes et scorpiones et crabrones similique bibitur e vino semine trito. silvestris eadem stomacho inutilis. alvum solvit, ad detrahendam bilem efficacissima duabus drachmis, scorpionibus tam contraria, ut omnino visa ea torpescant. radicem eius asiani boliten vocant, qua adalligata oculo albugines tolli dicuntur.

et vicapervica sive chamaedaphne arida tusa hydropicis datur in aqua coclearii mensura, celerrimeque reddunt aquam. eadem decocta in cinere sparsa vino tumores siccant. auribus suco medetur. alvi vitiis inposita plurimum prodesse dicitur.

rusci radix decocta bibitur alternis diebus in calculorum validitudine et tortuosiore urina vel cruenta. radicem pridie erui oportet, postero mane decoqui, ex eo sextario vini cyathis duobus misceri. sunt qui et crudam radicem tritam ex aqua bibant, et in totum ad virilia cauliculis eius ex aceto tritis nihil utilius putant.

batis quoque alvum mollit. inlinitur podagricis cruda et contunsa. acinon et coronarum causa et ciborum aegyptii serunt, eademque erat quae ocimum, nisi hirsutior ramis ac foliis esset et admodum odorata. ciet et menses et urinas.

colocasia glaucias acria corporis leniri putavit et stomachum iuvare.

anthalii, quod aegyptii edunt, nullum alium reperi usum. sed est herba anthyllum, quam alii anthyllum vocant, duorum generum: foliis et ramis lenticulae similis, palmi altitudine, sabulosis, apricis nascens, subsalsa gustanti; altera chamaepityi similis, brevior et hirsutior, purpurei floris, odore gravis, in saxosis nascens. prior vulvis aptissima, ex rosaceo ac lacte inposita, et vulneribus. bibitur in stranguria reniumque harenis tribus drachmis. altera bibitur in duritia vulvarum et in torminibus et in comitiali morbo cum melle et aceto quattuor drachmis.

parthenium alii leucanthes, alii amaracum vocant, celsus apud nos perdicium et muralem. nascitur in hortorum saepibus, flore albo, odore mali, sapore amaro. ad insidendum decoctae in duritia vulvarum et inflammationibus ... , sicca cum melle et aceto inposita detrahit bilem atram; ob hoc contra vertigines utilis et calculosis. inlinitur et sacro igni, item strumis cum axungia inveterata. magi contra tertianas sinistra manu evelli eam iubent dicique, cuius causa vellatur, nec respicere, dein eius folium aegri linguae subicere, ut mox in cyatho aquae devoretur.

trychno, quam quidam strychnon scripsere, utinam nec coronarii in aegypto uterentur, quos invitat hederæ foliorum similitudo in duobus eius generibus, quorum alterum, cui acini coccini, granosi in folliculis, halicacabon vocant, alii callion, nostri autem vesicariam, quoniam vesicae et calculis prosit. frutex est surculosus verius quam herba, folliculis magnis latisque et turbinatis grandi intus acino, qui maturescit novembri mense. tertio folia sunt ocimi, minime diligenter demonstrando remedia, non venena, tractantibus, quippe insaniam facit parvo quoque suco. quamquam et graeci auctores in iocum vertere. drachmae enim pondere lusum furoris gigni dixerunt, species vanas imaginesque conspicuas obversari demonstrantes; duplicatum hunc modum legitimam insaniam facere; quidquid vero adiciatur ponderi, repraesentari mortem. hoc est venenum, quod innocentissimi auctores simpliciter dorycnion appellavere ab eo, quod cuspides in proeliis tingerentur illo passim nascente. qui parcius insectabantur, manicon nominavere; qui nequiter occultabant, erythron aut neurada aut, ut nonnulli, perisson, ne cavendi quidem causa

curiosius dicendum. quin et alterum genus, quod halicacabon vocant, saporiferum est atque etiam opio velocius ad mortem, ab aliis morion, ab aliis moly appellatum, laudatum vero a diocle et euenore, a timaristo quidem etiam carmine. mira oblivione innocentiae - quippe praesentaneum remedium ad dentium mobiles firmandos, si colluerentur halicacabo in vino - exceptionem addidere, ne diutius id fieret; delirationem enim gigni. non demonstranda remedia, quorum medicina maioris mali periculum adferat: commendetur ergo in cibis tertium genus licet ac praeferatur hortensiis saporibus et nil sit corporis malorum, cui non salutare trychnos xenocrates praedicet; non tamen auxilia earum tanti sunt, ut ideo plura nos de iis commemorare fas putem, praesertim tanta copia innoxiorum medicaminum. halicacabi radicem bibunt qui vaticinari gallantesque vere ad confirmandas superstitiones aspici se volunt. remedio est - id enim libentius rettulerim - aqua copiosa mulsa calida potu. nec illud praeteribo, aspidum naturae halicacabum in tantum adversam, ut radice eius propius admota soporetur illa sopore enecans vis earum. ergo trita ex oleo percussis auxiliatur.

corchorum alexandrini cibi herba est convolutis foliis ad similitudinem mori, praecordiis, ut ferunt, utilis alopeciisque et lentigini. boum quoque scabiei celerrime sanari ea invenio apud nicandrum quidem et serpentium morsus, antequam floreat.

nec de cneco sive atractylide verbosius dici par esset, aegyptia herba, ni magnum contra venenata animalia praeberet auxilium, item adversus fungos. constat a scorpione percussos, quamdiu teneant eam herbam, non sentire cruciatum.

et pesolutam aegyptus in hortis serit, coronarum gratia. duo genera eius: femina ac mas; utraque subdita venerem inhiberi, virorum maxime, tradunt.

et quoniam in mensuris quoque ac ponderibus crebro graecis nominibus utendum est, interpretationem eorum semel hoc in loco ponemus: drachma attica - fere enim attica observatione medici utuntur - denarii argentei habet pondus, eademque vi obolos pondere efficit, obolus x chalcos. cyathus pendet per se drachmas x; cum acetabuli mensura dicitur, significat heminae quartam, id est drachmas xv. mna, quam nostri minam vocant, pendet drachmas atticas c.

LIBER XXII

implet posse miraculum sui natura atque tellus reputantium vel prioris tantum voluminis dotes totque genera herbarum utilitatibus hominum aut voluptatibus genita. sed quanto plura restant quantoque mirabilia inventu! illa enim maiore in parte cibi aut odoris decorisve commendatio ad numerosa experimenta duxit; reliquarum potentia adprobat, nihil ab rerum natura sine aliqua occultiore causa gigni.

equidem et formae gratia ritusque perpetui in corporibus suis aliquas exterarum gentium uti herbis quibusdam adverto animo. inlinunt certe aliis aliae faciem in populis barbarorum feminae; maresque etiam apud dacos et sarmatas corpora sua inscribunt. simili plantagini - glastum in gallia vocatur - britannorum coniuges nurusque toto corpore oblitae quibusdam in sacris nudae incedunt, aethiopum colorem imitantes. iam vero infici vestes scimus admirabili fuco, atque, ut sileamus galatiae, africae, lusitaniae grani coccum imperatoriis dicatum paludamentis, transalpina gallia herbis tyria atque conchyliis tinguit et omnes alios colores. nec quaerit in profundis murices seque obiciendo escam, dum praeripit, beluis marinis intacta etiam ancoris scrutatur vada, ut inveniatur per quod facilius matrona adultero placeat, corruptor insidiatur nuptae: stans et in sicco carpit, quo frugem modo. sed culpant ablui usu; alioqui fulgentius instrui poterat luxuria, certe innocentius.

non est nunc propositum ista consecrari, nec committeremus, ut subiciendo viliora luxuriam utilitate circumscribamus, dicturi et alias herbis tingui parietes nec pingi lapide. nec tinguendi tamen rationem omissemus, si umquam ea liberalium artium fuisset. interim fortius agetur, auctoritasque, quanta debet, etiam surdis, hoc est ignobilibus, herbis perhibebitur, siquidem auctores imperii romani conditoresque immensum quiddam et hinc sumpsere, quoniam non aliunde sagmina in remediis publicis fuere et in sacris legationibusque verbenae. certe utroque nomine idem significatur, hoc est gramen ex arce cum sua terra evolsum, ac semper e legatis, cum ad hostes clarigatumque mitterentur, id est res raptas clare repetitum, unus utique verbenarius vocabatur.

corona quidem nulla fuit graminea nobilior in maiestate populi terrarum principis praemiisque gloriae. gemmatae et aureae, vallares, murales, rostratae, civicae, triumphales post hanc fuere suntque cunctae magno intervallo magnaeque differentia. ceteras omnes singuli, et duces ipsi imperatoresque, militibus aut aliquando collegis dedere, decrevit in triumphis senatus cura belli solutus et populus otiosus, graminea numquam nisi in desperatione suprema contigit, nulli nisi ab universo exercitu servato decreta. ceteras imperatores dedere, hanc solam miles imperatori. eadem vocatur obsidionalis liberatis obsidione abominandoque exitu totis castris. quod si civicae honos uno aliquo ac vel humillimo cive servato praeclarus sacerque habetur, quid tandem existimari debet unius virtute servatus universus

exercitus dabatur haec viridi e gramine decerpto inde, ubi obsessos servasset aliquis. namque summum apud antiquos signum victoriae erat herbam porrigere victos, hoc est terra et altrice ipsa humo et humatione etiam cedere, quem morem etiam nunc durare apud germanos scio.

donatus est ea l. siccius dentatus semel, cum civicas quattuordecim meruisset depugnassetque centiens viciens semper victor. tanto rarius est servatorem unum a servatis donari. quidam imperatores et saepius donati sunt, veluti p. decius mus tribunus militum ab exercitu, altera ab his, qui in praesidio obsessi fuerant, quanta esset eius honoris auctoritas, confessus religione, siquidem donatus bovem album marti inmolavit et centum fulvos, qui ei virtutis causa dati fuerant simul ab obsessis. hic decius postea se consul imperioso conlega pro victoria devovit. data est et a senatu populoque romano, qua claritate nihil equidem in rebus humanis sublimius duco, fabio illi, qui rem omnem romanam restituit non pugnando; nec data, cum magistrum equitum exercitumque eius servasset, - tunc satius fuit nomine novo coronari appellatum patrem ab his, quos servaverat, - sed quo dictum est consensu honoratus est Hannibale italia pulso, quae corona adhuc sola ipsius imperii manibus inposita est et, quod peculiare ei est, sola a tota italia data.

praeter hos contigit eius coronae honos m. calpurnio flammae tribuno militum in sicilia, centurioni vero uni ad hoc tempus cn. petreio atinati cimbrico bello. primum pilum is capessens sub catulo exclusam ab hoste legionem suam hortatus tribunum suum dubitantem per castra hostium erumpere interfecit legionemque eduxit. invenio apud auctores eundem praeter hunc honorem adstantibus mario et catulo cos. praetextatum immolasse ad tibicinem foculo posito. scripsit et sulla dictator ab exercitu se quoque donatum apud nolan legatum bello marsico, idque etiam in villa sua tusculana, quae fuit postea ciceronis, pinxit. quod si verum est, hoc execrabilior eum dixerim, quandoquidem eam capiti suo proscriptione sua ipse detraxit, tanto paucioribus civium servatis quam postea occisis. addat etiamnum huic gloriae superbum cognomen felicem, ipse tamen obsessis in toto orbe proscriptis hac corona sertorio cessit. aemilianum quoque scipionem Varro auctor est donatum obsidionali in africa manilio consule, iii cohortibus servatis totidemque ad servandas eas eductis, quod et statuae eius in foro suo Divus Augustus inscripsit. ipsum Augustum m. cicerone filio consule idibus septembribus senatus obsidionali donavit; adeo civica non satis videbatur. nec praeterea quemquam invenimus donatum.

nullae ergo herbae fuere certae in hoc honore, sed quaecumque fuerant in periculi sede, quamvis ignobiles ignotaeque, honorem nobilem faciebant, quod latere apud nos minus quidem miror cernens neglegi ea quoque, quae ad valitudinem conservandam cruciatusque corporis propulsandos et mortem arcendam pertinent. sed quis non mores iure castiget addidere vivendi pretia deliciae luxusque; numquam fuit vitae cupido maior nec minor cura. aliorum hanc operae esse credimus ac ne mandato quidem nostro alios id agere, medicisque provisum esse pro morbis. ipsi fruimur voluptatibus et, quo nihil

equidem probrosius duco, vivimus aliena fiducia. immo vero plerisque ultro etiam inrisui sumus ista commentantes atque frivoli operis arguimur, magno quamquam immensi laboris solatio, sperni cum rerum natura, quam certe non defuisse nobis docebimus et invisis quoque herbis inseruisse remedia, quippe cum medicinas dederit etiam aculeatis. haec enim proxime restant ex iis, quas priore libro nominavimus, in quibus ipsis providentiam naturae satis mirari amplectique non est. dederat quas diximus molles cibusque gratas, pinxerat remedia in floribus visuque ipso animos invitaverat etiam deliciis auxilia permiscens: en, excogitavit aliquas aspectu hispidas, tactu truces, ut tantum non vocem ipsius fingentis illas rationemque reddentis exaudire videamur, ne scilicet depascat avida quadripes, ne procaces manus rapiant, ne neglecta vestigia obterant, ne insidens ales infringat, iis muniendo aculeis telisque armando, remediis ut tuta ac salva sint. ita hoc quoque, quod in iis odimus, hominum causa excogitatum est.

clara in primis aculeatarum erynge est sive eryngion contra serpentes et venena omnia nascens. adversus ictus morsusque radix eius bibitur drachmae pondere in vino aut, si plerumque tales iniurias comitetur et febris, ex aqua. inlinitur plagis, peculiariter efficax contra chersydros ac ranas. omnibus vero contra toxica et aconita efficacior heraclides medicus in iure anseris decoctam arbitratur. apollodorus adversus toxica cum rana decoquit, ceteri in aqua. ipsa dura, fruticosa, spinosis foliis, caule geniculato, cubitali et maiore aliquando, alia albicans, alia nigra, radice odorata. et sativa quidem est et sponte nascitur in asperis, saxosis, set in litoribus maris durior nigriorque, folio apii.

ex his candidam nostri centum capita vocant. omnes eiusdem effectus, caule et radice in cibos graecorum receptis utroque modo, sive coquere libeat sive cruda vesci. portentosum est, quod de ea traditur, radicem eius alterutrius sexus similitudinem referre, raro invento, set si viris contigerit mas, amabiles fieri; ob hoc et phaonem lesbium dilectum a sappho, multa circa hoc non magorum solum vanitate, sed etiam pythagoricorum. sed in medico usu praeter supra dicta auxiliatur inflationibus, torminibus, cordis vitiis, stomacho, iocineri, praecordiis in aqua mulsa, lieni in posca, item ex mulsa renibus, stranguriae, opisthotonis, spasmis, lumbis, hydropicis, comitialibus, mulierum mensibus, sive subsidant sive abundant, vulvarumque omnibus vitiis. extrahit infixam corpori cum melle. strumas, parotidas, panos, recedentes ab ossibus carnes sanat cum axungia salsa et cerato, item fracturas. crapulam praesumpta arcet, alvum sistit. aliqui e nostris sub solstitio colligi eam iussere, ex aqua caelesti inponi omnibus cervicis vitiis. oculorum quoque albugines sanare adalligatam aliqui tradiderunt.

sunt qui et acanum eryngio adscribant, spinosam brevemque et latam herbam spinisque latioribus. hanc inpositam sanguinem mire sistere.

alii eryngen falso eandem putavere esse et glycyrrhizam, quare subiungi eam protinus refert. et ipsa sine dubio inter aculeatas est, foliis echinatis, pinguibus tactuque cumminosis, fruticosa, binum cubitorum altitudine, flore

hyacinthi, fructu pilularum platani magnitudinis. praestantissima in cilicia, secunda ponto, radice dulci et hac tantum in usu. capitur ea vergiliarum occasu, longa, sucosa ceu lycium, coloris buxei, melior quae nigra, quaeque lenta quam quae fragilis. usus in subditis decoctae ad tertias, cetero ad mellis crassitudinem, aliquando et tusae, quo genere et vulneribus inponitur et faucium vitiis omnibus, item voci utilissima suco sic, ut spissatus est, linguae subdito, item thoraci, iocineri. hac diximus sitim famemque sedari; ob id quidam adipson appellavere eam et hydropicis dedere, ne sitirent. ideo et conmanducata stomatice est ulceribus oris; inspersa saepe et pterygiis. sanat et vesicae scabiem, renium dolores, condylomata, ulcera genitalium. dedere eam quidam potui in quartanis drachmarum duarum pondere et piper ex hemina aquae. conmanducata sanguinem ex vulnere sistit. sunt qui et calculos ea pelli tradiderunt.

tribuli unum genus in hortis nascitur, alterum in fluminibus tantum. sucus ex iis colligitur ad oculorum medicinas; est enim refrigerantis naturae et ideo utilis contra inflammationes collectionesque. ulcera per se erumpentia et praecipue in ore cum melle sanat, item tonsillas. potus calculos frangit. thraces, qui ad strymona habitant, foliis tribuli equos saginant, ipsi nucleo vivunt panem facientes praedulcem et qui contrahat ventrem. radix caste pureque collecta discutit strumas, semen adalligatum varicum dolores sedat, tritum vero in aqua sparsum pulices necat.

stoebe, quam aliqui pheon vocant, decocta in vino praecipue auribus purulentis medetur, item oculis ictu cruentatis, haemorrhagiae quoque et dysinteriae infusa.

hippophaes in sabulosis maritimis, spinis albis, hederæ modo racemosa est, candidis, ex parte rubentibus acinis. radix suco madet, qui aut per se conditur aut pastillis farinae ervi. bilem detrahit oboli pondere, saluberrime cum mulso. est altera hippophaes sine caule, sine flore, foliis tantum minutis. huius quoque sucus hydropicis mire prodest. debent adcommodatae esse et equorum naturae neque ex alia causa nomen accepisse. quippe quaedam animalium remediis nascuntur locupleti divinitate ad generanda praesidia, ut non sit mirari satis ingenium eius disponentis auxilia in genera, in causas, in tempora, ut aliis prosit aliud horis diesque nullus prope sine praesidiis reperiatur.

urtica quid esse invisius potest at illa praeter oleum, quod in aegypto ex ea fieri diximus, vel plurimis scatet remediis. semen eius cicutae contrarium esse nicander adfirmat, item fungis vel argento vivo, apollodorus et salamandris cum iure coctae testudinis, item adversari hyoscyamo et serpentibus et scorpionibus. quin ipsa illa amaritudo mordax uvas in ore procidentesque vulvas et infantium sedes tactu resilire cogit, lethargicos expergisci tactis cruribus magisque fronte. eadem canis morsibus addito sale medetur, sanguinem trita naribus indita sistit et magis radice. carcinomata et sordida ulcera sale admixto, item luxata sanat et panos, parotidas carnesque ab ossibus recedentes. semen potum cum sapa vulvam strangulatis aperit. profluvia

narium sistit inpositum. vomitiones in aqua mulsa sumptum a cena faciles praestat duobus obolis, uno autem in vino potio lassitudines recreat. vulvae vitii tostum acetabuli mensura, potum in sapa resistit stomachi inflationibus. orthopnoicis prodest cum melle et thoracem purgat eodem ecligmate et lateri medetur cum semine lini. addunt hysopum et piperis aliquid. inlinitur lien, difficilem ventrem tostum cibo emollit. hippocrates vulvam purgari potio eo pronuntiat, dolore levare tosto acetabuli mensura, dulci potio et inposito cum suco malvae, intestinorum animalia pelli cum hydromelite et sale, defluvia capitis semine inlito cohonestari. articulariis morbis et podagricis plurimi cum oleo vetere aut folia cum ursino adipe trita inponunt. ad eadem radix tusa cum aceto non minus utilis, item lien, et cocta in vino discutit panos cum axungia vetere salsa. eadem psilotrum est sicca. condidit laudes eius phanias physicus, utilissimam cibis coctam conditamve professus arteriae, tussi, ventris destillationi, stomacho, panis, parotidibus, pernionibus, cum oleo sudorem, coctam cum conchyliis ciere alvum, cum tisana pectus purgare mulierumque menses, cum sale ulcera, quae serpant, cohibere. suco quoque in usu est. expressus inlitis fronti sanguinem narium sistit, potus urinam ciet, calculos rumpit, uvam gargarizatus reprimit. semen colligi messibus oportet. alexandrinum maxime laudatur. ad omnia haec et mitiores quidem teneraeque efficaces, sed praecipue silvestris illa, et hoc amplius lepras e facie tollit in vino pota. si quadrupes fetum non admittat, urtica naturam fricandam monstrant.

ea quoque, quam lamium inter genera earum appellavimus, mitissima et foliis non mordentibus, medetur cum mica salis contusis incussisque, ustis et strumis, tumoribus, podagris, vulneribus. album habet in medio folio, quod ignibus sacris medetur.

quidam e nostris tempore discrevere genera, et autumnalis urticae radicem adalligatam in tertianis ita, ut aegri nuncupentur, cum eruatur ea radix, dicaturque cui et quorum filio eximatur, liberare morbo tradiderunt; hoc idem et contra quartanas pollere. iidem urticae radice addito sale infixam corpori extrahi, foliis cum axungia strumas discuti vel, si suppuraverint, erodi, compleri.

ex argumento nomen accepit scorpio herba. semen enim habet ad similitudinem caudae scorpionis, folia pauca. valet adversus animal nominis sui. est et alia eiusdem nominis effectusque, sine foliis, asparagi caule, in cacumine aculeum habens et inde nomen.

leucacantham alii phyllon, alii ischada, alii polygonaton appellant, radice cypiri, quae commanducata dentium dolores sedat, item laterum et lumborum, ut hicesius tradit, semine potio drachmis octo aut suco. eadem ruptis, convulsis medetur.

helxinen alii perdicium vocant, quoniam perdices ea praecipue vescantur, alii sideritem, nonnulli parthenium. folia habet mixtae similitudinis plantagini et marruvio, cauliculos densos, leviter rubentes, semina in capitibus lappaceis adhaerescencia vestibis, unde et helxinen dictam volunt. sed nos

qualis vera esset helxine diximus priore libro. haec autem inficit lanas, sanat ignes sacros et tumores collectionesque omnes et adusta, panos. sucus eius cum psimithio ignes sacros et guttura incipientia turgescere, item veterem tussim cyathio hausto et omnia vitia umida, sicut tonsillas et aures cum rosaceo. inponitur et podagris cum caprino sebo ceraque cypria.

perdicium sive parthenium sive etiam sideritis alia est; ab nostris herba urceolaris vocatur, ab aliis astercum; folio similis ocimo, nigrior tantum, nascens in tegulis parietinisque. medetur cum mica salis trita iisdem omnibus, quibus lamium, et eodem modo, item vomicae calfacto suco pota, sed contra vulsa, rupta lapsusque et praecipitia, ut vehiculorum eversiones, singularis. verna carus pericli atheniensium principi, cum is in arce templum aedificaret repissetque super altitudinem fastigii et inde cecidisset, hac herba dicitur sanatus, monstrata pericli somnio a minerva, quare parthenium vocari coepta est adsignaturque ei deae. hic est vernula, cuius effigies ex aere fusa est et nobilis ille splanchnoptes.

chamaeleonem aliqui ixian vocant. duo genera eius: candidior asperiora habet folia, serpit in terra echini modo spinas erigens, radice dulci, odore gravi. quibusdam in locis viscum gignit album sub alis foliorum, maxime circa canis ortum, quo modo tura nasci dicuntur, unde et ixia appellatur. hac mastiche utuntur mulieres. quare et chamaeleon vocetur, varietate foliorum evenit; mutat enim cum terra colores, hic niger, illic viridis, aliubi cyaneus, aliubi croceus atque aliis coloribus. ex his candidus hydropicos sanat suco radicis decoctae; bibitur drachma in passo. pellit et interaneorum animalia acetabuli mensura suci eiusdem in vino austero cum origani scopis. facit ad difficultatem urinae. hic sucus occidit et canes suesque in polenta addita aqua et oleo, contrahit in se mures ac necat, nisi protinus aquam sorbeant. radicem eius aliqui concisam servari iubent funiculis pendentem decoquereque in cibo contra fluctiones, quas graeci rheumatismos vocant. ex nigris aliqui marem dixere, cui flos purpureus esset, et feminam, cui violaceus; set una nascuntur caule cubitali, crassitudine digitali. radicibus eorum lichenes curantur cum sulphure et bitumine una coctis, conmanducatis vero dentes mobiles aut in aceto decoctis. suco scabiem et quadripedum sanant. et ricinos canum necat, iuencos quoque anginae modo, quare a quibusdam ulophyton vocatur, set et cynozolon propter gravitatem odoris. ferunt et haec viscum ulceribus utilissimum. omnium autem generum eorum radices scorpiionibus adversantur.

coronopus oblonga herba est cum fissuris. seritur interim, quoniam radix coeliaci praclare facit in cinere tosta.

et anchusae radix in usu est, digitali crassitudine. finditur papyri modo manusque inficit sanguineo colore, praeparat lanas pretiosis coloribus. sanat ulcera in cerato, praecipue senum, item adusta. liquari non potest in aqua, oleo dissolvitur; idque sincerae experimentum est. datur et ad renium dolores drachma eius potui in vino aut, si febris sit, in decocto balani; item iocinerum vitiis et lienis et bile subfusus. lepris et lentigini inlinitur ex aceto. folia trita cum melle et farina luxatis inponuntur, et pota drachmis duabus in mulso

alvum sistunt. pulices necare radix in aqua decocta traditur.

est et alia similis pseudoanchusa ob id appellata, a quibusdam vero echis aut doris et multis aliis nominibus, lanuginosior et minus pinguis, tenuioribus foliis, languidioribus. radix in oleo non fundit rubentem sucum, et hoc ab anchusa discernitur. contra serpentes efficacissima potu foliorum vel seminis. folia ictibus inponuntur. virus serpentes fugat. bibitur et propter spinam. folium eius sinistra decerpi iubent magi et, cuius causa sumatur, dici tertianisque febribus adalligari.

est et alia herba proprio nomine onochilon, quam aliqui anchusam vocant, alii archebion, alii onochelim, aliqui rhexiam, multi enchrysam, parvo frutice, flore purpureo, asperis foliis et ramis, radice messibus sanguinea, cetero nigra, in sabulosis nascens, efficax contra serpentes maximeque viperas et radice et foliis, aequae cibo ac potu. vires habet messibus. folia trita odorem cucumeris reddunt. datur in cyathis tribus vulva procidente. pellit et taenias cum hysopo, et in dolore renium aut iocineris ex aqua mulsa, si febris sit, sin aliter, e vino bibitur. lentigini ac lepris radix inlinitur. habentes eam a serpentibus feriri negantur. est et alia huic similis flore rubro, minor, et ipsa ad eosdem usus, traduntque, conmanducata ea si inspuatur, mori serpentem.

anthemis magnis laudibus celebratur ab asclepiade. aliqui leucanthemida vocant, alii leucanthemum, alii eranthemida, quoniam vere floreat; alii chamaemelon, quoniam odorem mali habeat. nonnulli melanthion vocant. genera eius tria fronde tantum distant, palmum non excedentia, parvis foliis ... rutae candidis aut malinis aut purpureis. in macro solo aut iuxta semitas colligitur vere et in coronamenta reponitur. eodem tempore et medici folia tusa in pastillos digerunt, item florem et radicem. dantur omnia mixta drachmae unius pondere contra serpentium omnium ictus. pellunt mortuos partus, item menstrua in potu et urinam calculosque, inlita inflationes, iocinerum vitia, bilem subfusam, aegilopia, conmanducata ulcerum eruptiones manantes sanant. ex omnibus his generibus ad calculos efficacissima est quae florem purpureum habet, cuius et foliorum et fruticis amplitudo maiuscula est. hanc proprie quidam eranthemim vocant.

loton qui arborem putant tantum esse, vel homero auctore coargui possunt. is enim inter herbas subnascentes deorum voluptati loton primam nominavit. folia eius cum melle oculorum cicatrices, argema, nubeculas discutunt.

est et lotometra, quae fit ex loto sata, ex cuius semine simili milio putri fiunt panes in aegypto a pastoribus, maxime aqua vel lacte subacti. negatur quicquam illo pane salubrius esse aut levius, dum caleat. refrigeratus difficilius concoquitur fitque ponderosus. constat eos, qui illo vivant, nec dysinteria nec tenesmo neque aliis morbis ventris infestari. itaque inter remedia eorum habetur.

heliotropii miraculum saepius diximus cum sole sese circumagentis etiam nubilo die; tantus sideris amor est. noctu velut desiderio contrahit caeruleum florem. genera eius duo, tricoccum et helioscopium. hoc altius, quamquam utrumque semipedalem altitudinem non excedit, ab ima radice ramosum.

semen in folliculo messibus colligitur. nascitur nonnisi in pingui solo cultoque maxime, tricoccum ubique. si decoquatur, invenio cibis placere et in lacte iucundius alvum molliri et, si decocti sucus bibatur, efficacissime exinaniri. maioris sucus excipitur aestate hora sexta, miscetur cum vino, sic firmior. capitis dolores sedat rosaceo admixto. verrucas cum sale tollit sucus e folio, unde nostri verrucariam herbam appellavere, aliis cognominari effectibus digniorem. namque et serpentibus et scorpionibus resistit ex vino aut aqua mulsa, ut apollophanes et apollodorus tradunt. folia infantium destillationibus, quod siriasim vocant, inlita medentur, item contractionibus, etiam si id comitialiter accidat. decocto quoque foveri os saluberrimum est. potum id pellit taenias et renium harenas. si cuminum adiciatur, calculos frangit. decoqui cum radice oportet, quae cum foliis et hircino sebo podagris inlinitur. alterum genus, quod tricoccum appellavimus et alio nomine scorpiuron vocatur, foliis non solum minoribus, sed etiam in terram vergentibus. semen ei est effigie scorpionis caudae, quare nomen. vis ad omnia venenata et phalangia, sed contra scorpiones praecipue inlita. non feriuntur habentes, et si terram surculo heliotropii circumscribat aliquis, negant scorpionem egredi, inposita vero herba aut uda omnino respersum protinus mori. seminis grana quattuor pota quartanis prodesse dicuntur, tria vero tertianis, vel si herba ipsa ter circumlata subiciatur capiti. semen et venerem stimulat, cum melle panos discutit. verrucas hoc utique heliotropium radicitus extrahit et excrescentia in sedibus. spinae quoque ac lumborum sanguinem corruptum trahit inlitum semen et potum in iure gallinaei decoctum aut cum beta et lente. cortex seminis liventibus colorem reddit. magi heliotropium in quartanis quater, in tertianis ter adligari iubent ab ipso aegro precarique eum, soluturum se nodos liberatum, et iacere non exempta herba.

aliud adianto miraculum: aestate viret, bruma non marcescit, aquas respuit, perfusum mersumve sicco simile est - tanta dissociatio deprehenditur - , unde et nomen a graecis alioqui frutici topiario. quidam callitrichon vocant, alii polytrichon, utrumque ab effectu. tinguunt enim capillum et ad hoc decoquuntur in vino cum semine apii adiecto oleo copioso, ut crispum densumque faciat; et defluere autem prohibet. duo genera eius: candidius et nigrum breviusque. id, quod maius est, polytrichon, aliqui trichomanes vocant. utrique ramuli nigro colore nitent, foliis felicis, ex quibus inferiora aspera ac fusca sunt, omnia autem contrariis pediculis, densa ex adverso inter se, radix nulla. umbrosas petras parietumque aspergines ac fontium maxime specus sequitur et saxa manantia, quod miremur, cum aquas non sentiat. calculos e corpore mire pellit frangitque, utique nigrum, qua de causa potius quam quod in saxis nasceretur a nostris saxifragum appellatum crediderim. bibitur e vino quantum terni decerpere digiti. urinam cient, serpentium et araneorum venenis resistunt, in vino decocti alvum sistunt. capitis dolores corona ex his sedat. contra scolopendrae morsus inlinuntur, crebro auferendi, ne perurant; hoc et in alopeciis. strumas discutiant furfuresque in facie et capitis manantia ulcera. decoctum ex his prodest suspiriosis et iocineri et lieni et felle subfusus et

hydropicis. stranguriae inlinuntur et renibus cum absinthio. secundas cient et menstrua. sanguinem sistunt ex aceto aut rubi suco poti. infantes quoque exulcerati perunguntur ex iis cum rosaceo et vino. - (virus folii in urina pueri inpubis tritum quidem cum aphronitro et inlitum ventri mulierum, ne rugosus fiat, praestare dicitur.) - perdices et gallinaceos pugnaciores fieri putant in cibum eorum additis, pecorique esse utilissimos.

picris ab insigni amaritudine cognominatur, ut diximus, folio rotundo. tollit eximie verrucas. thesium quoque non dissimili amaritudine est, sed purgat alvum, in quem usum teritur ex aqua.

asphodelum de clarissimis herbarum, ut quod heroion aliqui appellaverint, hesiodus et in silvis nasci dixit, dionysius marem ac feminam esse. defectis corporibus et phthisicis constat bulbos eius cum tisana decoctos aptissime dari, panemque ex his cum farina subactis saluberrimum esse. nicander et contra serpentes ac scorpiones vel caulem, quem anthericum vocavimus, vel semen vel bulbos dedit in vino tribus drachmis substravitque somno contra hos metus. datur et contra venenata marina et contra scolopendras terrestres. cocleae mire in campania caulem eum persequuntur et sugendo arefaciunt. folia quoque inlinuntur venenatorum vulneribus ex vino. bulbi nervis articulisque cum polenta tunsii inlinuntur. prodest et concisis ex aceto lichenas fricare, item ulceribus putrescentibus ex aqua inponere, mammarum quoque et testium inflammationibus. decocti in faece vini oculorum epiphoris supposito linteolo medentur. fere in quocumque morbo magis decoctis utuntur, item ad tibiaram taetra ulcera rimasque corporum quacumque in parte farina arefactorum. autumnus autem colliguntur, cum plurimum valent. sucus quoque ex tuis expressus aut decoctis utilis fit corporis dolori cum melle, idem odorem corporis iucundum affectantibus cum iri arida et salis exiguo. folia et supra dictis medentur et strumis, panis, ulceribus in facie decocta in vino. cinis e radice alopecias emendat et rimas pedum sedisque, decoctae radicis in oleo sucus perniones et ambusta et gravitatem aurium; infunditur a contraria aure in dolore dentium. prodest et urinae pota modice radix et menstruis et lateris doloribus, item ruptis, convulsis, tussibus, drachmae pondere in vino pota. eadem et vomitiones adiuvat commanducata. semine sumpto turbatur venter. chrysermus et parotidas in vino decocta radice curavit, item strumas admixta cachry ex vino. quidam aiunt, si inposita radice pars eius in fumo suspendatur quartoque die solvatur, una cum radice arescere strumam. diocles ad podagras utroque modo, cocta crudaque, usus est, ad perniones decocta ex oleo; dedit et suffusis felle in vino et hydropicis. venerem quoque concitari cum vino et melle perunctis aut bibentibus tradidere. xenocrates et lichenas, psoras, lepras radice in aceto decocta tolli dicit, item suco cum hyoscyamo et pice liquida alarum quoque et feminum vitia; et capillum crispiorem fieri, raso prius capite, si radice ea fricetur, simos lapides renium in vino decocta potaque eximi. hippocrates semine ad impetus lienis dari censet. iumentorum quoque ulcera ac scabiem radix inlita aut decoctae sucus ad pilum reducit. mures eadem fugantur, caverna praeclusa moriuntur.

asphodelum ab hesiodo quidam halimon appellari existimavere, quod falsum arbitror; est enim suo nomine halimon, non parvi et ipsum erroris inter auctores. alii enim fruticem esse dicunt densum, candidum, sine spina, foliis oleae, sed mollioribus; coqui haec ciborum gratia, radice tormina discuti drachmae pondere in aqua mulsa pota, item rupta, convulsa. alii olus maritimum esse dixere salsum et inde nomen, foliis in rotunditatem longis, laudatum in cibis. duorum praeterea generum, silvestre et mitius, utrumque prodesse dysintericis etiam exulceratis cum pane, stomacho vero ex aceto. ulceribus vetustis inlini crudum et vulnorum recentium impetus lenire et luxatorum pedum ac vesicae dolores. silvestri tenuiora folia, sed in iisdem remediis effectus maiores et in sananda hominum ac pecorum scabie. praeterea nitorem corpori fieri dentibusque candorem, si fricentur radice ea, semine linguae subdito sitim non sentiri. hoc quoque mandi et utraque etiam condiri. crateuas tertium quoque genus tradidit longioribus foliis et hirsutioribus, odore cupressi, nasci sub hedera maxime, prodesse opisthotonis, contractionibus nervorum tribus obolis in sextarium aquae.

acanthi, topiariae et urbanae herbae lato longoque folio crepidines marginum adsurgentiumque pulvinorum toros vestientis, duo genera sunt: aculeatum et crispum, quod brevius, alterum leve, quod aliqui paederota vocant, alii melamphyllum. huius radices ustis luxatisque mire prosunt, item ruptis, convulsis, et phthisin metuentibus, id coctae cibo, maxime tisana. podagris quoque inlinuntur tritae et calefactae, e sale calidis.

bupleuron in sponte nascentium olerum numero graeci habent, caule cubitali, foliis multis longisque, capite aneti, laudatum in cibis ab hippocrate, in medicina glaucone et nicandro. semen contra serpentes valet. folia ad secundas feminarum vel sucum ex vino inlinunt, et strumis folia cum sale et vino. radix contra serpentes datur in vino et urinae ciendae.

buprestim magna inconstantia graeci in laudibus ciborum etiam habuere, iidemque remedia tamquam contra venenum prodiderunt. et ipsum nomen indicio est boum certe venenum esse, quos dissilire degustata fatentur. quapropter nec de hac plura dicemus. est vero causa, quare venena monstremus inter gramineas coronas! nisi libidinis causa expetenda alicui videtur, quam non aliter magis accendi putant quam pota ea.

elaphoboscon ferulaceum est, geniculatum digiti crassitudine, semine corymbis dependentibus silis effigie, set non amaris, foliis olusatri. et hoc laudatum in cibis - quippe etiam conditum prorogatur - , ad urinam ciendam, lateris dolores sedandos, rupta, convulsa sananda, inflationes discutiendas colique tormenta, contra serpentium omniumque aculeatorum ictus, quippe fama est, hoc pabulo cervos resistere serpentibus. fistulas quoque radix nitro addito inlita sanat, siccanda autem in eo usu prius est, ne suco suo madeat, qui contra serpentium ictus non facit deteriore eam.

scandix quoque in olera silvestri a graecis ponitur, ut ophion et erasistratus tradunt. item decocta alvum sistit, semine singultus confestim ex aceto sedat. inlinuntur ambustis, urinas ciet. decoctae sucus prodest stomacho, iocineri,

renibus, vesicae. haec est quam aristophanes euripidi poetae obicit ioculariter: matrem eius ne olus quidem legitimum venditasse, sed scandicem. eadem erat enthryscum, si teneriora folia et odoratiora haberet. peculiaris laus eius, quod fatigato venere corpori succurrit marcentesque iam senio coitus excitat. sistit profluvia alba feminarum.

et iasine olus silvestre habetur, in terra repens, cum lacte multo, florem fert candidum; conchylum vocant. et huius eadem commendatio ad stimulandos coitus. cruda ex aceto in cibis et mulieribus lactis ubertatem praestat. salutaris est phthisin sentientibus. infantium capiti inlita nutrit capillum tenacioremque eius cutem efficit.

estur et caucalis feniculo similis, brevi caule, flore candido, cordi utilis. sucus quoque eius bibitur, stomacho perquam commendatus et urinae calculisque et harenis pellendis et vesicae pruritibus. extenuat et lienis, iocineris reniumque pituitas. semen menses feminarum adiuvat bilemque a partu siccatur. datur et contra profluvia geniturae viris. chrysippus et conceptionibus eam putat conferre multum. bibitur in vino ieiunis. inlinitur et contra venena marinorum, sicut petrichus in carmine suo significat.

his adnumerant et sium latius apio, in aqua nascens, pinguius nigriusque, copiosum semine, sapore nasturtii. prodest urinis, renibus, lienibus mulierumque mensibus, sive ipsum in cibo sumptum sive ius decocti sive semine in vino drachmis duabus. calculos rumpit aquisque, quae gignunt eos, resistit. dysintericis prodest infusum, item inlitum lentigini et mulierum vitiis in facie noctu inlitum, lomentoque cutem emendat et ramices lenit, equorum etiam scabiem.

sillybum chamaeleonti albo similem, aequae spinosam, ne in cilicia quidem aut syria aut phoenice, ubi nascitur, coquere tanti est. ita operosa eius culina traditur. in medicina nullum usum habet.

scolymum quoque in cibos recipit oriens et alio nomine limoniam appellat. frutex est numquam cubitali altior tristisque foliorum aculeis, radice nigra, sed dulci, eratostheni quoque laudata in pauperis cena. urinam ciere praecipue traditur, sanare lichenas et lepras ex aceto, venerem stimulare in vino hesiodo et alcaeo testibus, qui florente ea cicadas acerrimi cantus esse et mulieres libidinis avidissimas virosque in coitum pigerrimos scripsere, velut providentia naturae hoc adiumento tunc valentissimo. item graveolentiam alarum emendat radice emedullatae uncia, in vini falerni heminis tribus decocta ad tertias et a balneo ieiuno itemque post cibum cyathis singulis pota. mirum est, quod xenocrates promittit experimento, vitium id ex alis per urinam effluere.

estur et soncos - ut quem theseo apud callimachum adponat hecale - uterque, albus et niger. lactucae similes ambo, nisi spinosi essent, caule cubitali, anguloso, intus cavo, sed qui fractus copioso lacte manet. albus, cui e lacte nitor, utilis orthopnoicis lactucarum modo ex embammate. erasistratus calculos per urinam pelli eo monstrat et oris graveolentiam commanducato corrigi. sucus trium cyathorum mensura in vino albo et oleo calefactus adiuvat

partus ita, ut a potu ambulent gravidae. datur et in sorbitione. ipse caulis decoctus facit lactis abundantiam nutricibus coloremque meliorem infantum, utilissimus his, quae lac sibi coire sentiant. instillatur auribus sucus, calidusque in stranguria bibitur cyathi mensura et in stomachi rosionibus cum semine cucumeris nucleisque pineis. inlinitur et sedis collectionibus. bibitur contra serpentes scorpionesque, radix vero inlinitur. eadem decocta in oleo et punici mali calyce, aurium morbis praesidium est. haec omnia ex albo. cleomporus nigro prohibet vesci ut morbos faciente, de albo consentiens. agathocles etiam contra sanguinem tauri demonstrat sucum eius, refrigeratorem tamen vim esse convenit nigro et hac causa inponendum cum polenta. zenon radicem albi in stranguria suadet.

condrion sive condrilla folia habet intubi, circumrosis similia, caulem minus pedalem, suco madentem amaro, radice fabae simili, aliquando numerosa. habet proximam terrae mastichen tuberculo fabae, quae adposita feminarum menses trahere dicitur. tusa cum radicibus tota dividitur in pastillos contra serpentes, argumento probabili, siquidem mures agrestes laesi ab his hanc esse dicuntur. sucus ex vino coctae alvum sistit. eadem palpebrarum pilos inordinatissimos pro cummi efficacissime regit. dorotheus stomacho et concoctionibus utilem carminibus suis pronuntiavit. alioqui feminis et oculis generationique virorum contrariam putavere.

inter ea, quae temere manduntur, et boletos merito posuerim, opimi quidem hos cibi, sed inmenso exemplo in crimen adductos, veneno tiberio claudio principi per hanc occasionem ab coniuge agrippina dato, quo facto illa terris venenum alterum sibi ante omnes neronem suum dedit. quorundam ex iis facile noscuntur venena diluto rubore, rancido aspectu, livido intus colore, rimosa stria, pallido per ambitum labro. non sunt haec in quibusdam, siccique et veris similes, veluti guttas in vertice albas ex tunica sua gerunt. vulvam enim terra ob hoc prius gignit, ipsum postea in vulva, ceu in ovo est luteum. nec tunicae minor gratia in cibo infantis boleti. rumpitur haec primo nascente, mox increscente in pediculi corpus absumitur, rarumque ut geminus ex uno pede. origo prima causaque e limo et acescente suco madentis terrae aut radicis fere glandiferae, initioque spuma lentior, dein corpus membranae simile, mox partus, ut diximus. illa pernicialia quot probandi alia aliis signa! si caligaris clavus ferrive aliqua robigo aut panni marcor adfuerit nascenti, omnem ilico sucum alienum saporemque in venenum concoqui deprehendisse qui nisi agrestes possunt atque qui colligunt ipsi alia vitia ne hi quidem, si serpentis caverna iuxta fuerit, si patescentem primo adhalaverit, capaci venenorum cognatione ad virus accipiendum. itaque caveri conveniat prius, quam se condant serpentes. signa erunt tot herbae, tot arbores fruticesque ab emersu earum ad latebram usque vernantes et vel fraxini tantum folia nec postea nascentia nec ante decidentia. et boletis quidem ortus occasusque omnis intra dies septem est.

fungorum lentior natura et numerosa genera, sed origo non nisi ex pituita arborum. tutissimi qui rubent callo, minus diluto rubore quam boleti; mox

candidi, velut apice flaminis insignibus pediculis; tertium genus suilli, venenis accommodatissimi. familias nuper interemere et tota convivia, annaeum serenum, praefectum neronis vigilum, et tribunos centurionesque. quae voluptas tam ancipitis cibi quidam discrevere arborum generibus, fico ferulave et cummim ferentibus, non item taxo aut robore, cupresso, ut diximus. sed ista quis spondet in venalibus omnium colos lividus; hic habebit veneni argumentum, quo similior fuerit arborum cortici. adversus haec diximus remedia dicemusque; interim sunt aliqua et in iis. glaucias stomacho utiles putat boletos. siccantur pendentes suilli, iunco transfixi, quales e bithynia veniunt. hi fluctationibus alvi, quas rheumatismos vocant, medentur excrescentibusque in sede carnibus; minuunt enim eas et tempore absumunt, item lentiginem et mulierum in facie vitia. lavantur etiam, ut plumbum, in oculorum medicamenta. sordidis ulceribus et capitis eruptionibus, canum morsibus ex aqua inlinuntur. libet et coquendi dare aliquas communes in omni eo genere observationes, quando ipsae suis manibus deliciae praeparant hunc cibum solum et cogitatione ante pascuntur sucinis novaculis aut argenteo apparatu comitante. noxii erunt fungi, qui in coquendo duriores fient; innocentiores, qui nitro addito coquentur, utique si percoquantur. tutiores fiunt cum carne cocti aut cum pediculo piri; prosunt et pira confestim sumpta. debellat eos et aceti natura contraria iis.

imbris proveniunt omnia haec, imbre et silphium venit primo, ut dictum est. ex syria nunc hoc maxime inportatur, deterius parthico, sed medico melius, extincto omni cyrenaico, ut diximus. usus silphii in medicina foliorum ad purgandas vulvas pellendosque emortuos partus; decocuntur in vino albo et odorato, ut bibatur mensura acetabuli a balineis. radix prodest arteriis exasperatis, collectionibus sanguinis inlinitur. sed in cibus concoquitur aegre, inflationes facit et ructus. urinae quoque noxia est, suggillatis cum vino et oleo amicissima et cum cera strumis. verrucae sedis crebriore eius suffitu cadunt.

laser e silphio profluens quo diximus modo inter eximia naturae dona numeratum plurimis compositionibus inseritur, per se autem algores excalfacit, potum nervorum vitia extenuat. feminis datur in vino et lanis mollibus admovetur vulvae ad menses ciendos. pedum clavos circumscariphatos ferro mixtum cerae extrahit. urinam ciet ciceris magnitudine dilutum. andreas spondet copiosius sumptum nec inflationes facere et concoctioni plurimum conferre senibus et feminis, item hieme quam aestate utilius, et tum aquam bibentibus. cavendum, ne qua sit exulceratio intus. ab aegritudine recreationi efficax in cibo; tempestive enim datum cauterii vim optinet, adsuetis etiam utilius quam expertibus. extera corporum indubitatas confessiones habent: venena telorum et serpentium extinguit potum; ex aqua vulneribus his circumlinitur, scorpionum tantum plagis ex oleo, ulceribus vero non maturescentibus cum farina hordeacia vel fico sicca, carbunculis cum ruta vel cum melle vel per se visco superlitum, ut haereat; sic et ad canis morsus; excrescentibus circa sedem cum tegmine punici mali ex aceto decoctum, clavis, qui volgo morticini appellantur, nitro mixto. alopecias

nitro ante subactas replet cum vino et croco aut pipere ac murium fimo et aceto. perniones ex vino fovet et ex oleo coctum; inponitur sic et callo, clavis pedum superrasis; praecipuae utilitatis contra aquas malas, pestilentes tractus vel dies; in tussi, uva; fellis veteri suffusioni, hydropicis, raucitatibus; confestim enim purgat fauces vocemque reddit. podagras in spongia dilutum posca lenit. pleuriticis in sorbitione vinum poturis datur, contractionibus, opisthotonicis ciceris magnitudine cera circumlitum. in angina gargarizatur. anhelatoribus et in tussi vetusta cum porro ex aceto datur; at ex aceto his, qui coagulum lactis sorbuerint, praecordiorum vitiis syntecticis, comitialibus cum vino, in aqua mulsa linguae paralyti. coxendicibus et lumborum doloribus cum decocto melle inlinitur. non censuerim, quod auctores suadent, cavernis dentium in dolore inditum cera includi, magno experimento hominis, qui se ea de causa praecipitavit ex alto. quippe tauros inflamat naribus inlitis, serpentes avidissimas vini admixtum rumpit; ideo nec inungi suaserim, cum attico licet melle praecipiant. quas habeat utilitates admixtum aliis, inmensum est referre, et nos simplicia tractamus, quoniam in his naturam esse apparet, in illis coniecturam saepius fallacem, nulli satis custodita in mixturis concordia naturae ac repugnantia. qua de re mox plura.

non esset mellis auctoritas in pretio minor quam laseris, ni ubique nasceretur. illud ipsa fabricata est natura, sed huic gignendo animal, ut diximus, innumeros ad usus, si quotiens misceatur aestimemus. prima propolis alvorum, de qua diximus, aculeos et omnia infixi corpori extrahit, tubera discutit, dura concoquit, dolores nervorum mulcet ulceraque iam desperantia cicatricem cludit. mellis quidem ipsius natura talis est, ut putrescere corpora non sinat. iucundo sapore atque non aspero, alia quam salis natura, faucibus, tonsillis, anginae omnibusque oris desideriis utilissimum arescentique in febribus linguae, iam vero peripneumonicis, pleuriticis decoctum, item vulneribus, a serpente percussis et contra venena, fungos, paralyticis in mulso, quamquam suae mulso dotes constant. mel auribus instillatur cum rosaceo, lendes et foeda capitis animalia necat. usus despumati semper aptior, stomachum tamen inflat, bilem auget, fastidium creat. et oculis per se inutile aliqui arbitrantur; rursus quidam angulos exulceratos melle tangi suadent. mellis causas atque differentias nationesque et indicationem in apium ac deinde florum natura diximus, cum ratio operis dividi cogeret miscenda rursus naturam rerum pernoscere volentibus.

in mellis operibus et aqua mulsa debet tractari. duo genera eius, subitae ac recentis, alterum inveteratae. repentina despumato melle praeclaram utilitatem habet in cibo aegrotantium levi, hoc est alica eluta, viribus recreandis, ore stomachoque mulcendo, ardores refrigerando. frigidam enim dari utilius ventri molliendo. invenio apud auctores, decoctum bibendum alsiosis, item animi humilis et praeparci, quos illi dixere micropsychos. ut est ratio subtilitatis inmensae a platone descendens, corpusculis rerum levibus scabris, angulosis rotundis, magis aut minus ad aliorum naturam accedentibus, ideo non eadem omnibus amara aut dulcia esse; sic et in lassitudine prioniores esse ad

iracundiam et in siti. ergo et haec animi asperitas, seu potius animae, dulciore suco mitigatur lenito transitu spiritus et molliore facto meatu, ne scindat euntem redeuntemque. experimenta in se cuique: nullius non ira luctusque, tristitia et omnis animi impetus cibo mollitur, ideoque observanda sunt quae non solum corporum medicinam, sed et morum habent.

aqua mulsa et tussientibus utilis traditur, calefacta invitat vomitiones, contra venenum psimithii salutaris addito oleo, item contra hyoscyami cum lacte maxime asinino, et contra halicacabi, ut diximus. infunditur et auribus et genitalium fistulae. vulvis inponitur cum pane molli, subitis tumoribus, luxatis leniendisque omnibus. inveteratae usum damnavere posterī, minus innocentem aqua minusque vino firmum; longa tamen vetustate transit in vinum, ut constat inter omnes, stomacho inutilissimum nervisque contrarium.

semper mulsum ex vetere vino utilissimum, facillimeque cum melle concorporatur, quod in dulci numquam evenit. ex austero factum non inflat stomachum, neque ex decocto melle, minusque implet, quod fere evenit; adpetendi quoque revocat aviditatem cibi. alvum mollit frigidus potus, pluribus calido sistit, corpora auget. multi senectam longam mulsi tantum intrita toleravere, neque alio ullo cibo, celebri pollionis romili exemplo. centensimum annum excedentem eum Divus Augustus hospes interrogavit, quam maxime ratione vigorem illum animi corporisque custodisset. at ille respondit: “intus mulso, foris oleo”. Varro regium cognominatum arquatorum morbum tradit, quoniam mulso curetur.

melitites quo fieret modo ex musto et melle, docuimus in ratione vini. saeculis iam fieri non arbitror hoc genus, inflationibus obnoxium. solebat tamen inveteratum alvi causa dari in febre, item articulario morbo et nervorum infirmitate laborantibus et mulieribus vini abstemiis.

mellis naturae adnexa cera est, de cuius origine, bonitate, nationibus suis locis diximus. omnis autem mollit, calefacit, explet corpora. recens melior. datur in sorbitione dysintericis, faviq̃ue ipsi in pulte alicae prius tostae. adversatur lactis naturae, ac milii magnitudine decem grana cerae hausta non patiuntur coagulari lacti in stomacho. si inguen tumeat, albam ceram in pube fixisse remedio est.

nec huius usus, quos mixta aliis praestat, enumerare possit medicina, sicuti nec ceterorum, quae cum aliis prosunt. ista, ut diximus, ingeniis constant. non fecit ceratum, malagmata, emplastra, collyria, antidota parens illa ac divina rerum artifex; officinarum haec, immo verius avaritiae commenta sunt. naturae quidem opera absoluta atque perfecta gignuntur, paucis ex causa, non ex coniectura rebus adsumptis, ut suco aliquo sicca temperentur ad meatus aut corpore alio umentia ad nexus. scripulatim quidem colligere ac miscere vires non coniecturae humanae opus, sed inpudentiae est. nos nec indicarum arabicarumque mercium aut externi orbis adtingimus medicinas. non placent remediis tam longe nascentia, non nobis gignuntur, immo ne illis quidem; alioqui non venderent. odorum causa unguentorumque et deliciarum, si placet, etiam superstitionis gratia emanant, quoniam ture supplicamus et costo.

salutem quidem sine istis posse constare, vel ob id probabimus, ut tanto magis sui delicias pudeat.

sed medicinas e floribus coronamentisque et hortensiis quaeque mandantur herbae persecuti quonam modo frugum omittimus nimirum et has indicare conveniat. in primis sapientissima animalium esse constat, quae fruge vescantur. siliginis grana combusta et trita in vino ammineo, oculis inlita epiphoras sedant, tritici vero ferro combusta iis, quae frigus usserit, praesentaneo sunt remedio. farina tritici ex aceto cocta nervorum contractionibus, cum rosaceo vero et fico sicca myxisque decoctis furfures tonsillis faucibusque gargarizatione prosunt. sex. pomponius, praetorii viri pater, hispaniae citerioris princeps, cum horreis suis ventilandis praesideret, correptus dolore podagrae mersit in triticum super genua sese, levatusque siccatis pedibus mirabilem in modum hoc postea remedio usus est. vis tanta est, ut cados plenos siccet. paleam quoque tritici vel hordei calidam inponi ramicum incommodis experti iubent, quaque decoctae sint aqua fovere. est in farre vermiculus teredini similis, quo cavis dentium cera incluso cadere vitiati dicuntur, etiam si fricentur. olyram arincam diximus vocari. hac decocta fit medicamentum, quod aegyptii atheram vocant, infantibus utilissimum, sed et adultos inlinunt eo.

farina ex hordeo et cruda et decocta collectiones impetusque discutit, lenit concoquitque. decoquitur alias in mulsa aqua aut fico sicca; at iocineris doloribus, cum pus concoqui opus est, in vino; cum inter coquendum discutiendumque cura est, tunc in aceto melius aut in faece aceti aut cotoneis pirisve decoctis; ad multipedae morsus cum melle, ad serpentium in aceto et contra suppurantia, ad extrahendas suppurationes ex posca addita resina gallica; ad concoctiones vero et ulcera vetera cum resina, ad duritias cum fimo columbarum aut fico sicca aut cinere, ad nervorum inflammationes aut intestinorum vel laterum dolores cum papavere aut meliloto, et quotiens ab ossibus caro recedit, ad strumas cum pice et inpubis pueri urina, cum oleo. cum graeco feno contra praecordiorum tumores vel in febribus cum melle vel adipe vetusto. suppuratis triticea farina multo lenior. nervis cum hyoscyami suco inlinitur, ex aceto et melle lentigini. zae, ex qua alicam fieri diximus, efficacior etiam hordeacea videtur, trimenstris mollior, ex vino rubro ad scorpionum ictus tepida et sanguinem excreantibus, item arteriae, tussi cum caprino sebo aut butyro. ex feno graeco, mollissima omnium, ulcera manantia sanat et furfures corporis, stomachi dolores, pedes et mammas cum vino et nitro cocta. aerina magis ceteris purgat ulcera vetera et gangraenas cum raphano et sale, ex aceto lichenas, lepras cum sulphure vivo, et capitis dolores cum adipe anserino inposita fronti. strumas et panos concoquit cum fimo columbino et lini semine decocta in vino.

de polentae generibus in frugum loco satis diximus. medicorum ratione a farina hordei distat eo, quod torretur, ob id stomacho utilis. alvum sistit impetusque rubicundi tumoris; et oculis inlinitur et capitis dolori cum menta aut alia refrigerante herba, item pernionibus et serpentium plagis, item

ambustis ex vino, inhibetque pusulas.

farina in pollinem subacta vim extrahendi umoris habet adeo, ut cruore suffusis in fascias usque sanguinem perducatur, efficacius in sapa. inponitur et pedum callo clavisque. nam cum oleo vetere ac pice decocto polline condylomata et alia omnia sedis vitia quam maxime calido mirabilem in modum curantur. pulte corpus augetur. farina, qua chartae glutinantur, sanguinem excreantibus datur tepida sorbenda efficaciter.

alica res romana est et non pridem excogitata; alioqui non tisanæ potius laudes scripsissent graeci. nondum arbitror pompei magni aetate in usu fuisse, et ideo vix quicquam de ea scriptum ab asclepiadis schola. esse quidem eximie utilem nemo dubitat, sive eluta detur ex aqua mulsa sive in sorbitione decocta sive in pulte. eadem in alvo sistenda torretur, dein favorum cera coquitur, ut supra diximus. peculiariter tamen longo morbo ad tabitudinem redactis subvenit ternis eius cyathis in sextarium aquae sensim decoctis, donec omnis aqua consumatur, postea sextario lactis ovilli aut caprini addito per continuos dies ... , mox adiecto melle. tali genere sorbitionis emendantur syntexis.

milio sistitur alvus, discutiuntur tormina, in quem usum torretur ante. nervorum doloribus et aliis fervens in sacco inponitur, neque aliud utilius, quoniam levissimum mollissimumque est et caloris capacissimum. itaque talis usus eius est ad omnia, quibus calor profuturus est. farina eius cum pice liquida serpentium et multipedae plagis inponitur.

panicum diocles medicus mel frugum appellavit. effectus habet quos milium. in vino potum prodest dysintericis. similiter his, quae vaporanda sunt, excalfactum inponitur. sistit alvum in lacte caprino decoctum et bis die haustum. sic prodest et ad tormina.

sesima trita in vino sumpta inhibet vomitiones. aurium inflammationi inlinitur et ambustis. eadem efficit et dum in herba est. hoc amplius oculis inponitur decocta in vino. stomacho inutilis in cibis et animae gravitatem facit. stellionum morsibus resistit, item ulceribus, quae cacoe+the vocant, et auribus oleum, quod ex ea fit, prodesse diximus. sesamoides a similitudine nomen accepit, grano amaro, folio minore. nascitur in glareosis. detrahit bilem in aqua potum semen, inlinitur igni sacro, discutit panos. est etiamnum aliud sesamoides, anticyrae nascens, quod ideo aliqui anticyricon vocant, cetera simile erigeronti herbae, de qua dicemus suo loco, grano sesamae. datur in vino dulci ad detractiones quantum tribus digitis capitur. miscent ibi et ellebori albi unum et dimidium obolum, purgationem eam adhibentes maxime insaniae melancholicae, comitialibus, podagris. et per se drachmae pondere exinanit.

hordeum optimum quod candidissimum. sucus decocti in aqua caelesti digeritur in pastillos, ut infundantur exulceratis interaneis et vulvis. cinis eius ambustis inlinitur et carnibus, quae recedunt ab ossibus, et eruptionibus pituitae, muris aranei morsibus. idem adperso sale ac melle candorem dentibus, suavitatem oris facit. eos, qui pane hordeacio utuntur, morbo pedum

temptari negant. novem granis furunculum si quis circumducat, singulis ter manu sinistra, et omnia in ignem abiciat, confestim sanari aiunt. est et herba phoenice appellata a graecis, nostris vero hordeum murinum; haec trita e vino pota praeclare ciet menses.

tisanae, quae ex hordeo fit, laudes uno volumine condidit hippocrates, quae nunc omnes in alicam transeunt. quanto innocentior alica! hippocrates tamen sorbitionis gratia laudavit, quoniam lubrica ex facili hauriretur, quoniam sitim arceret, quoniam in alvo non intumesceret, quoniam facile redderetur et aduetis hic cibus solus in febris die posset dari, tantum remotus ab istis, qui medicinam fame exercent. sorbitionem tamen dari totam vetuit aliudve quam sucum tisanae; item vetuit, quamdiu pedes frigidi essent, tunc quidem nec potionem dandam. fit et ex tritico glutinosior arteriaeque exulceratae utilior.

amylon hebetat oculos, et gulae inutile, contra quam creditur. item alvum sistit, epiphoras oculorum inhibet et ulcera sanat, item pusulas et fluctiones sanguinis. genas duras emollit. datur cum ovo iis, qui sanguinem reiecerint, in vesicae vero dolore semuncia amyli cum ovo et passi tribus ovis subfervefacta a balineo. quin et avenacea farina decocta in aceto naevos tollit.

panis hic ipse, quo vivitur, innumeras paene continet medicinas. ex aqua et oleo aut rosaceo mollit collectiones; ex aqua mulsa ad duritias valde mitigandas, ex vino ad discutienda aut quae praestringi opus sit et, si magis etiamnum, ex aceto, adversus acutas pituitae fluctiones, quas graeci rheumatismos vocant, item ad percussa, luxata, ad omnia autem fermentatus, qui vocatur autopyrus, utilior. inlinitur et paronychiis et callo pedum in aceto. vetus aut nauticus panis tusus atque iterum coctus sistit alvum. vocis studiosis et contra destillationes siccum esse primo cibo utilissimum est. sitanius, hoc est e trimestri, incussa in facie aut desquamata cum melle aptissime curat. candidus aegris aqua calida frigidave madefactus levissimum cibum praebet. oculorum tumori ex vino inponitur; sic et pusulis capitis aut adiecta arida myrto. tremulis panem ex aqua esse ieiunis statim a balineis demonstrant. quin et gravitatem odorum in cubiculis ustus emendat et vini in saccos additus.

et faba auxiliatur. namque solida fricta fervensque in acre acetum coniecta torminibus medetur. in cibo fresa et cum alio cocta contra deploratas tusses suppurationesque pectorum cotidiano cibo sumitur, et commanducata ieiuno ore et ad furunculos maturandos discutiendosve inponitur, et in vino decocta ad testium tumores, ad genitalia. lomento quoque ex aceto decocto tumores maturat atque aperit, item livoribus, combustis medetur. voci eam prodesse auctor est M. Varro. fabalium etiam siliquarumque cinis ad coxendices, ad nervorum veteres dolores cum adipis suilli vetustate prodest. et per se cortices decocti ad tertias sistunt alvum.

lens optima quae facillime coquitur et ea, quae maxime aquam absorbet. aciem quidem oculorum obtundit et stomachum inflat, sed alvum sistit in cibo magisque caelesti aqua discocta; eadem solvit minus percocta. pusulas

ulcerum rumpit; ea, quae intra os sunt, purgat et adstringit. collectiones omnes inposita sedat maximeque exulceratas et rimosas, oculorum autem epiphoras cum meliloto aut cotoneo. contra suppurantia cum polenta inponitur. decoctae succus ad oris exulcerationes et genitalium adhibetur, ad sedem cum rosaceo aut cotoneo, in iis, quae acrius remedium exigant, cum putamine punici melle modico adiecto. ad id demum, ne celeriter inarescat, adiciunt et betae folia. inponitur et strumis, panis vel maturis vel maturescentibus ex aceto discocta, rimis ex aqua mulsa et gangraenis cum punici tegmine; item podagris cum polenta et vulvis et renibus, pernionibus, ulceribus difficile cicatricem trahentibus. propter dissolutionem stomachi xxx grana lentis devorantur. in choleris quoque et dysinteria efficacior est in tribus aquis cocta, in quo usu melius semper eam torrere ante et tundere, ut quam tenuissima detur vel per se vel cum cotoneo malo aut piris aut myrto aut intubo erratico aut beta nigra aut plantagine. pulmoni est inutilis et capitis dolori nervosisque omnibus et felli, nec somno facilis, at pusulis utilis ignique sacro et mammis in aqua marina decocta, in aceto autem duritias et strumas discutit. stomachi quidem causa polentae modo potionibus inspergitur. quae sint ambusta, aqua semiscocta curant, postea trita et per cribrum effuso furfure, mox procedente curatione addito melle. ex posca coquitur ad guttura. est et palustris lens, per se nascens in aqua non profluenti, refrigeratoriae naturae, propter quod collectionibus inlinitur et maxime podagris et per se et cum polenta. glutinat et interanea procidentia.

est silvestris elelispacos dicta a graecis, aliis sphacos dicta, sativa lente levioe et folio minore atque sicciore et odoratiore. est et alterum genus eius silvestrius, odore gravi; haec mitior folia habet cotonei mali effigie, set minora et candida, quae cum ramis decocuntur. menses ciet et urinas, et pastinacae marinae ictus sanat, torporem autem obducit percusso loco. bibitur cum absinthio et dysinteriae. cum vino eadem commorantes menses trahit, abundantes sistit decocto eius potio. per se inposita herba vulnere sanguinem cohibet. purgat et serpentium morsus et, si in vino decoquatur, pruritus testium sedat. nostri, qui nunc sunt, herbarii elelispacum graece, salviam latine vocant, mentae similem, canam, odoratam. partus emortuos ea adposita extrahunt, item vermes ulcerum auriumque.

cicer et silvestre est, foliis simile, odore gravi. si largius sumatur, alvus solvitur et inflatio contrahitur et tormina. tostum salubrius habetur. cicercula etiamnum magis in alvo proficit. farina utriusque ulcera manantia capitis sanat, efficacius silvestris, item comitiales et iocinerum tumores et serpentium ictus. ciet menses et urinas, grano maxime. emendat et lichenas et testium inflammationes, regium morbum, hydropicos. laedunt omnia haec genera exulceratam vesicam et renes. gangraenis utiliora cum melle et his, quae cacoe+the vocantur. verrucarum in omni genere prima luna singulis granis singulas tangunt, eaque grana in linteolo deligata post se abiciunt, ita fugari vitium arbitantes. nostri praecipiunt arietinum in aqua cum sale discoquere, ex eo bibere cyathos binos in difficultatibus urinae; sic et calculos pelli

morbumque regium. eiusdem foliis sarmentisque decoctis aqua quam maxime calida morbos pedum lenit, et ipsum calidum tritumque inlitum. columbini decocti aqua horrorem tertianae et quartanae minuere creditur. nigrum autem cum gallae dimidio tritum oculorum ulceribus ex passo medetur.

de ervo quaedam in mentione eius diximus, nec potentiam ei minorem veteres quam brassicae tribuere contra serpentium ictus ex aceto, ad crocodilorum hominumque morsum. si quis ervum cotidie ieiunus edit, lienem eius absumi certissimi auctores adfirmant. farina eius varos, sed et maculas cutis toto corpore emendat. serpere ulcera non patitur, in mammis efficacissimum. carbunculos rumpit ex vino. urinae difficultates, inflationem, vitia iocineris, tenesmon et quae cibum non sentiant, atropa appellata, tostum et in nucis abellanae magnitudinem melle collectum devoratumque corrigit; item impetigines ex aceto coctum et quarto die solutum. panos in melle inpositum suppurare prohibet. aqua decocti perniones et pruritus sanat fovendo. quin et universo corpori, si quis cotidie ieiunus biberit, meliorem fieri colorem existumant. cibus idem hominis alienum. vomitiones movet, alvum turbat, capiti et stomacho onerosum; genua quoque degravat. sed madefactum pluribus diebus mitescit, bubus iumentisque utilissimum. siliquae eius virides prius, quam indurescant, cum suo caule foliisque contritae capillos nigro colore inficiunt.

lupini quoque silvestres sunt, omni modo minores praeterquam amaritudine. ex omnibus, quae eduntur, sicco nulli minus ponderis est nec plus utilitatis. mitescunt cinere aut aqua calidis. colorem hominis frequentiores in cibo exhilarant, amari contra aspidas valent. ulcera atra aridi decorticate triti supposito linteolo ad vivum corpus redigunt. strumas, parotidas in aceto cocti discutunt. sucus decoctorum cum ruta et pipere vel in febris datur ad ventris animalia pellenda minoribus xxx annorum, pueris vero etiam inpositi in ventrem ieiunis prosunt, et alio genere tosti vel in defruto poti vel ex melle sumpti. iidem aviditatem cibi faciunt, fastidium detrahunt. farina eorum aceto subacta papulas pruritusque in balneis inlita cohibet et per se siccatur ulcera. livores emendat, inflammationes cum polenta sedat. silvestrium efficacior vis contra coxendicum et lumborum debilitatem. ex iisdem decocta lentigines et cutem foventium corrigit, si vero ad mellis crassitudinem decoquantur, vel sativi vitiligines nigras et lepras emendant. sativi quoque rumpunt carbunculos inpositi, panos, strumas minuunt aut maturant cocti ex aceto, cicatricibus candidum colorem reddunt; si vero caelesti aqua discoquantur, sucus ille zmegma fit, quo fovere gangraenas, eruptiones pituitae, ulcerum manantia expediat, ad lienem bibere et cum melle haerentibus menstruis. lienem crudi cum fico sicca triti ex aceto inponuntur. radix quoque in aqua decocta urinas pellit. medentur pecori cum chamaeleone herba decocti, aqua in potum colata. sanant et scabiem quadripedum omnium in amurca decocti vel utroque liquore postea mixto. fumus crematorum culices necat.

irionem inter fruges sesamae similem esse diximus et a graecis erysimon

vocari, galli velam appellant. est autem fruticosum, foliis erucae, angustioribus paulo, semine nasturtii, utilissimum tussientibus cum melle et in thoracis purulentis excreationibus. datur et regio morbo et lumborum vitiis, pleuriticis, torminibus, coeliacis. inlinitur vero parotidum et carcinomatum malis, testium ardoribus ex aqua, alias cum melle, infantibus quoque utilissimum, item sedis vitiis et articulariis morbis cum melle et fico, contra venena etiam efficax potu. medetur et suspiriosis, item fistulis cum axungia vetere ita, ne intus addatur.

horminum semine, ut diximus, cumino simile est, cetero porro, dodrantali altitudine, duorum generum: alteri semen nigrius et oblongum - hoc ad venerem stimulandam et ad oculorum argema, albugines - , alteri candidius semen et rotundius. utroque tuso extrahuntur aculei ex corpore per se inlito vel ex aqua, folia ex aceto inposita panos per se vel cum melle discutunt, item furunculos, priusquam capita faciant, omnesque acrimonias.

quin et ipsae frugum pestes in aliquo sunt usu. infelix dictum est a vergilio lolium, hoc tamen molitum, ex aceto coctum inpositumque sanat inpetigines celerius, quo saepius mutatum est. medetur et podagrae aliisque doloribus cum oxymelite. ratio haec: aceti sextario uno diluuntur mellis unciae duae. iustum est ita temperatis sextariis tribus decoctae farinae lolii sextarios ... usque ad crassitudinem, calidumque inponi dolentibus membris. eadem farina extrahit ossa fracta.

miliaria appellatur herba, quae necat milium. haec trita et cornu cum vino infusa podagras iumentorum dicitur sanare.

bromos semen est spicam ferentis herbae. nascitur inter vitia segetis avenae genere, folio et stipula triticum imitatur; in cacuminibus dependentes parvas veluti locustas habet. semen utile ad cataplasmata, ad quae hordeum et similia. prodest tussientibus succus.

orobanchen appellavimus necantem ervum et legumina; alii cynomorion eam appellant a similitudine canini genitalis. cauliculus est sine foliis, pinguis, rubens. estur et per se et in patinis, cum tenera est, decocta.

et leguminibus innascuntur bestiolae venenatae, quae manus pungunt et periculum vitae adferunt, solipugarum generis. adversus has omnia eadem medentur, quae contra araneos et phalangia demonstrantur. et frugum quidem haec sunt in usu medico.

ex iisdem fiunt et potus, zythum in aegypto, caelia et cerea in hispania, cervesia et plura genera in gallia aliisque provinciis, quorum omnium spuma cutem feminarum in facie nutrit. nam quod ad potum ipsum attinet, praestat ad vini transire mentionem atque a vite ordiri medicinas arborum.

LIBER XXIII

peracta cerealium in medendo quoque natura est omniumque, quae ciborum aut florum odorumve gratia proveniunt supina tellure. non cessit iis pomona partesque medicas et pendentibus dedit, non contenta protegere arborumque umbra alere quae diximus, immo velut indignata plus auxili inesse his, quae longius a caelo abessent quaeque postea coepissent; primum enim homini cibum fuisse inde, et sic inducto caelum spectare, pascique et nunc ex se posse sine frugibus. ergo, hercule, artes in primis dedit vitibus, non contenta delicias etiam et odores atque unguenta omphacio et oenanthe ac massari, quae suis locis diximus, nobiliter instruxisse. ‘plurimum, inquit, homini voluptatis ex me est. ego sucum vini, liquorem olei gigno, ego palmas et poma totque varietates, neque, ut tellus, omnia per labores, aranda tauris, terenda areis, deinde saxis, ut quando quantove opere cibi fiant at ex me parata omnia nec cura laboranda, sed sese porrigentia ultro et, si pigeat attingere, etiam cadentia’. certavit ipsa secum plusque utilitatis causa genuit etiam quam voluptatis.

folia vitium et pampini capitis dolores inflammationesque corporum mitigant cum polenta, folia per se ardores stomachi ex aqua frigida, cum farina vero hordei articulares morbos. pampini triti et inpositi tumorem omnem siccant, sucus eorum dysintericis infusus medetur. lacrima vitium, quae veluti cummis est, lepras et lichenas et psoras nitro ante praeparatas sanat. eadem cum oleo saepius pilis inlitis psilotri effectum habet, maximeque quam virides accensae vites exudant, qua et verrucae tolluntur. pampini sanguinem excreantibus et mulierum a conceptu defectioni diluti potu prosunt. cortex vitium et folia arida vulnerum sanguinem sistunt ipsumque vulnus conglutinant. vitis albae, viridis tusae, suco inpetigines tolluntur. cinis sarmentorum vitium et vinaceorum condylomatis et sedis vitiis medetur ex aceto, item luxatis et ambustis et lienis tumori cum rosaceo et ruta et aceto. item igni sacro ex vino citra oleum aspergitur et intertrigini. et pilos absumit. dant et bibendum cinerem sarmentorum ad lienis remedia aceto conspersum ita, ut bini cyathi in tepida aqua bibantur utque qui biberit in lienem iaceat. claviculae ipsae, quibus repunt vites, tritae ex aqua potae sistunt vomitionum consuetudinem. cinis vitium cum axungia vetere contra tumores proficit, fistulas purgat, mox et persanat, nervorum dolores frigore ortos contractionesque, contusas vero partes vel cum oleo, carnes excrescentes in ossibus cum aceto et nitro, scorpionum et canum plagas cum oleo. corticis per se cinis combustis pilos reddit.

omphacium qua fieret ratione incipientis uvae pubertate, in unguentorum loco docuimus. nunc ad medicinam de eo pertinentia indicabimus. sanat ea quae in umore sint ulcera, ut oris, tonsillarum, genitalium. oculorum claritati plurimum confert, scabritiae genarum ulceribusque angulorum, nubeculis, ulceribus quacumque in parte manantibus, cicatricibus marcidis, ossibus

purulente limosis. mitigatur vehementia eius melle aut passo. prodest et dysintericis, sanguinem excreantibus, anginis.

omphacio cohaeret oenanthe, quam vites silvestres ferunt, dicta nobis in unguenti ratione. laudatissima in syria, maxime circa antiochiae et laodiceae montes et ex alba vite. refrigerat, astringit, vulneribus inspergitur, stomacho inlinitur, utilis urinae, iocineris, capitis doloribus, dysintericis, coeliacis, cholericis, contra fastidia obolo ex aceto pota. siccatur manantes capitis eruptiones, efficacissima ad vitia, quae sint in umidis, ideo et oris ulceribus et verendis ac sedi cum melle et croco. alvum sistit, genarum scabritiem emendat oculorumque lacrimationes, ex vino stomachi dissolutionem, ex aqua frigida pota sanguinis excreationes. cinis eius ad collyria et ad ulcera purganda et paronychia et pterygia probatur. uritur in furno, donec panis percoquatur. - massaris odoribus tantum gignitur, omniaque ea aviditas humani ingeni nobilitavit rapere festinando.

marescentium autem uvae vehementiores nigrae - ideo vinum ex his minus iucundum - , suaviores albae, quoniam e tralucido facilius accipitur a +r. recentes stomachum et spiritus inflatione alvum turbant. itaque in febris damnantur, utique largiores; gravedinem enim capiti morbumque lethargum faciunt. innocetiores quae decerptae diu pependere, qua ventilatione etiam utiles fiunt stomacho aegrisque, nam et refrigerant leviter et fastidium auferunt.

proximae a pensilibus in palea servatae; nam et in vinaceis servatae et caput et vesicam et stomachum infestant, sistunt tamen alvum, sanguinem excreantibus utilissimae. quae in vino aut in dulci conditae fuere, caput temptant; quae vero in musto fuere, peiorem vim etiamnum habent quam quae in vinaceis. sapa quoque inutiles stomacho facit. saluberrimas putant medici in caelesti aqua servatas, etiamsi minime iucundas, sed voluptatem earum in stomachi ardore sentiri et in amaritudine iecoris fellisque vomitionibus et in choleris, hydropicis cum ardore febrium aegrotantibus. at in ollis servatae et os et stomachum et aviditatem excitant, paulo tamen graviores existimantur fieri vinaceorum halitu. - uvae florem in cibo si edere gallinaei, uvas non attingunt. -

sarmenta earum, in quibus acini fuere, adstringendi vim habent, efficaciora ex ollis.

nuclei acinorum eandem vim optinent. hi sunt qui in vino capiti dolorem faciant. tosti tritique stomacho utiles sunt. inspergitur farina eorum polentae modo potioni et dysintericis et coeliacis et dissoluto stomacho. decocto etiam eorum fovere psoras et pruritum utile est.

vinacei per se minus capiti aut vesicae nocent quam nuclei, mammarum inflammationi utiles cum sale triti. decoctum eorum veteres dysintericos et coeliacos iuvat et potione et fotu.

uva theriace, de qua suo loco diximus, contra serpentium ictus estur. pampinos quoque eius edendos censent inponendosque. et vinum et acetum ex his factum auxiliarem contra eadem vim habet.

uva passa, quam astaphida vocant, stomachum, ventrem et interanea temptaret, nisi pro remedio in ipsis acinis nuclei essent. iis exemptis vesicae utilis habetur et tussi - alba utilior - , utilis et arteriae et renibus, sicut ex his passum privatim e serpentibus contra haemorrhoida potens. testium inflammationi cum farina cumini aut coriandri inponuntur, item carbunculis, articulariis morbis sine nucleis tritae cum ruta. fovere ante vino ulcera oportet. sanant epinyctidas et ceria et dysinteriam cum suis nucleis. et in oleo coctae gangraenis inlinuntur cum cortice raphani et melle, podagris et unguium mobilibus cum panace. et per se ad purgandum os caputque cum pipere conmanducantur.

astaphis agria sive staphis, quam uvam taminiam aliqui vocant falso - suum enim genus habet - , cauliculis nigris, rectis, foliis labruscae, fert folliculos verius quam acinos, virides, similes ciceri, in his nucleum triangulum. maturescit cum vindemia nigrescitque, cum taminiae rubentes norimus acinos sciamusque illam in apricis nasci, hanc non nisi in opacis. his nucleis ad purgationem uti non censuerim propter ancipitem strangulationem, neque ad pituitam oris siccandam, quia fauces laedunt. phthiriasi caput et reliquum corpus triti liberant, facilius admixta sandaraca, item pruritu et psoris. ad dentium dolores decocuntur in aceto, ad aurium vitia, rheumatismos cicatricum, ulcerum manantia. flos tritus in vino contra serpentes bibitur; semen enim abdicaverim propter nimiam vim ardoris. quidam eam pituitariam vocant. plagis serpentium utique inlinunt.

labrusca quoque oenanthem fert satis dictam. quae, a graecis ampelos agria appellata, spissis et candicantibus foliis, geniculata, rimoso cortice, fert uvas rubentes cocci modo, quae cutem in facie mulierum purgant et varos, coxendicum et lumborum vitiis tusae cum foliis et suco prosunt. radix decocta in aqua pota in vini coi cyathis ii umorem alvi ciet et ideo hydropicis datur. hanc potius crediderim esse quam vulgus uvam taminiam vocat. utuntur ea pro amuleto et ad expuitionem sanguinis quoque adhibent, non ultra gargarizationes et ne quid devoretur, addito sale, thymo, aceto mulso. ideo et purgationibus ancipitem putant.

est huic similis, sed in salictis nascens; ideo distinguitur nomine, cum eosdem usus habeat, et salicastrum vocatur. scabiem et pruriginem hominum quadripedumque aceto mulso trita haec efficacius tollit.

vitis alba est quam graeci ampelon leucen, alii staphylen, alii melothron, alii psilotrum, alii archezostim, alii cedrostin, alii madon appellant. huius sarmenta longis et exilibus internodiis geniculata scandunt. folia pampinosa ad magnitudinem hederæ dividuntur ut vitium. radix alba, grandis, raphano similis initio. ex ea caules asparagi similitudine exeunt. hi decocti in cibo alvum et urinam ciet. folia et caules exulcerant corpus, utique ulcerum phagedaenis et gangraenis tibiærumque taedio cum sale inlinuntur. semen in uva raris acinis dependet, suco rubente, postea crocino. novere id qui coria perficiunt; illo enim utuntur. psoris et lepris inlinitur, lactis abundantiam facit coctum cum tritico potumque. radix, numerosis utilitatibus nobilis, contra

serpentium ictus trita drachmis ii bibitur. vitia cutis in facie varosque et lentigines et suggillata emendat et cicatrices, eademque praestat in oleo decocta. datur et comitialibus potus, item mente conmotis aut vertigine laborantibus, drachmae pondere cotidie anno toto. et ipsa autem largior aliquando sensus turbat. illa vis praeclara, quod ossa infracta extrahit in aqua inposita ut bryonia; quare quidam hanc albam bryoniam vocant, aliam vero nigram. efficacior in eodem usu cum melle et ture. suppurationes incipientes discutit, veteres maturat et purgat. ciet menses et urinam. ecligma ex ea fit suspiriosis et contra lateris dolores, ruptis, convulsis. splenem ternis obolis pota xxx diebus consumit. inlinitur eadem cum fico et pterygiis digitorum. ex vino secundas feminarum adposita trahit et pituitam drachma pota in aqua mulsa. sucus radice colligi debet ante seminis maturitatem. qui inlitus per se et cum ervo laetiore quodam colore et cutis teneritate mangonicat corpora, serpentes fugat. tunditur ipsa radix cum fico pingui erugatque corpus, si statim bina stadia ambulentur, alias uret et nisi frigida abluatur. iucundius hoc idem praestat nigra vitis, quoniam alba prurimum adfert.

est ergo et nigra, quam proprie bryoniam vocant, alii chironiam, alii gynaecanthen aut aproniam, similem priori, praeterquam colore; huius enim nigrum esse diximus. asparagos eius diocles praetulit veris asparagis in cibo urinae ciendae lienique minuendo. in frutectis et harundinetis maxime nascitur. radix foris nigra, intus buxoe colore. ossa infracta vel efficacius extrahit quam supra dicta, cetera eadem. peculiare quod iumentorum cervicibus unice medetur. aiunt, si quis villam ea cinxerit, fugere accipitres tutasque fieri villares alites. eadem in iumento homineque flemina aut sanguinem, qui se ad talos deiecerit, circumligata sanat. et hactenus de vitium generibus.

musta differentias habent naturales has, quod sunt candida aut nigra aut inter utrumque, alia ex quibus vinum fiat, alia ex quibus passum. cura differentias innumerabiles facit; in plenum ergo haec dixisse conveniat: mustum omne stomacho inutile, venis iucundum. a balneis raptim et sine interspiratione potum necat. cantharidum naturae adversatur, item serpentibus, maxime haemorrhoidi et salamandrae. capitis dolores facit et gutturi inutile, prodest renibus, iocineri et interaneis, vesicae; conlevat enim ea. privatim contra buprestim valet, contra meconium, lactis coagulationem, cicutam, toxica, dorycnium, ex oleo potum redditumque vomitionibus. ad omnia infirmius album, iucundius passi mustum et quod minorem capitis dolorem adferat.

vini genera differentiasque perquam multas exposuimus et fere cuiusque proprietates. neque est ulla pars difficilius tractatu aut numerosior, quippe cum sit arduum dictu, pluribus prosit an noceat. praeterea quam ancipiti eventu potum statim auxilium fit aut venenum! etenim de natura ad remedia tantum pertinente nunc loquimur. unum de dando eo volumen asclepiades condidit, ab eo cognominatis qui postea uno de volumine illo disseruere innumera. nos ista romana gravitate artiumque liberalium adpetentia non ut medici, sed ut

indices salutis humanae diligenter distinguemus.

de generibus singulis disserere inmensum et inexplicabile est, discordibus medicorum sententiis. surrentinum veteres maxime probavere, sequens aetas albanum aut falernum, et deinde alia alii iniquissimo genere decreti, quod cuique gratissimum, ceteris omnibus pronuntiando. quod ut constarent sententiae, quota portio tamen mortalium his generibus posset uti iam vero nec proceres usquam sinceris. eo venere mores, ut nomina modo cellarum veneant, statim in lacibus vindemiae adulterentur. ergo, hercules, mirum dictu, innocentius iam est quodcumque et ignobilius. haec tamen fere constantissimae videntur sententiae, quorum mentionem fecimus. si quis hoc quoque discrimen exiget, falernum nec in novitate nec in nimia vetustate corpori salubre est; media eius aetas a xv annis incipit. frigidum potu stomacho utile, non item in calida. diutinae tussi sorbetur merum utiliter a ieiunis, item in quartanis. nullo aequae venae excitantur. alvum sistit, corpus alit. creditum est obscuritatem visus facere nec prodesse nervis aut vesicae. albana nervis utiliora; stomacho minus quae sunt dulcia; austera vel falerno utiliora. concoctionem minus adjuvant, stomachum modice implent; at surrentina nullo modo, nec caput temptant, stomachi et intestinorum rheumatismos cohibent. caecuba iam non gignuntur. et, quae supersunt, setina concoqui cibos cogunt; virium plus surrentino, austeritatis albano, vehementiae minus falerno habent. ab his statana non longo intervallo afuerint. alvo citae signinum maxime conducere indubitatum est. reliqua in commune dicentur.

vino aluntur vires, sanguis colosque hominum. hoc distat orbis medius et mitior plaga circumiectis. quantum illis feritas facit roboris, tantum nobis hic sucus. lactis potus ossa alit, frugum nervos, aqua carnes; ideo minus ruboris est in corporibus illis et minus roboris contraque labores patientiae. vino modico nervi iuvantur, copiosiore laeduntur; sic et oculi. stomachus recreatur et adpetentia ciborum invitatur; tristitia, cura hebetatur, urina et algor expellitur, somnus conciliatur. praeterea vomitiones sistit, collectiones extra lanis umidis inpositis mitigat. asclepiades utilitatem vini aequari vix deorum potentia posse pronuntiavit. vetus copiosiore aqua miscetur; quo magis urinam expellit, minus siti resistit. dulce minus inebriat, sed stomacho innatat; austerum facilius concoquitur. levissimum est quod celerrime inveteratur. minus infestat nervos quod vetustate dulcescit. stomacho minus utile est pingue, nigrum, sed corpora magis alit. tenue et austerum minus alit, magis stomachum nutrit, celerius per urinam transit; tanto magis capita temptat. hoc et in omni alio suco semel dictum sit. vinum diutino fumo inveteratum insaluberrimum. mangones ita in apothecis excogitare, iam et patresfamilias, aetatem addi. atqui per se cariem traxere. quo certe vocabulo satis consilii dedere prisci, quoniam et in materiis cariem fumus erodit; at nos e diverso fumi amaritudine vetustatem indui persuasum habemus. quae sunt admodum exalbida, haec vetustate insalubria fiunt. quo generosius vinum est, hoc magis vetustate crassescit et in amaritudinem corpori minime utilem coit. condire eo aliud minus annosum insalubre est; sua cuique vino saliva

innocentissima est, sua cuique aetas gratissima, hoc est media.

corpus augere volentibus aut mollire alvum conducit inter cibos bibere, contra minuentibus alvumque cohibentibus sitire in edendo, postea parum bibere. vinum ieiunos bibere novicio inutilissimum est curiosis vigoremque animi ad procinctum tendentibus; somno vero ac securitatibus iamdudum hoc fuit, quod homerica illa helena ante cibum ministravit. sic quoque in proverbium cessit “sapientiam vino obumbrari”. vino demus homines, quod soli animalium non sitientes bibimus. aquae potum interponere utilissimum itemque iugi superbibere. ebrietatem quidem frigidae potus extemplo discutit. meracis potionibus per xx dies ante canis ortum totidemque postea suadet hesiodus uti. merum quidem remedio est contra cicutas, coriandrum, aconita, viscum, meconium, argentum vivum, apes, vespas, crabrones, phalangia, serpentium scorpionumque ictus contraque omnia, quae refrigerando nocent, privatim contra haemorrhoidas, presteras, fungos, item contra inflationes rosionesque praecordiorum et quorum stomachus in vomitiones effunditur, et si venter aut interanea rheumatismum sentiant, dysintericis, sudatoribus e longa tussi, in epiphoris meracum. cardiacis in mamma laeva merum in spongia inponi prodest, ad omnia autem maxime album inveterascens. utiliter et fovetur vino calido virilitas. iumentis infusum cornu lassitudinem aufert. simias quadripedesque, quibus digiti sunt, negant crescere adsuetas meri potu.

nunc circa aegritudines sermo de vinis erit. saluberrimum liberaliter genitis campaniae quodcumque tenuissimum, vulgo vero quod quemque maxime iuverit validum. utilissimum omnibus sacco viribus fractis. meminerimus sucum esse, qui fervendo vires e musto sibi fecerit. misceri plura genera omnibus inutile. saluberrimum cui nihil in musta additum est, meliusque, si nec vasis pix adfuit. marmore enim et gypso aut calce condita quis non et validus expaverit in primis igitur vinum marina aqua factum inutile est stomacho, nervis, vesicae. resina condita frigidis stomachis utilia existimantur, non expedire vomitionibus, sicut neque mustum neque sapa neque passum. novicium resinatum nulli conducit; capitis dolorem et vertigines facit. ab hoc dicta crapula est. tussientibus et in rheumatismo nominata prosunt, item coeliacis et dysintericis, mulierum mensibus. in hoc genere rubrum nigrumve magis constringit magisque calefacit. innocentius pice sola conditum. sed et picem meminisse debemus non aliud esse quam combustae resinae fluxum. hoc genus vini excalfacit, concoquit, purgat. pectori, ventri utile, item vulvarum dolori, si sine febris sint, veteri rheumatismo, exulcerationi, ruptis, convulsis, vomicis, nervorum infirmitati, inflationibus, tussi, anhelationibus, luxatis in sucida lana inpositum. ad omnia haec utilius id, quod sponte naturae suae picem resipit picatumque appellatur helvico in pago, quo tamen nimio caput temptari convenit. quod ad febrium valitudines attinet, certum est, non dandum in febris nisi veteribus aegris nec nisi declinante morbo; in acutis vero periculis nullis nisi qui manifestas remissiones habeant, et has noctu potius - dimidia pars periculi est noctu, hoc

est spe somni, bibentibus - , nec a partu abortive nec a libidine aegrotantibus, nec in capitis doloribus, nec quorum accessiones cum frigore extremitatum fient, nec in febris tussientibus, nec in tremore nervorumve doloribus vel faucium aut si vis morbi circa ilia intellegatur, nec in duritia praecordiorum, venarum vehementia, neque in opisthotono, tetano, nec singultientibus nec si cum febris dyspnoea sit; minime vero oculis rigentibus, e genis stantibus aut defectis, gravibus nec quorum coniventium perlucebunt oculi palpebrisve non coeuntibus vel si dormientibus hoc idem eveniet aut si cruore suffundentur oculi vel si lemae in oculis erunt; minime lingua fungosa vel gravi et subinde imperfecta loquentibus; nec si urina difficile reddetur, neque expavescentibus repente, nec spasticis aut rursus torpentibus, nec si per somnos genitura effundetur.

cardiacorum morbo unicam spem hanc e vino esse certum est. sed id dandum non nisi in accessione censeat, alii in remissione, illi, ut sudorem coerceant, hi, quia tutius putant minuente se morbo, quam plurimum sententiam esse video. dari utique non nisi in cibo debet nec a somno nec praecedente alio potu, hoc est utique siti, nec nisi in desperatione suprema, et viro facilius quam feminae, seni quam iuveni, iuveni quam puero, hieme quam aestate, adsueto potius quam expertibus. modus dandi pro vehementia vini, item mixtura aquae. vulgo satis putant unum cyathum ii aquae misceri, si dissolutio sit stomachi, dandum; si cibus non descendat, iterum.

vini genera, quae fingi docuimus, nec fieri iam arbitror et supervacuum eorum usum, cum ipsis rebus, ex quibus finguntur, doceamus uti. et alias modum excesserat medicorum in his ostentatio, veluti e nasis vinum utile esse ab armorum equitandive lassitudine praecipientium atque, ut reliqua omittamus, etiam e iunipero. et quis satius censeat apsinthite vino utendum potius quam apsinthio ipso in reliquis omittatur et palmeum, capiti noxium ventrique tantum molliendo et sanguinem excreantibus non inutile. ficticium non potest videri quod non appellavimus, cum sit in eo sola pro arte festinatio. prodest stomacho dissoluto aut cibos non perficienti, praegnantibus defectis, paralyticis, tremulis, vertigini, torminibus, inchiadicis. in pestilentia quoque ac peregrinationibus vim magnam auxiliandi habere dicitur.

vini etiam vitium transit in remedia aceto. summa vis ei in refrigerando, non tamen minor in discutiendo; ita fit, ut infuso terra spumet. dictum est saepius diceturque, quotiens cum aliis prosit. per se haustum fastidia discit, singultus cohibet, sternumenta olfactatum. in balineis aestus arcet, si contineatur ore. quin et cum aqua bibitur multorum stomacho utiliter, gargarizatur cum eadem convalescentium, et a solis ardoribus oculis quoque illo modo saluberrimum fotu. medetur pota hirudine, item lepro, furfuribus, ulceribus manantibus, canis morsibus, scorpionum ictibus, scolopendrarum, muris aranei contraque omnium aculeatorum venena et pruritus, item contra multipedae morsum calidum in spongia adiecto aut sulphuris sextante sextariis iii aut hysopi fasciculo. medetur et sedis vitiis, in sanguinis fluctatione post excisos calculos et omnia alia foris in spongia inpositum, intus potum

cyathis binis quam acerrimum. conglobatum utique sanguinem discutit. contra lichenem et bibitur et inponitur. sistit alvum et rheumatismos interaneorum infusum, item procidentias sedis vulvaeque. tussim veterem inhibet et gutturis rheumatismos, orthopnoeam, dentium labefactionem. vesicae nocet nervorumque infirmitatibus. nesciere medici, quantum contra aspidas polleret. nuper ab aspidē calcata percussus utrem aceti ferens, quotiens deposuisset, sentiebat ictum, alias inlaeso similis. intellectum ibi remedium est potuque succursum. neque aliter os conluunt venena exsugentes. in totum domitrix vis haec non ciborum modo est, verum et rerum plurimarum. saxa rumpit infusum, quae non ruperit ignis antecedens. cibos quidem et sapes non alius magis sucus commendat aut excitat, in quo usu mitigatur usto pane aut cumino vel accenditur pipere ac lasere, utique sale conpescitur. non est praetereundum in eo exemplum ingens, siquidem m. agrippa supremis suis annis conflictatus gravi morbo pedum, cum dolorem eum perpeti nequiret, unius medicorum portentosa scientia ignorante Divo Augusto tanti putavit usu pedum sensuque omni carere, dummodo et dolore illo careret, demersis in acetum calidum cruribus in acerrimo impetu morbi.

acetum scillinum inveteratum magis probatur. prodest super ea, quae diximus, acescentibus cibis, gustatu enim discutit poenam eam; item iis qui ieiuni vomant, callum enim faucium facit ac stomachi. odorem oris tollit, gingivas adstringit, dentes firmat, colorem meliorem praestat. tarditatem quoque aurium gargarizatione purgat et transitum auditus aperit. oculorum aciem obiter exacuit, comitialibus, melancholicis, vertigini, volvarum strangulationibus, percussis aut praecipitatis et ob id sanguine conglobato, nervis infirmis, renium vitiis perquam utile, cavendum exulceratis.

oxymeli antiqui, ut dieuches tradit, hoc modo temperabant: mellis minas x, aceti veteris heminas v, salis marini pondo libram quadrantem, aquae sextarios v pariter coquebant deciens defervescente cortina atque ita diffundebant inveterabantque. sustulit totum id asclepiades coarguitque - nam etiam in febribus databant - , profuisse tamen fatetur contra serpentes, quas sepas vocant, et contra meconium ac viscum, et anginis calidum gargarizatum et auribus, oris gutturisque desideriiis. quae nunc omnia oxyalme contingunt, id est sale et aceto recente, efficacius.

vino cognata res sapa est musto decocto, donec tertia pars supersit. ex albo hoc melius. usus contra cantharidas, buprestim, pinorum erucas, quas pityocampas vocant, salamandras, contra mordentia venenata. secundas partusque emortuos trahit cum bulbis potum. fabianus auctor est venenum esse, si quis ieiunus a balineis id bibat.

consequens horum est faex, sui cuiusque generis. ergo vini faecibus tanta vis est, ut descendentes in cupas enecet. experimentum demissa praebet lucerna, quamdiu extinguitur, periculum denuntians. inlota miscetur medicamentis, cum iridis vero pari pondere eruptionibus pituitae inlinitur, et sicca vel madida contra phalangia et testium mammarumque inflammationi vel in quacumque parte corporis, item cum hordeacia farina et turis polline in

vino cocta. crematur et siccata. experimentum est legitime coctae, ut refrigerata linguam tactu videatur urere. celerrime exanimatur non inclusa condita. crematio ei multum virium adicit, utilissimae ad conpescendos lichenas, furfures cum fico decocta. sic et lepris et ulceribus manantibus inponitur. fungorum naturae contraria est pota, sed magis cruda. oculorum medicamentis cocta et lota miscetur. medetur inlita et testibus et genitalibus, in vino autem adversus strangurias bibitur. cum expiravit quoque, lavandis corporibus et vestibus utilis, tunc usum acaciae habet.

faex aceti pro materia acrior sit necesse est multoque magis exulceret. resistit suppurationum incrementis; stomachum, interanea, ventrem inlita adiuvat. sistit rheumatismos earum partium et mulierum menses. panos discutit nondum exulceratos et anginas, ignes sacros cum cera. mammas lactis sui inpatientes eadem extinguit, ungues scabros aufert. e serpentibus contra cerastas validissima cum polenta, cum melanthio autem contra crocodili morsus et canis. et haec cremata ampliat vires. tunc addito lentiscino oleo inlita una nocte rufat capillum. eadem ex aqua in linteolo adposita vulvas purgat.

sapae faece ambusta sanantur, melius addita lanugine harundinis, eadem faece decocta potaque tusses veteres. decoquitur in patinis cum sale et adipe ad tumorem quoque maxillarum et cervicium.

olearum proxima auctoritas intellegitur. folia earum vehementissime adstringunt, purgant, sistunt. itaque commanducata inposita ulceribus medentur et capitis doloribus inlita cum oleo, decoctum eorum cum melle iis, quae medici usserint, gingivarum inflammationibus et paronychiis sordidisque ulceribus et putrescentibus. cum melle sanguinis profluvium e nervosis partibus cohibet. sucus eorum carbunculantibus circa oculos ulceribus et pusulis procidentique pupillae efficax, quapropter in collyria additur. nam et veteres lacrimationes sanat et genarum erosiones. exprimitur autem sucus tunsis adfuso vino et aqua caelesti siccatusque in pastillos digeritur. sistit menses in lana admotus vulvae, utilis et sanie manantibus, item condylomatis, ignibus sacris quaeque serpunt ulcera, epinyctidi.

eosdem effectus et flos earum habet. uruntur cauliculi efflorescentes, ut cinis spodi vicem praestet, vinoque infuso iterum uritur. suppurationes et panos inlinunt cinere eo vel foliis tuis cum melle, oculos vero cum polenta. sucus fruticis recentis accensi destillans sanat lichenas, furfures, manantia ulcera. nam lacrima, quae ex arbore ipsa destillat, aethiopicae maxime oleae, mirari satis non est repertos, qui dentium dolores inlinendos censerent, venenum esse praedicantes atque etiam in oleastro quaerendum. e radice oleae quam tenerrimae cortex derasus in mel crebro gustatu medetur sanguinem reicientibus et suppurata extussientibus. ipsius oleae cinis cum axungia tumores sanat extrahitque fistulis vitia et ipsas sanat.

olivae albae stomacho utiliores, ventri minus. praeclarum habent usum, antequam condiantur, recentes per se cibi modo devoratae. medentur enim harenosae urinae, item dentibus carne mandenda adtritis aut convolsis. nigra

oliva stomacho inutilior, ventri faciliior; capiti, oculis non convenit. utraque ambustis prodest, trita et inlita illa, sed nigra commanducatur et protinus ex ore inposita pusulas gigni prohibet. colymbades sordida ulcera purgant, inutiles difficultatibus urinae.

de amurca poteramus videri satis dixisse catonem secuti, sed reddenda medicinae quoque est. gingivis et oris ulceribus, dentium stabilitati efficacissime subvenit, item ignibus sacris infusa et iis, quae serpant. pernionibus nigrae olivae amurca utilior, item infantibus fovendis, albae vero mulierum vulvae in lana admovetur. multo autem omnis amurca decocta efficacior. coquitur in cyprio vase ad crassitudinem mellis. usus eius cum aceto aut vino vetere aut mulso, ut quaeque causa exigat, in curationem oris, dentium, aurium, ulcerum manantium, genitalium, rhagadum. vulneribus in linteolis inponitur, luxatis in lana. ingens hic usus utique inveterato medicamento; tale enim fistulas sanat. infunditur sedis, genitalium, vulvae exulcerationi, inlinitur vero podagris incipientibus, item articulariis morbis. si vero cum omphacio recoquatur ad mellis crassitudinem, causarios dentes extrahit; item iumentorum scabiem cum decocto lupinorum et chamaeleonte herba mire sanat. cruda amurca podagras foveri utilissimum. oleastri foliorum eadem natura. spodium e cauliculis vehementius inhibet rheumatismos. sedat et inflammationes oculorum, purgat ulcera alienata et explet, excrescentia leniter erodit siccaturque et ad cicatricem perducit. cetera ut in oleis, peculiare autem, quod folia decocuntur ex melle et dantur coclearibus iii contra sanguinis excreationes. oleum tantum acrius efficaciusque, et ideo os quoque colluitur illo ad firmitatem dentium. inponuntur folia et paronychiis et carbunculis et contra omnem collectionem cum vino, iis vero, quae purganda sint, cum melle. miscentur oculorum medicamentis decoctum foliorum et sucus oleastri. utiliter et auribus instillatur cum melle vel si pus effluat. flore oleastri condylomata inlinuntur et epinyctides, item cum farina hordeacea venter in rheumatismo, cum oleo capitis dolores. cutem in capite ab ossibus recedentem cauliculi decocti et cum melle inpositi conprimunt. ex oleastro maturi in cibo sumpti sistunt alvum, tosti autem et cum melle triti nomas repurgant, carbunculos rumpunt.

olei naturam causasque abunde diximus. ad medicinam ex olei generibus haec pertinent, utilissimum esse omphacium, proxime viride, praeterea quam maxime recens - nisi cum vetustissimum quaeritur - , tenue, odoratum quodque non mordeat, e diverso quam cibus eligitur. omphacium prodest gingivis, si contineatur in ore, et colorem dentium custodit motusque stabilis. sudores cohibet. oenanthino idem effectus qui rosaceo. omni autem oleo mollitur corpus, vigorem et robur accipit. stomacho contrarium, auget et ulcerum incrementa. fauces exasperat et venena omnia hebetat, praecipue psimithi et gypsi, in aqua mulsa aut ficorum siccarum decocto potum contra meconium, ex aqua contra cantharidas, buprestim, salamandras, pityocampas, per se potum redditumque vomitionibus contra omnia supra dicta. lassitudinum et perfrictionum refectio est. tormina calidum potum cyathis vi

magisque ruta simul decocta pellit, item ventris animalia. solvit alvum heminae mensura cum vino et calida aqua potum aut tisanae suco, vulnerariis emplastris utile faciem purgat. bubus infusum per nares, donec ructent, inflationem sedat. vetus autem magis excalfacit corpora magisque discutit sudores, duritias magis diffundit, lethargicis auxiliare et inclinato morbo. oculorum claritati confert aliquid cum pari portione mellis acapni. capitis doloribus remedium est, item ardoribus in febris cum aqua. si vetusti non sit occasio, decoquitur, ut vetustatem repraesentet.

oleum cicinum bibitur ad purgationes ventris cum pari caldae mensura. privatim dicitur purgare praecordia. prodest et articulorum morbis, duritiis omnibus, vulvis, auribus, ambustis, cum cinere vero muricum sedis inflammationibus, item psorae. colorem cutis commendat capillumque fertili natura evocat. semen, ex quo fit, nulla animans attingit. ellychnia ex uva fiunt claritatis praecipuae, ex oleo lumen obscurum propter nimiam pinguitudinem. folia igni sacro inlinuntur ex aceto, per se autem recentia mammis et epiphoris, eadem decocta in vino inflammationibus cum polenta, croco; per se autem triduo inposita faciem purgant.

oleum amygdalinum purgat, mollit corpora, cutem erugat, nitorem commendat, varos cum melle tollit e facie. prodest et auribus cum rosaceo aut melle et mali punici tegmine decoctum vermiculosque in his necat et gravitatem auditus discutit, sonos incertos et tinnitus, obiter capitis dolores et oculorum. medetur furunculis et a sole ustis cum cera. ulcera manantia et furfures cum vino expurgat, condylomata cum meliloto; per se vero capiti inlitum somnum adlicit.

oleum laurinum utilius, quo recentius quoque viridius colore. vis eius excalfactoria, et ideo paralyticis, spasticis, ischiadicis, suggillatis, capitis doloribus, inveteratis destillationibus, auribus in calyce punici calfactum inlinuntur.

similis et myrtei olei ratio. adstringit, indurat. medetur gingivis, dentium dolori, dysinteriae, volvae exulceratae, vesicis, ulceribus vetustis vel manantibus cum squama aeris et cera, item eruptionibus, ambustis. adtritita sanat et furfures, rhagadas, condylomata, articulos luxatos, odorem gravem corporis. adversatur cantharidi, buprestis aliisque malis medicamentis, quae exulcerando nocent.

chamaemyrsinae sive oxymyrsinae eadem natura. - cupressinum oleum eosdem effectus habet quos myrteum, item citreum. - e nuce vero iuglande, quod caryinum appellavimus, alopeciis utile est et tarditati aurium infusum, item capitis dolori inlitum, cetero iners et gravi sapore. enimvero si quid in nucleo putridi fuerit, totus modius deperit. - ex cnidio grano factum eandem vim habet quam cicinum. - e lentisco factum utilissimum acopo est idemque proficeret quod rosaceum, ni durius paulo intellegeretur. utuntur eo et contra nimios sudores papulasque sudorum. scabiem iumentorum efficacissime sanat. - balaninum oleum repurgat varos, furunculos, lentigines, gingivas.

cypros qualis esset et quemadmodum ex ea fieret oleum docuimus. natura

eius excafacit, emollit nervos. folia stomacho inlinuntur et vulvae concitatae, sucus quoque eorum adponitur. folia recentia commanducata ulceribus in capite manantibus, item oris medentur et collectionibus, condylomatis. decoctum foliorum ambustis et luxatis prodest. ipsa rufant capillum tusa adiecto struthi mali suco. flos capitis dolores sedat cum aceto inlitus, item combustus in cruda olla nomas sanat et putrescentia ulcera per se vel cum melle. odor floris oleique somnum facit. - adstringit gleucinum et refrigerat eadem ratione qua oenanthinum.

balsaminum longe pretiosissimum omnium, ut in unguentis diximus, contra omnes serpentes efficax, oculorum claritati plurimum confert, caliginem discutit, item dyspnoeas, collectiones omnes duritiasque lenit. sanguinem densari prohibet, ulcera purgat, auribus, capitis doloribus, tremulis, spasticis, ruptis perquam utile. adversatur aconito ex lacte potum, febres cum horrore venientes perunctis leviores facit. utendum tamen modico, quoniam adurit augetque vitia non servato temperamento.

malobathri quoque naturam et genera exposuimus. urinam ciet, oculorum epiphoris in vino expressum utilissime inponitur, item frontibus dormire volentibus, efficacius, si et nares inlinantur aut si ex aqua bibatur. oris et halitus suavitatem commendat linguae subditum folium, sicut et vestium odorem interpositum.

hyoscyaminum emolliendo utile est, nervis inutile. potum quidem cerebri motus facit. - therminum e lupinis emollit, proximum rosaceo effectum. - narcissinum dictum est cum suo flore. - raphaninum phthiriasis longa valitudine contractas tollit scabritiasque cutis in facie emendat. - sesaminum aurium dolores sanat et ulcera, quae serpunt, et quae cacoe+the vocant. - liliinum, quod et syrium vocavimus, renibus utilissimum est sudoribusque evocandis, vulvae molliendae concoquendisque intus. - selgiticum nervis utile esse diximus, sicut herbacium quoque, quod iguvini circa flaminiam viam vendunt.

elaemeli, quod in syria ex ipsis oleis manare diximus, sapore melleo, non sine nausea alvum solvit, bilem praecipue detrahit ii cyathis in hemina aquae datis; qui bibere, torpescunt excitanturque crebro. potiores certaturi praesumunt ex eo cyathum unum. - pissino oleo usus ad tussim et quadripedum scabiem est.

a vitibus oleisque proxima nobilitas palmis. inebriant recentes, capitis dolorem adferunt minus siccae, nec, quantum videtur, utiles stomacho. tussim exasperant, corpus alunt. sucum decoctarum antiqui pro hydromelite dabant aegris ad vires recreandas, sitim sedandam, in quo usu praeferebant thebaicas, sanguinem quoque excreantibus utiles, in cibo maxime. inlinuntur caryotae stomacho, vesicae, ventri, intestinis cum cotoneis et cera et croco. suggillata emendant. nuclei palmarum cremati in fictili novo cinere loto spodi vicem efficiunt miscenturque collyriis et calliblephara faciunt addito nardo.

palma, quae fert myrobalanum, probatissima in aegypto, ossa non habet reliquarum modo in balanis. alvum et menses ciet in vino austero et vulnera

conglutinat.

palma elate sive spathe medicinae confert germina, folia, corticem. folia inponuntur praecordiiis, stomacho, iocineri, ulceribus, quae serpunt cicatrici repugnantia. psoras cortex eius tener cum resina et cera sanat diebus xx. decoquitur et ad testium vitia. capillum denigrat. suffitu partus extrahit. datur bibendus renium vitiis et vesicae et praecordiorum, capiti et nervis inimicus. vulvae ac ventris fluctiones sistit decoctum eius; item cinis et tormina, potus in vino albo in vulvarum vitiis efficacissimus.

proxime varietates generum medicinarumque mala habent. ex his verna acerba et stomacho inutilia sunt, alvum, vesicam circumagunt, nervos laedunt. cocta meliora. - cotonea cocta suaviora, cruda tamen, dumtaxat matura, prosunt sanguinem excreantibus et dysintericis, cholericis, coeliacis. non idem possunt decocta, quoniam amittunt constringentem illam vim suci, et tamen decocuntur in aqua caelesti ad eadem, quae supra scripta sunt. inponuntur et pectori in febris ardoribus, ad stomachi autem dolores cruda decoctave cerati modo inponuntur. lanugo eorum carbunculos sanat. cocta in vino et inlita cum cera alopecii capillum reddunt. quae ex iis cruda in melle conduntur, alvum movent; mellis autem suavitati multum adiciunt stomachoque utilius id faciunt. quae vero in melle cocta conduntur, quidam ad stomachi vitia trita cum rosae foliis decoctis dant pro cibo. sucus crudorum lienibus, orthopnoicis, hydropicis prodest, item mammis, condylomatis, varicibus; flos et viridis et siccus inflammationibus oculorum, excreationibus sanguinis, mensibus mulierum. fit et sucus ex illis mitis cum vino dulci tusis, utilis coeliacis et iocineri. decocto quoque eorum fovetur, si procidant, vulvae et interanea. fit et oleum ex iis, quod melinum vocavimus, quotiens ... non fuerint in umidis nata. ideo utilissima quae ex sicilia veniunt, minus utilia struthia, quamvis cognata. radix eorum circumscripta terra manu sinistra capitur ita, ut qui id faciet dicat, quare capiat et cuius causa. sic adalligata strumis medetur.

melimela et reliqua dulcia stomachum et ventrem solvunt, siticulosa, aestuosa, sed nervos non laedunt. - orbiculata sistunt alvum et vomitiones, urinas cient. - silvestria mala similia sunt vernis acerbis alvumque sistunt; sane in hunc usum immatura opus sunt.

citrea contra venenum in vino bibuntur vel ipsa vel semen. faciunt oris suavitatem decocto eorum colluti aut suco expresso. horum semen edendum praecipunt in malacia praegnatibus, ipsa vero contra infirmitatem stomachi, sed non nisi ex aceto facile manduntur.

punici mali novem genera nunc iterari supervacuum. ex iis dulcia, quae apyrena alio nomine appellavimus, stomacho inutilia habentur; inflationes pariunt, dentes gingivasque laedunt. quae vero ab his sapore proxima vinosa diximus, parvum nucleum habentia, utiliora paulo intelleguntur; alvum sistunt et stomachum, dumtaxat pauca, ultraque satietatem et haec minime danda, quamquam omnino nulla in febris, nec carne acinorum utili nec suco. caventur aequae vomitionibus ac bilem reicientibus. uvam in his ac ne mustum quidem,

sed protinus vinum aperuit natura. utrumque asperiore cortice; hic acerbis in magno usu. vulgus coria maxume perfici illo novit; ob id malicorium appellant medici. urinam cieri eodem monstrant mixtaque galla in aceto decoctum mobiles dentes stabilire. expetitur gravidarum malaciae, quoniam gustatu moveat infantem. dividitur malum caelestique aqua madescit ternis fere diebus; haec bibitur frigida coeliacis et sanguinem excreantibus.

ex acerbo fit medicamentum quod stomatice vocatur, utilissimum oris vitii, narium, aurium, oculorum caligini, pterygiis, genitalibus et iis, quas nomas vocant et quae in ulceribus excrescunt, contra leporem marinum hoc modo: acinis detracto cortice tunsis sucoque decocto ad tertias cum croci et aluminis scissi, murrae, mellis attici selibris. alii et hoc modo faciunt: punica acida multa tunduntur, sucus in cacabo novo coquitur mellis crassitudine ad virilitatis et sedis vitia et omnia, quae lycio curantur, aures purulentas, epiphoras incipientes, rubras maculas in manibus. rami punicorum serpentes fugant. cortices punici ex vino cocti et inpositi perniones sanant. contusum malum ex iii heminis vini decoctum ad heminam tormina et taenias pellit. punicum in olla nova, coperculo inlito, in furno exustum et contritum potumque in vino sistit alvum, discutit tormina.

primus pomi huius partus florere incipientis cytinus vocatur a graecis, mirae observationis multorum experimento. si quis unum ex his, solutus vinculo omni cinctus et calciatus atque etiam anuli, decerpserit ii digitis, pollice et quarto, sinistrae manus atque ita lustratis levi tactu oculis in os additum devoraverit, ne dente contingat, adfirmatur nullam oculorum inbecillitatem passurus eodem anno. iidem cytini siccati tritique carnes excrescentes cohibent, gingivis et dentibus medentur, vel si mobiles sint, decocto suco. ipsa corpuscula trita ulceribus, quae serpunt putrescuntve, inlinuntur, item oculorum inflammationi intestinorumque et fere ad omnia quae cortices malorum. adversantur scorpionibus.

non est satis mirari curam diligentiamque priscorum, qui omnia scrutati nihil intemptatum reliquerunt. in hoc ipso cytino flosculi sunt, antequam scilicet malum ipsum prodeat, erumpentes, quos balaustium vocari diximus. hos quoque ergo experti invenere scorpionibus adversari. sistunt potu menses feminarum, sanant ulcera oris, tonsillas, uvam, sanguinis excreationes, ventris et stomachi solutiones, genitalia, ulcera quacumque in parte manantia. siccavere etiam, ut sic quoque experirentur, inveneruntque tusorum farina dysintericos a morte revocari. alvum sistunt. quin et nucleos ipsos acinorum experiri non piguit. tosti tusique stomachum iuvant cibo aut potionibus. per se bibuntur ex aqua caelesti ad sistendam alvum. radix decocta sucum remittit, qui taenias necat victoriati pondere. eadem discocta in aqua quas lycium praestat utilitates.

est et silvestre punicum a similitudine appellatum. eius radices rubro cortice denari pondere ex vino potae somnos faciunt. semine poto aqua, quae subierit cutem, siccatur. mali punici corticis fumo culices fugantur.

pirorum omnium cibus, etiam valentibus onerosus, aegris vini quoque

modo negatur. decocta eadem mire salubria et grata, praecipue crustumina; quaecumque vero cum melle decocta stomachum adiuvant. fiunt cataplasmata e piris ad discutienda corporum vitia, et decocto eorum ad duritias utuntur. ipsa adversantur boletis atque fungis pelluntque pondere et pugnante suco. - pirum silvestre tardissime maturescit. conciditur suspensumque siccatur ad sistendam alvum, quod et decoctum eius potu praestat. decocuntur et folia cum pomo ad eosdem usus. pirorum ligni cinis contra fungos etiamnum efficacius proficit. - mala piraque iumentis portatu mire gravia sunt vel pauca. remedio aiunt esse, si prius edenda dentur aliqua aut utique ostendantur.

fici sucus lacteus aceti naturam habet, itaque coaguli modo lac contrahit. excipitur ante maturitatem pomi et in umbra siccatur ad aperienda ulcera, cienda menstrua adpositu cum luteo ovi aut potu cum amylo. podagris inlinitur cum farina graeci feni et aceto. pilos quoque detrahit palpebrarumque scabiem emendat, item lichenas et psoras. alvum solvit. lactis ficulni natura adversatur crabronum vesparumque et similium venenis, privatim scorpionum. idem cum axungia verrucas tollit. folia et quae non maturuere fici strumis inlinuntur omnibusque, quae emollienda sint discutiendave; praestant hoc et per se folia. et alius usus eorum in fricando lichene et alopeciis et quaecumque exulcerari opus sit. et adversus canis morsus ramorum teneri cauliculi cuti inponuntur. iidem cum melle ulceribus, quae ceria vocantur, inlinuntur. extrahunt infracta ossa cum papaveris silvestris foliis; canum rabiosorum morsus folio trito ex aceto restingunt. e nigra fico candidi cauliculi inlinuntur furunculis, muris aranei morsibus cum cera. cinis earum e foliis gangraenis consumendisque quae excrescant. fici maturae urinam cient, alvum solvunt, sudorem movent papulasque, ob id autumno insalubres, quoniam sudantia huius cibi opera corpora perfrigescunt. nec stomacho utiles, set ad breve tempus, et voci contrariae intelleguntur. novissimae salubriores quam primae, medicatae vero numquam. iuvenum vires augent, senibus meliorem valitudinem faciunt minusque rugarum. sitim sedant, calorem refrigerant, ob id non negandae in febribus constrictis, quas stegnas vocant. siccae fici stomachum laedunt, gutturi et faucibus magnifice utiles. natura his excalfaciendi. sitim adferunt, alvum molliunt, rheumatismis eius et stomacho contrariae, vesicae semper utiles et anhelatoribus ac suspiriosis, item iocinerum, renium, lienum vitiis. corpus et vires adiuvant; ob id antea athletae hoc cibo pascebantur - pythagoras exercitator primus ad carnes eos transtulit - ; recolligentes se a longa valitudine utilissime. item comitialibus et hydropicis omnibusque, quae maturanda aut discutienda sint, inponuntur, efficacius calce aut nitro aut iri admixta. coctae cum hysopo pectus purgant, pituitam, tussim veterem, cum vino autem sedem et tumores maxillarum. ad furunculos, panos, parotidas decoctae inlinuntur. utile et decocto fovere earum, feminasque decocto eodem cum faeno graeco. utiles sunt et pleuriticis ac peripneumonicis, cum ruta coctae torminibus. prosunt tibiurum ulceribus cum aeris flore, et parotidi, pterygiis cum punico malo, ambustis, pernionibus cum cera, hydropicis coctae in vino et cum absinthio et farina hordeacea. nitro

addito manducatae alvum solvunt. scorpionum ictibus cum sale tritae inlinuntur. carbunculos extrahunt in vino coctae et inpositae. carcinomati, si sine ulcere sit, quam pinguissimam ficum inponi paene singulare remedium est, item phagedaenae. cinis non ex alia arbore acrior. purgat, conglutinat, replet, adstringit. bibitur et ad discutiendum sanguinem concretum, item percussis, praecipitatis, ruptis, convulsis cineris cyathus in singulis aquae et olei. datur tetanicis et spasticis, item potus vel infusus coeliacis et dysintericis. et si quis eo cum oleo perungatur, excalfacit. idem cum cera et rosaceo subactus ambustis cicatricem tenuissimam obducit. lusciosos ex oleo inlitis emendat dentiumque vitia crebro fricatu. produnt etiam, si quis inclinata arbore supino ore aliquem nodum eius morsu abstulerit nullo vidente atque cum aluta inligatum licio e collo suspenderit, strumas et parotidas discuti. cortex tritus cum oleo ventris ulcera sanat. crudae grossi verrucas, thymos nitro, farina additis tollunt. spodi vicem exhibet fruticum a radice exeuntium cinis. bis lotus adiecto psimithio digeritur in pastillos ad ulcera oculorum et scabritiam.

caprificus etiamnum multo efficacior fico; surculo quoque eius lacte coagulatur in caseo. lactis minus habet; exceptum id coactumque in duritiam suavitatem carnibus adfert fricatu. dilutum aceto miscetur exulceratoriis medicamentis. alvum solvit, vulvam cum amylo aperit, menses ciet cum luteo ovi. podagricis cum farina graeci feni inlinuntur. lepras, psoras, lichenas, lentigines expurgat, item venenatorum ictus et canis morsus. dentium quoque dolori hic sucus adpositus in lana prodest aut in cava eorum additus. cauliculi et folia admixto ervo contra marinorum venena prosunt; adicitur et vinum. bubulas carnes additi caules magno ligni compendio percoquunt. grossi inlita strumas et omnem collectionem emolliunt et discutiunt; aliquatenus et folia. quae mollissima sunt ex iis, cum aceto ulcera manantia et epinyctidas, furfures sanant. cum melle foliis ceria sanant et canis morsus recentes, cum vino phagedaenas; cum papaveris foliis ossa extrahunt. grossi caprifici inflammationes discutiunt suffitu - resistunt et sanguini taurino potio et psimithio et lacti coagulato potae - , item in aqua decoctae atque inlita parotidas. cauliculi aut grossi eius quam minutissimae ad scorpionum ictus e vino bibuntur. lac quoque instillatur plagae et folia inponuntur, item adversus murem araneum. cauliculorum cinis uvam faucium sedat, arboris ipsius cinis ex melle rhagadia, radix defervefacta in vino dentium dolores. hiberna caprificus in aceto cocta et trita inpetigines tollit. inlinuntur ramenta e ramo sine cortice quam minutissima ad scobis modum. caprifico quoque medicinae unius miraculum additur: corticem eius intumescens puer impubis si defracto ramo detrahat dentibus, medullam ipsam adalligatam ante solis ortum prohibere strumas. caprificus tauros quamlibet feroces collo eorum circumdata in tantum mirabili natura conpescit, ut immobiles praestet.

herbam quoque graeci erinon vocant, reddendam in hoc loco propter gentilitatem. palmum alta est, cauliculis quinis fere, ocimi similitudine; flos candidus, semen nigrum, parvum. tritum cum attico melle oculorum epiphoris

medetur. suci instillatio - decerpta enim manat lacte multo dulci herba - perquam utilis aurium dolori nitri exiguo addito. folia resistunt venenis.

pruni folia decocta tonsillis, gingivis, uvae prosunt, in vino decocta et vehementius, subinde conluto ore. ipsa pruna alvum molliunt, stomacho non utilissima, sed brevi momento.

utiliora persica sucusque eorum, etiam in vino aut in aceto expressus. neque alius eis pomis innocentior cibus; nusquam minus odoris, suci plus, qui tamen sitim stimulet ... folia eius trita inlita haemorrhagian sistunt. nuclei persicorum cum oleo et aceto capitis doloribus inlinuntur.

silvestrium quidem prunorum bacae, vel e radice cortex, in vino austero si decoquantur ita, ut triens ex hemina supersit, alvum sistunt et tormina. satis est singulos cyathos decocti sumi. - et in his et sativis prunis est limus arborum, quem graeci lichena appellant, rhagadiis et condylomatis mire utilis.

mora, in aegypto et cypro sui generis, ut diximus, largo suco abundant summo cortice desquamato; altior plaga sicca est mirabili natura. sucus adversatur venenis serpentium, prodest dysintericis, discutit panos omnesque collectiones, vulnera conglutinat, capitis dolores sedat, item aurium. splenicis bibitur atque inlinitur et contra perfrictiones. celerrime teredinem sentit. neque apud nos suco minor usus: adversatur aconito et araneis in vino potus; alvum solvit, pituitas taeniasque et similia ventris animalia extrahit. hoc idem praestat et cortex tritus. folia tingunt capillum cum fici nigrae et vitis corticeve simul coctis aqua caelesti. pomi ipsius sucus alvum solvit protinus. ipsa poma ad praesens stomacho utilia, refrigerant, sitim faciunt; si non superveniat alius cibus, intumescunt. ex in maturis sucus sistit alvum, veluti animalis alicuius in hac arbore observandis miraculis, quae in natura eius diximus.

fit ex pomo panchrestos stomatice, eadem arteriace appellata, hoc modo: sextarii iii suci e pomo leni vapore ad crassitudinem mellis rediguntur; post additur omphacii aridi pondus #1108 ii aut murrae #1108 i, croci #1108 i; haec simul trita miscentur decocto. neque est aliud oris, arteriae, uvae, stomachi iucundius remedium. fit et alio modo: suci sextarii ii, mellis attici sextarius decoquantur ut supra diximus.

mira sunt praeterea quae produntur: prima germinatione, priusquam in folia exeant, sinistra decerpi futura poma. ricinos graeci vocant. hi terram si non attingere, sanguinem sistunt adalligati, sive ex vulnere fluat sive ore sive naribus sive haemorrhoidis. ad hoc servantur repositi. idem praestare et ramus dicitur luna plena defractus incipiens fructum habere, si terram non adtigerit, privatim mulieribus adalligatus lacerto contra abundantiam mensum. hoc et quocumque tempore ab ipsis decerptum ita, ut terram non adtingat, adalligatumque existimant praestare. folia mori trita aut arida decocta serpentium ictibus inponuntur; aequae potu proficitur. scorpionibus adversatur e radice corticis sucus ex vino aut posca potus. reddenda est et antiquorum compositio. sucum expressum pomi maturi in maturique mixtum coquebant vase aereo ad mellis crassitudinem. aliqui murra adiecta et cupresso praeduratum in vaso sole torrebant, permiscentes spatha ter die. haec erat

stomatice, qua et vulnera ad cicatricem perducebant. alia ratio suci: siccato exprimebant pomo, multum saporis opsoniorum conferentem, in medicina vero contra nomas et pectoris pituitas et ubicumque opus esset adstringi viscera. dentes quoque conluebant eo. tertium genus suci foliis et radice decoctis ad ambusta ex oleo inlinenda. inponuntur et folia per se. radix per messes incisa sucum dat aptissimum dentium dolori collectionibusque et suppurationibus. alvum purgat. folia mori in urina madefacta pilum coriis detrahunt.

cerasia alvum molliunt, stomacho inutilia; eadem siccata alvum sistunt, urinam cient. invenio apud auctores, si quis matutino roscida cum suis nucleis devoret, in tantum levare alvum, ut pedes morbo liberentur.

mespila exceptis setaniis, quae malo propiorem vim habent, reliqua adstringunt stomachum sistuntque alvum. item sorba sicca, nam recentia stomacho et alvo citae prosunt.

nuces pineae, quae resinam habent, contusae leviter, additis in singulas sextariis aquae ad dimidium decoctae, sanguinis excreationi medentur ita, ut cyathi bini bibantur ex eo. corticis e pinu in vino decoctum contra tormina datur. nuclei nucis pineae sitim sedant et acrimoniam stomachi rosionesque et contrarios umores consistentes ibi. et infirmitatem virium roborant, renibus, vesicae utiles. fauces videntur exasperare et tussim. bilem pellunt poti ex aqua aut vino aut passo aut balanorum decocto. miscetur his contra vehementiores stomachi rosiones cucumeris semen et sucus porcilacae, item ad vesicae ulcera et renes, quoniam et urinam cient.

amygdalae amarae radicum decoctum cutem in facie corrigit coloremque hilariorem facit. nucis ipsae somnum faciunt et aviditatem, urinam et menses cient. capitis dolori inlinuntur maximeque in febris; si ab ebrietate, in aceto et rosaceo et aquae sextario. sanguinem sistunt cum amylo et menta, lethargicis et comitialibus prosunt capite peruncto, epinyctidas sanant e vino vetere, ulcera putrescentia, canum morsus cum melle et furfures ex facie ante fotu praeparata, item iocineris et renium dolores ex aqua potae, set saepe et ecligmate cum resina terebinthina. calculosis et difficili urinae in passo et ad purgandam cutem in aqua mulsa tritae sunt efficaces. prosunt ecligmate cum lacte iocineri, tussi et colo cum elelisphaco modice addito e melle; sumitur nucis abellanae magnitudo. aiunt quinis fere praesumptis ebrietatem non sentire potores, vulpesque, si ederint eas nec contingat e vicino aquam lambere, mori. minus valent in remediis dulces. et hae tamen purgant, urinam cient. recentes stomachum implent.

nucibus graecis cum absinthii semine ex aceto sumptis morbus regius sanari dicitur, isdem inlitis per se vitia sedis et privatim condylomata, item tussis, sanguinis reiectio.

nuces iuglandes graeci a capitis gravedine appellavere. etenim arborum ipsarum foliorumque virus in cerebrum penetrat. hoc minore tormento, sed in cibis, nuclei faciunt. sunt autem recentes iucundiores; siccae unguinosiores et stomacho inutiles, difficiles concoctu, capitis dolorem inferentes, tussientibus inimicae, vomituris ieiunis aptae in tenesmo solo, trahunt enim pituitam.

eaedem praesumptae venena hebetant, item adversantur cepis leniuntque earum saporem. aurium inflammationi inponuntur, cum mellis exiguo et ruta mammis et luxatis, anginae cum ruta et oleo, cum cepa autem et sale et melle canis hominisque morsui. putamine nucis iuglandis dens cavus inuritur. putamen combustum tritumque in oleo aut vino infantium capite peruncto nutrit capillum; ideo ad alopecias sic utuntur. quo plures nuces quis ederit, hoc facilius taenias pellit. quae perveteres sunt, nuces gangraenis et carbunculis medentur, item suggillatis; cortex iuglandium lichenum vitio et dysintericis, folia trita cum aceto aurium dolori. in sanctuariis mithridatis, maximi regis, devicti cn. pompeius invenit in peculiari commentario ipsius manu compositionem antidoti e ii nucibus siccis, item ficis totidem et rutae foliis xx simul tritis, addito salis grano: ei, qui hoc ieiunus sumat, nullum venenum nociturum illo die. contra rabiosi quoque canis morsum nuclei a ieiuno homine commanducati inlitique praesenti remedio esse dicuntur.

nucis abellanae capitis dolorem faciunt et inflationem stomachi, corpori et pinguitudinis conferunt plus quam sit verisimile. set tostae et destillationi medentur, tussique veteri tritae in aqua mulsa potae; quidam adiciunt grana piperis, alii e passo bibunt. - pistacia eosdem usus habent, quos nuclei pinei, praeterque ad serpentium ictus, sive edantur sive bibantur. - castaneae vehementer sistunt stomachi et ventris fluctiones, alvum cient, sanguinem excreantibus prosunt, carnes alunt.

siliquae recentes, stomacho inutiles, alvum solvunt. eaedem siccatae sistunt stomachoque utiliores fiunt, urinam cient. syriacas in dolore stomachi ternas in aquae sextariis decoquunt quidam ad dimidium eumque sucum bibunt. - sudor virgae corni arboris, lamna candente ferrea exceptus non contingente ligno, inlitaeque inde ferrugo incipientes lichenas sanat. - arbutus sive unedo fructum fert difficilem concoctioni et stomacho inutilem.

laurus excafactoriam naturam habet et foliis et cortice et bacis; itaque decoctum ex his maximeque foliis, prodesse volvis et vesicis convenit. inlita vero vesparum crabronumque et apium, item serpentium venenis resistunt, maxime sepos, dipsadis et viperae. prosunt et mensibus feminarum cum oleo cocta, cum polenta autem, quae tenera sunt, trita ad inflammationes oculorum, cum ruta testium, cum rosaceo capitis dolores aut cum irino. quin et commanducata atque devorata per triduum terna liberant tussi, eadem suspiriis trita cum melle. cortex radice cavendus gravidis. ipsa radix calculos rumpit, iocineri prodest iii obolis in vino odorato pota. folia potu vomitiones movent. bacae menses trahunt adpositae tritae vel potae. tussim veterem et orthopnoean sanant binae detracto cortice in vino potae, si et febris sit, ex aqua aut ecligmate ex passo aut aqua mulsa decoctae. prosunt et phthisicis eodem modo et omnibus thoracis rheumatismis; nam et concoquunt pituitam et extrahunt. adversus scorpiones quaternae ex vino bibuntur. epinyctidas ex oleo inlitae et lentigines et ulcera manantia et ulcera oris et furfures, cutis porriginem sucus bacarum emendat et phthiriasim; aurium dolori aut gravitati instillatur cum vino vetere et rosaceo. perunctos eo fugiunt venenata omnia;

prodest contra ictus et potus.

maxime autem valet laurus, quae tenuissima habet folia. bacae cum vino serpentibus et scorpionibus et araneis resistunt; ex oleo et aceto inlinuntur et lien, iocineri, gangraenis cum melle. et in fatigatione etiam aut perfrictione suco eo perungui nitro adiecto prodest. sunt qui celeritati partus conferre multum putent radicem acetabuli mensura in aqua potam, efficacius recentem quam aridam. quidam adversus scorpionum ictus x bacas dari iubent potui, item et in remedio uvae iacentis quadrantem pondo bacarum foliorumve decoqui in aquae sextariis iii ad tertias, eam calidam gargarizare et in capitis dolore impari numero bacas cum oleo conterere et calfacere. - laurus delphicae folia trita olfactaque subinde pestilentiae contagia prohibent, tanto magis si et urantur. oleum ex delphica ad cerata acopumque, ad perfrictiones discutiendas, nervos laxandos, lateris dolores, febres frigidas utile est, item ad aurium dolorem in mali punici cortice tepefactum. folia decocta ad tertias partes aquae uvam cohibent gargarizatione, potu alvi dolores intestinorumque, tenerrima ex iis trita in vino papulas pruritusque inlita noctibus. - proxime valent cetera laurus genera. laurus alexandrina sive idaea partus celeres facit radice pota iii denariorum pondere in vini dulcis cyathis iii, secundas etiam pellit mensesque. eodem modo pota daphnoides sive iis nominibus, quae diximus, silvestris laurus prodest, alvum solvit vel recenti folio vel arido drachmis iii cum sale in hydromelite. manducata pituitas extrahit, folium et vomitus, stomacho inutile. sic et bacae quinae denae purgationis causa sumuntur.

myrtus sativa candida minus utilis medicinae quam nigra. semen eius medetur sanguinem excreantibus, item contra fungos in vino potum. odorem oris commendat vel pridie commanducatum; ita apud menandrum synaristosae hoc edunt. datur et dysintericis idem denarii pondere in vino. ulcera difficilia in extremitatibus corporis sanat cum vino subfervefactum. inponitur lippitudini cum polenta et cardiacis in mamma sinistra et contra scorpionis ictum in mero et ad vesicae vitia, capitis dolores, aegilopas, antequam suppurent, item tumoribus, exemptisque nucleis in vino vetere tritum eruptionibus pituitae. sucus seminis alvum sistit, urinam ciet. ad eruptiones pusularum pituitaeque cum cerato inlinuntur et contra phalangia; capillum denigrat. lenius suco oleum est ex eadem myrto, lenius et vinum, quo numquam inebriantur. inveteratum sistit alvum et stomachum, tormina sanat, fastidium abigit. foliorum arentium farina sudores cohibet inspersa vel in febre, utilis et coeliacis, procidentiae vulvarum, sedis vitiis, ulceribus manantibus, igni sacro fotu, capillis fluentibus, furfuribus, item aliis eruptionibus, ambustis. additur in medicamenta, quae liparas vocant, eadem de causa, qua oleum ex iis, efficacissimum ad ea, quae in umore sunt, tamquam in ore et vulva. folia ipsa fungis adversantur trita ex vino, cum cera vero articulariis morbis et collectionibus. eadem in vino decocta dysintericis et hydropicis potui dantur. siccantur in farinam, quae inspergitur ulceribus aut haemorrhagiis. purgant et lentigines, pterygia et paronychia et epinychidas,

condylomata, testes, tetra ulcera, item ambusta cum cerato. ad aures purulentas et foliis crematis utuntur et suco et decocto. comburuntur et in antidota; item cauliculi in flore decerpti et in fictili novo operto cremati in furno, dein triti ex vino. et ambustis foliorum cinis medetur. inguen ne intumescat ex ulcere, satis est surculum tantum myrti habere secum nec ferro nec terra contactum.

myrtidanum diximus quomodo fieret. vulvae prodest adpositu, fotu et inlitu, myrto efficacius et cortice et folio et semine. exprimitur et foliis succus, mollissimis in pila tuis, adfuso paulatim vino austero, alias aqua caelesti, atque etiam expresso utuntur ad oris, sedis ulcera, vulvae et ventris, capillorum nigritiam, alarum perfusiones, purgationes lentiginum et ubi constringendum aliquid est.

myrtus silvestris sive oxymyrsine sive chamaemyrsine bacis rubentibus et brevitate a sativa distat. radix eius in honore est, decocta vino ad renium dolores pota et difficili urinae praecipueque crassae et graveolenti, morbo regio et vulvarum purgationi trita cum vino; cauliculi quoque incipientes asparagorum modo in cibo sumpti et in cinere cocti. semen cum vino potum aut oleo et aceto calculos frangit, item in aceto et rosaceo tritum capitis dolores sedat et potum morbum regium. castor oxymyrsinen myrti ... foliisque acutis, ex qua fiunt ruri Scopae, ruscum vocavit, ad eosdem usus.

et hactenus habent se medicinae urbanarum arborum; transeamus ad silvestres.

LIBER XXIV

ne silvae quidem horridiorque naturae facies medicinis carent, sacra illa parente rerum omnium nusquam non remedia disponente homini, ut medicina fieret etiam solitudo ipsa, et ad singula illius discordiae atque concordiae miraculis occurrentibus. quercus et olea tam pertinaci odio dissident, ut altera in alterius scrobe depacta emoriantur, quercus vero et iuxta nucem iuglandem. pernicialia et brassicae cum vite odia; ipsum olus, quo vitis fugatur, adversum cyclamino et origano arescit. quin et annosas iam et quae sternantur arbores difficilius caedi, celerius marcescere tradunt, si prius manu quam ferro attingantur. pomorum onera a iumentis statim sentiri, ac, nisi prius ostendantur iis, quamvis pauca portent, sudare ilico. ferulae asinis gratissimo sunt in pabulo, ceteris vero iumentis praesentaneo veneno, qua de causa id animal libero patri adsignatur, cui et ferula. surdis etiam rerum sua cuique sunt venena ac minimis quoque. philyra coci et polline nimium salem cibus eximunt; praedulcium fastidium sal temperat; nitrosae aut amarae aquae polenta addita mitigantur, ut intra duas horas bibi possint, qua de causa in saccos vinarios additur polenta. similis vis rhodiae cretae et argillae nostrati. concordia valent, cum pix oleo extrahitur, quando utrumque pinguis naturae est. oleum solum calci miscetur, quando utrumque aquas odit. cummis aceto facilius eluitur, atramentum aqua, innumera praeterea alia, quae suis locis dicentur adsidue.

hinc nata medicina. haec sola naturae placuerat esse remedia, parata vulgo, inventu facilia ac sine impendio e quibus vivimus. postea fraudes hominum et ingeniorum capturae officinas invenere istas, in quibus sua cuique homini venalis promittitur vita. statim compositiones et mixturae inexplicabiles decantantur, arabia atque india remedia aestimantur, ulcerique parvo medicina a rubro mari inputatur, cum remedia vera cotidie pauperrimus quisque cenet. nam si ex horto petantur aut herba vel frutex quaeratur, nulla artium vilior fiat. ita est profecto, magnitudine populus r. perdidit ritus, vincendoque victi sumus. paremus externis, et una artium imperatoribus quoque imperaverunt. verum de his alias plura.

loton herbam itemque aegyptiam eodem nomine, alias et syrticam arborem, diximus suis locis. haec lotos, quae faba graeca appellatur a nostris, alvum baxis sistit. ramenta ligni decocta in vino prosunt dysintericis, menstruis, vertigini, comitialibus, cohibent et capillum. mirum his ramentis nihil esse amarius fructuque dulcius. fit et e scobe eius medicamentum ex aqua myrti decocta subacta et divisa in pastillos, dysintericis utilissimum pondere victoriati cum aquae cyathis iii.

glans intrita duritias, quas cacoe+the vocant, cum salsa axungia sanat. vehementiores iligna et in omnibus cortex ipse corticique tunica subiecta. haec decocta iuvat coeliacos. dysintericis et inlinitur vel ipsa glans. eadem resistit serpentium ictibus, rheumatismis, suppurationibus. folia et bacae vel

cortex vel sucus decocti prosunt contra toxica. cortex inlinitur decoctus lacte vaccino serpentis plagae; datur et ex vino dysintericis. eadem et ilici vis.

coccum ilicis vulneribus recentibus ex aceto inponitur, epiphoris ex aqua, oculis subfusus sanguine instillatur. est autem genus ex eo in africa fere et asia nascens, celerrime in vermiculum id se mutans, quod ideo scolecium vocant inprobantque. principalia eius genera diximus.

nec pauciora gallae genera fecimus, solidam perforatam, item albam nigram, maiorem minorem. vis omnium similis; optima commagena. excrescentia in corpore tollunt, prosunt gingivis, uvae, oris exulcerationi. crematae et vino extinctae ... coeliacis, dysintericis inlinuntur, paronychiis ex melle et unguibus scabris, pterygiis, ulceribus manantibus, condylomatis, ulceribus quae phagedaenica vocantur. in vino autem decoctae auribus instillantur, oculis inlinuntur, adversus eruptiones, panos cum aceto. nucleus commanducatus dentium dolorem sedat, item intertrigines et ambusta. inmaturae ex iis ex aceto potae lienem consumunt; eadem crematae et aceto salso extinctae menses sistunt vulvasque procidentes fotu. omnis capillos denigrat.

viscum e robore praecipuum haberi diximus et quo conficeretur modo. quidam contusum in aqua decocunt, donec nihil innatet, quidam commanducantes acinos expuunt cortices. optimum quod sine cortice quodque levissimum, extra fulvum, intus porraceum. nihil est glutinosius. emollit, discutit tumores, siccatur strumas; cum resina et cera panos mitigat omnis generis. quidam et galbanum adiciunt pari pondere singulorum eoque modo et ad vulnera utuntur. unguium scabritias expolit, si septenis diebus illinantur nitroque conluantur. quidam id religione efficacius fieri putant prima luna collectum e robore sine ferro, si terram non attigerit; comitialibus mederi, conceptum feminarum adiuvere, si omnino secum habeant; ulcera commanducato inpositoque efficacissime sanari.

roboris pilulae ex adipe ursino alopecias capillo replent. - cerri folia et cortex et glans siccatur collectiones suppurationesque, fluctiones sistit. torpentes membrorum partes conroborat decoctum eius fotu, cui et insidere expedit siccandis adstringendisque partibus. radix cerri adversatur scorpionibus.

suberis cortex tritus ex aqua calida potus sanguinem fluentem ex utralibet parte sistit. eiusdem cinis ex vino calido sanguinem excreantibus magnopere laudatur.

fagi folia manducantur in gingivarum laborumque vitiis. calculis glandis fagineae cinis inlinitur, item cum melle alopeciis.

cupressi folia trita serpentibus ulceribus inponuntur, et capiti cum polenta, si a sole doleat, item ramici, qua de causa et bibuntur. testium quoque tumori cum cera inlinuntur, capillum denigrant ex aceto. eadem trita cum ii partibus panis mollis e vino ammineo subacta pedum ac nervorum dolores sedant. pilulae adversus serpentium ictus bibuntur aut si eiciatur sanguis; collectionibus inlinuntur. ramici quoque tenerae tusae cum axungia et lomento prosunt. bibuntur ex eadem causa. parotidi et strumae cum farina inponuntur.

exprimitur sucus tuis cum semine. qui mixtus oleo caliginem oculorum aufert; item victoriati pondere in vino potus inlatusve cum fico sicca pingui exemptis granis vitia testium sanat, tumores discutit et cum fermento strumas. radix cum foliis trita pota vesicae et stranguriae medetur et contra phalangia. ramenta pota menses cient, scorpionum ictibus adversantur.

cedrus magna, quam cedrelaten vocant, dat picem, quae cedria vocatur, dentium doloribus utilissimam. frangit enim eos et extrahit, dolores sedat. cedri sucus ex ea quomodo fieret diximus. magni ad volumina usus, ni capiti dolorem inferret, defuncta corpora incorrupta aëvis servat, viventia corrumpit, mira differentia, cum vitam auferat spirantibus defunctisque pro vita sit. vestes quoque corrumpit et animalia necat. ob haec non censeam in anginis hoc remedio utendum neque in cruditatibus, quod suasere aliqui, gustatu. dentes quoque conluere ex aceto in dolore timuerim vel gravitati aut vermibus aurium instillare. portentum est, quod tradunt, abortivum fieri in venere ante perfusa virilitate. phthiriasis perunguere eo non dubitaverim, item porriginis. suadent et contra venenum leporis marini bibere in passo. facilius in elephantiasi inlinant. et ulcera sordida et excrescentia in iis auctores quidam et oculorum albugines caliginesque inunxere eo et contra pulmonis ulcera cyathum eius sorberi iusserunt, item adversus taenias. fit ex eo et oleum, quod pisselaeon vocant, vehementioris ad omnia eadem usus. cedri scobe serpentes fugari certum est, item bacis tritis cum oleo si qui perunguantur.

cedrides, hoc est fructus cedri, tussim sanant, urinam cient, alvum sistunt, utiles ruptis, convulsis, spasticis, stranguriae, vulvis, contra aconita, lepores marinos, eadem quae supra, collectionibus inflammationibusque.

de galbano diximus. neque humidum neque aridum probatur et quale docuimus. per se bibitur ad tussim veterem, suspiria, rupta, convulsa, inponitur ischiadicis, lateris doloribus, panis, furunculis, corpori ab ossibus recedenti, strumis, articulorum nodis, dentium quoque doloribus. inlinitur et cum melle capitis ulceribus. purulentis infunditur auribus cum rosaceo aut nardo. odore comitialibus subvenit et vulva strangulante vel in stomachi defectu. abortus non exeuntes trahit adpositu vel suffitu, item ramo hellebori circumlitum atque subiectum. serpentes nidore urentium fugari diximus. fugiunt et perunctos galbano. medetur et a scorpione percussis. bibitur et in difficili partu fabae magnitudine in cyatho vini, vulvasque conversas corrigit, cum murra autem et vino mortuos partus extrahit. adversatur et venenis, maxime toxicis, cum murra et vino. serpentes oleo et spondylion mixto tactu necat. nocere urinae existimatur.

similis hammoniacy natura atque lacrimae, probandae ut diximus. mollit, calefacit, discutit, dissolvit. claritati visus in collyriis convenit, pruritus, cicatrices, albugines oculorum tollit, dentium dolores sedat, efficacius accensum. prodest dyspnoicis, pleuriticis, pulmonibus, vesicis, urinae cruentae, lieni, ischiadicis potum - sic et alvum solvit -, articulis et podagrae cum pari pondere picis aut cerae et rosaceo coctum. maturat panos, extrahit clavos cum melle; sic et duritias emollit; lieni cum aceto et cera cypria vel

rosaceo efficacissime inponitur. lassitudines perungui cum aceto et oleo exiguoque nitro utile.

et styracis naturam in peregrinis arboribus exposuimus. placet praeter illa, quae diximus, maxime pinguis, purus, albicantibus fragmentis. medetur tussi, faucibus, pectoris vitiis, vulvae praeclusae duritieve laboranti, ciet menses potu adpositoque, alvum mollit. inuenio potu modico tristitiam animi resolvi, largiore contrahi. sonitus aurium emendat infusu, strumas illitu nervorumque nodos. adversatur venenis, quae frigore necent, ideo et cicutae.

spondylium una demonstratum infunditur capitibus phreneticorum et lethargicorum, item capitis doloribus longis cum oleo vetere; bibitur et in iocinerum vitiis, morbo regio, comitialibus, orthopnoicis, vulvarum strangulatione, quibus et suffitu prodest. alvum mollit. illinitur ulceribus, quae serpunt, cum ruta. flos auribus purulentis efficaciter infunditur, sed sucus, cum exprimitur, integendus est, quoniam mire adpetitur a muscis et similibus. radix derasa et in fistulas coniecta callum earum erodit. auribus quoque instillatur cum suco. datur et ipsa contra morbum regium et in iocineris vitio et vulvarum. capillos crispas facit peruncto capite.

sphagnos sive sphacos sive bryon et in gallia, ut indicavimus, nascitur, vulvis insidentium utilis, item genibus et feminum tumoribus mixtus nasturtio et aquae salsae tritus. cum vino autem et resina sicca potus urinam pellit celerrime. hydropicos inanit cum vino et iuniperis tritus ac potus.

terebinthi folia et radix collectionibus inponuntur. decoctum eorum stomachum firmat. semen in capitis dolore bibitur in vino et contra difficultatem urinae, ventrem leniter emollit, venerem excitat.

piceae et laricis folia trita ... et in aceto decocta dentium dolori. prodest cinis corticum intertrigini, ambustis; potus alvum sistit, urinam movet, suffitu vulvas corrigit. piceae folia privatim iocineri utilia sunt drachmae pondere in aqua mulsa pota. silvas eas dumtaxat, quae picis resinaeque gratia radantur, utilissimas esse phthisicis aut qui longa aegritudine non recolligant vires satis constat et illum caeli ae+ra plus ita quam navigationem aegyptiam proficere, plus quam lactis herbidos per montium aestiva potus.

chamaepitys latine abiga vocatur propter abortus, ab aliis tus terrae, cubitalibus ramis, flore pinus et odore. altera brevior et incurva, ... similis. tertia eodem odore et ideo nomine quoque, parvola, cauliculo digitali, foliis scabris, exilibus, albis, in petris nascens, omnes herbae, sed propter cognationem nominis non differendae. prosunt adversus scorpionum ictus, item iocineri inlita cum palmis aut cotoneis; renibus et vesicae decoctum earum cum farina hordeacea. morbo quoque regio et urinae difficultatibus ex aqua decoctae bibuntur. novissima contra serpentes valet cum melle; sic et adpositu vulvas purgat. sanguinem densatum extrahit pota. sudores facit perunctis ea, peculiariter renibus utilis. fiunt ex ea et hydropicis pilulae cum fico alvum trahentes. lumborum dolorem victoriati pondere in vino finit et tussim recentem. mortuos partus ex aceto cocta et pota eicere protinus dicitur.

cum honore et pityusa simili de causa dicetur, quam quidam in tithymali

genere numerant. frutex est similis piceae, flore parvo, purpureo. bilem et pituitam per alvum detrahit radix decocti hemina aut seminis lingula in balanis. folia in aceto decocta furfures cutis emendant, mammas quoque mixto rutae decocto et tormina et serpentium ictus et in totum collectiones incipientes.

resinam supra dictis arboribus gigni docuimus et genera eius et nationes in ratione vini ac postea in arboribus. summae species duae, sicca et liquida. sicca e pinu et picea fit, liquida terebintho, larice, lentisco, cupresso; nam et hae ferunt in asia ac syria. falluntur qui eandem putant esse e picea atque larice; picea enim pinguem et turis modo sucosam fundit, larix gracilem ac mellei coloris, virus redolentem. medici liquida raro utuntur et in ovo fere, e larice propter tussim ulceraque viscerum - nec pinea magnopere in usu - , ceteris non nisi coctis. et coquendi genera satis demonstravimus.

arborum differentia placet terebinthina odoratissima atque levissima, nationum cypria et syriaca, utraque mellis attici colore, sed cypria carnosior crassiorque. in sicco genere quaerunt ut sit candida, pura, perlucida, in omni autem ut montana potius quam campestris, item aquilonia potius quam ab alio vento. resolvitur resina ad vulnerum usus et malagmata oleo, in potiones amygdalis amaris. natura in medendo contrahere vulnera, purgare, discutere collectiones. lenit pectoris vitia terebinthina; inlinitur eadem calida membrorum doloribus spasticisque - in sole abluitur - et totis corporibus mangonum maxime cura ad gracilitatem emendandam, spatiis ita laxantium cutem per singula membra, capacioraque ciborum facienda corpora. proximum locum optinet e lentisco. inest ei vis adstringendi, movet et ante ceteras urinam. reliquae ventrem emolliunt, cruda concocunt, tussim veterem sedant, vulvae onera extrahunt etiam suffitae. privatim adversantur visco, panos et similia cum sebo taurino et melle sanant. palpebras lentiscina commodissime replicat, fractis quoque utilissima et auribus purulentis, item in pruritu genitalium. pinea capitis vulneribus optime medetur.

pix quoque unde et quibus conficeretur modis indicavimus et eius duo genera, spissum liquidumque. spissarum utilissima medicinae bruttia, quoniam pinguissima et resinosissima utrasque praebet utilitates, ob id et magis rutila quam ceterae. id enim quod in hoc adiciunt, ex mascula arbore meliorem esse, non arbitror posse intellegi. picis natura excalfacit, explet. adversatur privatim cerastae morsibus cum polenta, item anginae cum melle, destillationibus et sternumentis a pituita. auribus infunditur cum rosaceo, inlinitur cum cera. sanat lichenas, alvum solvit, excreationes pectoris adiuvat ecligmate aut inlitis tonsillis cum melle; sic et ulcera purgat, explet. cum uva passa et axungia carbunculos purgat et putrescentia ulcera; quae vero serpunt, cum pineo cortice aut sulphure. phthisicis cyathi mensura quidam dederunt et contra veterem tussim. rhagadas sedis et pedum panosque et ungues scabros emendat, vulvae duritias et conversiones, item odore lethargicos. strumas cum farina hordeacea et pueri inpubis urina decocta ad suppurationem perducit. et ad alopecias sicca pice utuntur, ad mulierum mammas bruttia ex vino

subfervefacta cum polline farraceo quam calidissimis linteis inpositis.

liquida pix oleumque, quod pisselaeon vocant, quemadmodum fieret diximus. quidam iterum decocunt et vocant palimpissam. liquida anginae perunguntur intus et uva, ... aurium dolores, claritatem oculorum, oris circumlitiones, suspiriosos, vulvas, tussim veterem et crebras excreationes pectoris, spasmos, tremores, opisthotonos, paralysis, nervorum dolores, praestantissimum ad canum et iumentorum scabiem.

est et pissasphaltos, mixta bitumini pice naturaliter ex apolloniatarum agro - quidam ipsi miscent - , praecipuum ad scabiem pecorum remedium aut si fetus mammae laeserit. nativum optimum ex eo, quod, cum fervet, innatat.

zopissam eradi navibus diximus, cera marino sale macerata. optima haec a tirocinio navium. additur autem in malagmata ad discutiendas collectiones.

taedae ... decoctaeque in aceto dentium dolores efficaciter colluunt.

lentisci arboris et semen et cortex et lacrima urinam cient, alvum sistunt; decoctum eorum ulcera, quae serpunt, fotu. inlinitur in umidis et igni sacro, gingivas conluit. folia dentibus in dolore atteruntur; mobiles decocto colluuntur; capillum tingunt. lacrima sedis vitiis prodest, cum quid siccari exalferive opus sit. decoctum et e lacrima stomacho utile, ructum et urinam movens. quod et capitis doloribus cum polenta illinitur. folia tenera oculis inflammatis illinuntur. mastiche lentisci replicandis palpebris et ad extendendam cutem in facie et zmegmata adhibetur et sanguinem reicientibus, tussi veteri et ad omnia, quae acaciae vis. medetur et attritis partibus sive oleo e semine eius facto ceraeque mixto sive foliis ex oleo decoctis, si hae cum aqua ita foveantur. scio democratem medicum in valitudine considia, m. servili consularis filiae, omnem curationem austeram recusantis diu efficaciter usum lacte caprarum, quas lentisco pascebat.

platani adversantur vespertilionibus, pilulae earum in vino potae #1108 iiii pondere omnibus serpentium et scorpionum venenis, item ambustis. tunsae autem cum aceto acri magisque scillite sanguinem omnem sistunt et lentiginem et carcinomata malandriasque veteres addito melle emendant. folia autem et cortex inlinuntur collectionibus et suppurationibus, his et decoctum eorum, corticis autem in aceto dentium remedium est, foliorum tenerrima in vino albo decocta oculorum. lanugo foliorum auribus et oculis inutilis. cinis pilularum sanat ambusta igni vel frigore. cortex e vino scorpionum ictus restinguit.

fraxinus quam vim adversus serpentes haberet indicavimus. semen foliis eius inest, quo medentur iocineris, laterum doloribus in vino, aquam, quae subit cutem, extrahunt. corpus obesum levant onere sensim ad maciem reducentibus isdem foliis cum vino tritis ad virium portionem, ita ut puero v folia iii cyathis diribeantur, robustioribus vii folia quinis vini. non omittendum ramenta eius et scobem a quibusdam cavenda praedici.

aceris radix contusa e vino iocineris doloribus efficacissime inponitur.

populi albae uvarum in unguentis usum exposuimus. cortex potus ischiadicis, stranguriae prodest, foliorum sucus calidus aurium dolori. virgam

populi in manu tenentibus intertrigo non metuitur. populus nigra efficacissima habetur, quae in creta nascitur; comitalibus semen ex aceto utile. fundit illa et resinam exiguam, qua utuntur ad malagmata. folia podagris in aceto decocta inponuntur.umor e cavis populi nigrae effluens verrucas papulasque - est attritu odoratus - tollit. populi ferunt et in foliis guttam, ex qua apes propolim faciunt. gutta quoque ad quae propolis ex aqua efficax.

ulmi et folia et cortex et rami vim habent spissandi et volnera contrahendi. corticis utique interior tilia lepras sedat et folia ex aceto inlita. corticis denarii pondus potum in hemina aquae frigidae alvum purgat pituitasque et aquas privatim trahit. inponitur et collectionibus lacrima et volneribus et ambustis, quae decocto fovere prodest. umor in folliculis arboris huius nascens cuti nitorem inducit faciemque gratiorem praestat. cauliculi foliorum primi vino decocti tumores sanant extrahuntque per fistulas. idem praestant et tiliae corticis. multi corticem commanducatum volneribus utilissimum putant, folia trita aqua adspersa pedum tumori. umor quoque e medulla, uti diximus, castratae arboris effluens capillum reddit capiti inlitus defluentesque continet.

arbor tilia lenius ad eadem fere utilis est, ad quae oleaster. folia autem tantum in usu et ad infantium ulcera et in ore et commanducata et decocta. urinam cient, menses sistunt inlita, sanguinem pota detrahunt.

sabucus habet alterum genus magis silvestre, quod graeci chamaeacten, alii helion vocant, multo brevius. utriusque decoctum in vino vetere foliorum vel seminis vel radice ad cyathos binos potum stomacho inutile, set alvo detrahens aquam. refrigerat etiam inflammationem, maxime recentia ambusta et canis morsus, cum polenta mollissimis foliorum inlitis. sucus cerebri collectiones privatimque membranae, quae circa cerebrum est, lenit infusus. acini eius infirmiores quam reliqua; tingunt capillum, poti acetabuli mensura urinam movent. foliorum mollissima ex oleo et sale eduntur ad pituitam bilemque detrahendam. ad omnia efficacior quae minor. radice eius decoctae in vino ii cyathi poti hydropicos exinaniunt, volvas emolliunt, has et foliorum decoctum insidentium. caules teneri mitioris sabuci in patinis cocti alvum solvunt. resistunt folia et serpentium ictibus in vino pota. podagris cum sebo hircino vehementer prosunt cauliculi inliti. iidem in aqua macerantur, ut sparsa ea pulices necentur; foliorum decocto si locus spargatur, muscae necantur. boa appellatur morbus popularum, cum rubent corpora; sabuci ramo verberatur. cortex interior tritus ex vino albo potus alvum solvit.

iunipirus vel ante cetera omnia excalfacit, extenuat, cedro alias similis. et huius duo genera, altera minor. utraque accensa serpentes fugat. semen stomachi, pectoris, lateris doloribus utile. inflationes algoresque discutit, tusses; concoquit duritias. inlitum tumores sistit, item alvum bacis ex vino nigro potis, item ventris tumores inlitis. miscetur et antidotis, oxyporis. urinas ciet. inlinitur et oculis in epiphoris. datur convulsis, ruptis, torminibus, volvis, ischiadicis cum vino albo potum pilulis quaternis aut decoctis xx in vino. sunt qui et perunguant corpus suco e semine eius in serpentium metu.

salicis fructus ante maturitatem in araneam abit, sed, si prius colligatur,

sanguinem reicientibus prodest. corticis e ramis primis cinis clavum et callum aqua mixta sanat. vitia cutis in facie emendat, magis admixto suco suo. est autem hic trium generum: unum arbor ipsa exsudat cummum modo, altero manat in plaga, cum floret, exciso cortice iii digitorum magnitudine. vis ad expurganda quae obstant oculis, item ad spissanda quae opus sit, ciendamque urinam et ad omnes collectiones intus extrahendas. tertius sucus est detruncatione ramorum a falce destillans. ex his ergo aliquis cum rosaceo in calice punici calfactus auribus infunditur vel folia cocta et cum cera trita inponuntur. item podagricis cortice et foliis in vino decoctis foveri nervos utilissimum. flos tritus cum foliis furfures purgat in facie. folia contrita et pota intemperantiam libidinis coercent atque in totum auferunt usum saepius sumpta. amerinae nigrae semen cum spuma argenti pari pondere a balneo inlitum psilotrum est.

non multum a salice vitilium usu distat vitex, foliorum quoque adspectu, nisi odore gratior esset. graeci lygon vocant, alias agnon, quoniam matronae thesmophoriis athenieniensium castitatem custodientes his foliis cubitus sibi sternunt. duo genera eius: maior in arborem salicis modo adsurgit, minor ramosa, foliis candidioribus, lanuginosis. prima album florem emittit cum purpureo; quae et candida vocatur, nigra quae tantum purpureum. nascuntur palustribus campis. semen potum vini quendam saporem habet et dicitur febres solvere et, cum unguantur oleo admixto, sudorem facere, sicut lassitudines dissolvere. urinam cient et menses. caput temptant vini modo - nam et odor similis - , set inflationes pellunt in inferiora, alvum sistunt, hydropicis et lienibus perquam utiles. lactis ubertatem faciunt. adversantur venenis serpentium, maxime quae frigus inferunt; minor efficacior ad serpentes: bibitur seminis drachma in vino vel posca aut ii foliorum terribiliorum. et inlinuntur utraque adversus araneorum morsus; vel perunctis tantum, suffitu quoque aut substratu fugant venenata. ad venerem impetus inhihent eoque maxime phalangiis adversantur, quorum morsus genitale excitat. capitis dolorem ex ebrietate sedant cum rosaceo flos tenerique cauliculi. seminis decoctum vehementiorem capitis dolorem dissolvit fotu et volvam etiam suffitu vel adpositu purgat, alvum cum puleio et melle potum. vomicas et panos, difficile concoquens, cum farina hordeacea mollit. lichenas et lentigines cum aphronitro et aceto semen sanat et oris ulcera et eruptionum cum melle, testium cum butyro et foliis vitium, rhagadas sedis cum aqua illitum. luxatis cum sale et nitro et cera et semine utilissimae et folio. additur in malagmata ad vitia nervorum et podagras semen; instillatur in oleo decoctum capiti in lethargia et phrenesi. virgam qui in manu habeant aut in cinctu, negantur intertriginem sentire.

ericen graeci vocant fruticem non multum a vitice differentem, colore roris marini et paene folio. hoc adversari serpentibus tradunt.

genista quoque vinculi usum praestat, floris apibus gratissimi. dubito an haec sit quam graeci auctores sparton appellavere, cum ex ea lina piscatoria apud eos factitari docuerim, et numquid hanc designaverit homerus, cum dixit

navium sparta dissoluta. nondum enim fuisse hispanum africanumve spartum in usu certum est et, cum fierent sutiles naves, lino tamen, non sparto umquam sutas. semen eius, quod graeci eodem nomine appellant, in folliculis passiolorum modo nascens purgat hellebori vice drachma et dimidia pota in aquae mulsae cyathis iiii ieiunis. rami, similiter frondes, in aceto macerati pluribus diebus et tunsu sucum dant ischiadicis utilem cyathi unius potu. quidam marina aqua macerare malunt et infundere clystere. perunguntur eodem suco ischiadici addito oleo. quidam et ad stranguriam utuntur semine. genista tunsu cum axungia genua dolentia sanat.

myricen ericam vocat lenaeus, similem scopis amerinis; sanari dicit ea carcinomata in vino decocta tritaque cum melle inlita. eandem esse arbitrantur quidam tamaricem et ad lienem praecipuam, si sucus eius expressus in vino bibatur, adeoque mirabilem eius antipathian contra solum hoc viscerum faciunt, ut adfirmant, si ex ea alveis factis bibant sues, sine liene inveniri. et ideo homini quoque splenico cibum potumque dant in vasis ex ea factis. gravis autem auctor in medicina virgam ex ea defractam, ut neque terram neque ferrum attingeret, sedare ventris dolores adseveravit inpositam ita, ut tunica cinctuque corpori adprimeretur. volgus infelicem arborem eam appellat, ut diximus, quoniam nihil ferat nec seratur umquam. corinthus et quae circa est graecia bryan vocat eiusque duo genera facit, silvestrem plane sterilem, alteram mitiorem. haec fert in aegypto syriaque etiam abundanter lignosum fructum, maiorem galla, asperum gustu, quo medici utuntur vice gallae in compositionibus, quas antheras vocant. et lignum autem et flos et folia et cortex in eosdem usus adhibentur, quamquam remissiora. datur sanguinem reicientibus cortex tritus et contra profluvia feminarum, coeliacis quoque; idem tunsus inpositusque collectiones omnes inhibet. foliis exprimitur sucus ad haec eadem et in vino decoquitur; ipsa vero adiecto melle gangraenis inlinuntur. decoctum eorum in vino potum ... imposita cum rosaceo et cera sedant; sic et epinyctidas sanant. dentium dolori, aurium decoctum eorum salutare est. radix ad eadem similiter. folia hoc amplius ad ea, quae serpunt, inponuntur cum polenta. semen drachmae pondere adversus phalangia et araneos bibitur, cum altilium vero pingui furunculis inponitur, efficax et contra serpentium ictus praeterquam aspidum. nec non morbo regio, phthiriasi, lendibus decoctum infusum prodest abundantiamque mulierum sistit. cinis arboris ad omnia eadem prodest. aiunt, si bovis castrati urinae misceatur vel in potu vel in cibo, venerem finire. carbo ex eo genere urina ea restinctus in umbra conditur: idem, cum libeat accendere, restituitur. magi id et spadonis urina fieri tradiderunt.

nec virga sanguinea felicior habetur. cortex eius interior cicatrices, quae praesanuere, aperit.

sileris folia inlita fronti capitis dolores sedant. eiusdem semen contritum in oleo phthiriasis coerces. serpentes et hunc fruticem fugiunt, baculumque rustici ob id ex eo gerunt.

ligustrum si eadem arbor est, quae in oriente cypros, suos in europa usus

habet. sucus discutit nervos, articulos, algores; folia ubique veteri ulceri, cum salis mica et oris exulcerationi prosunt, acini contra phthiriasim, item contra intertrigines vel folia. sanant et gallinaceorum pituitas acini.

folia alni ex ferventi aqua remedio sunt tumoris.

hederae genera viginti demonstravimus. natura omnium in medicina anceps. mentem turbat et caput purgat largius pota; nervis intus nocet, iisdem nervis adhibita foris prodest. eadem natura, quae aceto est, omnia genera eius refrigerant. urinam cient potu, capitis dolorem sedant, praecipue cerebro continentique cerebrum membranae utiliter mollibus inpositis foliis cum aceto et rosaceo tritis et decoctis, addito postea rosaceo oleo; inlinuntur autem fronti. et decocto eorum fovetur os caputque perungitur. lieni et pota et inilita prosunt. decocuntur et contra horrores febrium eruptionesque pituitae aut in vino teruntur. corymbi quoque poti vel iniliti lienem sanant, iocinera autem iniliti. trahunt et menses adpositi. sucus hederae taedia narium graveolentiamque emendat, praecipue albae sativae. idem infusus naribus caput purgat, efficacius addito nitro. infunditur etiam purulentis auribus aut dolentibus cum oleo. cicatricibus quoque decorem facit. ad lienes efficacior albae ferro calefactus. satis est acinos vi in vini cyathis ii sumi. acini ex eadem alba terni in aceto mulso poti taenias pellunt, in qua curatione ventri quoque inposuisse eos utile est. hedera, quam chrysocarpon appellavimus, baxis aurei coloris xx in vini sextario tritis, ita ut terni cyathi potentur, aquam, quae cutem subierit, urina educit; erasistratus eiusdem acinos v tritos in rosaceo oleo calefactosque in cortice punici instillavit dentium dolori a contraria aure. acini, qui croci sucum habent, praesumpti potu a crapula tutos praestant; item sanguinem excreantes aut torminibus laborantes hederae nigrae. candidioris corymbi poti steriles etiam viros faciunt. inlinuntur decocta quaecumque in vino omni ulcerum generi, etiamsi cacoe+the sint. lacrima hederae psilotrum est phthiriasimque tollit. flos cuiuscumque generis iii digitorum captu dysintericos et alvum citam emendat in vino austero bis die potus. et ambustis inlinuntur utiliter cum cera. denigrant capillum corymbi. radice sucus in aceto potus contra phalangia prodest. huius quoque ligni vaso splenicos bibentes sanari invenio. et acinos terunt, mox comburunt et ita inlinunt ambusta prius perfusa aqua calida. sunt qui et incidant suci gratia eoque utantur ad dentes erosos, frangique tradunt, proximis cera munitis, ne laedantur. cummim etiam in hedera quaerunt, quam ex aceto utilissimam dentibus promittunt.

graeci vicino vocabulo cisthon appellant fruticem maiorem thymo, foliis ocimi. duo eius genera: flos masculo rosaceus, feminae albus. ambo prosunt dysintericis et solutionibus ventris in vino austero ternis digitis flore capto et similiter bis die poto, ulceribus veteribus et ambustis cum cera et per se oris ulceribus. - sub his maxime nascitur hypocisthis, quam inter herbas dicemus.

cissos erythranos ab iisdem appellatur similis hederae, coxendicibus utilis e vino potus, item lumbis, tanta vi acini, ut sanguinem urina detrahat. - item chamaecisson appellant hederam non attollentem se a terra. et haec contunsa in vino acetabuli mensura lieni medetur, folia ambustis cum axungia. - milax

quaque, quae, anthophoros cognominatur, similitudinem hederæ habet, tenuioribus foliis. coronam ex ea factam in pari foliorum numero aiunt capitis doloribus mederi. quidam duo genera milacis dixere: alteram immortalitati proximam in convallibus opacis, scandentem arborum, comantibus acinorum corymbis, contra venenata omnia efficacissime iuvantem acinorum suco: infantibus saepe instillato nulla postea venena nocitura. alterum genus culta amare et in his gigni, nullius effectus. illam esse milacem priorem, cuius lignum ad aures sonare diximus. - similem huic aliqui clematida appellaverunt, repentem per arbores, geniculatam et ipsam. folia eius lepras purgant; semen alvum solvit acetabuli mensura in aquae hemina aut aqua mulsa. datur ex eadem causa et decoctum eius.

harundinis genera xxviii demonstravimus, non aliter evidentiore illa naturæ vi, quam continuis his voluminibus tractamus, siquidem harundinis radix contrita inposita felicitis stirpem corpore extrahit, item harundinem felicitis radix. et, quo plura genera facimus, illa, quae in iudaea syriaque nascitur odorum unguentorumque causa, urinam movet cum gramine aut apii semine decocta; ciet et menstrua admota; medetur convulsis ii obolis pota, iocineri, renibus, hydropi, tussi etiam suffitu magisque cum resina, furfuribus ulcerumque manantibus cum murra decocta. excipitur et sucus eius fitque elaterio similis. efficacissima in omni harundine quae proxima radici, efficaciora genicula. harundo cypria, quae donax vocatur, corticis cinere alopecias emendat, item putrescentia ulcera. foliis eius ad extrahendos aculeos utuntur, efficacibus et contra ignes sacros collectionesque omnes. vulgaris harundo extractoriam vim habet et recens tusa, non in radice tantum, in mulso enim et ipsam harundinem tradunt. medetur et luxatis et spinæ doloribus radix in aceto inlita; eadem recens trita et in vino pota venerem concitat. harundinum lanugo inlata auribus obtundit auditum.

cognata in aegypto res est harundini papyrus, praecipuae utilitatis, cum inaruit, ad laxandas siccandasque fistulas et intumescendo ad introitum medicamentorum aperiendas. charta, quae fit ex eo, cremata inter caustica est. cinis eius ex vino potus somnum facit; ipsa ex aqua inposita callum sanat.

ne in aegypto quidem nascitur hebenus, ut docuimus, nec tractamus in medicina alienos orbes, non omittetur tamen propter miraculum. scobem eius oculis unice mederi dicunt lignoque ad cotem trito cum passo caliginem discuti, ex aqua vero radice albugines oculorum, item tussim pari modo dracunculi radicis adiecto cum melle. hebenum medici et inter erodentia adsumunt.

rhododendros ne nomen quidem apud nos invenit latinum; rhododaphnen vocant aut nerium. mirum folia eius quadripedum venenum esse, homini vero contra serpentes praesidium ruta addita e vino pota. pecus etiam et caprae, si aquam biberint, in qua folia ea maduerint, mori dicuntur.

nec rhus latinum nomen habet, cum in usum pluribus modis veniat. nam et herba est silvestris, foliis myrti, cauliculis brevibus, quae taenias pellit, et frutex coriarius appellatur, subrutilis, cubitalis, crassitudine digitalis, cuius

aridis foliis ut malicorio coria perficiuntur. medici autem rhoicis utuntur ad contusa, item coeliacos et sedis ulcera aut quae phagedaenas vocant; ... trita cum melle et inlita cum aceto. decoctum eorum instillatur auribus purulentis. fit et stomatice decoctis ramis ad eadem quae ex moris, sed efficacior admixto alumine. inlinitur eadem hydropicorum tumori.

rhus, qui erythros appellatur, semen est huius fruticis. vim habet adstringendi refrigerandique. adspergitur pro sale obsoniis alvo soluta omnesque carnes cum silphio suaviores facit. medetur ulceribus manantibus, cum melle asperitati linguae, percussis, lividis, desquamatis; eodem modo capitis vulnera ad cicatricem celerrime perducit. feminarum abundantiam sistit cibo.

alia res erythrodanum, quam aliqui ereuthodanum vocant, nos rubiam, qua tinguntur lanae pellesque perficiuntur. in medicina urinam ciet, morbum regium sanat ex aqua mulsa - et lichenas ex aceto inlita - , ischiadicos, paralyticos ita, ut bibentes laventur cotidie. radix semenque trahunt menses, alvum sistunt et collectiones discutiunt. contra serpentes rami cum foliis inponuntur. folia et capillum inficiunt. invenio apud quosdam morbum regium sanari hoc frutice, etiam si adalligatus spectetur tantum.

distat ab eo qui alysson vocatur foliis tantum et ramis minoribus. nomen accepit, quod a cane morsos rabiem sentire non patitur ex aceto potus adalligatusque. mirum est quod additur, saniem conspecto omnino frutice eo sicari.

tinguentibus et radícula lanas praeparat, quam struthion a graecis vocari diximus. medetur morbo regio et ipsa et decoctum eius potu, item pectoris vitiis. urinam ciet, alvum solvit. et vulvas purgat, quam ob rem aureum $\pi\epsilon\sigma\sigma\acute{o}\nu$ medici vocant ex ea. e melle prodest magnifice et tussi, orthopnoeae coclearis mensura, cum polenta vero et aceto lepras tollit. eadem cum panace et capparis radice calculos frangit pellitque, panos discutit cum farina hordeacia et vino decocta. miscetur et malagmatis et collyriis claritatis causa, sternumento utilis inter pauca, lienī quoque ac iocineri. eadem pota denarii unius pondere ex aqua mulsa suspiriosos sanat, sic et pleuríticos et omnes lateris doloris. - apocyni semen ex aqua - frutex est folio hederæ, molliore tamen, et minus longis viticulis, semine acuto, diviso, lanuginoso, gravi odore - canes et omnes quadripedes necat in cibo datum.

rosmarinum dictum est. duo genera eius: alterum sterile, alterum cui et caulis et semen resinaceum, quod cachrys vocatur. foliis odor turis. radix vulnera sanat viridis inposita et sedis procidentiam, condylomata, haemorrhoidas, sucus et fruticis et radicis morbum regium et ea, quae repurganda sunt. oculorum aciem exacuit. semen ad vetera pectoris vitia datur potui et ad vulvas cum vino et pipere, menses adiuvat, podagris inlinitur cum aerina farina, purgat etiam lentigines et quae excalfacienda sint aut cum sudor quaerendus inlitum, item convulsis. auget et lacte in vino potum, item radix. ipsa herba strumis cum aceto inlinitur, ad tussim cum melle prodest.

cachrys multa genera habet, ut diximus. sed haec, quae ex rore supra dicto

nascitur, si fricetur, resinosa est. adversatur venenis et venenatis praeterquam anguib. sudores movet, tormina discutit, lactis ubertatem facit.

herba sabina, brathy appellata a graecis, duorum generum est, altera tamarici folio similis, altera cupresso; quare quidam creticam cupressum dixerunt. a multis in suffitus pro ture adsumitur, in medicamentis vero duplicato pondere eosdem effectus habere quos cinnamum traditur. collectiones minuit et nomas conpescit, inlita ulcera purgat, partus emortuos adposita extrahit et suffita. inlinitur igni sacro et carbunculis cum melle; ex vino pota regio morbo medetur. gallinacii generis pituitas fumo eius herbae sanari tradunt.

similis herbae huic sabinae est selago appellata. legitur sine ferro, dextra manu per tunicam operta, sinistra eruitur velut a furante, candida veste vestito pureque lautis nudis pedibus, sacro facto, priusquam legatur, pane vinoque; fertur in mappa nova. hanc contra perniciem omnem habendam prodidere druidae gallorum et contra omnia oculorum vitia fumum eius prodesse.

iidem samolum herbam nominavere nascentem in umidis, et hanc sinistra manu legi a ieiunis contra morbos suum boumque, nec respicere legentem neque alibi quam in canali deponere, ibi conterere poturis.

cummium genera diximus. in his maiores effectus melioris cuiusque erunt. dentibus inutiles sunt, sanguinem coagulant et ideo reicientibus sanguinem prosunt, item ambustis, arteriae vitiis inutiles, urinam cient, amaritudines hebetant. adstrictoriis ceteris, quae ex amygdala amara est spissandisque visceribus efficacior, habet excafactorias vires. proponuntur prunorum etiam et cerasorum ac vitium. siccant inlita et adstringunt, ex aceto vero infantium lichenes sanant, prosunt et tussi veteri iiii obolis in mixto potis. creduntur et colorem gratiorem facere ciborumque adpetentiam et calculosis prodesse cum passo potae. oculorum et vulnerum utilitatibus maxime conveniunt.

spina arabica - spinae aegyptiae laudes in odorum loco diximus - et ipsa astringit spissatque destillationes omnes et sanguinis excreationes mensumque abundantiam, etiamnum radice valentior.

spinae albae semen contra scorpiones auxiliatur. corona ex ea inposita capitis dolores minuit. - est huic similis quam graeci acanthion vocant, minoribus multo foliis, aculeatis per extremitates et araneosa lanugine obductis, qua collecta etiam vestes quaedam bombycinis similes fiunt in oriente. ipsa folia vel radices ad remedia opisthotoni bibuntur.

et acacia e spina fit in aegypto, alba nigraque arbore, item viridi, sed longe meliore prioribus. fit et in galatia, deterrima spinosiore arbore. semen omnium lenticulae simile, minore tantum et grano et folliculo. colligitur autumnno, ante collectum nimio validius spissat. sucus ex folliculis aqua caelesti perfusis, mox in pila tuis exprimitur organis, tunc densatur in sole mortariis in pastillos. fit et foliis minus efficax. ad coria perficienda semine pro galla utuntur. foliorum sucus et galaticae acaciae nigerrimus inprobatur, item qui valde rufus. purpurea aut leucophaea et quae facillime diluitur - vis summa ad spissandum refrigerandumque est - oculorum medicamentis ante alia utiles.

lavantur in eos usus pastilli, ab aliis torrentur, ab aliis peruruntur. capillum tingunt, sanant ignem sacrum, ulcera, quae serpunt, et umida vitia corporis, collectiones, articulos contusos, perniones, pterygia. abundantiam mensum in feminis sistunt vulvamque et sedem procidentes, item oculos, oris ulcera et genitalium.

vulgaris quoque haec spina, ex qua aenae fulloniae implentur, radicis usus habet. per hispanias quidem multi et inter odores et ad unguenta utuntur illa, aspalathum vocantes. est sine dubio hoc nomine spina silvestris in oriente, ut diximus, candida, magnitudine arboris iustae, sed et frutex humilior, aequè spinosus, in nisyro et rhodiorum insulis, quem alii erysisceptrum, alii phasganon, syri diaxylon vocant. optimus qui minime ferulaceus, rubens aut in purpuram vergens detracto cortice. nascitur pluribus locis, sed non ubique odoratus. quam vim haberet caelesti arcu in eum innixio diximus. sanat taetra oris ulcera et ozaenas, genitalia exulcerata aut carbunculantia, item rhagadia, inflationes potu discutit et strangurias. cortex sanguinem reddentibus medetur. decoctum eius alvum sistit. similia praestare silvestrem quoque putant.

spina et appendix appellata, quoniam bacae puniceo colore in ea appendices vocantur. hae crude per se et aridae decoctae in vino alvum citam ac tormina conpescunt. - pyracanthae bacae contra serpentium ictus bibuntur.

paliurus quoque spinæ genus est. semen eius afri zuram vocant, contra scorpiones efficacissimum, item calculosis et tussi. folia adstrictoriam vim habent. radix discutit panos, collectiones, vomicas, urinas trahit pota. decoctum eius in vino alvum sistit, serpentibus adversatur. radix praecipue datur in vino.

aquifoliae folia contusa addito sale articulorum morbis prosunt, bacae purgationi feminarum, coeliacis, dysintericis, cholericis. in vino potae sistunt alvum. radix decocta et inlita extrahit infixæ corpori, utilissima et luxatis tumoribusque. aquifolia arbor in domo aut villa sata veneficia arcet. flore eius aquam glaciari pythagoras tradit; item baculum ex ea factum in quodvis animal emissum, etiamsi citra ceciderit defectu mittentis, ipsum per sese cubito propius adlabi; tam praecipuam naturam inesse arbori. - taxi arboris fumus necat mures.

nec rubos ad maleficia tantum genuit natura, ideoque et mora his, hoc est vel hominibus cibos, dedit. vim habent siccandi, adstringendi, gingivis, tonsillis, genitalibus accommodatissimi. adversantur serpentium sceleratissimis, haemorrhoidi et presteri, flos aut mora scorpionibus. vulnera sine collectionum periculo iungunt. urinas cient. caules eorum teneri tunduntur exprimiturque sucus, mox sole cogitur in crassitudinem mellis; singulari remedio contra mala oris oculorumque, sanguinem exscreantes, anginas, vulvas, sedes, coeliacos intellegitur potus aut inlitus. oris quidem vitiis etiam folia commanducata prosunt et ulceribus manantibus aut quibuscumque in capite inlinuntur. cardiacis sic vel per se inponuntur a mamma sinistra, item stomacho in doloribus oculisque procidentibus. instillatur sucus eorum et auribus. sanat condylomata cum rosaceo cerato.

cauliculorum ex vino decoctum uvae praesentaneum remedium est. iidem per se in cibo sumpti cymae modo aut decocti in vino austero labantes dentes firmant. alvum sistunt et profluvia sanguinis; dysintericis prosunt. siccantur in umbra, ut cinis crematorum uvam reprimat. folia quoque arefacta et contusa iumentorum ulceribus utilia traduntur. mora, quae in iis nascuntur, vel efficacior stomaticen praebuerint quam sativa morus. eadem compositione vel cum hypocisthidae tantum et melle bibuntur in cholera et a cardiacis et contra araneos. inter medicamenta, quae styptica vocant, nihil efficacius rubi mora ferentis radice decocta in vino ad tertias partes, ut colluantur eo oris ulcera et sedis foveantur, quae tanta vis est, ut spongeae ipsae lapidescant.

alterum genus rubi, in quo rosa nascitur, gignit pilulam castaneae similem, calculosis praecipuo remedio - alia est cynorrhoda, quam proximo dicemus volumine - ; cynosbaton, alii cynapanxin, alii neurospaston vocant. folium habet vestigio hominis simile. fert et uvam nigram, in cuius acino nervum habet, unde neurospastos dicitur tota, alia quam cappari, quod medici cynosbaton appellarunt. huius thyrsus ad remedia splenis et inflationes conditus ex aceto manditur. nervus eius cum mastiche chia commanducatus os purgat. ruborum rosa alopecias cum axungia emendat. mora capillum tingunt cum omphacino oleo. flos mori messe colligitur; candidus pleuriticis praecipuus ex vino potus, item coeliacis. radix ad tertias decocta alvum sistit et sanguinem, item dentes collutos decocto. eodem suco foveantur sedis atque genitalium ulcera. cinis e radice reprimat uvam.

idaeus rubus appellatus est, quoniam in ida non alius nascitur. est autem tenerior ac minor, rarioribus calamis innocentioribusque, sub arborum umbra nascens. huius flos cum melle epiphoris inlinitur et ignibus sacris, stomachicisque ex aqua bibendus datur. cetera eadem praestat, quae supra dicta.

inter genera ruborum rhamnos appellatur a graecis, candidior, fruticosior et ramos spargens rectis aculeis, non, ut ceteri, aduncis, foliis maioribus. alterum genus eius silvestre, nigrius et quadamtenus rubens; fert veluti folliculos. huius radice decocta in aqua fit medicamentum, quod vocatur lycium. semen secundas trahit. alter ille candidior adstringit magis, refrigerat, collectionibus et vulneribus adcommodatior. folia utriusque et cruda et decocta inlinuntur cum oleo.

lycium praestantius spina fieri tradunt, quam et pyxacanthon chironian vocant, qualem in indicis arboribus diximus, quoniam longe praestantissimum existimatur indicum. coquantur in aqua tusi rami radicesque summae amaritudinis aereo vase per triduum iterumque exempto ligno, donec mellis crassitudo fiat. adulteratur amaris sucis, etiam amurca et felle bubulo. spuma eius ac flos quidam oculorum medicamentis additur. reliquo suco faciem purgat et psoras sanat, erosos angulos oculorum veteresque fluctiones, aures purulentas, tonsillas, gingivas, tussim, sanguinis excreationes fabae magnitudine devoratum aut, si ex vulneribus fluat, inlitum, rhagadia, genitalium ulcera, attritus, ulcera recentia et serpentina ac putrescentia, in

naribus clavos, suppurationes. bibitur et mulieribus in lacte contra profluvia. indici differentia glaebris extrinsecus nigris, intus rufis, cum freris, cito nigrescentibus. adstringit vehementer cum amaritudine. ad eadem omnia utile est, sed praecipue ad genitalia.

sunt qui et sarcocollam spinae lacrimam putent, pollini turis similem, cum quadam acrimonia dulcem, cumminosam. sistit fluxiones, inlinitur infantibus maxime. vetustate et haec nigrescit, melior quo candidior.

unum etiamnum arborum medicinis debetur nobile medicamentum, quod oporicen vocant. fit ad dysintericos stomachique vitia in congio musti albi lento vapore decoctis malis cotoneis v cum suis seminibus, punicis totidem, sorborum sextario et pari mensura eius, quod rhun syriacam vocant, croci semuncia. coquitur usque ad crassitudinem mellis.

his subtexemus ea, quae graeci communicatione nominum in ambiguo fecere, anne arborum essent.

chamaedrys herba est, quae latine trixago dicitur. aliqui eam chamaeropem, alii teucriam appellavere. folia habet magnitudine mentae, colore et divisura quercus - alii serrata et ab eo serram inventam esse dixerunt - , flore paene purpureo. carpitur praegnans suco in petrosis, adversus serpentium venena potu inlituque efficacissima, item stomacho, tussi vetustae, pituitae in gula cohaerescenti, ruptis, convulsis, lateris doloribus. lienem consumit, urinam et menses ciet, ob id incipientibus hydropicis efficax, manualibus scopis eius in iii heminis aquae decoctis usque ad tertias. faciunt et pastillos terentes eam ex aqua ad supra dicta. sanat et vomicas et vetera ulcera vel sordida cum melle. fit et vinum ex ea pectoris vitiis. foliorum sucus cum oleo caligines oculorum discutit, ad splenem ex aceto sumitur. excalfacit perunctione.

chamaedaphne unico ramulo est, cubitali ferme; folia tenuiora lauro; semen rubens adnexum foliis. inlinitur capitis doloribus recens, ardores refrigerat, ad tormina cum vino bibitur. menses sucus eius et urinam ciet potu partusque difficiles in lana adpositus.

chamelaea similitudinem foliorum oleae habet - sunt autem amara, odorata - , in petrosis, palmum altitudine non excedente. alvum purgat, detrahit pituitam, bilem foliis in ii absinthii partibus decoctis, suco eo cum melle poto. foliis inpositis et ulcera purgantur. aiunt, si quis ante solis ortum eam capiat dicatque ad albugines oculorum se capere, adalligata discuti id vitium, quoquo modo vero collectam iumentorum pecorumque oculis salutarem esse.

chamaesyce lentis folia habet nihil se adtollentia, in aridis, petrosis, claritati oculorum et contra subfusiones utilis suco ad cicatrices, caligines, nubeculas inuncto. vulvae dolores sedat adposita in linteolo. tollit et verrucas omnium generum inlita. prodest et orthopnoicis.

chamaecissos spicata est tritici modo, ramulis quinis fere, foliosa - cum floret, existimari potest alba viola - , radice tenui. bibunt ischiadici folia iii obolis in vini cyathis ii septenis diebus, admodum amara potione.

chamaeleucen apud nos farfarum sive farfugium vocant. nascitur secundum fluvios, folio populi, sed ampliore. radix eius inponitur carbonibus cupressi,

atque is nidor per infundibulum bibitur inveteratae tussi.

chamaepeuce, larici folio similis, lumborum et spinae doloribus propria est. - chamaecyparissos herba ex vino pota contra venena serpentium omnium scorpionumque pollet. - ampeloprason in vinetis nascitur, foliis porri, ructu gravis, contra serpentium ictus efficax. urinam et menses ciet, eruptiones sanguinis per genitale inhibet potum inpositumque. datur et a partu mulieribus et contra canis morsus. - ea quoque, quae stachys vocatur, porri similitudinem habet, longioribus foliis pluribusque et odoris iucundi colorisque in luteum inclinati. pellit menstrua.

clinopodium alii cleopiceton, alii zopyrontion, alii ocimoides appellant, serpyllo similem, surculosam, palmi altitudine, in petrosis, orbiculato foliorum ambitu speciem lecti pedum praebentem. bibitur ad convulsa, rupta, strangurias, serpentium ictus, item decoctae succus.

nunc subtexemus herbas mirabiles quidem, sed minus claras, nobilibus in sequentia volumina dilatis.

centunculum vocant nostri, foliis ad similitudinem capitis paenularum, iacentem in arvis, graeci clematidem, egregii effectus ad sistendam alvum in vino austero. idem sanguinem sistit tritus oxymelitis aut aquae calidae cyathis v denarii unius pondere, sic et ad secundas mulierum efficax. - sed graeci clematidas et alias habent, unam quam aliqui aetiten vocant, alii laginen, nonnulli tenuem scamoniam. ramos habet pedales, foliosos, non dissimiles scamoniae, nisi quod nigriora minoraque sunt folia. invenitur in vineis arvisque. estur ut olus cum oleo ac sale; alvum ciet. eadem dysintericis cum lini semine ex vino austero sorbetur. folia epiphoris inponuntur cum polenta subposito udo linteolo. strumas inposita ad suppurationem perducunt, deinde axungia adiecta percurant; item haemorrhoida cum oleo viridi, phthisicos iuvant cum melle. lactis quoque ubertatem faciunt in cibis et infantibus inlita capillum alunt, ex aceto edentium venerem stimulant. - est alia clematis aegyptia cognomine, quae ab aliis daphnoides, ab aliis polygonoides vocatur, folio lauri, longa tenuisque, adversus serpentes et privatim aspidas ex aceto pota efficax.

aegyptus hanc maxime gignit, quae et aron, de qua inter bulbos diximus, magnae cum dracontio litis; quidam enim eandem esse dixere. glaucias satu discrevit, dracontium silvestrem aron pronuntiando. aliqui radicem aron appellarunt, caulem vero dracontium, in totum alium, si modo hic est qui apud nos dracunculus vocatur. namque aros radicem nigram in latitudinem rotundam habet multoque maiorem et qua manus inpleatur, dracunculus subrutilam et draconis convoluti modo, unde et nomen. quin et ipsi graeci immensam posuere differentiam: semen dracunculi fervens mordaxque tradendo tantumque et virus, ut olfactum gravidis abortum inferret, aron miris laudibus tulere, primum in cibis feminam praeferentes, quoniam mas durior esset et in coquendo lentior; pectoris vitia purgare, aridum potioni inspersum aut ecligmate urinam et menses ciere, sic et in oxymelite potum. stomacho interaneisque exulceratis ex lacte ovillo bibendum, ad tussim in cinere coctum

dedere ex oleo. alii coxere in lacte, ut decoctum biberetur. epiphoris elixum inposuere, item suggillatis, tonsillis. glaucias ex oleo haemorrhoidum vitio infudit, lentigines ex melle inlinens. laudavit et pro antidoto contra venena, pleuriticis, peripneumonicis quo tussientibus modo. semen intritum cum oleo aut rosaceo infudit aurium dolori. dieuches tussientibus aut suspiriosis et orthopnoicis et pura excreantibus farinae permixtum pane cocto dedit, diodotus phthisicis e melle ecligmate et pulmonis vitiis, ossibus etiam fractis inposuit. partus omnium animalium extrahit naturae circumlitum. sucus radices cum melle attico oculorum caligines, stomachi vitia discutit, tussim decocti ius cum melle. ulcera omnium generum, sive phagedaenae sint sive carcinomata sive serpant sive polypi in naribus, sucus mire sanat. folia ambustis prosunt ex vino et oleo cocta. alvum inaniunt ex sale et aceto sumpta et luxatis cum melle cocta prosunt, item articulis podagricis cum sale recentia vel sicca. hippocrates utralibet ad collectiones cum melle inposuit. ad menses trahendos seminis vel radices drachmae ii in vini cyathis ii sufficiunt. eadem potio, si a partu non purgentur, et secundas trahit. hippocrates et radicem ipsam adposuit. dicunt et in pestilentia salutarem esse in cibis. ebrietatem discutit. serpentes nidore, cum crematur, privatim aspidas, fugat aut inebriat ita, ut torpentes inveniantur. perunctos quoque aro e laureo oleo fugiunt. ideo et contra ictus dari potui in vino nigro putant utile. in foliis ari caseus optime servari traditur.

dracunculus, quem dixi, hordeo maturescente effoditur luna crescente. omnino habentem serpentes fugiunt. adeo percussis prodesse potum aiunt; maiorem vim esse, si ferro non attingatur. sucus eius et aurium dolori prodest. id autem, quod graeci dracontion vocant, triplici effigie demonstratum mihi est: foliis betae, non sine thyrsos, flore purpureo; hoc est simile aro. alii radice longa veluti signata articulosae monstrare, ternis omnino cauliculis, foliis, decoqui ex aceto contra serpentium ictus iubentes. tertia demonstratio fuit folio maiore quam cornus, radices harundineae, totidem, ut adfirmabant, geniculatae nodis, quot haberet annos, totidemque esse folia; hi ex vino vel aqua contra serpentes dabant.

est et aris, quae in eadem aegypto nascitur, similis aro, minor tantum minoribusque foliis et utique radice, quae tamen olivae grandis magnitudinem inpleat, alba geminum caulem, altera unum tantum emittens. medetur utraque ulceribus manantibus, item ambustis ac fistulis collyrio inmisso. nomas sistunt inlitu decoctarum in aqua et postea tritarum rosaceo addito. sed unum miraculum ingens, contacto genitali cuiusque feminini sexus animal in perniciem agi.

myriophyllum, quod nostri milifolium vocant, caulis est teneri, similis feniculo, plurimis foliis, unde et nomen accepit. nascitur in palustribus, magnifici usus ad vulnera cum aceto. bibitur ad difficultates urinae et vesicae aut suspiria praecipitatisque ex alto. eadem efficacissima ad dentium dolores. etruscia hoc nomine appellat herbam in pratis tenuem, a lateribus capillamenti modo foliosam, eximii usus ad vulnera, boum nervos abscisos vomere solidari

ea rursusque iungi addita axungia adfirmans.

pseudobunion napi folia habet, fruticans palmi altitudine, laudatissima in creta. contra tormina, stranguriam, laterum praecordiorumque dolores bibuntur rami eius quini senive.

myrris, quam alii myrrizan, alii myrran vocant, simillima est cicutae caule foliisque et flore, minor tantum et exilior, cibo non insuavis. ciet menstrua et partus cum vino. aiunt eandem potam in pestilentia salutare esse. subvenit et phthisicis in sorbitione data. aviditatem cibi facit, phalangiorum morsus restinguit. ulcera quoque in facie aut capite sucus eius in aqua triduo maceratae sanat.

oenobreches folia lentis habet, longiora paulo, florem rubentem, radicem exigua et gracilem. nascitur circa fontes. siccata in farinae modum et inspersa vino albo strangurias finit, alvum sistit. sucus eius perunctis cum oleo sudores movet.

in promisso herbarum mirabilium occurrit aliqua dicere et de magicis. quae enim mirabiliores primi eas in nostro orbe celebrare pythagoras atque democritus, consecrati magos.

coracesia et calicia pythagoras aquam glaciari tradit, quarum mentionem apud alios non reperio, nec apud eum alia de his. idem minyada appellat et nomine alio corinthiam, cuius decocto in aqua suco protinus sanari ictus serpentium, si foveantur, dicit. eundem effusum in herba qui vestigio contigerint aut forte respersos insanabili leto perire, monstifica prorsus natura veneni praeterquam contra venena. ab eodem pythagora aproxis appellatur herba, cuius radix e longinquo concipiat ignes, ut naphtha, de qua in terrae miraculis diximus. idem tradit, si qui morbi humano corpori inciderint florente brassica, quamvis sanatos admonitionem eorum sentire, quotiens floreat; item si florente acciderint aut frumento aut cicuta aut viola, similem conditionem habere. nec me fallit hoc volumen eius a quibusdam clemporo medico adscribi, verum pythagorae pertinax fama antiquitasque vindicant, et id ipsum auctoritatem voluminum adfert, si quis alius curae suae opus illo viro dignum iudicavit, quod fecisse clemporum, cum alia suo et nomine ederet, quis credat

democriti certe chirometa esse constat. at in his ille post pythagoram magorum studiosissimus quanto portentosiora tradit! ut aglaophotim herbam, quae admiratione hominum propter eximium colorem acceperit nomen, in marmoribus arabiae nascentem persico latere, qua de causa et marmaritim vocari; hac magos uti, cum velint deos evocare. - achaemenida, colore electri, sine folio nascentem taradastilis indiae, qua pota in vino noxii per cruciatus confiteantur omnia per varias numinum imaginationes; eandem hippophobada appellat, quoniam equae praecipue caveant eam. - theombrotion xxx schoenis a choaspe nasci, pavonis picturis similem, odore eximio; hanc a regibus persarum bibi contra omnia corporum incommoda; a stabilitate mentis et iustitiae, eandem semnion a potentiae maiestate appellari. - aliam deinde adamantida, armeniae cappadociaeque alumnam; hac admota leones

resupinari cum hiatu lasso. nominis causam esse quod conteri nequeat. - arianida in arianis gigni, igneam colore; colligi, cum sol in leone sit. huius tactu peruncta oleo ligna accendi. - therionarca in cappadocia et mysia nascente omnes feras torpescere nec nisi hyaenae urina adspersa recreari. aethiopida in meroe nasci, ob id et meroida appellari, folio lactucae, hydropicis utilissimam e mulso potam; ophiusam in elephantine eiusdem aethiopiae, lividam difficilemque aspectu, qua pota terrorem minasque serpentium obversari ita, ut mortem sibi eo metu consciscant; ob id cogi sacrilegos illam bibere. adversari ei palmeum vinum. - thalassaeqlen circa indum amnem inveniri, quae ob id nomine alio potamaugis appellatur; hac pota lymphari homines obversantibus miraculis. - theangelida in libano syriae, dicte cretae montibus et babylone et susis persidis nasci, qua pota magi divinent; gelotophyllida in bactris et circa borysthenen. haec si bibatur cum murra et vino, varias obversari species ridendique finem non fieri nisi potis nucleis pineae nucis cum pipere et melle in vino palmeo. - hestiaterrida a convictu nominari in perside, quoniam hilarentur illa, eandem protomediam, qua primatum apud reges obtineant; casigneten, quoniam secum ipsa nascatur nec cum aliis ullis herbis, eandem dionysonymphadem, quoniam vino mira conveniat. - helianthes vocat in themiscyrena regione et ciliciae montibus maritimis, folio myrti. hac cum adipe leonino decocta, addito croco et palmeo vino, perungui magos et persarum reges, ut fiat corpus aspectu iucundum; ideo eandem heliocallida nominari. - hermesias ab eodem vocatur ad liberos generandos pulchros bonosque non herba, sed compositio e nucleis pineae nucis tritis cum melle, murra, croco, vino palmeo, postea admixto theombrotio et lacte. bibere generaturos iubet et a conceptu, puerperas partum nutrientes; ita fieri excellentes animi et formae bonis. atque harum omnium magica quoque vocabula ponit.

adiicit his apollodorus adsectator eius herbam aesclynomenen, quoniam adpropinquante manu folia contraheret, aliam crocida, cuius tactu phalangia morerentur, crateuas onothurin, cuius aspersu e vino feritas omnium animalium mitigaretur, anacampseroten celebrer arte grammatica paulo ante, cuius omnino tactu redirent amores vel cum odio depositi. et abunde sit hactenus attigisse insignia magorum in herbis alia de his aptiore dicturis loco.

eriphiam multi prodidere. scarabaeum haec in avena habet sursum deorsum decurrentem cum sono haedi, unde et nomen accepit. hac ad vocem nihil praestantius esse tradunt.

herba lanaria ovibus ieiunis data lactis abundantiam facit. - aequae nota lactoris vulgo est, plena lactis quod degustatum vomitiones concitat. eandem hanc aliqui esse dicunt, alii similem illi, quam militarem vocant, quoniam vulnus ferro factum nullum non intra dies v sanat ex oleo inposita.

celebratur autem et a graecis stratiotes, sed ea in aegypto tantum et inundatione nili nascitur, aizoo similis, ni maiora haberet folia. refrigerat mire et vulnera sanat ex aceto inlita, item ignes sacros et suppuraciones. sanguinem quoque, qui defluit a renibus, pota cum ture masculo mirifice sistit.

herba in capite statuae nata, collecta in vestis alicuius pannum et inligata lino rufo, capitis dolorem confestim sedare traditur. - herba quaecumque e rivis aut fluminibus ante solis ortum collecta ita, ut nemo colligentem videat, adalligata laevo brachio ita, ut aeger quid sit illud ignoret, tertianas arcere traditur. - lingua herba nascitur circa fontes. radix eius combusta et trita cum adipe suis - adiciunt ut nigra sit et sterilis - alopecias emendat unguentum in sole. - cribro in limite abiecto herbae intus extantes decerptae adalligataeque gravidis partus adcelerant. - herba, quae gignitur super fimeta ruris, contra anginas efficacissime pollet ex aqua pota. - herba, iuxta quam canes urinam fundunt, evulsa ne ferro attingatur, luxatis celerrime medetur.

rumpotinum arborem demonstravimus inter arbusta. iuxta hanc viduam vite nascitur herba, quam galli rodarum vocant. caulem habet virgae ficulneae modo geniculatum, folia urticae in medio exalbida, eadem procedente tempore tota rubentia, florem argenteum, praecipua contra tumores fervoresque et collectiones cum axungia vetere tusa ita, ut ferro non attingatur. qui perunctus est, despuat ad suam dexteram terna. efficacius remedium esse aiunt, si tres trium nationum homines perungant dextrorsus.

herba impia vocatur incana, roris marini aspectu, thyrsi modo vestita atque capitata. inde alii ramuli exsurgunt sua capitula gerentes; ob id impiam appellavere, quoniam liberi super parentem excellant. alii potius ita appellatam, quoniam nullum animal eam attingat, existimavere. haec inter duos lapides trita fervet praecipuo adversus anginas suco, lacte et vino admixto. mirum traditur, numquam eo morbo temptari qui gustaverint; itaque et subus dari, quaeque medicamentum id noluerint haurire, eo morbo interimi. sunt qui avium nidis inseri aliquid ex ea putent atque ita non strangulari pullos avidius devorantes.

veneris pectinem appellant a similitudine pectinum, cuius radix cum malva tusa omnia corpori infixae extrahit. - veterno liberat quae exedum vocatur. - notia herba coriariorum officinis familiaris est aliis aliisque nominibus; efficacissimam adversus scorpionem esse potam e vino aut posca reperio.

philanthron herbam graeci appellant nasute, quoniam vestibis adhaerescat. ex hac corona inposita capitis dolores sedat. - nam quae canaria appellatur lappa, cum plantagine et milifolio trita ex vino carcinomata sanat, ternis diebus soluta. medetur et subus, effossa sine ferro, addita in colluviem poturis vel ex lacte ac vino. quidam adiciunt effodientem dicere oportere: "haec est herba argemon, quam minerva repperit subus remedium, quae de illa gustaverint".

tordylon alii semen silis esse dixerunt, alii herbam per se, quam et syreon vocaverunt. neque aliud de ea proditum invenio quam in montibus nasci, combustam potu ciere menses et pectoris excreationes, efficaciore etiamnum radice; suco eius ternis obolis hausto renes sanari; addi radicem eius et in malagmata.

gramen ipsum inter herbas vulgatissimum geniculatis serpit internodiis crebroque ab his et ex cacumine novas radices spargit. folia eius in reliquo

orbe in exilitatem fastigantur, in parnaso tantum hederacia specie densius quam usquam fruticant, flore odorato candidoque. iumentis herba non alia gravior, sive viridis sive in feno siccata et, cum detur, adspersa aqua. sucum quoque eius in parnaso excipi tradunt propter ubertatem; dulcis hic est. in vicem eius in reliqua parte terrarum succedit decoctum ad vulnera conglutinanda, quod et ipsa herba tusa praestat tueturque ab inflammationibus plagas. adicitur decocto vinum ac mel, ab aliquis et turis, piperis, murrae tertiae portiones, rursusque coquitur in aereo vase ad dentium dolores, epiphoras. radix decocta in vino torminibus medetur et urinae difficultatibus ulceribusque vesicae, calculos frangit. semen vehementius urinam inpellit, alvum vomitionesque sistit. privatim autem draconum morsibus auxiliatur. sunt qui genicula viiii vel unius vel e duabus tribusve herbis ad hunc articulorum numerum involvi lana sucida nigra iubeant ad remedia strumae panorumve. ieiunum esse debere qui colligat; ita ire in domum absentis, cui medeatur, supervenientique ter dicere, ieiuno ieiunum medicamentum dare, atque ita adalligare triduoque id facere. quod e graminum genere vii internodia habet, efficacissime capiti contra dolores adalligatur. quidam propter vesicae cruciatus decoctum ex vino gramen ad dimidias a balineis bibi iubent.

sunt qui et aculeatum gramen vocent trium generum. cum in cacumine aculei sunt plurimum quini, dactylon appellant. hos convolutos naribus inserunt extrahuntque sanguinis ciendi gratia. altero, quod est aizoo simile, ad paronychia et pterygia unguum et, cum caro unguibus increvit, utuntur cum axungia, ideo dactylon appellantes, quia digitis medeatur. tertium genus dactyli, sed tenuis, nascitur in parietinis aut tegulis. huic caustica vis est. sistit ulcera, quae serpunt. gramen capiti circumdatum sanguinis e naribus fluctiones sistit. camelos necare traditur in babylonis regione id, quod iuxta vias nascitur.

nec faeno graeco minor auctoritas, quod telin vocant, alii carphos, aliqui buceras, alii aegoceras, quoniam corniculis semen est simile, nos siliciam. quomodo sereretur, docuimus suo loco. vis eius siccare, mollire, dissolvere. sucus decocti feminarum pluribus malis subvenit, sive duritia sive tumor sive contractio sit vulvae: foveatur, insidunt; infusum quoque prodest. furfures in facie extenuat. spleni addito nitro decoctum et inpositum medetur, item ex aceto. sic et iocineri decoctum. diocles difficile parientibus semen eius dedit acetabuli mensura tritum in viiii cyathis sapae, ut tertias partes biberent, dein calida lavarentur, et in balineo sudantibus dimidium ex relicto iterum dedit, mox a balineo relicum, pro summo auxilio. farinam faeni cum hordeo aut lini semine decoctam aqua mulsa contra vulvae cruciatus subiecit idem inposuitque imo ventri. lepras, lentigines sulphuris pari portione mixta farinae curavit, nitro ante praeparata cute, saepius die inlinens perunguique prohibens. theodorus faeno miscuit quartam partem purgati nasturci acerrimo aceto ad lepras. timon semen feni acetabuli dimidii mensura cum sapae et aquae viiii cyathis ad menses ciendos dedit potui. nec dubitatur, quin decoctum eius

utilissimum sit vulvis interaneisque exulceratis, sicuti semen articulis atque praecordiis; si vero cum malva decoquatur postea addito mulso, potus ante cetera vulvis interaneisque laudatur, quippe cum vapor quoque decocti plurimum prosit. alarumque etiam graveolentiam decoctum faeni semen emendat. farina porrigines capitis furfuresque cum vino et nitro celeriter tollit. in hydromelite autem decocta addita axungia genitalibus medetur, item pano, parotidi, podagrae, chiragrae, articulis, carnibus quae recedunt ab ossibus, aceto vero subacta luxatis. inlinitur et lieni decocta in aceto et melle tantum. carcinomata subacta ex vino purgat, mox addito melle persanat. sumitur et sorbitio e farina ad pectus exulceratum longamque tussim. decoquitur, donec amaritudo desinat; postea mel additur. - nunc ipsa claritas herbarum dicetur.

LIBER XXV

ipsa quae nunc dicetur herbarum claritas, medicinae tantum gignente eas tellure, in admirationem curae priscorum diligentiaeque animum agit. nihil ergo intemptatum inexpertumque illis fuit, nihil deinde occultatum quodque non prodesse posteris vellent. at nos elaborata iis abscondere ac suppressere cupimus et fraudare vitam etiam alienis bonis. ita certe recondunt qui pauca aliqua novere, invidentes aliis, et neminem docere in auctoritatem scientiae est. tantum ab excogitandis novis ac iuvanda vita mores absunt, summumque opus ingeniorum diu iam hoc fuit, ut intra unumquemque recte facta veterum perirent. at, hercules, singula quosdam inventa deorum numero addidere, omnium utique vitam clariorem fecere cognominibus herbarum, tam benigne gratiam memoria referente. non aequae haec cura eorum mira est in iis, quae satu blandiuntur aut cibo invitant: culmina quoque montium invia et solitudines abditas omnesque terrae fibras scrutati invenere, quid quaeque radix polleret, ad quos usus herbarum fila pertinerent, etiam quadripedum pabulo intacta ad salutis usus vertentes.

minus hoc quam par erat nostri celebravere, omnium utilitatum et virtutum rapacissimi, primusque et diu solus idem ille m. cato, omnium bonarum artium magister, paucis dumtaxat attigit, boum etiam medicina non omissa. post eum unus inlustrum temptavit gaius valgius eruditione spectatus imperfecto volumine ad Divum Augustum, inchoata etiam praefatione religiosa, ut omnibus malis humanis illius potissimum principis semper mederetur maiestas.

antea condiderat solus apud nos, quod equidem inveniam, pompeius lenaeus magni libertus, quo primum tempore hanc scientiam ad nostros pervenisse animo adverto. namque mithridates, maximus sua aetate regum, quem debellavit pompeius, omnium ante se genitorum diligentissimus vitae fuisse argumentis, praeterquam fama, intellegitur. uni ei excogitatum cotidie venenum bibere praesumptis remediis, ut consuetudine ipsa innoxium fieret; primo inventa genera antidoti, ex quibus unum etiam nomen eius retinet; illius inventum, sanguinem anatum ponticarum miscere antidotis, quoniam veneno viverent; ad illum asclepiadis medendi arte clari volumina composita extant, cum sollicitatus ex urbe roma praecepta pro se mitteret; illum solum mortalium certum est xxii linguis locutum, nec e subiectis gentibus ullum hominem per interpretem appellatum ab eo annis lvi, quibus regnavit. is ergo in reliqua ingeni magnitudine medicinae peculiariter curiosus et ab omnibus subiectis, qui fuere magna pars terrarum, singula exquirens scrinium commentationum harum et exemplaria effectusque in arcanis suis reliquit, pompeius autem omni praeda regia potitus transferre ea sermone nostro libertum suum lenaeum grammaticae artis iussit vitaeque ita profuit non minus quam reipublicae victoria illa.

praeter hos graeci auctores prodidere, quos suis locis diximus, ex his

crateuas, dionysius, metrodorus ratione blandissima, sed qua nihil paene aliud quam difficultas rei intellegatur. pinxere namque effigies herbarum atque ita subscripsere effectus. verum et pictura fallax est coloribus tam numerosis, praesertim in aemulationem naturae, multumque degenerat transcribentium socordia. praeterea parum est singulas earum aetates pingi, cum quadripartitis varietatibus anni faciem mutant.

quare ceteri sermone eas tradidere, aliqui ne effigie quidem indicata et nudis plerumque nominibus defuncti, quoniam satis videbatur potestates vimque demonstrare quaerere volentibus. nec est difficilis cognitio: nobis certe, exceptis admodum paucis, contigit reliquas contemplari scientia antoni castoris, cui summa auctoritas erat in ea arte nostro aevo, visendo hortulo eius, in quo plurimas alebat centesimum annum aetatis excedens, nullum corporis malum expertus ac ne aetate quidem memoria aut vigore concussis. neque aliud mirata magis antiquitas reperietur. inventa iam pridem ratio est praenuntians horas - non modo dies ac noctes - solis lunaeque defectuum; durat tamen tradita persuasio in magna parte vulgi, veneficiis et herbis id cogi eamque unam feminarum scientiam praevalere. certe quid non repleverunt fabulis colchis media aliaeque, in primis itala circe dis etiam adscripta unde arbitror natum, ut aeschylus e vetustissimis in poetica refertam italiam herbarum potentia proderet, multique circeios, ubi habitavit illa, magno argumento etiam nunc durante in marsis, a filio eius orta gente, quoniam esse domitores serpentium constat.

homerus quidem primus doctrinarum et antiquitatis parens, multus alias in admiratione circae, gloriam herbarum aegyptio tribuit, cum etiam tum quae rigatur aegyptus illa non esset, postea fluminis limo invecta. herbas certe aegyptias a regis uxore traditas helenae suae plurimas narrat ac nobile illud nepenthes oblivionem tristitiae veniamque adferens et ab helena utique omnibus mortalibus propinandum. primus autem omnium, quos memoria novit, orpheus de herbis curiosius aliqua prodidit. post eum musaeus et hesiodus polium herbam in quantum mirati sint diximus. orpheus et hesiodus suffitiones commendavere. homerus et alias nominatim herbas celebrat, quas suis locis dicemus. ab eo pythagoras clarus sapientia primus volumen de effectu earum composuit, apollini, aesculapio et in totum dis immortalibus inventione et origine adsignata; composuit et democritus, ambo peragratis persidis, arabiae, aethiopiae, aegypti magis, adeoque ad haec attonita antiquitas fuit, ut adfirmaverit etiam incredibilia dictu. xanthus historiarum auctor in prima earum tradit, occisum draconis catulum revocatum ad vitam a parente herba, quam balim nominat, eademque tyloem, quem draco occiderat, restitutum saluti. et iuba in arabia herba revocatum ad vitam hominem tradit. dixit democritus, credidit theophrastus esse herbam, cuius contactu inlatae ab alite, quam retulimus, exiliret cuneus a pastoribus arbori adactus. quae etiamsi fide carent, admirationem tamen implent coguntque confiteri multum esse quod vero supersit. inde et plerosque ita video existimare, nihil non herbarum vi effici posse, sed plurimarum vires esse

incognitas, quorum in numero fuit herophilus clarus medicina, a quo ferunt dictum, quasdam fortassis etiam calcatas prodesse. observatum certe est, inflammari vulnera ac morbos superventu eorum, qui pedibus iter confecerint.

haec erat antiqua medicina, quae tota migrabat in graeciae linguas. sed quare non plures noscantur, causa est quod eas agrestes litterarumque ignari experiuntur, ut qui soli inter illas vivant; praeterea securitas quaerendi obvia medicorum turba. multis etiam inventis desunt nomina, sicut illi, quam retulimus in frugum cura scimusque defossam in angulis segetis praestare, ne qua ales intret. turpissima causa raritatis quod etiam qui sciunt demonstrare nolunt, tamquam ipsis perituum sit quod tradiderint aliis. accedit ratio inventionis anceps, quippe etiam in repertis alias invenit casus, alias, ut vere dixerim, deus. insanabile ad hosce annos fuit rabidi canis morsus, pavorem aquae potusque omnis adferens odium. nuper cuiusdam militantis in praetorio mater vidit in quiete, ut radicem silvestris rosae, quam cynorrhodon vocant, blanditam sibi aspectu pridie in fructu, mitteret filio bibendam. in laetania res gerebatur, hispaniae proxima parte, casuque accidit, ut milite a morsu canis incipiente expavescere aquas superveniret epistula orantis, ut pareret religioni, servatusque est ex insperato et postea quisquis auxilium simile temptavit. alias apud auctores cynorrhodi una medicina erat spongiolae, quae in mediis spinis eius nascitur, cinere cum melle alopecias capitis expleri. in eadem provincia cognovi in agro hospitii nuper ibi repertum dracunculum appellatum caulem pollicari crassitudine, versicoloribus viperarum maculis, quem ferebant contra omnium morsus esse remedio, alium quam quos in priore volumine eiusdem nominis diximus. est huic alia figura, aliud miraculum exerenti se terra ad primas serpentium vernationes bipedali fere altitudine rursusque cum isdem in terram condenti, nec omnino occultato eo apparet serpens, vel hoc per se satis officioso naturae munere, si tantum praemoneret tempusque formidinis demonstraret.

nec bestiarum solum ad nocendum scelera sunt, sed interim aquarum quoque ac locorum. in germania trans rhenum castris a germanico caesare promotis maritimo tractu fons erat aquae dulcis solus, qua pota intra biennium dentes deciderent compagesque in genibus solverentur. stomacacen medici vocabant et scelotyrben ea mala. reperta auxilio est herba, quae appellatur britannica, non nervis modo et oris malis salutaris, sed contra anginas quoque et contra serpentes. folia habet oblonga nigra, radicem nigram. sucus eius exprimitur et e radice. florem vibones vocant, qui collectus, priusquam tonitrum audiat, et devoratus securos in totum annum a metu anginae praestat. frisi, gens tum fida, in qua castra erant, monstravere illam. mirorque nominis causam, nisi forte confines oceano britanniae veluti propinqua dicavere. non enim inde appellatam, quoniam ibi plurima nasceretur, certum est etiam tum britannia libera.

fuit quidem et hic quondam ambitus nominibus suis eas adoptandi, ut docebimus fecisse reges. tanta res videbatur herbam invenire, vitam iuvare, nunc fortassis aliquis curam hanc nostram frivolum quoque existimaturis;

adeo deliciis sordent. etiam quae ad salutem pertinent. auctores tamen, quarum inveniuntur, in primis celebrari par est effectum earum digesto in genera morborum. quae quidem in reputatione misereri sortis humanae subit, praeter fortuita casusque et quae nova omnis hora excogitat, milia morborum singulis mortalium timenda. qui gravissimi ex his sint, discernere stultitiae prope videri possit, cum suus cuique ac praesens quisque atrocissimus videatur. et de hoc tamen iudicare aevi experimenta, asperrimi cruciatus esse calculorum a stillicidio vesicae, proximum stomachi, tertium eorum, quae in capite doleant, non ob alios fere morte conscita.

a graecis et noxias herbas demonstratas miror equidem, nec venenorum tantum, quoniam ea condicio vitae est, ut mori plerumque etiam optimis portus sit, tradatque M. Varro, servium clodium equitem romanum magnitudine doloris in podagra coactum veneno crura perunxisse et postea caruisse sensu omni aequae quam dolore in ea parte corporis. sed quae fuit venia monstrandi qua mentes solverentur, partus eliderentur, multaque similia ego nec abortiva dico ac ne amatoria quidem, memor lucillum imperatorem clarissimum amatorio perisse, nec alia magica portenta, nisi ubi cavenda sunt aut coarguenda, in primis fide eorum damnata. satis operae fuerit abundeque praestatum vitae salutare dixisse, ... ac postea inventas.

clarissima herbarum est homero teste quam vocari a dis putat moly, et inventionem eius mercurio adsignat contraque summa veneficia demonstrationem. nasci eam hodie circa pheneum et in cyllene arcadiae tradunt specie illa homerica, radice rotunda nigraque, magnitudine cepae, folio scillae, effodi autem non difficulter. graeci auctores florem eius luteum pinxere, cum homerus candidum scripserit. inveni e peritis herbarum medicis qui et in italia nasci eam diceret adferrique e campania autumnus aliquot diebus, effossam inter difficultates saxeas, radicis xxx pedes longae ac ne sic quidem solidae, sed abruptae.

ab ea maxima auctoritas herbae est, quam dodecatheon vocant omnium deorum maiestate commendantes. in aqua potam omnibus morbis mederi tradunt. folia eius septem, lactucis simillima, exeunt a lutea radice.

vetustissima inventu paeonia est nomenque auctoris retinet, quam quidam pentorobon appellant, alii glycyssiden. nam haec quoque difficultas est, quod eadem aliter alibi nuncupatur. nascitur opacis montibus, caule inter folia digitorum iiii, ferente in cacumine veluti graecas nuces iiii aut v. inest his semen copiosum, rubrum nigrumque. haec medetur et faunorum in quiete ludibriis. praecipiunt eruere noctu, quoniam, si picus martius videat, tuendo in oculos impetum faciat.

panaces ipso nomine omnium morborum remedia promittit, numerosum et dis inventoribus adscriptum. unum quippe asclepion cognominatur, a quo is filiam panaciam appellavit. sucus est coactus ferulae qualem diximus, radice multi corticis et salsi. hac evolsa scrobem repleri vario genere frugum religio est ac terrae piamentum. ubi et quonam fieret modo aut quale maxime probaretur, inter peregrina docuimus. id, quod e macedonia adfertur,

bucolicon vocant armentariis sponte erumpentem sucum excipientibus; hoc celerrime evanescit. et in aliis autem generibus inprobatur maxime nigrum ac molle; id enim argumento est cera adulterati. - alterum genus heracleon vocant et ab hercule inventum tradunt, alii origanum heracleoticum aut silvestre, quoniam est origano simile, radice inutili, de quo origano diximus. - tertium panaces chironium cognominatur ab inventore. folium eius simile lapathum, maius tamen et hirsutius, flos aureus, radix parva. nascitur pinguibus locis. huius flos efficacissimus, eoque amplius quam supra dicta prodest. - quartum genus panaces, ab eodem chirone repertum, centaurion cognominatur, sed et pharnaceon, in controversia inventionis a pharnace rege deductum. seritur hoc, longioribus quam cetera foliis et serratis. radix odorata in umbra siccatur vinoque gratiam adicit. alia eius genera duo fecere aliqui, levis folii, alterum tenuius.

heracleon siderion et ipsum ab hercule inventum est, caule tenui, digitorum iiiii altitudine, flore puniceo, foliis coriandri. iuxta lacus et amnes invenitur omniaque vulnera ferro inlata efficacissime sanat.

est chironis inventum ampelos, quae vocatur chironia, de qua diximus inter vites, sicuti de herba, cuius inventio adsignatur minervae.

herculi eam quoque adscribunt, quae apollinaris aut a rabie aliis altercum, apud graecos vero hyoscyamos appellatur. plura eius genera: unum nigro semine, floribus paene purpureis, spinosum calice, nascitur in galatia; vulgare autem candidius est et fruticosius, altius papavere; tertii semen irionis semini simile est, omnia insaniam gignentia capitisque vertigines. quartum genus molle, lanuginosum, pinguius ceteris, candidi seminis, in maritimis nascens. hoc recepere medici, item rufi seminis; nonnumquam autem candidum rufescit, si non ematuruit, inprobaturque. et alioqui nulla nisi cum inaruit legitur. natura vini, ideo mentem caputque infestans. usus seminis et per se et suco expresso. exprimitur separatim et caulibus foliisque. utuntur et radice, temeraria in totum, ut arbitror, medicina. quippe etiam foliis constat mentem corrumpi, si plura quam iiiii bibant; ... etiam antiqui in vino, febrim depelli arbitantes. oleum fit ex semine, ut diximus, quod ipsum auribus infusum temptat mentem, mireque, ut contra venenum, remedia prodidere iis, qui id bibissent, et ipsum pro remediis, adeo nullo omnia experiendi fine, ut cogant etiam venena prodesse.

linozostis sive parthenium mercuri inventum est. ideo apud graecos hermu poan multi vocant eam, apud nos omnes mercurialem. duo eius genera, masculus et femina, quae efficacior, caule et cubitali, interdum ramoso in cacumine, ocimo angustioribus foliis, geniculis ... , densis alarum cavis multis, semine in geniculis dependente, feminae copioso, mari iuxta genicula stante et rariore ac brevi contortoque, feminae soluto et candido. folia maribus nigriora, feminis candidiora; radix supervacua, praetenuis. nascuntur in campestribus cultis. mirum est quod de utroque eorum genere proditur: ut mares gignantur, hunc facere, ut feminae, illam; hoc contingere, si a conceptu protinus bibatur sucus in passo edanturve folia decocta ex oleo et sale, vel

cruda ex aceto. quidam decoctum eam in novo fictili cum heliotropio et ii vel iii spicis, donec cogatur. decoctum dari iubent et herbam ipsam in cibo altero die purgationis mulieribus per triduum, quarto die a balneo coire eas. hippocrates miris laudibus in mulierum usum praedicavit has, at hunc modum medicorum nemo novit. ille eas volvae cum melle vel rosaceo vel irino vel lilino admovit, item ad ciendos menses secundasque. idem praestare potu fotuque dixit. instillavit auribus olidis sucum, inunxit cum vino vetere alvo. folia inposuit epiphoris; stranguriae et vesicis decoctum eius dedit cum murra et ture. alvo quidem solvendae vel in febris decoquitur quantum manus capiat in ii sextariis aquae ad dimidias; bibitur sale et melle admixto nec non cum ungula suis aut gallinaceo decocta salubrius. purgationis causa putavere aliqui utramque dandam sive cum malva decoctam. thoracem purgant, bilem detrahunt, sed stomachum laedunt. reliquos usus dicemus suis locis.

invenisse et achilles discipulus chironis qua vulneribus mederetur - quae ob id achilleos vocatur - ac sanasse telephum dicitur. alii primum aeruginem invenisse utilissimam emplastris - ideoque pingitur ex cuspe decutiens eam gladio in vulnus telephi - , alii utroque usum medicamento volunt. aliqui et hanc panacem heracliam, alii sideriten et apud nos milifoliam vocant, cubitali scapo, ramosam, minutioribus quam feniculi foliis vestitam ab imo. alii fatentur quidem illam vulneribus utilem, sed veram achilleon esse scapo caeruleo pedali, sine ramis, ex omni parte singulis foliis rotundis eleganter vestitam; alii quadrato caule, capitulis marruvii, foliis quercus; hac etiam praecisos nervos glutinari. faciunt alii et sideritim in maceris nascentem, cum teratur, foedi odoris; etiamnum aliam similem huic, sed candidioribus foliis et pinguioribus, teneriorem cauliculis, in vineis nascentem, aliqui vero binum cubitorum, ramulis exilibus, triangulis, folio felcis pediculo longo, betae semine, omnes vulneribus praecipuas. nostri eam, quae est latissimo folio, Scopas regias vocant. medetur anginis suum.

invenit et teucer eadem aetate teucrion, quam quidam hemionion vocant, spargentem iuncos tenues, folia parva, asperis locis, austero sapore. numquam florem neque semen gignit. medetur lienibus, constatque sic inventam: cum exta super eam proiecta essent, adhaesisse lieni eumque exinanisse. ob id a quibusdam splenion vocatur. narrant sues, qui radicem eius edint, sine splene inveniri. quidam ramis hysopi surculosam, folio fabae, eodem nomine appellant et colligi, cum floreat, iubent - adeo florere non dubitant - maximeque ex ciliciis et pisidiae montibus laudant.

melampodis fama divinationis artibus nota est. ab hoc appellatur unum hellebori genus melampodion. aliqui pastorem eodem nomine invenisse tradunt, capras purgari pasto illo animadvertentem, datoque lacte earum sanasse proetidas furentes ... quam ob rem de omnibus eius generibus dici simul convenit.

prima duo sunt, candidum ac nigrum. hoc radicibus tantum intellegi tradunt plerique, alii et folia nigri platano similia, sed minora nigrioraque et pluribus divisuris scissa, albi betae incipientis, haec quoque nigriora et canalium dorso

rubescencia, utraque caule palmi, ferulaceo, bulborum tunicis convoluta, radice fimbriata ceparum modo. nigro equi, boves, sues necantur, itaque cavent id, cum candido vescantur. tempestivum esse tradunt messibus. plurimum autem nascitur in oete monte et optimum, uno eius loco circa pyram. nigrum ubique provenit, sed melius in helicone, qui mons et aliis laudatur herbis. candidum probatur secundum oetaeum ponticum, tertio loco eleaticum, quod in vitibus nasci ferunt, quarto parnasium, quod adulteratur aetolico ex vicino. nigrum ex his melampodium vocant, quo et domus suffiunt purgantque, spargentes et pecora, cum precatione sollemni. hoc et religiosius colligitur, primum enim gladio circumscribitur, dein qui succisurus est ortum spectat et precatur, ut id liceat sibi concedentibus diis facere observatque aquilae volatus; fere enim secantibus interest, et, si prope advolavit, moriturum illo anno qui succidat augurium est. nec album facile colligitur, caput adgravans maxime, nisi praesumatur alium et subinde vinum sorbeatur celeriterque fodiatur. nigrum alii encymon vocant, alii polyrrhizon. purgat per inferna, candidum autem vomitione causasque morborum extrahit, quondam terribile, postea tam promiscuum, ut plerique studiorum gratia, ad pervidenda acrius quae commentabantur, saepius sumptitaverint. carneaden responsurum zenonis libris ... drusumque apud nos, tribunorum popularium clarissimum, cui ante omnis plebs adstans plausit, optimates vero bellum marsicum inputavere, constat hoc medicamento liberatum comitali morbo in anticyra insula. ibi enim tutissime sumitur, quoniam, ut diximus, sesamoides admiscet. italia veratrum vocat.

farina eorum per se et mixta radicae, qua lanas diximus lavari, sternumentum facit, amboque somnum. leguntur autem tenuissimae radices brevesque ac velut decurtatae et imae. nam summa, quae est crassissima, cepis similis, canibus tantum datur purgationis causa. antiqui radicem cortice quam carnosissimo seligebant, quo tenuior eximeretur medulla; hanc umidis spongeis opertam turgescensque acu in longitudinem findebant, dein fila in umbra siccabant his utentes. nunc ramulos ipsos ab radice quam crassissimi corticis ita dant. optimum quod acre gustu fervensque in frangendo pulverem emittit. durare vim xxx annis ferunt.

nigrum medetur paralyticis, insanientibus, hydropicis, dum citra febrim, podagris veteribus, articulariis morbis. trahit ex alvo bilem, pituitas, aquas. datur ad leniter molliendam alvum plurimum drachma una, modice iiii obolis. miscuere aliqui et scamonium, sed tutius salem. in dulcibus datum copiosius periculum infert. oculorum caliginem fotu discutit; ob id quidam et inunxere trito. strumas, suppurata, duritias concoquit et purgat, item fistulas tertio die exemptum. verrucas tollit cum squama aeris et sandaraca. hydropicorum ventri inponitur cum farina hordeacia et vino. pecorum et iumentorum pituitas sanat surculo per aurem traiecto et postero die eadem hora exempto, scabiem quadripedum cum ture, cera ac pice vel cum pisselaeo.

album optimum, quod celerrime movet sternumenta, sed multum terribilius nigro, praecipue si quis apparatus poturorum apud antiquos legat contra

horrores, strangulatus, intempestivas somni vires, singultus infinitos aut sternumenta, stomachi dissolutiones, tardiores vomitus aut longiores, exigui aut nimios. quippe alia dare soliti, quae concitarent vomitiones, ipsumque helleborum extrahere medicamentis aut clysteribus, saepius etiam sanguine venis emissio. iam vero et cum prospere cedat, terribilius variis coloribus vomitionum et post vomitiones observatione alvi, balinearum dispensatione, totius corporis cura, antecedente omnia haec magno terrore famae, namque tradunt absumi carnes, si coquatur una. sed antiquorum vitium erat quod propter hos metus parcius dabant, cum celerius erumpat, quo largius sumitur. themison binas, non amplius, drachmas datavit; sequentes et quaternas dedere claro herophili praeconio, qui helleborum fortissimi ducis similitudini aequabat; concitatis enim intus omnibus ipsum in primis exire. praeterea mirum inventum est, quod incisum forficulis, ut diximus, cribrant: cortex remanet, hoc inaniunt; medulla cadit, haec in nimia purgatione data vomitiones sistit.

cavendum est felici quoque cura, ne nubilo die detur, inpetibiles quippe cruciatus existunt. nam aestate potius quam hieme dandum non est in dubio. corpus vii diebus ante praeparandum cibis acribus, abstinencia vini, quarto et tertio die vomitionibus, pridie cenae abstinencia. album et in dulci datur, aptissime vero in lente aut pulte. nuper invenere dissectis raphanis inserere helleborum rursusque conprimere raphanos, ut transeat vis, atque lenimento dare. reddi post iiii fere horas incipit; totum opus septenis peragitur horis. medetur ita morbis comitialibus, ut diximus, vertigini, melancholicis, insanientibus, lymphatis, elephantiasi albae, lepris, tetano, tremulis, podagricis, hydropicis incipientibusque tympanicis, stomachicis, spasticis cynicis, ischiadicis, quartanis, quae aliter non desinant, tussi veteri, inflationibus, torminibus redeuntibus.

vetant dari senibus, pueris, item mollis ac feminei corporis animive, exilibus aut teneris, et feminis minus quam viris, item timidis aut si exulcerata sint praecordia vel tumeant, minime sanguinem excreantibus causariisve latere. faucibus medetur extra corpori inpositum, eruptionibus pituitae cum axungia salsa inlitum, item suppurationi veteri. mures polentae admixtum necat. galli sagittas in venatu helleboro tingunt circumcisoque vulnere teneriorem sentiri carnem adfirmant. muscae quoque necantur albo trito et cum lacte sparso. eodem et phthiriasis emendatur.

ipsi mithridati crateuas adscripsit unam, mithridatiam vocatam. huic folia ii a radice, acantho similia, caulis inter utraque sustinens roseum florem. alteram lenaeus, scordotim sive scordion, ipsius manu adscriptam, magnitudine cubitali, quadriangulo caule, ramosam, querna similitudine foliis lanuginosis. reperitur in ponto campis pinguibus umidisque, gustus amari. est et alterius generis, latioribus foliis, mentastro similis, plurimosque utraque ad usus per se et inter alia in antidotis.

polemoniam alii philetaeriam a certamine regum inventionis appellant, cappadoceas autem chiliodynamiam. radice crassa, exilibus ramis, quibus in

summis corymbi dependent nigro semine, cetero rutae similis, nascitur in montosis.

eupatoria quoque regiam auctoritatem habet, caulis lignosi, nigricantis, hirsuti, cubitalis et aliquando amplioris, foliis per intervalla quinquefolii aut cannabis, per extremitates incisus quinquepartito, nigris et ipsis plumosisque, radice supervacua. semen dysintericis in vino potum auxiliatur unice.

centaurio curatus dicitur chiron, cum herculis excepti hospitio pertractanti arma sagitta excidisset in pedem, quare aliqui chironion vocant. folia sunt lata et oblonga, serrato ambitu, densi ab radice caules ternum cubitorum, geniculati - in his capita ceu papaverum - , radix vasta, rubescens, tenera fragilisque, ad bina cubita, madida suco, amara cum quadam dulcedine. nascitur in collibus pingui solo, laudatissima in arcadia, elide, messenia, pholoe, lycaeo, et in alpibus vero plurimisque aliis locis. in lycia quidem et ex ea lycium faciunt. vis in vulneribus tanta est, ut cohaerescere etiam carnes tradant, si coquatur simul. in usu radix, tantum ii drachmis bibenda quibus dicetur, si febris sit, in aqua trita, ceteris in vino. medetur et febrium morbis decoctae succus.

est alterum centaurium cognomine lepton, minutis foliis, quod aliqui libadion vocant, quoniam secundum fontes nascitur, origano simile, angustioribus et longioribus foliis, anguloso caule, palmum alto, fruticosum, flore lychnidis, radice tenui et supervacua, suco efficax. ipsa herba autumnio legitur, succus e fronde. quidam caules concisos madefaciunt diebus xviii atque ita exprimunt. hoc centaurium nostri fel terrae vocant propter amaritudinem summam, galli exacum, quoniam omnia mala medicamenta potum e corpore exigat per alvum.

tertia est centauris cognomine triorchis. qui eam secat, rarum est ut non vulneret sese. haec succum sanguineum emittit. theophrastus defendi eam inpuernarique colligentes tradit a triorche accipitrum genere, unde et nomen accepit. inperiti confundunt haec omnia et primo generi adsignant.

clymenus a rege herba appellata est, hederæ foliis, ramosa, caule inani articulis præcincta, odore gravi et semine hederæ, silvestribus et montuosis nascens. quibus morbis pota medeatur, dicemus, sed hic indicandum est, dum medeatur, sterilitatem pota etiam viris fieri. graeci plantagini similem esse dixerunt, caule quadrato, folliculis cum semine inter se inplexis veluti polyporum cirris. et succus autem in usu, vi summa in refrigerando.

gentianam invenit gentius rex illyriorum, ubique nascentem, illyrico tamen præstantissimam, folio fraxini, sed magnitudine lactucae, caule tenero, pollicis crassitudine, cavo et inani, ex intervallis foliato, iii aliquando cubitorum, radice lenta, subnigra, sine odore, aquosis montibus subalpinis plurima. usus in radice et suco. radicis natura est excalfactoria, sed praegnantibus non bibenda.

invenit et lysimachus quæ ab eo nomen retinet, celebrata erasistrato. folia habet salicis viridia, florem purpureum, fruticosa ramulis erectis, odore acris. gignitur in aquosis. vis eius tanta est, ut iumentis discordantibus iugo inposita

asperitatem cohibeat.

mulieres quoque hanc gloriam adfectavere, in quibus artemisia uxor mausoli adoptata herba, quae antea parthenis vocabatur. sunt qui ab artemide ilithyia cognominatam putent, quoniam privatim medeatur feminarum malis. est autem absinthii modo fruticosa, maioribus foliis pinguisque. ipsius duo genera: altior latioribus foliis, altera tenera tenuioribus et non nisi in maritimis nascens. sunt qui in mediterraneis eodem nomine appellent, simplici caule, minimis foliis, floris copiosi, erumpentis cum uva maturescit, odore non iniucundo. quam quidam botryn, alii ambrosiam vocant, talis in cappadocia nascitur.

nymphaea nata traditur nympa zelotypia erga herculem mortua - quare heracleon vocant aliqui, alii rhopalon a radice clavae simili - , ideoque eos, qui biberint eam xii diebus, coitu genituraque privari. laudatissima in orchomenia et marathone. boeoti mallon vocant et semen edunt. nascitur in aquosis, foliis magnis in summa aqua et aliis ex radice, flore lilio simili et, cum defloruit, capite papaveris, levi caule. secatur autumnio radix nigra, in sole siccatur. adversatur ita lien. est et alia nymphaea in thessalia, amne penio, radice alba, capite luteo, rosae magnitudine.

invenit et patrum nostrorum aetate rex iuba quam appellavit euphorbeam medici sui nomine. frater is fuit musae, a quo Divum Augustum conservatum indicavimus. iidem fratres instituere a balineis frigida multa corpora adstringere; antea non erat mos nisi calida tantum lavari, sicut apud homerum etiam invenimus. sed iubae volumen quoque extat de ea herba et clarum praeconium. invenit eam in monte atlante, specie thyrsi, foliis acanthinis. vis tanta est, ut e longinquo sucus excipiatur incisa conto; subitur excipulis ventriculo haedino. umor lactis videtur defluens; siccatus cum coit, turis effigiem habet. qui colligunt, clarius vident. contra serpentes medetur quacumque parte percussa vertice inciso et medicamento addito ibi. gaetuli, qui legunt, taedio lacte adulterant, sed discernitur igni; id enim, quod sincerum non est, fastidiendum odorem habet. multum infra hunc sucum est qui in gallia fit ex herba chamelaea, granum cocci ferente. fractus hammoniaco similis est, etiam levi gustu os accensum diu detinens et magis ex intervallo, donec fauces quoque siccet.

celebravit et themiso medicus vulgarem herbam plantaginem tamquam inventor volumine de ea edito. duo eius genera: minor angustioribus foliis et nigrioribus linguae pecorum similis, caule anguloso in terram inclinato, in pratis nascens; altera maior, foliis laterum modo inclusa, quae quia septena sunt, quidam eam heptapleuron vocavere. huius et caulis cubitalis est. et ipsa in umidis nascitur, multo efficacior. mira vis in siccando densandoque corpore, cauterii vicem optinens. nulla res aequae sistit fluctiones, quas graeci rheumatismos vocant.

iungitur huic buglossos, boum linguae similis, cui praecipuum, quod in vinum deiecta animi voluptates auget et vocatur euphrosynum. iungitur et cynoglossos caninam linguam imitata, topiariis operibus gratissima. aiunt

quae iii thyrso seminis emittat, eius radicem potam ex aqua ad tertianas prodesse, quae iiii, ad quartanas. - est et alia similis ei, quae fert lappas minutas. eius radix pota ex aqua ranis et serpentibus adversatur.

est et bupthalmus similis boum oculis, folio feniculi, circa oppida nascens, fruticosa caulibus, qui et manduntur decocti. quidam chalcen vocant. haec cum cera steatomata discutit.

invenere herbas et universae gentes, scythia primam eam, quae scythice vocatur circa maeotim nascens, praedulcem alias utilissimamque ad ea, quae asthmata vocant. magna et ea commendatio, quod in ore eam habentes sitim famemque non sentiunt. - idem praestat apud eosdem hippace, distincta, quod in equis quoque eundem effectum habeat, traduntque his duabus herbis scythas etiam in duodenos dies durare in fame sitique.

ischaemonem thracia invenit, qua ferunt sanguinem sisti non aperta modo vena, sed etiam praecisa. serpit in terra, milio similis, foliis asperis et lanuginosis. farcitur in nares, quae in italia nascitur, et ciet sanguinem, eadem adalligata sistit.

vettones in hispania eam, quae vettonica dicitur in gallia, in italia autem serratula, a graecis cestros aut psychrotrophon, ante cunctas laudatissima. exit anguloso caule cubitorum ii, a radice spargens folia fere lapathi, serrata, semine purpureo. folia siccantur in farinam plurimos ad usus. fit vinum ex ea et acetum stomacho et claritati oculorum, tantumque gloriae habet, ut domus, in qua sata sit, tuta existimetur a piaculis omnibus.

in eadem hispania inventa est cantabrica per Divi Augusti tempora a cantabris reperta. nascitur ubique caule iunceo, pedali, in quo sunt flosculi oblongi veluti calathi, in his semen perquam minutum. nec alias defuere hispaniae herbis exquirendis, ut in quibus etiam nunc hodie in more sit laetiore convictu potionem e centum herbis mulso additis credere saluberrimam suavissimamque. nec quisquam genera earum iam novit aut multitudinem, numerus tamen constat in nomine.

nostra aetas meminit herbam in marsis repertam. nascitur et in aequicolis circa vicum nervesiae; vocatur consiligo. prodest, ut demonstrabimus suo loco, deploratis in phthisi.

invenit nuper et servilius democrates e primis medentium quam appellavit hiberida, quamquam ficto nomini inventione eius adsignata carmine. nascitur maxime circa vetera monumenta parietinasque et inculta itinerum; floret semper, folio nasturci, caule cubitali, semine vix ut aspi-ci possit. radici odor nasturci. usus aestate efficacior et recenti tantum; tunditur difficulter. coxendicibus et articulis omnibus cum axungia modica utilissima, viris plurimum quaternis horis, feminis minus dimidio adalligata, ut deinde in balineis descendatur in calidam et postea oleo ac vino perunguatur corpus, diebusque vicenis interpositis idem fiat, si qua admonitio doloris supersit. hoc modo rheumatismos omnes sanat occultos. inponitur non in ipsa inflammatione, sed inminuta.

animalia quoque invenere herbas, in primisque chelidoniam. hac enim

hirundines oculis pullorum in nido ... restituuntque visum, ut quidam volunt, etiam erutis oculis. genera eius duo: maior fruticosa, folio pastinacae erraticae ampliore, ipsa altitudine ii cubitorum, colos albicans, flos luteus; minori folia hederæ rotundiora, minus candida. sucus croci, mordax, semen papaveris. florent adventu hirundinum, discessu marcescunt. sucus florentibus exprimitur et in aereo vase cum melle attico leniter cinere ferventi decoquitur, singulari remedio contra caligines oculorum. utuntur et per se suco et in collyriis, quae chelidonia appellantur ab ea.

inveniunt et canes qua fastidium vincunt eamque in nostro conspectu mandunt, sed ita, ut numquam intellegatur, quae sit; etenim depasta cernitur. notata est haec animalis eius malignitas in alia herba maior. percussus enim a serpente mederi sibi quadam dicitur, sed illam homine spectante non decerpit.

simplicius cervæ monstravere elaphoboscon, de qua diximus, item helxinen a partu dictam, ostendere, ut indicavimus, dictamnium vulneratae pastu statim telis decidentibus. non est alibi quam in creta, ramis praetenuæ, puleio simile, fervens et acre gustu. foliis tantum utuntur; flos nullus aut semen aut caulis, radix tenuis ac supervacua. et in creta autem non spatiose nascitur mireque capris expetitur. pro eo est pseudodictamnium multis in terris nascens, folio simile, ramulis minoribus, a quibusdam chondris vocatum. minoris effectus statim intellegitur; dictamnium enim minima potione accendit os. qui legere eas, in ferula aut harundine condunt praeligantque, ne potentia evanescat. sunt qui dicant utramque nasci multifariam, sed deteriores in agris pinguibus, veram quidem dictamnium non nisi in asperis. est et tertium genus dictamnium vocatum, sed neque facie neque effectu simile, folio sisymbri, ramis maioribus, praecedente persuasione illa, quicquid in creta nascatur, infinito praestare ceteris eiusdem generis alibi genitis, proxime quod in parnaso. alioqui herbiferum esse et pelium montem in thessalia et telethrium in euboea et totam arcadiam ac laconicam tradunt, arcades quidem non medicaminibus uti, sed lacte circa ver, quoniam tum maxime sucis herbae turgeant medicenturque ubera pascuis. bibunt autem vaccinum, quoniam boves omnivori fere sunt in herbis. potentia earum per quadrupes etiamnum duobus claris exemplis manifesta fit. circa abderam et limitem, qui diomedis vocatur, equi pasti inflammantur rabie, circa potnias vero et asini.

inter nobilissimas aristolochiae nomen dedisse gravidæ videntur, quoniam esset ἀρίστη λεχοῦσαις. nostri malum terræ vocant et quattuor genera eius servant: unum tuberibus radicis rotundis, foliis inter malvam et hederam, nigrioribus mollioribusque, alterum masculae, radice longa, iiii digitorum longitudine, baculi crassitudine, tertium longissimae, tenuitate vitis novellae, cuius sit praecipua vis, quae et clematidis vocatur, ab aliis cretica. omnes colore buxæ, caulibus parvis, flore purpureo. ferunt baculas parvas, ut cappari. valent radice tantum. est et quae plistolochia vocatur, quarti generis, tenuior quam proxime dicta, densis radicis capillamentis, iunci plenioris crassitudine. hanc quidem polyrrhizon cognominant. odor omnium medicatus, sed oblongae radici tenuiorique gratior; carnosus enim est corticis, unguentis

quoque nardinis conveniens. nascuntur pinguibus locis et campestribus. effodere eas messibus tempestivum; in desquamato terreno servantur. maxime tamen laudatur pontica et in quocumque genere ponderosissima quaeque, medicinis aptior rotunda, contra serpentes oblonga, in summa tamen gloria est ea, si modo a conceptu admota vulvis in carne bubula mares figurat, ut traditur. piscatores campaniae radicem eam, quae rotunda est, venenum terrae vocant, coramque nobis contusam mixta calce in mare sparsere. advolant pisces cupiditate mira statimque exanimati fluitant. quae polyrrhizos cognominatur convulsis, contusis, ex alto praecipitatis radice pota ex aqua utilissima esse traditur, semine pleuriticis et nervis, confirmare, excalfacere, eadem satyrion esse.

verum et effectus ususque dicendi sunt ordiendumque malorum omnium pessimo est, serpentium ictu. medentur ergo britannica herba, panacis omnium generum radix e vino, chironii et flos et semen potum inlitumve ex vino et oleo, privatim quae cunila bubula appellatur, polemonia vel philetaeris radice drachmis iiii in mero, teucris, sideritis, scordotis ex vino, privatim ad angues, pota et inlita sive suco sive folio sive decocto, centaurii maioris radix drachma in vini albi cyathis iii, gentiana praecipue adversus angues ii drachmis cum pipere et ruta in vini cyathis vi, sive viridis sive sicca. et lysimachiae odorem fugiunt. datur ex vino percussis chelidonia; morsibus inponitur vettonica praecipue, cui vis tanta perhibetur, ut inclusae circulo eius serpentes ipsae sese interimant flagellando. datur ad ictus semen eius denarii pondere cum iii cyathis vini vel farina drachmis iii sextario aquae - farina et inponitur - , cantabrica, dictamnium, aristolochia radice drachma in vini hemina, sed saepius bibenda. prodest et inlita ex aceto; similiter plistolochia, quin omnino suspensa supra focum fugat e domibus serpentes; argemonia quoque radice denarii pondere in vini cyathis iii poto. plura de ea convenit dici ceterisque, qua primum nominabuntur, in eo autem genere medendi primum nominari quamque, in quo maxime valebit. folia habet qualia anemone, divisa apii modo, caput in cauliculo papaveris silvestris, item radicem, sucum croci colore acrem et acutum. nascitur in arvis. apud nos tria genera eius faciunt et id demum probant, cuius radix tus redolet.

agaricum ut fungus nascitur in arboribus circa bosporum colore candido; dantur oboli iiii contriti cum binis cyathis aceti mulsi. id, quod in gallia nascitur, infirmius habetur. praeterea mas spissior amariorque - hic et capitis dolores facit - , femina solutior. initio gustus dulcis mox in amaritudinem transit.

echios utriusque generis puleio similis, foliis coronat; datur drachmis ii ex vini cyathis iiii. item altera, quae lanugine distinguitur spinosa, cui et capitula viperae similia sunt; haec ex vino et aceto. quidam echion personatam vocant, cuius folio nullum est latius, grandes lappas ferentem; huius radicem decoctam ex aceto dant potui. - hyoscyamum contusum cum foliis ex vino datur peculiariter contra aspidas.

nulla tamen romanae nobilitatis plus habet quam hiera botane. aliqui

aristereon, nostri verbenacam vocant. haec est quam legatos ferre ad hostes indicavimus; hac iovis mensa verritur, domus purgantur lustranturque. genera eius duo: foliosa, quam feminam putant, mas rarioribus foliis. ramuli utriusque plures, tenues, cubitales, angulosi, folia minora quam quercus angustioraque, divisuris maioribus, flos glaucus, radix longa, tenuis. nascitur ubique in planis aquosis. quidam non distinguunt et unum omnino genus faciunt, quoniam utraque eosdem effectus habeat. utraque sortiuntur galli et praecinunt responsa, sed magi utique circa hanc insaniunt: hac perunctos inpetrare quae velint, febres abigere, amicitias conciliare nullique non morbo mederi. colligi debere circa canis ortum ita, ne luna aut sol conspiciat, favis ante et melle terrae ad piamentum datis; circumscriptam ferro effodi sinistra manu et in sublime tolli; siccari in umbra separatim folia, caulem, radicem. aiunt, si aqua spargatur triclinium, in qua maduerit, laetiores convictus fieri. adversus serpentes conteritur ex vino.

est similis verbasco herba, quae saepe fallit pro ea capta, foliis minus candidis, cauliculis pluribus, flore luteo. haec abiecta blattas in se contrahit ideoque romae blattaria vocatur.

molemonium sucum lacteum emittit concrescentem cummis modo, umidis locis. datur denarii pondus in vino.

quinquefolium nulli ignotum est, cum etiam fraga gignendo commendetur; graeci pentapetes aut pentaphyllon aut chamaezelon vocant. cum effoditur, rubram habet radicem; haec inarescens nigrescit et angulosa fit. nomen a numero foliorum. et ipsa herba incipit et desinit cum vite. adhibetur et purgandis domibus.

adversus serpentes bibitur et eius radix, quae sparganion vocatur, ex vino albo.

dauci genera quattuor fecit petronius diodotus, quae persequi nihil attinet, cum sint differentiae duae, probatissimi in creta, mox in achaia et ubicumque in siccis nati, feniculi similitudine, candidioribus foliis et minoribus hirsutisque, caule pedali recto, radice suavissimi gustus et odoris. hoc in saxosis nascitur meridianis; reliqua genera ubique nascuntur terrenis collibus limitibusque, nec nisi pingui solo ... foliis coriandri, caule cubitali, capitibus rotundis, saepe pluribus quam ternis, radice lignosa et, cum inaruit, supervacua. semen huius cumino simile, prioris milio, album, acre, odoratum omnibus et fervens. secundum priore vehementius est ideoque parce sumi debet. si iam maxime tertium genus facere libeat, est simile staphylino, quod pastinacam erraticam appellant, semine oblongo, radice dulci. omnia haec et hieme et aestate sunt intacta quadripedi nisi post abortus. ex aliis usus seminis, ex cretico radicis et magis ad serpentes. bibitur e vino drachma una, datur et quadripedibus percussis.

therionarca alia quam magica et in nostro orbe nascitur, fruticosa, foliis subviridibus, flore roseo. serpentes necat. cuicumque admota ferae et haec torporem adfert.

persollata, quam nemo ignorat, graeci arcion vocant, folia habet maiora

etiam cucurbitis et hirsutiora nigrioraque et crassiora, radicem albam et grandem. haec ex vino bibitur denariorum ii pondere; item cyclamini radix contra serpentes omnes. folia habet minora quam hederā nigrioraque et tenuiora, sine angulis, in quibus albicant maculae, caule exiguo, inani, floribus purpureis, radice lata, ut rapum videri possit, cortice nigro. nascitur in umbrosis. a nostris tuber terrae vocatur, in omnibus serenda domibus, si verum est, ubi sata sit, nihil nocere mala medicamenta; amuletum vocant. narrant et ebrietatem repraesentari addita in vinum. radix et siccata, scillae modo concisa reponitur; decoquitur eadem ad crassitudinem mellis. suum tamen venenum ei est, traduntque, si praegnans radicem eam transgrediatur, abortum fieri.

est et altera cyclaminos cognomine cissantheos, geniculatis caulibus supervacuis a priore distans, circa arbores se volvens, acinis hederae, sed mollibus, flore candido, specioso, radice supervacua. acini tantum in usu, gustu acres et lenti. siccantur in umbra tusique dividuntur in pastillos.

mihi et tertia cyclaminos demonstrata est cognomine chamaecissos, uno omnino folio, radice ramosa, qua pisces necabantur.

sed inter prima celebratur peucedanum, laudatissima in arcadia, mox samothrace. caulis ei tenuis, longus, feniculo similis, iuxta terram foliosus, radice nigra, crassa, gravi odore, sucosa. gignitur in montibus opacis, foditur exitu autumnī. placent tenerimae et altissimae radices. hae conciduntur in quaternos digitos osseis cultellis funduntque sucum in umbra, capite prius et naribus rosaceo perunctis, ne vertigo sentiatur. et alius sucus invenitur caulibus adhaerens; incisi quoque manant. probatur crassitudine mellea, colore rufo, odore suaviter gravi, fervens gustu. hic in usu et radix et decoctum eius plurimis medicamentis, suco tamen efficacissimo, qui resolvitur amaris amygdalis aut ruta contra serpentes bibiturque et ex oleo perunctos tuetur. - ebuli quoque, quam nemo ignorat, fumo fugantur serpentes.

privatim adversatur scorpionibus polemoniae radix, vel adalligata tantum, item phalangio ac ceteris minoribus venenatis, scorpionibus aristolochia, agaricum obolis iiii in vini mixti cyathis totidem, verbenaca et phalangio cum vino aut posca, item quinquefolium, daucum.

verbascum graeci phlomon vocant. genera habet prima duo: album, in quo mas intellegitur, alterum nigrum, in quo femina. tertium genus non nisi in silvis invenitur. sunt folia brassicae latiora, pilosa, caulis erectus, cubitali amplior. semen nigrum inutile, radix una, crassitudine digiti. nascuntur in campestribus. silvestri folia elelisphaci, alta, ramis lignosis. sunt et phlomides duae hirsutae, rotundis foliis, humiles. tertia lychnitis vocatur, ab aliis thryallis, foliis ternis aut cum plurimum quaternis, crassis pinguibusque, ad lucernarum lumina aptis. aiunt in foliis eius, quam feminam diximus, ficus omnino non putrescere. distingui genera haec paene supervacuum est, cum sint omnia eiusdem effectus. contra scorpiones bibitur radix cum ruta ex aqua, magna amaritudine, sed effectū pari.

thelyphonon herba ab aliis scorpion vocatur propter similitudinem radicis. cuius tactu moriuntur scorpiones; itaque contra eorum ictus bibitur. scorpionem mortuum si quis helleboro candido linat, revivescere aiunt. thelyphonon omnem quadripedem necat inposita verendis radice, folio quidem intra eundem diem. quod est simile cyclamino, ipsa geniculata. nascitur in opacis. - scorpionibus adversatur et vettonicae sucus ac plantaginis.

sunt et ranis venena, rubetis maxime, vidimusque psyllus in certamen e patinis candefactis admittentes, ociores etiam quam aspidum perniciem. auxiliatur phrynon in vino pota. aliqui neurada appellant, alii poterion, floribus parvis, radicibus multis, nervosis, bene olentibus. item alcima, quam alii damasonion, alii lyron appellant. folia erant plantaginis, nisi angustiora essent et magis laciniosa convexaque in terram, alias etiam venosa similiter, caule simplici, tenui, cubitali, capite thyrsi, radicibus densis, tenuibus ut veratri nigri, acris, odoratis, pinguibus. nascitur in aquosis. alterum genus eiusdem in silvis, nigrius, maioribus foliis. in usu radices utriusque adversus ranas et lepores marinos drachmae pondere in vini potu. lepori marino adversatur et cyclaminos. veneni vim canis quoque rabidi morsus habent, contra quos erit cynorrhodon, de quo diximus; plantago et ad omnes bestiarum morsus pota atque inlita, vettonica ex mero vetere.

peristereos vocatur caule alto, foliato, cacumine in alios caules se spargens, columbis admodum familiaris, unde et nomen. hanc habentes negant latrari a canibus.

proxima ab his malis venena sunt, quae sibimet ipsi homines excogitant. contra haec omnia magicasque artes erit primum illud homericum moly, dein mithridatia ac scordotis. et centaurium potu omnia mala medicamenta exigit per alvum, vettonicae semen in mulso aut passo vel farina drachma in vini veteris cyathis iiii; vomere cogendi atque iterum bibere. iis, qui cotidie gustent eam, nulla nocitura mala medicamenta tradunt. poto veneno aristolochia subvenit eadem mensura qua contra serpentes, quinquefolii sucus, agaricum, postquam vomuerint, denarii pondere ex aquae mulsae cyathis iii.

antirrinum vocatur sive anarrinon lychnis agria, simile lino, radice nulla, flore hyacinthi, semine vituli narium. et hoc perunctos venustiores fieri nec ullo malo medicamento laedi posse vel si quis in brachiali habeat, arbitrantur magi. similiter ea, quam eupliam vocant, traduntque ea perunctos commendatoris esse famae. artemisiam quoque secum habentibus negant nocere mala medicamenta aut bestiam ullam, ne solem quidem; bibitur et haec ex vino. - adversus opium alcima privatim potens traditur, pota ut adversus ranas.

pericarpum bulbi genus est. duae eius species: cortice rubro, alterum nigro, papaveri simile, sed vis maior quam priori, utrique autem in excalfaciendo. ideo contra cicutam datur, contra quam et tus et panaces, chironium praecipue; hoc et contra fungos.

verum et generatim membratimque singulis corporum morbis remedia subtexemus orsi a capite.

alopecias emendat nymphaeae heracliae radix, sive una ... trita inlinantur. polythrix distat a callitriche, quod iuncos albos habet et folia plura maioraque, frutice quoque maior est. defluentem capillum confirmant et densant. item lingulaca, circa fontes nascens, cuius radix admixta combusta teritur cum adipe suis nigrae; id quoque excipitur, ut eius suis, quae numquam pepererit; sol deinde plurimum confert inlitae. similis usus est cyclamini radice. - porriginem veratri radix tollit in oleo decocta vel in aqua. - capitis dolori medetur panacis omnium generum radix in oleo contrita, aristolochia, hiberis adalligata hora vel diutius, si pati possit, comitante balinei usu. medetur et daucum. purgat autem cyclaminos cum melle in nares addita et ulcera capitis sanat inlita. medetur et peristereos.

cacalia sive leontice vocatur, semen margaritis minutis simile, dependens inter folia grandia, in montibus fere. huius grana xv in oleo macerantur, atque ita adverso capillo caput inungitur.

fit et ex callitriche sternumentum. folia sunt lenticulae, caules iunci tenuissimi, radice minima. nascitur opacis et umidis, gustatu fervens.

hysopum in oleo contritum phthiriasi resistit et prurigini in capite. est autem optimum cilicium e tauro monte, dein pamphylium ac zmyrnaeum. stomacho contrarium, purgat cum fico sumptum per inferna, cum melle vomitionibus. putant et serpentium ictibus adversari, tritum cum melle et sale et cumino.

lonchitis non, ut plerique existimaverunt, eadem est quae xiphion aut phasganion, quamquam cuspidi similis semine; habet enim folia porri, rubentia ad radicem et plura quam in caule, capitula personis comicis similia, parvam exserentibus linguam, radicibus praelongis. nascitur in sitientibus, e diverso xiphion et phasganion in umidis. cum primum exit, gladii praebet speciem, caule ii cubitorum, radice ad nucis abellanae figuram fimbriata, quam effodi ante messes oportet, siccari in umbra. superior pars eius cum ture trita, aequo pondere admixto vino, ossa fracta capite extrahit aut quicquid in corpore suppuret vel si calcata sint ossa serpentis; eadem contra venena efficax. - caput in dolore veratro in oleo vel rosaceo decocto tritoque ungui convenit, peucedano ex oleo vel rosaceo et aceto. tepidum hoc prodest et doloribus, qui plerumque ex dimidia parte capitis sentiuntur, et vertigini. perungunt et radice eius sudoris causa eliciendi, quoniam caustica vis ei est.

psyllion alii cynoides, alii crystallion, alii sicelicon, alii cynomyiam appellant, radice tenui, supervacua, sarmentosum, fabae granis in cacuminibus, foliis canino capiti non dissimilibus, semine autem pulci, unde et nomen. hoc in baxis, ipsa herba in vineis invenitur. vis ad refrigerandum et discutiendum ingens. semen in usu. fronti inponitur in dolore et temporibus ex aceto et rosaceo aut posca; ad cetera inlinitur. acetabuli mensura sextarium aquae densat ac contrahit; tunc terere oportet et crassitudinem inlinere cuicumque dolori et collectioni inflammationique. - vulneribus capitis medetur aristolochia, fracta extrahens ossa et in alia quidem parte corporis, sed maxime capite; similiter plistolochia. - thryselinum est non dissimile apio;

huius radix commanducata purgat capitis pituitas.

oculorum aciem centaurio maiore putant adiuvari, si addita aqua foveantur, suco vero minoris cum melle culices, nubeculas, obscuritates discuti, cicatrices extenuari, albugines quidem etiam iumentorum sideritide. nam chelidonia supra dictis omnibus mire medetur. panacis radicem cum polenta epiphoris inponunt. hyoscyami semen et bibunt obolo, tantundem meconii adicientes vinumque, ad epiphoras inhibendas. inungunt et gentianae suco, quem collyriis quoque acrioribus pro meconio miscent. facit claritatem et euphorbeum inunctis. instillatur plantaginis sucus lippitudini. caligines aristolochia discutit, hiberis adalligata capiti, quinquefolium. epiphoras et si qua in oculis vitia sunt emendat verbascum. epiphoris inponitur peristereos ex rosaceo vel aceto. ad hypochysis et caliginem cyclamini pastillos diluunt, peucedani sucum ut diximus, ad claritatem et caligines cum meconio et rosaceo. psyllion inlitum fronti epiphoras suspendit.

anagallida aliqui acoron vocant. duo genera eius: mas flore phoeniceo, femina caeruleo, non altiores palmo, frutice tenero, foliis pusillis, rotundis, in terra iacentibus. nascuntur in hortis et aquosis. prior floret caerulea. utriusque sucus oculorum caliginem discutit cum melle et ex ictu cruorem et argema rubens, magis cum attico melle inunctis. pupillas dilatat, et ideo hae inunguntur ante quibus paracentesis fit. iumentorum quoque oculis medentur. sucus caput purgat per nares infusus ita, ut deinde vino colluatur. bibitur et contra angues suci drachma in vino. mirum quod feminam pecora vitant aut, si decepta similitudine - flore enim tantum distant - degustavere, statim eam, quae asyla appellatur, in remedium quaerunt. a nostris felis oculus vocatur. praecipiant aliqui effossuris ante solis ortum, priusquam quicquam aliud loquantur, salutare eam, sublatam exprimere; ita praecipuas esse vires. de euphorbeae suco satis dictum est. lippitudini, si tumor erit, absinthium cum melle tritum, item cum ... vettonicae farina conveniet.

aegilopas sanat herba eodem nomine, quae in hordeo nascitur, tritici folio, semine contrito cum farina permixta inpositaque vel suco. exprimitur hic e caule foliisque praegnantibus dempta spica et in trimestri farina digeritur in pastillos.

antiqui et mandragora utebantur, postea abdicatus est in hac curatione. epiphoris, quod certum est, medetur et oculorum dolori radix tusa cum rosaceo et vino. nam sucus multis oculorum medicamentis miscetur. mandagoran alii circaeon vocant. duo eius genera: candidus qui et mas, niger qui femina existimatur, angustioribus quam lactucae foliis, hirsutis et caulibus, radicibus binis ternisve rufulis, intus albis, carnosus tenerisque, paene cubitalibus. ferunt mala abellanarum nucum magnitudine et in iis semen ceu pirorum. hoc albo alii arsena, alii morion, alii hippophlomon vocant. huius folia alba, alterius foliis latiora, ut lapathi sativae. effossuri cavent contrarium ventum et iii circulis ante gladio circumscribunt, postea fodiunt ad occasum spectantes. sucus fit et e malis et caule deciso cacumine et e radice punctis aperta aut decocta. utilis haec vel surculo; concisa quoque in

orbiculos servatur in vino. sucus non ubique invenitur, sed, ubi potest, circa vindemias quaeritur. odor gravis ei, ut et radicis et mali, gravior ex albo. mala matura in umbra siccantur. sucus ex iis sole densatur, item radicis tusae vel in vino nigro ad tertias decoctae. folia servantur in muria efficacius; salsus rore tantum sucus pestis est; sic quoque noxae vires gravedinem adferunt etiam olfactu. quamquam mala in aliquis terris manduntur, nimio tamen odore obmutescunt ignari, potu quidem largiore etiam moriuntur. vis somnifica pro viribus bibentium; media potio cyathi unius. bibitur et contra serpentes et ante sectiones punctionesque, ne sentiantur; ob haec satis est aliquis somnum odore quasisse. bibitur et pro helleboro ii obolis in mulso - efficacius helleborum - ad vomitiones et ad bilem nigram extrahendam.

cicuta quoque venenum est, publica atheniensium poena invisae, ad multa tamen usus non omittendi. semen habet noxium; caulis autem et viridis estur a plerisque et in patinis. levis hic et geniculatus ut calami, nigricans, altior saepe binis cubitis, in cacuminibus ramosus, folia coriandri teneriora, gravia odoratu, semen aneso crassius, radix concava, nullius usus. semini et foliis refrigeratoria vis; sic et necat: incipiunt algere ab extremitatibus corporis. remedio est, priusquam ad vitalia perveniat, vini natura excalfactoria. sed in vino pota inremediabilis existit. sucus exprimitur foliis floribusque, tum enim maxime tempestivus est; melior semine trito expressus et sole densatus in pastillos. necat sanguinem spissando - haec altera vis ei - ; ideo sic necatorum maculae in corporibus apparent. ad dissolvenda medicamenta utuntur illo pro aqua. fit ex eo et ad refrigerandum stomachum malagma. praecipuus tamen est ad cohibendas epiphoras aestivas oculorumque dolores sedandos circumlitus; miscetur collyriis. et alias omnes rheumatismos cohibet. folia quoque tumorem omnem doloremque et epiphoras sedant. anaxilaus auctor est mammas a virginitate inlitas semper staturas. quod certum est, lac puerperarum mammis inposita extinguit veneremque testibus circa pubertatem inlita. remedia, in quibus bibenda censetur, non equidem praeceperim. vis maxima natae susi parthorum, mox laconicae, creticae, asiaticae, in graecia vero megaricae, deinde atticae.

cremnos agrios gremias tollit oculorum inpositus, tumorem quoque polenta addita.

nascitur vulgo molybdaena, id est plumbago, etiam in arvo, folio lapathi, crassa, hispida. hac commanducata si oculus subinde lingatur, plumbum, quod est genus vitii, ex oculo tollitur.

capnos trunca, quam pedes gallinacios vocant, nascens in parietinis et saepibus, ramis tenuissimis sparsisque, flore purpureo, viridis suco caliginem discutit; itaque in medicamenta oculorum additur.

similis et nomine et effectum, sed alia est capnos fruticosa, praetenera, foliis coriandri, cineracei coloris, flore purpureo. nascitur in hortis et segetibus hordeaciis. claritatem facit inunctis oculis delacrimationemque ceu fumus, unde nomen. eadem evolsas palpebras renasci prohibet.

acoron iridis folia habet, angustiora tantum et longiore pediculo, radices

nigras minusque venosas, cetero et has similes iridis, gustu acres, odore non ingratas, ructu faciles. optumae daspetiaca e galatia, mox creticae, sed plurimae in colchide iuxta phasin amnem et ubicumque in aquis. recentibus virus maius quam vetustis, creticae candidiores ponticis. siccantur, ut iris, in umbra digitalibus frustis. nec non inveniuntur qui oxymyrsinae radicem acoron vocant, ideoque quidam hanc acorion vocare malunt. vis ei ad calfaciendum extenuandumque, efficax contra suffusiones et caligines oculorum, suco eiusdem poto contra serpentes.

cotyledon parvula herba est, in cauliculo tenero, pusillo folio pingui, concavo ut coxendices. nascitur in maritimis petrosisque umidis, radice olivae modo rotunda. oculis medetur suco. est aliud genus eiusdem sordidis foliis, latoribus densioribusque circa radicem velut oculum cingentibus, asperissimi gustus, longiore caule, sed pergracili. usus ad eadem quae sativi aizoi.

duo genera eius: maius in fictilibus vasculis seritur, quod aliqui buphthalmon appellant, alii zoophthalmon, alii stergethron, quia amatoris conveniat, alii hypogeson, quoniam in subgrundiis fere nascitur; sunt qui ambrosiam potius vocant et qui amerimnon, italia sedum magnum aut oculum aut digitillum. alterum minusculum, quod erithales vocant, alii trithales, quia ter floreat, alii erysithales, aliqui isoe+tes, italia sedum, sed aequae aizoum utrumque, quoniam vireat semper. maius et cubiti altitudinem excedit, crassitudine plus quam pollicari. folia in cacumine linguae similia, carnosa, pingua, larga suco, latitudine pollicari, alia in terram convexa, alia stantia ita, ut ambitu effigiem imitentur oculi. quod minus est, in muris parietinisque et tegulis nascitur, fruticosum a radice et foliosum usque ad cacumen, foliis angustis, mucronatis, sucosis, palmum alto caule. radix inutilis.

huic similis est quam graeci andrachnen agrian vocant, italia inlecebram, pusillis latoribus foliis et brevior caumine. nascitur in petris et colligitur cibi causa.

omnium harum vis eadem, refrigerare et adstringere. medentur epiphoris folia inposita vel sucus inunctis, purgat enim ulcera oculorum expletque et ad cicatricem perducit, palpebras deglutinat. eadem capitis doloribus medentur suco vel folio temporibus inlitis, adversantur phalangiorum ictibus, aconito vero maius aizoum praecipue. a scorpionibus quoque habentem id feriri negant.

medentur et aurium dolori, item sucus hyoscyami modicus, item achilleae et centaurii minoris et plantaginis, peucedani cum rosaceo et meconio, acori sucus cum rosa - omnis autem strigili calefactus infunditur - , cotyledon etiam purulentis cum medulla cervina calefacta, ebuli radice tritae sucus linteus colatus, mox in sole densatus et, cum opus sit, rosaceo dilutus et calefactus.

parotidas verbenaca, item plantago sanat, item sideritis cum axungia vetere.

narium ozaenas emendat aristolochia cum cypero.

dentibus remedio sunt panacis radix commanucata, praecipue chironiae, item sucus collutis, radix hyoscyami ex aceto manducata, item polemoniae.

commanducatur et plantaginis radix, aut colluuntur in aceto decoctae suco; et folia esse utile, vel si sanguine gingivae putrescant; vel semen eiusdem apostemata et collectiones gingivarum sanat. et aristolochia gingivas dentesque confirmat, verbenaca cum radice commanducata et decoctae ex vino aut aceto sucus collutus, item quinquefolii radice decoctae ad tertias in vino aut aceto. prius quam decoquatur, aqua marina aut salsa lavatur; decoctum diu tenendum in ore. quidam cinere quinquefolii fricare malunt. et verbasci radix decoquitur in vino ad colluendos dentes, et hysopo colluuntur et peucedani suco cum meconio vel radicum anagallidis, magis feminae, suco ab altera nare, quam doleat, infuso.

erigeron a nostris vocatur senecio. hanc si ferro circumscriptam effodiat aliquis tangatque ea dentem et alternis ter despuat ac reponat in eundem locum ita, ut vivat herba, aiunt dentem eum postea non doliturum. herba est trixaginis specie et mollitia, cauliculis subrubicundis. nascitur in tegulis et in muris. nomen hoc graeci dederunt, quia vere canescit. caput eius numerose dividitur lanugine, qualis est spinae, inter divisuras exeunte; quare callimachus eam acanthida appellavit, alii pappum. nec deinde graecis de ea constat. alii erucae foliis esse dixerunt, alii roboris - at minora multo - , radice alii supervacua, alii nervis utili, alii potu strangulante. e diverso quidam regio morbo cum vino dederunt et contra omnia vesicae vitia, item cordis et iocineris. extrahere renibus harenam dixere. ischiadicis drachmam cum oxymelite ab ambulatione propinavere, torminibus quoque et in passo utilissimam, praecordiis etiam cibo ex aceto eam praedicantes serentesque in hortis. nec defuere qui et alterum genus facerent nec quale esset demonstrarent, contra serpentes in aqua bibendam edendamque comitialibus dantes. nos eam romanis experimentis per usus digeremus. lanugo eius cum croco et exiguo aquae frigidae trita inlinitur epiphoris, tosta cum mica salis strumis.

ephemeron folia habet lili, sed minora, caulem parem, florem caeruleum, semen supervacuum, radicem unam digitali crassitudine, dentibus praecipuam concisam in aceto decoctamque, ut tepido colluantur. et ipsa etiam radix sistit; cavis, exesis inprimitur. chelidoniae radix ex aceto trita continetur ore, erosio veratrum nigrum inprimitur, mobiles utrolibet decocto in aceto firmantur.

labrum venerium vocant in flumine nascentem. est ei vermiculus, qui circa dentes fricatur aut cavis dentium cera includitur. cavendum ne vulsa herba terram tangat.

ranunculum vocamus quam graeci batrachion. genera eius iiii: unum pinguioribus quam coriandri foliis et ad latitudinem malvae accedentibus, colore livido, caule alto, gracili et radice alba. nascitur in limitibus umidis et opacis. alterum foliosius, pluribus foliorum incisuris, altius caulibus. tertium minimum est, gravi odore, flore aureo. quartum simile huic, flore lacteo. omnibus vis caustica, si cruda folia inponantur, pusulasque ut ignis faciunt. ideo ad lepras et psoras iis utuntur et ad tollenda stigmata, causticisque omnibus miscent. alopeciis inponunt celeriter removentes. radix in dolore

commanducata diutius rumpit dentes; eadem sicca concisa sternumentum est. nostri herbarii strumum eam vocant, quoniam medetur strumis et panis parte in fumo suspensa, creduntque ea rursus sata rebellare quae curaverint vitia, in quo scelere et plantagine utuntur. oris ulcera intus sucus plantaginis emendat et folia radicesque commanducatae, vel si rheumatismo laboret os, ulcera faetoremque quinquefolium, ulcera psyllium.

composita quoque contra faetores, vel maxime pudendum vitium, trademus. ergo folia myrti et lentisci pari pondere, gallae syriacae dimidium pondus simul terere et vino vetusto sparsa mandere matutino ex usu est, vel hederæ bacas cum casia et murra pari pondere ex vino. naribus utilissimum est dracontii semen contritum ex melle, etiam si carcinomata in iis sint. suggillata hysopo emendantur, stigmata in facie mandragoras inlitis delet.

LIBER XXVI

sensit facies hominum et novos omnique aevo priore incognitos non italiae modo, verum etiam universae prope europae morbos, tunc quoque non tota italia nec per illyricum galliasve aut hispanias magno opere vagatos aut alibi quam romae circaque, sine dolore quidem illos ac sine pernicie vitae, sed tanta foeditate, ut quaecumque mors praeferenda esset.

gravissimum ex iis lichenas appellavere graeco nomine, latine, quoniam a mento fere oriebatur, ioculari primum lascivia, ut est procax multorum natura in alienis miseriis, mox et usurpato vocabulo mentagram, occupantem multis et latius totos utique voltus, oculis tantum immunibus, descendentem vero et in colla pectusque ac manus foedo cutis furfure.

non fuerat haec lues apud maiores patresque nostros et primum ti. claudi caesaris principatu medio inrepsit in italiam quodam perusino equite romano, quaestorio scriba, cum in asia adparuisset, inde contagionem eius inportante. nec sensere id malum feminae aut servitia plebesque humilis aut media, sed proceres veloci transitu osculi maxime, foediore multorum, qui perpeti medicinam toleraverant, cicatrice quam morbo. causticis namque curabatur, ni usque in ossa corpus exustum esset, rebellante taedio. adveneruntque ex aegypto, genetrice talium vitiorum, medici hanc solam operam adferentes magna sua praeda, siquidem certum est manilium cornutum e praetoriis legatum aquitanicae provinciae hs cc elocasse in eo morbo curandum sese. accidit quoque saepius, ut nova contra genera morborum gregatim sentirentur. quo mirabilius quid potest reperiri aliqua gigni repente vitia terrarum in parte certa membrisque hominum certis vel aetatibus aut etiam fortunis, tamquam malo eligente, haec in pueris grassari, illa in adultis, haec proceres sentire, illa pauperes!

l. paullo q. marcio censoribus primum in italia carbunculum evenisse annalibus notatum est, peculiare narbonensis provinciae malum, quo duo consulares obiere condentibus haec nobis eodem anno, iulius rufus atque laecanius bassus, ille medicorum inscitia sectus, hic vero pollici laevae manus evulso acu ab semet ipso tam parvo, ut vix cerni posset. nascitur in occultissimis corporum partibus et plerumque sub lingua duritia rubens vari modo, sed capite nigricans, alias livida, in corpus intendens neque intumescens, sine dolore, sine pruritu, sine alio quam somni indicio, quo gravatos in triduo aufert, aliquando et horrorem adferens circaque pusulas parvas, rarius febrem, stomachum faucesque ut invasit, ocissime exanimans.

diximus elephantiasim ante pompeii magni aetatem non accidisse in italia, et ipsam a facie saepius incipientem, in nare prima veluti lenticula, mox incrementum per totum corpus, maculosa variis coloribus et inaequali cute, alibi crassa, alibi tenui, dura, alibi ceu scabie aspera, ad postremum vero nigrescente et ad ossa carnes adprimente, intumescens digitis in pedibus manibusque. aegypti peculiare hoc malum et, cum in reges incidisset, populis

funebre, quippe in balineis solia temperabantur humano sanguine ad medicinam eam. et hic quidem morbus celeriter in italia restinctus est, sicut et ille, quem gemursam appellavere prisci inter digitos pedum nascentem, etiam nomine oblitterato.

id ipsum mirabile, alios desinere in nobis, alios durare, sicuti colum. ti. caesaris principatu inrepsit id malum, nec quisquam id prior imperatore ipso sensit, magna civitatis ambage, cum in edicto eius excusantis valetudinem legeret nomen incognitum. quid hoc esse dicamus aut quas deorum iras parum enim erant homini certa morborum genera, cum supra trecenta essent, nisi etiam nova timerentur! neque ipsi autem homines pauciora sibi opera sua negotia inportant.

haec apud priscos erant quae memoramus remedia, medicinam ipsa quodammodo rerum natura faciente, et diu fuere. hippocratis certe, qui primus medendi praecepta clarissime condidit, referta herbarum mentione invenimus volumina, nec minus diocli carysti, qui secundus aetate famaue extitit, item praxagorae et chrysippi ac deinde erasistrati cei, herophilo quidem, quamquam subtilioris sectae conditori, ante omnis celebratam rationem, iam paulatim, usu efficacissimo rerum omnium magistro, peculiariter utique medicinae, ad verba garrulitatemque descendentem. sedere namque in scholis auditioni operatos gratius erat quam ire per solitudines et quaerere herbas alias aliis diebus anni.

durabat tamen antiquitas firma magnasque confessae rei vindicabat reliquias, donec asclepiades aetate magni pompeii orandi magister nec satis in arte ea quaestuosus, ut ad alia quam forum sagacis ingenii, huc se repente convertit atque, ut necesse erat homini qui nec id egisset nec remedia nosset oculis usuque percipienda, torrenti ac meditata cotidie oratione blandiens omnia abdicavit totamque medicinam ad causas revocando coniecturae fecit, quinque res maxime communium auxiliorum professus, abstinentiam cibi, alias vini, fricationem corporis, ambulationem, gestationes, quae cum unusquisque semet ipsum sibi praestare posse intellexeret, faventibus cunctis, ut essent vera quae facillima erant, universum prope humanum genus circumegit in se non alio modo quam si caelo demissus advenisset.

trahebat praeterea mentes artificio inani, alias vinum promittendo aegris dandoque tempestive, iam frigidam aquam et, quoniam causas morborum scrutari prius herophilus instituerat, vini rationem inlustraverat cleophantus apud priscos, ipse cognominari se frigida danda praeferens, ut auctor est M. Varro. alia quoque blandimenta excogitabat, iam suspendendo lectulos, quorum iactatu aut morbos extenuaret aut somnos adliceret, iam balneas avidissima hominum cupidine instituendo et alia multa dictu grata atque iucunda, magna auctoritate nec minore fama, cum occurrisset ignoto funeri, relato homine ab rogo atque servato, ne quis levibus momentis tantam conversionem factam existimet. id solum possumus indignari, unum hominem e levissima gente, sine opibus ullis orsum, vectigalis sui causa repente leges salutis humano generi dedisse, quas tamen postea abrogavere multi.

asclepiaden adiuvere multa in antiquorum cura nimis anxia et rudia, ut obruendi aegros veste sudoresque omni modo ciendi, nunc corpora ad ignes torrendi solesve adsiduo quaerendi in urbe nimbosa, immo vero tota italia imbricitrice, tum primum pensili balinearum usu ad infinitum blandiente. praeterea in quibusdam morbis medendi cruciatus detraxit, ut in anginis, quas curabant in fauces organo demisso. damnavit merito et vomitiones tunc supra modum frequentes. arguit et medicamentorum potus stomacho inimicos, quod est magna ex parte verum. itaque nos in primis quae sunt stomacho utilia signamus.

super omnia adiuvere eum magicae vanitates in tantum evectae, ut abrogare herbis fidem cunctis possent: aethiopide herba amnes ac stagna siccari; onothuridis tactu clausa omnia aperiri; achaemenide coniecta in aciem hostium trepidare agmina ac terga verti; latacen dari solitam a persarum rege legatis, ut, quocumque venissent, omnium rerum copia abundarent, ac multa similia. ubinam istae fuere, cum cimbri teutonique terribili marte ulularent aut cum lucullus tot reges magorum paucis legionibus sterneret curve romani duces primam semper in bellis commerciorum habuere curam cur caesaris miles ad pharsaliam famem sensit, si abundantia omnis contingere unius herbae felicitate poterat non satius fuit aemilianum scipionem carthaginis portas herba patefacere quam machinis claustra per tot annos quater siccentur hodie meroide pomptinae paludes tantumque agri suburbanae reddatur italiae! nam quae apud eundem democritum invenitur compositio medicamenti, quo pulchri bonique et fortunati gignantur liberi, cui umquam persarum regi tales dedit mirum esset profecto hucusque provectam credulitatem antiquorum saluberrimis ortam initiis, si in ulla re modum humana ingenia novissent atque non hanc ipsam medicinam ab asclepiade repertam probaturi suo loco essemus evectam ultra magos etiam. haec est omni in re animorum condicio, ut a necessariis orsa primo cuncta pervenerint ad nimium. igitur demonstratarum priore libro herbarum reliquos effectus reddemus, adicientes ut quasque ratio dictabit.

sed in lichenis remediis atque tam foedo malo plura undique acervabimus, quamquam non paucis iam demonstratis. medetur ergo plantago trita, quinquefolium, radix albuci ex aceto, ficulni caules ex aceto decocti, hibisci radix cum glutino et aceto acri decocta ad quartas. defricant etiam pumice, ut rumicis radix trita ex aceto inlinatur. et flos visci cum calce subactus laudatur et tithymalli cum resina decoctum. lichen vero herba omnibus his praefertur, inde nomine invento. nascitur in saxis, folio uno ad radicem lato, caule uno parvo, longis foliis dependentibus. haec delet et stigmata. teritur cum melle. est aliud genus lichenis, petris totum adhaerens ut muscus, qui et ipse inlinatur. hic et sanguinem sistit vulneribus instillatus et collectiones inlitus. morbum quoque regium cum melle sanat ore inlito et lingua. qui ita curentur, aqua salsa lavari iubentur, ungui oleo amygdalino, hortensiis abstinere. ad lichenas et thapsiae radice utuntur trita cum melle.

anginae argemonia medetur sumpta ex vino, hysopum cum fico decoctum

et gargarizatum, peucedanum cum coagulo vituli marini aequis partibus, proserpinaca cum muria ex menis et oleo trita vel sub lingua habita, item sucus de quinquefolio potus cyathis iii. hic et omnibus faucium vitiis medetur gargarizatus, verbascum privatim tonsillis in aqua potum, strumis plantago, chelidonia cum melle et axungia, quinquefolium, radix persollatae, item cum axungia operitur folio suo inposita, item artemisia, radix mandragorae ex aqua. sideritis latifolia clavo sinistra manu circumfossa adalligatur, custodienda sanatis, ne rursus sata taedium herbariorum scelere, ut in quibusdam diximus, rebellet, quod et in iis, quos artemisia sanaverit, praedici reperio, item in iis, quos plantago. damasonium, quae et alcima vocatur, sub solstitio collecta inponitur ex aqua caelesti, folium tritum vel radix tusa cum axungia ita, ut inposita folio suo operiatur. sic et ad omnes cervicis dolores tumoresque quacumque in parte. - bellis in pratis nascitur, flore albo, aliquatenus rubente. hanc cum artemisia inlitam efficaciorē esse produnt. - condurum quoque herba solstitialis, flore rubro, suspensa in collo conprimere dicitur strumas, item verbenaca cum plantagine. - digitorum vitiis omnibus et privatim pterygiis quinquefolium medetur.

in pectoris vitiis vel gravissimum est tussis. huic medetur panacis radix in vino dulci, sucus hyoscyami etiam sanguinem excreantibus, nidor quoque accensi tussientibus, item scordotis mixto nasturcio et resina cum melle tunsā arida - facit et per se faciles excreationes - , item centaurium maius vel sanguinem reicientibus, cui vitio et plantaginis sucus medetur et vettonica obolis iii in aqua; contra purulentas contraque cruentas exscreationes persollatae radix drachmae pondere cum pineis nucleis xi, peucedani sucus. pectoris doloribus acorum subvenit, idem antidotis miscetur; tussi daucum, item scythica herba, eadem omnibus pectoris vitiis; tussi et purulenta excreantibus obolis iii in passi totidem verbascum, cuius est flos aureus. huic tanta vis, ut iumentis etiam non tussientibus modo, sed ilia quoque trahentibus auxilietur potu, quod et de gentiana reperio. radix cacaliae comanducata et in vino madefacta non tussi tantum, sed et faucibus prodest. hysopi v rami cum ii rutae et ficis iii decocti thoracem purgant, tussim sedant.

bechion tussilago dicitur. duo eius genera. silvestris ubi nascitur, subesse aquas credunt, et hoc habent signum aquileges. folia sunt maiuscula quam hederæ v aut vii, subalbida a terra, superne pallida, sine caule, sine flore, sine semine, radice tenui. quidam eandem esse arcion et alio nomine chamaeleucen putant. huius aridae cum radice fumus per harundinem haustus et devoratus veterem sanare dicitur tussim, sed in singulos haustus passum gustandum est. altera a quibusdam salvia appellatur, similis verbasco. conteritur et colata calfit atque ita ad tussim laterisque dolores bibitur, contra scorpiones eadem et dracones marinos efficax. contra serpentes quoque ex oleo perungui ea prodest. - hysopi fasciculus cum quadrante mellis decoquitur ad tussim, lateris, pectoris dolores, verbascum cum ruta ex aqua, vettonicae farina bibitur ex aqua calida.

stomachum conroborat scordotis suco, centaurium, gentiana ex aqua pota,

plantago aut per se in cibo sumpta aut cum lente alicaeve sorbitione. vettonica alias gravis stomacho, vitia tamen sanat pota vel foliis conmanducata, item aristolochia pota, agaricum manducatum siccum, ut ex intervallo merum sorbeatur, nymphaea heraclia inlita, peucedani sucus. psyllion ardoribus inponitur, vel cotyledon trita cum polenta vel aizoum.

molon scapo est striato, foliis mollibus, parvis radice iiii digitorum, in qua extrema alii caput est. vocatur a quibusdam syron. ex vino stomacho ... dyspnoeae medetur centaurium maius ecligmate, plantago suco vel cibo, vettonicae tusae pondo libra, mellis attici semuncia ex aqua calida cotidie bibentibus, aristolochia vel agaricum obolis ternis ex aqua calida aut lacte asini potum. cissanthemos ad orthopnoeas bibitur, item hysopum et asthmaticis, peucedani sucus in iocineris doloribus et pectoris laterisque, si febres non sint. sanguinem quoque expuentibus subvenit agaricum victoriati pondere tritum et in mulsi v cyathis datum. idem et amomon facit. iocineri privatim teucra bibitur recens drachmis iiii in poscae hemina, vettonicae drachma i in aquae calidae cyathis iii ad cordis vitia in frigidae cyathis ii. quinquefolii sucus iocineris et pulmonis vitiis sanguinemque reicientibus et cuicumque vitio sanguinis intus occurrit. iocineri anagallides mire prosunt. capnon herbam qui edere, bilem per urinam reddunt. acoron iocineri medetur, thoraci et praecordiis daucum.

ephedra, ab aliis anabasis vocata, nascitur ventoso fere tractu scandens arborem et ex ramis propendens, folio nullo cirris numerosa, qui sint iunci geniculati, radice pallida. datur ex vino nigro austero trita ad tussim, suspiria, tormina et sorbitione facta, in quam vinum addi convenit. item gentiana madefacta pridie contrita denarii pondere in vini cyathis iii.

gaeum radículas tenues habet nigras, bene olentes. medetur non modo pectoris doloribus aut lateris, sed et cruditates discutit iucundo sapore. verbenaca vero omnibus visceribus medetur, lateribus, pulmonibus, iocineribus, thoraci; peculiariter autem pulmonibus et quos ab iis phthisis temptet radix herbae consiliginis, quam nuper inventam diximus. suum quidem et pecoris omnis remedium praesens est pulmonum vitio vel traiecta tantum in auricula. bibi debet ex aqua haberique in ore adsidue sub lingua. superficies eius herbae an sit in aliquo usu, adhuc incertum est. renibus prodest plantaginis cibus, vettonicae potus, agaricum potum ut in tussi.

tripolion in maritimis nascitur saxis, ubi adludit unda, neque in mari neque in sicco, folio isatis crassiore, caule palmum alto, in mucrone diviso, radice alba, odorata, crassa, calidi gustus. datur hepaticis in farre cocta. haec herba eadem videtur quibusdam quae polium, de qua suo loco diximus.

gromphaena, alternis viridibus roseisque per caulem foliis, in posca sanguinem reicientibus medetur. iocineri autem herba malundrum, nascens in segete ac pratis, flore albo, odorata. eius cauliculus conteritur ex vino vetere. item herba calcetum e vinaceis contrita inponitur. faciles praestat vomitiones radix vettonicae, hellebori modo iiii drachmis in passo aut mulso, hysopum tritum cum melle, utilius praesumpto nasturcio aut irione, molemonium

denarii pondere. et sillybi lacteus sucus, qui densatur in cummim, sumitur cum melle supra dicto pondere praecipueque bilem trahit. rursus sistunt vomitionem cuminum silvestre, vettonicae farina; sumuntur ex aqua. abstergent fastidia cruditatesque digerunt daucum, vettonicae farina ex aqua mulsa, plantago decocta caulium modo. - singultus hemionium sedat, item aristolochia, suspiria clymenus. - pleuriticis et peripneumonicis centaurium maius, item hysopum bibitur, pleuriticis peucedani sucus. alus autem, quam galli sic vocant, veneti cotoneam, medetur lateri, item renibus convolsisque et ruptis. similis est cunilae bubulae, cacuminibus thymo, dulcis et sitim sedans, radicis alibi albae, alibi nigrae. eosdem effectus in lateris doloribus habet chamaerops myrteis circa caules geminos foliis, capitibus graeculae rosae, ex vino pota. - ischiadicis dolores et spinae levat agaricum potum ut in tussi, item stoechadis aut vettonicae farina ex aqua mulsa.

plurimum tamen homini negotii alvus exhibet, cuius causa maior pars mortalium vivit. alias enim cibos non transmittit, alias non continet, alias non capit, alias non conficit, eoque mores venere, ut homo maxime cibo pereat. pessimum corporum vas instat ut creditor et saepius die appellat. huius gratia praecipue avaritia expetit, huic luxuria condit, huic navigatur ad phasim, huic profundi vada exquiruntur; et nemo vilitatem eius aestimat consummationis foeditate. ergo numerosissima est circa hanc medicinae opera.

sistit eam scordotis recens drachma cum vino trita vel decocta potu, polemonia, quae et dysintericis ex vino datur, verbasci radix pota ex aqua ii digitorum magnitudine, nymphaeae heracliae semen cum vino potum, radix superior e xiphio drachmae pondere ex aceto, semen plantaginis in vino tritum vel ipsa ex aceto cocta aut alica ex suco eius sumpta, item cum lenticula cocta vel aridae farina inspersa potioni cum papavere tosto et trito vel sucus infusus aut potus, vettonica in vino ferro calefacto. eadem coeliacis in vino austero datur; his et hiberis inponitur uti dictum est. - tenesmo radix nymphaeae heracliae e vino bibitur, psyllium in aqua, acori radicis decoctum. aizoi sucus alvum sistit et dysinterias et taenias rotundas pellit. symphyti radix pota in vino alvum et dysinteriam sistit, item dauci. aizoum foliis contritis ex vino torminibus resistit, alcimae siccae farina torminibus pota cum vino.

astragalus folia habet longa, incisuris multis obliquis, circa radicem caules iii aut ii, foliorum plenos, florem hyacinthi, radices villosas, implicatas, rubras, praeduras. nascitur in petrosis, apricis et isdem nivalibus, sicut in pheneo arcadiae. vis ei ad spissanda corpora. alvum sistit radix in vino pota, quo fit ut moveat urinam percusso liquore, sicut pleraque quae alvum sistunt. sanat et dysintericos in vino rubro tusa; difficile autem tunditur. eadem gingivarum suppurationi utilissima est fotu. colligitur exitu autumni, cum folia amisit; siccatur in umbra.

et ladano sistitur alvus utroque, quod in segetibus nascitur contuso et cribrato. bibitur ex aqua mulsa, item nobili e vino. ledon appellatur herba, ex qua fit in cypro barbis caprarum adhaerescens. nobilius in arabia fit, iam et in syria atque africa quod toxicum vocant; nervos enim in arcu circumdatos lanis

trahunt adhaeresciente roscida lanugine. plura de eo diximus inter unguenta. hoc gravissimum odore est durissimumque tactu. plurimum enim terrae colligit, cum probetur maxime purum, odoratum, molle, viride, resinosum. natura ei molliendi, siccandi, concoquendi, somnum adliciendi. capillum fluentem cohibet nigritiamque custodit, auribus cum hydromelite aut rosaceo infunditur, furfures cutis et manantia ulcera sale addito sanat, tussim veterem cum styrace sumptum, efficacissimum ad ructus.

alvum sistit et chondris sive pseudodictamnium. - hypocisthis, orobethron quibusdam dicta, malo granato immaturo similis, nascitur, ut diximus, sub cistho, unde nomen. haec arefacta in umbra sistit alvum, ex vino nigro austero utraque. duo enim genera eius, candida et rufa. usus in suco: spissat, siccatur. et rufa magis stomachi rheumatismos emendat pota iii obolis, sanguinis excreationes cum amylo, dysinterias pota et infusa, item verbenaca ex aqua data aut carentibus febris ex vino ammoneo, cochlearibus v additis in cyathos iii vini.

laver quoque, nascens in rivis, condita et cocta torminibus medetur, potamogiton vero ex vino dysintericis etiam et coeliacis, similis betae foliis, minor tantum hirsutiorque, paulum semper eminens extra aquam. usus in foliis: refrigerant, spissant, peculiariter cruribus vitiosis utilia et contra ulcerum nomas cum melle vel aceto. castor hanc aliter noverat, tenui folio velut equinis saetis, thyrsos longo et levi, in aquosis nascentem. radice sanabat strumas et duritias. potamogiton adversatur crocodilis; itaque secum habent eam qui venantur. alvum sistit et achillea. eosdem effectus praestat et statice, vii caulibus veluti rosae capita sustinens.

ceratia uno folio, radice nodosa et magna, in cibo coeliacis et dysintericis medetur. leontopodium alii leuceoron, alii doripetron, alii thorybethron vocant, cuius radix alvum sistit purgatque bilem, in aquam mulsam addito pondere denariorum ii. nascitur in campestri et gracili solo. semen eius potum lymphatica somnia facere dicitur. lagopus sistit alvum ex vino pota aut in febre ex aqua. eadem inguini adalligatur in tumore. nascitur in segetibus. multi super omnia laudant ad deploratos dysintericos quinquefolium decoctis in lacte radicibus potis et aristolochiam victoriati pondere in cyathis vini iii. quae ex supra dictis calida sumentur, haec candente ferro temperari aptius erit.

ex diverso purgat alvum sucus centaurii minoris drachma in hemina aquae cum exiguo salis et aceti bilemque detrahit, maiore tormina discutuntur. vettonica alvum solvit drachmis iiii in hydromelitis cyathis viiii, item euphorbeum vel agaricum drachmis ii cum sale modico potum ex aqua aut in mulso obolis iii. solvit et cyclaminos ex aqua pota aut balanis subditis, item chamaecissi balanus. hysopi manipulus decoctus ad tertias cum sale et pituitas trahit vel tritus cum oxymelite et sale pellitque ventris animalia. pituitam et bilem detrahit peucedani radix.

alvum purgant anagallides ex aqua mulsa, item epithymum, qui est flos ex thymo satyriae simili. differentia, quod hic herbaceus est, alterius thymi albus; quidam hippopheon vocant. stomacho minus utilis vomitiones movet,

sed tormina et inflationes discutit. sumitur et ecligmate ad pectoris vitia cum melle et aliquando iride. alvum solvit a iiii drachmis ad vi cum melle et exiguo salis atque aceti. quidam aliter epithymum tradunt sine radice nasci, tenue, similitudine pallioli, rubens, siccari in umbra, bibi ex aqua acetabuli parte dimidia, detrahare pituitam bilemque alvo leniter soluta. et nymphaea in vino austero solvit et pycnocomon, erucae foliis crassioribus et acrioribus, radice rotunda, lutei coloris, terram olente, caule quadriangulo, modico, tenui, flore ocimi. invenitur in saxosis. radix eius in aqua mulsa #1108 ii pondere et alvum et bilem et pituitam exinanit; semen somnia tumultuosa facit una drachma in vino potum. et capnos trunca detrahit bilem.

polypodi, quam nostri feliculam vocant, similis felici, radix in usu, pilosa, coloris intus herbacei, crassitudine digiti minimi, acetabulis cavernosa ceu polyporum cirri, subdulcis, in petris nascens aut sub arboribus vetustis. exprimitur sucus aqua madefactae, et ipsa minute concisa inspergitur oleri vel betae vel malvae vel salsamento aut cum pulicula coquitur ad alvum vel in febris leniter solvendam. detrahit bilem et pituitam, stomachum offendit. aridae farina indita naribus polypum consumit. florem et semen non fert.

scamonium quoque dissolutione stomachi bilem detrahit, alvum solvit, praeterquam si adiciantur aloes drachmae ii obolis eius ii. est autem sucus herbae ab radice ramosae, pinguibus foliis, triangulis, albis, radice crassa, madida, nausiosa. nascitur pingui et albo solo. radix circa canis ortum excavatur, ut in ipsam confluat sucus, qui sole siccatus digeritur in pastillos. siccatur et ipsa vel cortex. laudatur natione colophonium, mysium, prienense, specie autem nitidum et quam simillimum taurino glutini, fungosum tenuissimis fistulis, cito liquescens, virus redolens, cumminosum, linguae tactu lactescens, quam levissimum, cum diluatur, albescens. hoc evenit et adulterino, quod fit ervi farina et tithymalli marini suco fere in iudaea. quod etiam strangulat sumptum. deprehenditur gustu, tithymallus enim linguam excalefacit. usus bimo; nec ante nec postea utile. dedere et per se ex aqua vel mulsa et sale quaternis obolis, sed utilissime cum aloe ita, ut incipiente purgatione mulsum bibatur. fit et decoctum radicis in aceto ad crassitudinem mellis, quo leprae inlinuntur et caput inungitur in dolore cum oleo.

tithymallum nostri herbam lactariam vocant, alii lactucam caprinam, narrantque lacte eius inscripto corpore, cum inaruerit, si cinis inspergatur, apparere litteras, et ita quidam adulteras adloqui maluere quam codicillis. genera eius multa. primus cognominatur characias, qui et masculus existimatur, ramis digitali crassitudine, rubris, sucosis, v aut vi, cubitali longitudine, a radice foliis paene oleae, in cacuminibus coma iunci. nascitur in asperis maritimis, legitur semen autumnum cum coma, siccatum sole tunditur et reponitur. sucus vero incipiente pomorum lanugine defractis ramis excipitur farina ervi aut ficis, ut cum iis arescat. quinas autem guttas singulis excipi satis est, traduntque totiens purgari hydropicos fico sumpta, quot guttas ea lactis exceperit. sucus cum colligitur, ne attingat oculos, cavendum est. fit et e foliis tunsis priore minus efficax. fit et decoctum e ramis. est et semen in usu

cum melle decoctum ad catapotia solvendae alvi gratia. semen et dentium cavis cera includitur. colluuntur et radices decocto e vino aut oleo. inlinunt et lichenas suco bibuntque eum, ut purget vomitione et alvo soluta, alias stomacho inutilem. trahit pituitam sale addito in potu, bilem aphronitro, si per alvum purgari libeat, in posca, si vomitione, in passo aut aqua mulsa. media potio iii obolis datur. ficos a cibo sumpsisse melius est. fauces urit leniter, est enim tam ferventis naturae, ut per se extra corpori inpositus pusulas ignium modo faciat et pro caustico in usu sit. - alterum genus tithymalli myrtiten vocant, alii caryiten, foliis myrti acutis et pungentibus, sed maioribus, et ipsum in asperis nascens. colliguntur comae eius hordeo turgescente siccataeque in umbra diebus viiii in sole inarescunt. fructus non pariter maturescit, sed pars anno sequente, et nux vocatur. inde cognomen graeci dedere. demetitur cum messium maturitate lavaturque, deinde siccatur et datur cum papaveris nigri ii partibus ita, ut sit totum acetabuli modus. minus hic vomitorius quam superior, ceteri item. aliqui sic et folium eius dedere, nucem vero ipsam in mulso aut passo vel sesima. trahit pituitam et bilem per alvum, oris ulcera sanat. ad nomas oris folium cum melle estur. - tertium genus tithymalli paralium vocatur sive tithymallis folio rotundo, caule palmum alto, ramis rubentibus, semine albo, quod colligitur incipiente uva et siccatum teritur sumiturque acetabuli mensura ad purgationes. - quartum genus helioscopion appellant, foliis porcillacae, ramulis stantibus a radice iiii aut v rubentibus, semipedali altitudine, suci plenis. hoc circa oppida nascitur, semine albo, columbis gratissimo. nomen accepit, quoniam capita cum sole circumagit. trahit bilem per inferna in oxymelite dimidio acetabulo. ceteri usus qui characiae. - quintum cyparittian vocant propter foliorum similitudinem, caule gemino aut triplici, nascentem in campestribus. eadem vis quae helioscopio aut characiae. - sextum platyphyllon vocant, alii corymbiten, alii amygdaliten a similitudine. nec ullius latiora sunt folia. pisces necat. alvum solvit radice vel foliis vel suco in mulso aut aqua mulsa drachmis iiii. detrahit privatim aquas. - septimum dendroides cognominant, alii cobion, alii leptophyllon, in petris nascens, comosissimum ex omnibus, maximis cauliculis rubentibus et semine copiosissimum, eiusdem effectus cuius characian.

apios ischas sive raphanos agria, iuncos ii aut iii spargit in terra rubentes, foliis rutae. radix cepae, sed amplior, quare quidam raphanum silvestrem vocant. intus habet mammam candidam, extra cortices nigros. nascitur in montosis asperis, aliquando et herbosis. effoditur vere tusaque in fictili mergitur, deiectoque quod supernatat reliquus sucus purgat utraque parte sesquibolo in aqua mulsa. sic et hydropicis datur acetabuli mensura. inspergitur et aridae radices farina potioni. aiunt superiorem partem eius vomitione biles extrahere, inferiorem per alvum in aqua.

tormina discutit quodcumque panaces, vettonica praeterquam a cruditate, peucedani sucus et inflationes, ructus gignens, acori radix, daucum vel si lactucae modo sumatur. ladanum cyprium potum interaneorum vitiis occurrit,

gentianae farina ex aqua tepida fabae magnitudine, plantago mane sumpta ii lingulis et tertia papaveris in vini cyathis iiii non veteris. datur et in somnum euntibus addito nitro vel polenta, si multo post cibum detur. colo infunditur hemina suci vel in febrī.

agaricum potum obolis iii in vini veteris cyatho uno lieni medetur, e panace omnium generum radix in mulso, sed teucra praecipue pota arida et decocta, quantum manus capiat, in aceti heminis iii ad heminam. inlinitur eadem ex aceto aut, si tolerari non possit, ex fico vel aqua. polemonia bibitur ex vino, vettonica drachma in oxymelitis cyathis iii, aristolochia ut contra serpentes. argemonia vii diebus in cibo sumpta lienem consumere dicitur, agaricum in aceto mulso obolis ii. nymphaeae heracliae radix in vino pota et ipsa consumit. cissanthemus drachma bis die sumpta in vini albi cyathis ii per dies xl lienem dicitur paulatim emittere per urinam. prodest et hysopum cum fico decoctum, lonchitidis radix decocta prius quam semen demittat, peucedani quoque radix et lieni et renibus. lien suco acori potu consumitur, praecordiis et ilibus utilissimae radices; ... clymeni semen potum diebus xxx pondere denarii in vino albo, vettonicae farina ex melle et aceto scillite pota, radix lonchitidis in aqua. teucrium inlinitur, item scordium cum cera, agaricum cum farina e feno graeco.

vesicae malis contraque calculos, gravissimis cruciatibus, ut diximus, auxilio est polemonia ex vino pota, item agaricum, plantago foliis vel radice potis ex passo, vettonica ut in iocinere diximus, item ramici pota atque inlita, eadem ad strangurias efficacissima. quidam ad calculos vettonicam et verbenacam et milifolium aequis portionibus ex aqua pro singulari remedio bibere suadent. strangurias discuti et dictamno certum est, item quinquefolio decocto ad tertias in vino. hoc et enterocelicis dari atque inlini utilissimum est. xiphi quoque radix superior urinam ciet, infantibus enterocelicis datur ex aqua et inlinitur. vesicae vitiis peucedani succus, infantium ramici et umbilicis eminentibus psyllion inlinitur. urinam cient anagallides, acori radicis decoctum vel ipsa trita potaque et omnia vesicae vitia depellit, calculos et herba et radix cotyledonis itemque genitalium inflammationem omnem pari pondere et caulis et seminis et murræ. ebulum teneris cum foliis tritum ex vino potum calculos pellit, inpositum testes sanat. erigeron quoque cum farina turis et vino dulci testium inflammationes sanat. symphyti radix inlita enterocelas cohibet, genitalium nomas hypocisthis alba. artemisia quoque datur contra calculos ex vino dulci et ad stranguriam, dolores vesicae sedat ex vino radix nymphaeae heracliae.

eadem vis crethmo ab hippocrate admodum laudatae. est autem inter eas quae eduntur silvestrium herbarum; hanc certe apud callimachum adponit rustica illa hecale. species quae elatae hortensiae. caulis unus palmum altus; semen fervens, odoratum ceu libanotidis, rotundum; siccatum rumpitur. habet intus nucleum candidum, quem aliqui cachrym vocant. folia pingua albicant veluti olivae, crassiora et salsa gustu; radices digiti crassitudine iii aut iiii. nascitur in maritimis petrosis. estur cruda coctave cum olere, odorati saporis

et iucundi. servatur etiam in muria. praecipue ei usus ad strangurias folio vel caule vel radice ex vino. colorem quoque corporis gratiorem facit, verum largior inflationes. alvum solvit decocto, urinam et a renibus umorem trahit, sicut alcimae siccae farina, e vino pota stranguriae efficacius addito dauco, lienī quoque utilis. adversus serpentes bibitur. iumentis quoque in pituita aut stranguria hordeo inspersa succurrit.

anthyllion est lenti simillima, quae in vino pota vesicas vitiis liberat, sanguinem sistit. altera anthyllis, chamaepityi similis, flore purpureo, odore gravi, radice intubi, vel magis medetur

cepaea, similis porcilacae, nigriore radice, sed inutili, nascens in litoribus harenosis, gustu amara, in vino cum asparagi radice vesicae plurimum prodest. eadem praestat hypericon - alii chamaepityn, alii corissum appellant - , oleraceo frutice, tenui, cubitali, rubente, folio rutae, odore acri, semine in siliqua nigro, maturescente cum hordeo. natura semini spissandi. alvum sistit, urinam ciet, vesicae cum vino bibitur. est aliud hypericon, quod aliqui caron appellant, folio tamaricis - et sub ea nascitur - , sed pinguioribus foliis et minutis, rubentibus, odoratum, palmo altius, suave, leniter acutum. vis semini excafactoria, et ideo inflammationem facit, sed stomacho non inutile, praecipuum ad stranguriam, si exulcerata non sit vesica. medetur et pleuriticis ex vino potum, vesicae autem callithrix trita simul cum cumino et data ex vino albo, verbenacae cum foliis decocta ad tertias vel radix eius e mulso calido calculos eicit; item perpressa, quae arreti et in illyrico nascitur, in aqua decocta ex iii heminis ad unam pota, trifolium ex vino sumptum et chrysanthemum primum. anthemis quoque calculos eicit, parvis a radice foliis quinis, caulibus longis ii, flore roseo, radices tritae per se ... cei, laver crudum. silaus nascitur glariosis et perennibus rivis, cubitalis apii similitudine. coquitur ut olus acidum, magna utilitate vesicae. quae si scabiem sentiat, panacis radice sanatur, aliter inutilis vesicis. - calculos pellit malum erraticum radicis libra in congio decocta ad dimidias - inde heminae sumuntur per triduum, relicum ex vino - et urtica marina et daucum et plantaginis semen ex vino et herba fulviana trita ex vino. et haec nomen inventoris habet, nota tractantibus. urinas ciet scordion, testium tumores sedat hyoscyamum, genitalibus medetur peucedani sucus, ex melle semen, stranguriae agaricum obolis iii in vini veteris cyathō uno, trifolii radix drachmis ii in vino, dauci una drachma vel seminis.

ischiadici semine et foliis erythrodani tritis sanantur, panace potō et infricato, polemonia, aristolochiae decocto folii. agarico quidem et nervus, qui platys appellatur, et umerorum dolor sanatur obolis iii in vini veteris cyathō uno potō. quinquefolium ischiadicis et bibitur et inponitur, item scamonia decocta et cum hordei farina. semen hyperici utriusque bibitur ex vino.

sedis vitia et adtritūs celerrime sanat plantago, condylomata quinquefolium, sed ea in callum iam conversa cyclamini radix ex aceto. anagallidum caerulea procidentiam sedis retro agit, e diverso rubens proritat. cotyledon condylomata et haemorrhoidas mire curat, testium tumores acori

radix decocta in vino tritaque inlita. intertrigines negat fieri cato absinthium ponticum secum habentibus. alii adiciunt et puleium, quod ieiunus quis legerit: si post se alliget, inguinis dolores prohibet aut sedat coeptos. inguinalis, quam quidam argemonion vocant, passim in vepribus nascens, ut prosit, in manu tantum habenda est.

panos sanat panaces ex melle, plantago cum sale, quinquefolium, persollatae radix ut in strumis, item damasonium, verbascum cum sua radice tusum, vino aspersum folioque involutum et ita in cinere calefactum, ut inponatur calidum. experti adfirmavere plurimum referre, si virgo inponat nuda ieiuna ieiuno et manu supina tangens dicat: “negat apollo pestem posse crescere cui nuda virgo restinguat” atque ita retrorsa manu ter dicat totiensque despuant ambo. medetur et radix mandragorae ex aqua, radice scamoniae decoctum cum melle, sideritis cum adipe vetere contusa, marruvium cum axungia vetere, vel chrysippios cum ficis pinguibus. et haec ab inventore habet nomen.

venerem in totum adimit, ut diximus, nymphaea heraclia, eadem semel pota in xl dies, insomnia quoque veneris a ieiuno pota et in cibo sumpta. inlita quoque radix genitalibus inhibet non solum venerem, sed et affluentiam geniturae; ob id corpus alere vocemque dicitur. adpetentiam veneris facit radix e xiphio superior data potui in vino, item quam cremnon agrion appellant, orminos agrios cum polenta contritus.

sed inter pauca mirabilis est orchis herba sive serapias, foliis porri, caule palmeo, flore purpureo, gemina radice testiculis simili, ita ut maior sive, ut aliqui dicunt, tenuior ex aqua pota excitet libidinem, minor sive mollior e lacte caprino inhibeat. quidam folio scillae esse dicunt levior ac minore, caule spinoso. radices sanant oris ulcera, thoracis pituitas, alvum sistunt e vino potae.

concitatricem vim habet et satyrion. duo eius genera: longioribus foliis quam oleae, caule iiii digitorum, flore purpureo, radice gemina ad formam hominis testium, alternis annis intumescere ac residente. altera satyrios orchis cognominatur et femina esse credita est. distinguitur internodiis et ramosiore frutice, radice fascini. nascitur fere iuxta mare. haec tumores et vitia partium earum cum polenta inlita sedat vel per se trita. superioris radix in lacte ovis colonicae data nervos intendit, eadem ex aqua remittit. graeci satyrion foliis lilii rubris, minoribus et iii non amplius e terra exeuntibus tradunt, caule levi, cubitali, nudo, radice gemina, cuius inferior pars et maior mares gignat, superior ac minor feminas. et aliud genus satyrii erythraicon appellant, semine viticis maiore, levi, duro, radice cortice rufo; intus album includi sapore subdulce, fere in montuosis inveniri. venerem, etiam si omnino manu teneatur radix, stimulari, adeo si bibatur in vino austero; arietibus quoque et hircis segnioribus in potu dari, et a sarmatia equis ob adsiduum laborem pigrioribus in coitu, quod vitium prosedamum vocant. restinguit vim eius aqua mulsa aut lactuca sumpta. in totum quidem graeci, cum concitationem hanc volunt significare, satyrion appellant, sic et crataegin

cognominantes et thelygonon et arrhenogonon, quarum semen testibus simile est. tithymalli quoque ramorum medullam habentes ad venerem proniores fieri dicuntur. prodigiosa sunt quae circa hoc tradit theophrastus, auctor alioqui gravis, septuageno coitu durasse libidinem contactu herbae, cuius nomen genusque non posuit. - sideritis adalligata varices minuit et sine dolore praestat.

podagrae morbus rarior solebat esse non modo patrum avorumque memoria, verum etiam nostra, peregrinus et ipse, nam si italiae fuisset antiquitus, latinum nomen invenisset. insanabilis non est credendus, quippe quoniam et in multis sponte desiit et in pluribus cura. medentur radices panacis cum uva passa, sucus hyoscyami cum farina vel semen, scordion ex aceto, hiberis uti dictum est, verbenaca cum axungia trita, cyclamini radix, cuius decoctum et pernionibus. podagras refrigerat radix e xiphio, semen e psyllio, cicuta cum lithargyro aut axungia, aizoum in primo impetu podagrae rubentis, hoc est calidae. utrilibet vero convenit erigeron cum axungia, plantaginis folia trita addito sale modico, argemonia tusa ex melle. medetur et verbenaca inlita aut si pedes macerentur in aqua, in qua decocta sit, et lappago, similis anagallidi, nisi esset ramosior ac pluribus foliis, gravis odoris. quae talis est, mollugo vocatur; similis, sed asperioribus foliis asperugo. superioris et sucus pondere #1108 i in vini ii cyathis cotidie sumitur. - praecipue vero liberat eo malo phycos thalassion, id est fucus marinus, lactucae similis, qui conchyliis substernitur, non podagrae modo, sed omnibus articulorum morbis inpositus, priusquam arefiat. tria autem genera eius: latum et alterum longius, quadamtenus rubens, tertium crispis foliis, quo in creta vestes tingunt, omnia eiusdem usus. nicander ea et adversus serpentes in vino dedit. salutare est et semen eius herbae, quam psyllion appellavimus, madefactum aqua admixtis in heminam seminis resinae colophoniae coclearibus ii, turis uno. laudantur et mandragorae folia cum polenta tusa.

talibus vero tumentibus limus aquaticus cum oleo subactus mire prodest, articulis sucus e centauro minore. idem nervis utilissimus, item centauris. vettonica nervis discurrentibus per scapulas, umeris, spinae, lumbis pota ut in iocinere, articulis quinquefolium inpositum, mandragorae folia cum polenta vel radix recens tusa cum cucumere silvestri vel decocta in aqua, digitorum in pedibus rimis polypodii radix, articulis sucus hyoscyami cum axungia, amomon suco decocto, item centunculus decocta vel muscus recens ex aqua obligatus, donec inarescat, item lappae boariae radix e vino pota. - cyclaminos decocta in aqua perniunculos curat omniaque alia frigoris vitia, perniunculos et cotydelon cum axungia, folia ex batrachio, epithymi sucus. clavos pedum extrahit ladanum cum castoreo, verbenaca ex vino.

nunc peractis malis, quae membratim sentiuntur, dicemus de iis, quae totis corporibus grassantur. remedia autem haec communia invenio apud auctores potanda: dodecatheum, de qua diximus, deinde panacis omnium generum radices, peculiariter longinquis morbis, et semen interaneorum vitiis, ad omnes vero dolores corporis sucum e scordio, item vettonicae, quae pota

colorem plumbeum corporis privatim emendat, gratiorem reducit.

geranion aliqui myrrin, alii myrtidan appellant. similis est cicutae, minutioribus foliis et caule brevior, rotunda, saporis et odoris iucundi. nostri sic eam tradunt, graeci foliis paulo candidioribus quam malvae, caulibus tenuibus, pilosis ramosam ex intervallis, binum palmarum; esse in his folia, inter quae in cacuminibus capitula sint gruum. alterum genus foliis anemones, divisuris longioribus, radice mali modo rotunda, dulci, reficientibus se ab imbecillitate utilissima, et fere talis vera est. bibitur contra phthisis drachma in cyathis vini iii bis die, item contra inflationes, et cruda idem praestat. sucus radice auribus medetur, opisthotonis semen drachmis iiii cum pipere et murra potum. phthisis sanat et plantaginis sucus, si bibatur, et ipsa decocta in cibo; e sale et oleo a somno matutino refrigerat. eadem datur iis, quos atrophos vocant, interpositis diebus, vettonica vero phthisicis ecligmate cum melle, fabae magnitudine, agaricum potum obolis ii in passo, vel daucum cum centaurio maiore in vino. phagedaenis, quod nomen sine modo esurientium est et alias ulcerum, tithymalli medentur cum sesamis sumpti.

inter mala universi corporis vigiliae sunt plerisque. harum remedio monstratur panaces, clymenos, aristolochia odore et peruncto capite, aizoum sive sedum, si involutum panno nigro ignorantis pulvino subiciatur, et onotheras sive onear, hilaritatem adferens in vino, amygdalae folio, flore roseo, fruticosa, longa radice et, cum siccata est, vinum olente. haec in potu data feras quoque mitigat. cruditates, quae nausiam faciunt, digeruntur vettonica pota; eadem a cena concoctionem facit in oxymelitis cyathis iii drachmae pondere et crapulam discutit, item agaricum post cibum in aqua calida potum. - paralyisin vettonica sanare dicitur, item hiberis ut dictum est. eadem et torpentibus membris prodest, item argemonia omniaque, quae secari periclitentur, discutiendo.

comitiales sanantur panacis, quam heraclion diximus, radice pota cum coagulo vituli marini ita, ut sint panacis iii partes, plantagine pota, vettonica in oxymelitis drachma vel agarico obolis iii, foliis quinquefolii ex aqua. sanat et archezostis, sed anno pota. sanat et baccaris radix arida in pulverem contrita cyathis iii cum coriandri uno in aqua calida, et centunculus trita in aceto aut melle aut in aqua calida, verbenaca ex vino pota, hysopi baccae ternae contritae in aqua potae diebus xvi, peucedanum cum coagulo vituli marini aequis portionibus potum, quinquefolii contrita folia ex vino et sumpta diebus xxx, vettonicae farina pondere #1108 iii cum aceti scillini cyatho, mellis attici uncia, scamonium obolis ii cum castorei drachmis iiii.

febres frigidas leviores facit agaricum potum in calida aqua, tertianas sideritis cum oleo, item ladanum, quod in segetibus nascitur, contusum, plantago ex aqua mulsa ii horis ante accessionem pota binis drachmis vel sucus radice madefactae vel tusae vel ipsa radix trita in aqua ferro calfacta. quidam ternas radices in iii cyathis aquae dedere. eadem in quartanis quaterna fecerunt. buglosso inarescente, si quis medullam e caule eximat dicatque, ad quem liberandum febris id faciat, et alliget ei vii folia ante accessionem, aiunt

febri liberari; item vettonicae ... drachmam in aquae mulsaе cyathis iii vel agaricum, maxime in iis febribus, quae cum horrore veniant. quinquefolii folia quidam terna tertianis dedere, quaterna quartanis, plura ceteris; alii omnibus iii obolos cum pipere ex aqua mulsa. verbenaca quidem et iumentorum febribus in vino medetur, sed in tertianis a tertio geniculo incisa, quartanis a quarto. bibitur et semen hyperici utriusque in quartanis et horroribus, vettonicae farina, quae omnes horrores coercet, item panaces, adeo excalearia natura, ut per nivem ituris bibere id perunguique eo praecipiant. et aristolochia perfrictionibus resistit.

phreneticos somnus sanat, qui contingit peucedano ex aceto capiti infuso, anagallidum suco. e diverso lethargicos excitare labor est; hoc praestant euphorbeum ex aceto naribus tactis, peucedani sucus. contra insanias vettonica bibitur. carbunculos rumpit panaces, sanat vettonicae farina ex aqua aut brassica cum ture, frequenti potu calidae, vel e carbone in conspectu restincto favilla digito sublata et inlita, vel plantago tusa, tithymallus characias.

hydropicos sanat panaces, plantago in cibo, cum prius panem siccum comederint sine potu, vettonica drachmis ii in ii cyathis vini aut mulsi, vel agaricum vel semen lonchitidis ii lingulis ex aqua potum, psyllion ex vino, anagallidum sucus, cotyledonis radix e mulso, ebuli recentis radix excussa tantum nec colluta, quod ii digiti comprehendant, ex vini veteris caldi hemina, trifolii radix drachmis ii in vino, tithymallum platyphyllon cognomine, semen hyperici, quod caros appellatur, acte, quam esse ebulum putant quidam, radice contrita in vini cyathis iii, si febris absit, vel semine ex vino nigro, item verbenaca fasciculo manus plenae in aqua decocta ad dimidias. praecipue tamen chamaeactes sucus aptissimus creditur. - eruptiones pituitae emendant plantago, cyclamini radix e melle, ebuli folia trita e vetere vino; inposita etiam boam sanant, id est rubentes papulas, pruriginem sucus strychni inlitis.

igni sacro medentur aizoum, folia trita cicutae, mandragorae radix; secatur in asses ut cucumis, primumque super mustum suspenditur, mox in fumo, dein teritur e vino aut aceto. prodest et vino myrteo fovere, mentae sextans vivi sulphuris uncia ex aceto simul trita, fuligo ex aceto. ignis sacri plura sunt genera, inter quae medium hominem ambiens, qui zoster vocatur, et enecat, si cinxit. medetur plantago cum creta cimolia et peristereos per se, radix persollatae; aliis, quae serpunt, cotyledonis radix cum mulso, aizoum, sucus e linozosti ex aceto. radix polypodi inlita luxatis medetur, doloremque et tumores tollunt semen psyllii, folia plantaginis trita, sale modice addito, verbasci semen ex vino decoctum contritum, cicuta cum axungia. folia ephemeris tuberibus tumoribusque inlinuntur, quae etiam tum discuti possunt.

morbum regium in oculis praecipue mirari est, tenuitatem etiam densitatemque tunicularum felle subeunte. hippocrates a septimo die in febris mortiferum signum esse dicit. nos scimus vixisse aliquos etiam ab hac desperatione. fit vero et citra febres expugnaturque centaurio maiore ut diximus poto, vettonica, agarici obolis iii ex vini veteris cyatho, item

verbenacae folio obolis iii ex vini calidi hemina quadriduo. sed celerrime quinquefolii sucus medetur iii cyathis potus. cyclamini radix drachmis iii bibitur in loco calido et a perfrictionibus tuto - sudores enim felleos movet - , folia tussilaginis ex aqua, semen linozostis utriusque inspersionem potioni vel cum absinthio aut cicere decoctum, hysopi baccae cum aqua potae, lichen herba, si, cum sumitur, cetero olere abstinenceatur, polythrix in vino data, struthion in mulso.

passim et in quacumque parte, sed maxime incommoda nascuntur qui furunculi vocantur, mortiferum aliquando malum consectis corporibus. remedio sunt pycnocomi folia trita cum polenta, si nondum caput fecerint. discutiant et folia ephedri inlita.

fistulae quoque in omni parte serpunt medicorum vitio male sectis corporibus. auxilio est centaurium minus collyriis cum melle decocto additis, plantaginis sucus infusus, quinquefolium cum sale et melle, ladanum cum castoreo, cotyledon cum medulla cervina calefacta et inposita; verbasci radice medulla collyrii tenuitate in fistulam additur vel aristolochiae radix vel sucus tithymalli.

collectiones inflammationesque sanant argemoniae folia inlita, duritias et collectiones omnes verbenacae vel quinquefolium decoctum in aceto, verbasci folia vel radix, hysopum e vino inpositum, acori radix decocto eius foventibus, aizoon, item quae contusa sint duritiasque et sinus corporis illecebra. omnia infixae corpori extrahunt folia tussilaginis, daucum, semen leontopodii tritum in aqua cum polenta. suppurationibus inponuntur pycnocomi folia trita cum polenta vel semen, item orchis. vitia, quae sint in ossibus, satyrii radice inposita efficacissime sanari dicuntur, nomae et collectiones omnes fuco maris, priusquam inarescat. et alcimae radix collectiones discutit.

ambusta sanantur plantagine, arctio ita ut cicatrix fallat - folia eius in aqua decocta contrita inlinuntur - , radice cyclamini, aizoon, herba ipsa hyperici, quod corissum appellavimus.

nervis et articulis convenit plantago trita cum sale, argemonia tusa ex melle. peucedani suco perunguntur spastici, tetanici, nervorum duritiae aegilopis suco; doloribus erigeron ex aceto inlinitur, epithymum. spasticis et opisthotonicis perungui semine hyperici, quod caros vocatur, idemque bibere prodest. phrynon dicitur etiam abscisos sanare nervos, si confestim inponatur trita vel mansa. spasticis, tremulis, opisthotonicis alcimae radix bibitur ex aqua mulsa. sic et rigores excalfacit.

sanguinis profluvia sistit herbae paeoniae semen rubrum - eadem et in radice vis - , clymenus vero, sive ore sanguis reiciatur sive naribus sive alvo fluat sive feminarum utero, item lysimachia pota vel inlita vel naribus indita, item plantaginis semen, quinquefolium potum et inlitum, cicutae semen in nares, si inde fluat, tritum ex aqua inditum, aizoon, astragali radix. sistit et ischaemon et achillia.

equisaetum, hippuris graecis dicta et in pratis vituperata nobis - est autem

pilus terrae equinae saetae similis - , lienes cursorum extinguit decocta fictili novo ad tertias quantum vas capiat et per triduum heminis pota; unctis esculentis ex ante diem unum interdicitur. graecorum varia circa hanc opinio: alii pinus foliis similem, nigricantem eodem nomine appellant, vim eius admirabilem tradentes, sanguinis profluvia vel tacto tantum ea homine sisti; alii hippurin, alii ephedron, alii anabasim vocant, traduntque iuxta arbores nasci et scandentem eas dependere comis iunceis multis, nigris, ut ex equorum cauda, geniculatis ramulis, folia habere pauca, tenuia, exigua, semen rotundum, simile coriandro, radice lignosa, nasci in arbustis maxime. vis eius spissare corpora. sucus sanguinem e naribus fluentem inclusus sistit, item alvum. medetur dysintericis in vino dulci potus cyathis iii, urinam ciet, tussim, orthopnoeam sanat, item rupta et quae serpunt. intestinis et vesicae folia bibuntur, enterocelen cohibet. faciunt et aliam hippurim brevioribus et mollioribus comis candidioribusque, perquam utilem ischiadicis et vulneribus ex aceto inpositam propter sistendum sanguinem. - et nymphaea trita plagis inponitur. peucedanum cum semine cupressi bibitur, si sanguis per os redditus est fluxitve ab infernis. sideritis tantam vim habet, ut quamvis recenti gladiatoris vulnere inligata sanguinem claudat, quod facit et ferulae cinis vel carbo, fungus vero etiam efficacius, qui secundum radicem eius nascitur. per nares autem fluenti et cicutae semen tritum ex aqua additumque efficax habetur, item stephanomelis ex aqua. vettonicae farina e lacte caprino pota sistit ex ubere fluentem plantagoque contusa. eiusdem sucus vomentibus sanguinem datur. ad erraticum autem radix persollatae cum axungia vetere inlita probatur; ruptis convulsisque, ex alto deiectis centaurium maius, gentianae radix trita vel decocta vel sucus, vettonica et hoc amplius a vocis aut lateris contentionibus panaces, scordium, aristolochia pota, agaricum, idem contusis et eversis potum ii obolis in mulsi cyathis iii aut, si febris sit, in aqua mulsa, verbascum, cuius flos similis auro est, acori radix, aizoum omne, sed maioris sucus efficacissime, item symphyti ius vel radicis decoctum, daucos cruda, erysithales - flore luteo, foliis acanthi - e vino, item chamaerops et in sorbitione irio vel plantago omnibus modis, item

phthiriasi sulla dictator consumptus est, nascunturque in sanguine ipso hominis animalia exesura corpus. resistitur uvae taminiae suco aut veratri cum oleo perunctis corporibus; taminia quidem in aceto decocta etiam vestes eo taedio liberat.

ulcera multorum sunt generum ac multis modis curantur. panacis omnium generum radix ex vino calido inlinitur manantibus. siccat privatim quam chironiam diximus; cum melle trita tubera aperit ulceribusque, quae serpunt, deploratis auxilio est cum aeris flore vino temperata omnibus modis, vel semine vel flore vel radice. eadem cum polenta vetustis volneribus prodest, heraclion quoque siderion, apollinaris, psyllium, tragacantha. scordotis cum melle purgat; farina eius carnis excrescentes per se inspersa consumit. polemonia ulcera, quae cacoe+the vocant, sanat; centaurium maius inspersum vel inlitum, item minoris coma decocta vel trita vetera quoque ulcera purgat et

persanat. folliculi clymeni recentibus plagis inponuntur. inlinitur autem gentiana ulceribus, quae serpunt, radice tusa vel decocta in aqua ad mellis crassitudinem vel suco, volneribus ex ea factum lycium. lysimachia recentibus plagis medetur, plantago omnium generum ulceribus, peculiariter senum et infantum. igni emollita melior et cum cerato crassa ulcerum labra purgat, nomas sistit; tritam suis foliis integere oportet. suppurationes, collectiones, sinus ulcerum chelidonia quoque siccantur, volnera adeo, ut etiam pro spodio utantur; eadem iam desperatis cum axungia inponitur. dictamnium pota sagittas pellit et alia tela extrahit inlita - bibitur ex aquae cyatho foliorum obolo - , proxime pseudodictamnium; utraque et suppurationes discutit. aristolochia quoque putria ulcera exest, sordida purgat cum melle vermesque extrahit, item clavos in ulcere natos et infixi corpori omnia, praecipue sagittas et ossa fracta cum resina, cava vero ulcera explet per se et cum iride, recentia vulnura ex aceto; vetera ulcera verbenaca, quinquefolium cum sale et melle. radices persollatae volneribus ferro inlatis recentibus inponuntur, folia veteribus; cum axungia utrimque et suo folio operitur damasonium, ut in struma, folia verbasci ex aceto aut vino. peristereos ad omnia genera vel callosorum putrescentiumque ulcerum facit. manantia nymphaeae heracliae radix sanat, item cyclamini radix vel per se vel ex aceto vel cum melle; eadem et contra steatomata efficax. sic et ad ulcera manantia hysopum, item peucedanum; ei ad recentia volnura vis tanta est, ut squamam ossibus extrahat. praestant hoc et anagallides cohibentque quas vocant nomas et rheumatismos, utiles et recentibus plagis, sed praecipue senum corpori, cum cerato apostemata et ulcera taetra folia mandragorae recentia, radix volnura cum melle aut oleo, cicuta cum siligine mixta mero, aizoum herpetas quoque ac nomas ac putrescentia, sicut erigeron verminosa, recentia autem volnura astragali radix et vetera ulcera, quae purgat hypocisthis utraque. leontopodii semen tritum in aqua et cum polenta inlitum spicula sagittarum extrahit, item pycnocomi semen. tithymallus characias suco gangraenas, phagedaenas, putria vel decocto ramorum cum polenta et oleo, orchis radices hoc amplius et cacoe+the cum melle, siccae et recentes per se vulnura, onothera efferantia sese ulcera sanat. scythae ulcera scythica curant. ad carcinomata argemonia ex melle efficacissima est. ulceribus praesanatis asphodeli radix decocta ut diximus, trita cum polenta et inlita, quibuscumque vero apollinaris, astragali radix in pulverem trita umidis ulceribus prodest, item callithrix decocta in aqua, privatim vero iis, quae calciamento facta sint, verbenaca nec non et lysimachia contrita ac nymphaea arida infriata. polythrix inveteratis iisdem utilior est. - polycnemon cunilae bubulae similis est, semine pulei, surculosa, multis geniculis, corymbo odorata acri et dulci odore, ferro factis conmanducata inponitur, quinto die solvitur. symphyton ad cicatricem celerrime perducit, item sideritis; haec inponitur ex melle. verbasci semine ac foliis ex vino decoctis ac tritis omnia infixi corpori extrahuntur, item mandragorae foliis cum polenta, cyclamini radicibus cum melle. trixaginis folia in oleo contrita iis maxime adhibentur ulceribus, quae serpunt, et alcima

in melle trita, vettonica ad carcinomata et malandrias veteres addito sale.

verrucae tollit argemonia ex aceto vel batrachii radix, quae et unguis scabros aufert, linozostidis utriusque folia vel sucus inlitus. tithymalli omnes genera verrucarum omnia, item pterygia, varos tollunt; cicatrices cum elegantia ad colorem reducit ladanum. - artemisiam et elelisphacum alligatas qui habeat viator negatur lassitudinem sentire. -

muliebribus morbis medetur maxime in universum paeoniae herbae semen nigrum ex aqua mulsa; eadem et in radice vis. menses ciet panacis semen cum absinthio, menses et sudores scordotis potu et inlitu. vettonica drachma in vini cyathis iii bibitur contra omnia volvarum vitia aut quae a partu fiunt. menses nimios sistit achillia adposita et decoctum eius insidentibus. mammis inponitur hyoscyami semen ex vino, locis radix in cataplasmate, mammis et chelidonia. secundas morantes vel partus emortuos radices panacis adpositae extrahunt. ipsum panaces e vino potum volvas purgat adpositumque cum melle. polemonia pota ex vino secundas pellit, nidore corrigit volvas. centauri minoris sucus potu fotuque menses ciet, item maioris radix in volvae doloribus isdem modis prodest, detersa vero et adposita extrahit partus emortuos. plantago adponitur in lana in dolore volvae, in strangulatu bibitur. sed praecipua dictamno vis est: menses ciet, partus emortuos vel transversos eicit - bibitur ex aqua foliorum obolo - , adeo ad haec efficax, ut ne in cubiculum quidem praegnantium inferatur, nec potu tantum, sed et inlitu et suffitu valet; proxime pseudodictamnium, sed menses ciet cum mero decoctum denarii pondere. plurimis tamen modis aristolochia prodest, nam et menses et secundas ciet et emortuos partus extrahit, murra et pipere additis pota vel subdita; volvas quoque procidentes inhibet fotu vel suffitu vel subiectu, maxime tenuis. strangulatum ab his mensumque difficultatem agaricum obolis iii in vini veteris cyatho potum emendat, peristereos adposita in adipe suillo recenti, antirrhinum cum rosaceo et melle. item adposita nymphaeae thessalae radix dolori medetur, in vino nigro pota profluvia inhibet; e diverso ciet cyclamini radix pota et adposita et vesicae insidentium decocto medetur. secundas pota cissanthemos pellit, volvam sanat. e xiphio radix superior menses ciet drachma ex aceto pota. peucedanum strangulatus volvae nidore ustum recreat, menses albos praecipue psyllion drachma in cyathis iii aquae, semen mandragorae potum volvam purgat, menses ciet sucus adpositus et emortuos partus. nimia rursus profluvia sistit semen cum vivo sulphure, contra ea ciet batrachium potu vel cibo, ardens alias, ut diximus, cruda, sed cocta commendatur sale et oleo et cumino. daucum et menses et secundas potu facillime pellit, ladanum suffitu corrigit volvas, dolori earum exulceratisque inponitur. emortua scamonium pellit potum vel adpositum. menses ciet hypericum utrumque adpositum, ante alia vero, ut hippocrati videtur, crethmos e vino semine vel radicis cortice, trahit et secundas, succurrit et strangulationibus ex aqua pota; item radix e geranio peculiariter secundis inflationibusque volvarum conveniens. purgat hippuris pota et adposita volvas, polygonus pota. menses ciet et alcimae radix, folia plantaginis pellunt,

item agaricum ex aqua mulsa. artemisia volvae medetur trita, ex oleo irino aut cum fico aut cum murra adposita; eiusdem radix pota in tantum purgat, ut partus enectos extrahat. menses et secundas ciet ramorum decoctum insidentibus, item folia pota drachma. ad eadem omnia prosunt vel inposita ventri imo cum farina hordeacia. acoron quoque utile est interioribus feminarum morbis et conyza utraque et crethmos. et anthyllides duae vulvis utilissimae torminibusque et secundarum morae in vino potae. callithrix fotu locis medetur, albugines in capite tollit, capillos inficit oleo trita. geranion in vino albo potum, hypocisthis in rubro profluvium sistunt. hysopum suffocationes laxat. radix verbenacae pota ex aqua ad omnia in partu aut ex partu mala praestantissima est. peucedano quidam miscent in vino nigro semen cupressi contritum. nam semen psyllii defervefactum in aqua, cum intepuit, epiphoras omnes uteri lenit. symphyton tritum in vino nigro evocat menses. partus accelerat scordotis pota drachma suci in aquae mulsae cyathis iiii. dictamni folia praeclare dantur ex aqua; constat unius oboli pondere, vel si mortui sint in utero infantes, protinus reddi sine vexatione puerperae. similiter prodest pseudodictamnium, sed tardius, cyclaminos adalligata, cissanthemus pota, item vettonicae farina ex aqua mulsa.

arsenogonon et thelygonon herbae sunt habentes uvas floribus oleae similes, pallidioris tamen, semen album papaveris modo. thelygoni potu feminam concipi narrant; arsenogonon ab ea semine oleae nec alio distat; huius potu mares generari, si credimus. alii utramque ocimo similem tradunt, arsenogoni autem semen geminum esse testibus simile.

mammarum vitiis aizoum, quod digitillum appellavimus, unice medetur. erigeron ex passo mammas uberiores facit, sonci cum farre cocti ius. quae vero mastos vocatur, inlita pilos mammarum partu nascentes aufert; testas in facie aliaque cutis vitia emendat gentiana, nymphaea heraclia inlita, cyclamini radix maculas omnes. cacaliae grana mixta cerae liquidae extendunt cutem in facie erugantque. vitia omnia acori radix emendat.

capillum lycium suco flavum facit, denigrat hypericum, quod et corissum vocatur, item ophrys herba, denticulato oleri similis, foliis ii. nigrityam dat et polemonia in oleo decocta. psilotrum nos quidem in muliebribus medicamentis tractamus, verum iam et viris est in usu. efficacissimum autem habetur archezostis, item tithymalli, suco vel in sole cum oleo inlito crebro vel evolsis pilis. - quadripedum scabiem sanat hysopum ex oleo, suum anginas peculiariter sideritis. - verum et reliqua genera herbarum reddamus.

LIBER XXVII

crescit profecto apud me certe tractatu ipso admiratio antiquitatis, quantoque maior copia herbarum dicenda restat, tanto magis adorare priscorum in inveniendo curam, in tradendo benignitatem subit. nec dubie superata hoc modo posset videri etiam rerum naturae ipsius munificentia, si humani operis esset inventio. nunc vero deorum fuisse eam apparet aut certe divinam, etiam cum homo inveniret, eandemque omnium parentem et genuisse haec et ostendisse, nullo vitae miraculo maiore, si verum fateri volumus. scythicam herbam a maeotis paludibus et euphorbeam e monte atlante ultraque herculis columnas ex ipso rerum naturae defectu, parte alia britannicam ex oceani insulis extra terras positis, itemque aethiopidem ab exusto sideribus axe, alias praeterea aliunde ultro citroque humanae saluti in toto orbe portari, immensa romanae pacis maiestate non homines modo diversis inter se terris gentibusque, verum etiam montes et excedentia in nubes iuga partusque eorum et herbas quoque invicem ostentante! aeternum, quaeso, deorum sit munus istud! adeo romanos velut alteram lucem dedisse rebus humanis videntur.

sed antiquorum curam diligentiamque quis possit satis venerari constat omnium venenorum ocissimum esse aconitum et tactis quoque genitalibus feminini sexus animalium eodem die inferre mortem. hoc fuit venenum, quo interemptas dormientes a calpurnio bestia uxores m. caelius accusator obiecit. hinc illa atrox peroratio eius in digitum. ortum fabulae narravere e spumis cerberi canis extrahente ab inferis hercule ideoque apud heracleam ponticam, ubi monstratur is ad inferos aditus, gigni. hoc quoque tamen in usus humanae salutis vertere scorpionum ictibus adversari experiendo datum in vino calido. ea est natura, ut hominem occidat, nisi invenerit quod in homine perimat. cum eo solo conluctatur veluti praesentius invento, sola haec pugna est, cum venenum in visceribus reperit mirumque, exitialia per se ambo cum sint, duo venena in homine conmoriuntur, ut homo supersit. immo vero etiam ferarum remedia antiqui prodiderunt demonstrando, quomodo venenata quoque ipsa sanarentur. torpescunt scorpiones aconiti tactu stupentque pallentes et vinci se confitentur. auxiliatur iis helleborum album tactu resolvente, ceditque aconitum duobus malis, suo et omnium. quae si quis ulla forte ab homine excogitari potuisse credit, ingratis deorum munera intellegit. tangunt carnes aconito necantque gustatu earum pantheras, nisi hoc fieret, repleturas illos situs. ob id quidam pardalianches appellavere. at illas statim liberari morte excrementorum hominis gustu demonstratum. quod certe casu repertum quis dubitet et, quotiens fiat, etiam nunc ut novum nasci, quoniam feris ratio et usus inter se tradi non possit hic ergo casus, hic est ille qui plurima in vita invenit deus - hoc habet nomen per quem intellegitur eadem et parens rerum omnium et magistra - , utraque coniectura pari, sive ista cotidie feras invenire sive semper scire iudicemus. pudendumque rursus omnia animalia, quae sint

salutaria ipsis, nosse praeter hominem. sed maiores oculorum quoque medicamentis aconitum misceri saluberrime promulgavere aperta professione, ne malum quidem ullum esse sine aliquo bono. fas ergo nobis erit, qui nulla diximus venena, monstrare quale sit aconitum, vel deprehendendi gratia. folia habet cyclamini aut cucumeris, non plura iiii, ab radice, leniter hirsuta, radicem modicam, cammaro similem marino; quare quidam cammaron appellavere, alii thelyphonon ex qua diximus causa. cauda radice incurvatur paulum scorpionum modo, quare et scorpion aliqui vocavere. nec defuere qui myoctonon appellare mallent, quoniam procul et e longinquo odore mures necat. nascitur in nudis cautibus, quas aconas nominant, et ideo aconitum aliqui dixere, nullo iuxta, ne pulvere quidem, nutriente. hanc aliqui rationem nominis adtulere; alii, quoniam vis eadem esset in morte, quae cotibus in ferri acie deterenda, statimque admota velocitas sentiretur.

aethiopis folia habet phlomo similia, magna ac multa et hirsuta, ab radice, caulem quadriangulum, scabrum, similem arctio, multis concavum alis, semine ervo simile, candidum, geminum, radices numerosas, longas, plenas, molles, glutinosas gustu. siccae nigrescunt indurescuntque, ut cornua videri possint. praeter aethiopiam nascuntur et in ida monte troadis et in messenia. colliguntur autumnno, siccantur in sole aliquot diebus, ne situm sentiant. medentur volvis potae in vino albo, ischiadicis, pleuriticis, faucibus scabris decoctae potui dantur. sed quae ex aethiopia venit, eximie atque ilico prodest. - ageraton ferulacea est, duorum palmorum altitudine, origano similis, flore bullis aureis. huius ustae nidor urinam ciet volvasque purgat, tanto magis insidentibus. causa nominis non haec, sed quoniam diutissime non marcescit. - aloe scillae similitudinem habet, maior et pinguioribus foliis, ex obliquo striata. caulis eius tener est, rubens medius, non dissimilis antherici, radice una, ceu palo in terram demissa; ipsa gravis odore, gustu amara. laudatissima ex india adfertur, sed nascitur et in asia, non tamen ea utuntur nisi ad vulnera recentibus foliis, mirifice enim conglutinant suco. ob id in turbinibus cadorum eam serunt ut aizoum maius. quidam et caulem ante maturitatem seminis incidunt suci gratia, aliqui et folia. invenitur et per se lacrima adhaerens; ergo pavimentandum ubi sata sit censent, ut lacrima non absorbeatur. fuere qui traderent in iudaea super hierosolyma metallicam eius naturam, sed nulla magis inproba est, neque alia nigrior est aut umidior. erit ergo optima pinguis ac nitida, rufi coloris, friabilis et iocineris modo coacta, facile liquescens; inprobanda nigra et dura, harenosa, quaeque gustu intellegitur, cummi adulterata et acacia. natura eius spissare, densare et leniter calfacere; usus multi, sed principalis alvum solvere, cum paene sola medicamentorum, quae id praestant, confirmet etiam stomachum, adeo non infestet ulla vi contraria. bibitur drachma, ad stomachi vero dissolutionem in ii cyathis aquae tepidae vel frigidae coclearis mensura bis terve in die ex intervallis, ut res exigit, purgationis autem causa plurimum iii drachmis, efficacior, si pota ea sumatur cibus. capillum fluentem continet cum vino austero capite contra pilum peruncto. dolorem capitis sedat temporibus et fronti inposita ex aceto et

rosaceo dilutiorque infusa. oculorum vitia omnia sanari ea convenit, privatim pruriges et scabritiem genarum, item insignita ac livida inlita cum melle, maxime pontico, tonsillas, gingivas et omnia oris ulcera, sanguinis excreationes, si modicae sint, drachma ex aqua, si minus, ex aceto pota. vulnere quoque sanguinem et undecumque fluentem sistit per se vel ex aceto. alias etiam est vulneribus utilissima ad cicatricem perducens. eadem inspergitur exulceratis genitalibus virorum, condylomatis rimisque sedis, alias ex vino, alias ex passo, alias sicca per se, ut exigit mitiganda curatio aut coercenda. haemorrhoidum quoque abundantiam leniter sistit. dysinteriae infunditur et, si difficiliter concoquantur cibi, bibitur a cena modico intervallo, et in regio morbo iii obolis ex aqua; devorantur et pilulae cum melle decocto aut resina terebinthina ad purganda interiora. digitorum pterygia tollit. oculorum medicamentis lavatur, ut quod sit harenosissimum subsidat, aut torretur in testa pinnaeque subinde versatur, ut possit aequaliter torreri. - alcea folia habet similia verbenacae, quae aristereon cognominatur, caules iii aut ii, foliorum plenos, florem rosae, radices albas cum plurimum vi, cubitales, obliquas. nascitur in pingui solo nec sicco. usus radicis ex vino vel aqua dysintericis, alvo citae, ad rupta, convulsa. - alypon cauliculus est, molli capite, non dissimile betae, acre gustu ac lentum mordensque vehementer et accendens. alvum solvit in aqua mulsa addito sale modico. minima potio ii drachmarum, media iii, maxima vi, eximia purgatione quibus datur e gallinaceo iure. - alsine, quam quidam myosoton appellant, nascitur in lucis, unde et alsine dicta est. incipit a media hieme, arescit aestate media. cum prorepat, musculorum aures imitatur foliis. sed aliam docebimus esse quae iustius myosotis vocetur. haec eadem erat quae helxine, nisi minor minusque hirsuta esset. nascitur in hortis et maxime parietibus. cum teritur, odorem cucumeris reddit. usus eius ad collectiones inflammationesque, item eadem omnia quae helxines, sed infirmius. epiphoris peculiariter inponitur, item verendis ulceribusque cum farina hordeacia. succus eius auribus infunditur. - androsaces herba est alba, amara, sine foliis, folliculos in cirris habens et in his semen. nascitur in maritimis syriae. maxime datur hydropicis drachmis ii tusa aut decocta in aqua vel aceto vel vino; vehementer enim urinas ciet. datur et podagricis inliniturque. idem effectus et seminis. - androsaemon sive, ut alii appellavere, ascyron non absimile est hyperico, de qua diximus, cauliculis maioribus densioribusque et magis rubentibus. folia alba, rutae figura, semen papaveris nigri. comae tritae sanguineo succo manant; odor est resinosus. gignitur in vineis, fere medio autumno effoditur suspenditurque. usus ad purgandam alvum tusae cum semine potaeque matutino vel a cena ii drachmis in aqua mulsa vel vino vel aqua pura, potionis totius sextario. trahit bilem, prodest ischiadi maxime, sed postero die capparidis radicem resinae permixtam devorare oportet drachmae pondere iterumque quadridui intervallo eadem facere, a purgatione autem ipsa robustiores vinum bibere, infirmiores aquam. inponitur et podagris et ambustis, et vulneribus cohibens sanguinem. - ambrosia vagi nominis et circa alias herbas fluctuati unam habet certam,

densam, ramosam, tenuem, iii fere palmorum, tertia parte radice brevior, foliis rutae circa inum caulem. in ramulis semen est uvis dependentibus, odore vinoso, quia de causa botrys a quibusdam vocatur, ab aliis artemisia. coronantur illa cappadoce. usus eius ad ea, quae discuti opus sit. - ananion quidam ononida malunt vocare, ramosam, similem faeno graeco, nisi fruticosior hirsutiorque esset. odore iucunda, post ver spinosa. estur etiam muria condita, recens vero margines ulcerum erodit. radix decoquitur in posca dolori dentium. eadem cum melle pota calculos pellit. comitialibus datur in oxymelite decocta ad dimidias. - anagyros, quam aliqui acopon vocant, fruticosa est, gravis odore, flore oleris, semen in corniculis non brevibus gignit, simile renibus, quod durescit per messes. folia collectionibus inponuntur difficulterque parientibus adalligantur ita, ut a partu statim auferantur. quod si emortuus haereat et secundae mensesque morentur, drachma bibuntur in passo folia. sic et suspiriosis dantur et in vino vetere ad phalangiorum morsus. radix discutiendis concoquendisque adhibetur, semen commanducatum vomitiones facit. - anonymos non inveniundo nomen invenit. adfertur e scythia, celebrata hicesio, non parvae auctoritatis medico, item aristogitoni in volneribus praeclara, ex aqua tusa inposita, pota vero mammis praecordiisve percussis, item sanguinem excreantibus. putavere et bibendam volneratis. fabulosa arbitror quae adiciuntur, recentem eam, si uratur, in ferrum aut aes feruminari. - aparinen aliqui omphalocarpon, alii philanthropon vocant, ramosam, hirsutam, quinis senisve in orbem circa ramos foliis per intervalla. semen rotundum, durum, concavum, subdulce. nascitur in frumentario agro aut hortis pratisve, asperitate etiam vestium tenaci. efficax contra serpentes semine poto ex vino drachma et contra phalangia. sanguinis abundantiam ex volneribus reprimunt folia inposita, sucus auribus infunditur. - arction aliqui potius arcturum vocant. similis est verbasco foliis, nisi quod hirsutiora sunt, caule longo, molli, semine cumini. nascitur in petrosis radice tenera, alba, dulci, quae decoquitur in vino ad dentium dolorem, ut ore ita contineatur. decoctum bibitur propter ischiada et stranguriam. ex vino ambustis inponitur et pernionibus; foveantur eadem cum radice semine trito in vino. - asplenon sunt qui hemionion vocant, foliis trientalibus, multis, radice limosa, cavernosa sicut felicis, candida hirsuta. nec caulem nec florem nec semen habet. nascitur in petris parietibusque opacis, umidis, laudatissima in creta. huius foliorum in aceto decocto per dies xxx poto lienem absumi aiunt; et illinuntur autem eadem. sedant et singultus. feminis non danda, quoniam sterilitatem facit. - asclepias folia hederæ habet, ramos longos, radices numerosas, tenues, odoratas, floris virus grave, semen securiclatum. nascitur in montibus. radices torminibus medentur et contra serpentium ictus non solum potu, sed et inlitu. - aster ab aliquis bubonion appellatur, quoniam inguinum praesentaneum remedium est. cauliculus foliis oblongis ii aut iii, in cacumine capitula stellæ modo radiata. bibitur et adversus serpentes. sed ad inguinum medicinam sinistra manu decerpi iubent et iuxta cinctus alligari. prodest et coxendicis dolori adalligata. - ascyron et

ascyroides similia sunt inter se et hyperico, sed maiores habet ramos quod ascyroides vocatur, ferulaceos, coma rubentes, capitulis parvis, luteis. semen in caliculis pusillum, nigrum, resinosum. comae tritae velut cruentant, qua de causa quidam hanc androsaemon vocavere. usus seminis ad ischiadicos poti ii drachmis in hydromelitis sextario. alvum solvit, bilem detrahit. inlinitur et ambustis. - aphaca tenuia admodum folia habet, pusilla. altior lenticula et siliquas maiores fert, in quibus terna aut quaterna semina sunt, nigriora et minora lenticula. nascitur in arvis. natura ad spissandum efficacior quam lenti; reliquos usus eosdem habet. stomachi alvique fluctiones sistit semen decoctum. - alcibium qualis esset herba, non repperi apud auctores, sed radicem eius et folia trita ad serpentis morsum inponi et bibi, folia quantum manus capiat trita cum vini meri cyathis iii aut radicem drachmarum iii pondere cum vini eadem mensura. - alectoros lophos, quae apud nos crista dicitur, folia habet similia gallinae cristae plura, caulem tenuem, semen nigrum in siliquis. utilis tussientibus cocta cum faba fresa, melle addito et caligini oculorum. solidum semen coicitur in oculum nec turbat, sed in se caliginem contrahit; mutat colorem et ex nigro albicare incipit et intumescit ac per se exit. - alum nos vocamus, graeci symphyton petraeum, simile cunilae bubulae, foliis parvis, ramis iii aut iiii a radice, cacuminibus thymi, surculosum, odoratum, gustu dulce, salivam ciens, radice longa, rutila. nascitur in petris, ideo petraeum cognominatum, utilissimum lateribus, renibus, torminibus, pectori, pulmonibus, sanguinem reicientibus, faucibus asperis. bibitur radix trita et in vino decocta, et aliquando superlinitur. quin et commanducata sitim sedat praecipueque pulmonem refrigerat. luxatis quoque inponitur et contusis, lenit interanea. alvum sistit cocta in cinere detractisque folliculis trita cum piperis granis viiii et ex aqua pota. volneribus sanandis tanta praestantia est, ut carnes quoque, dum cocuntur, conglutinet addita, unde et graeci nomen inposuere. ossibus quoque fractis medetur, alga rufa scorpionum ictibus. - actaea gravi foliorum odore, caulibus asperis, geniculatis, semine nigro ut hederæ, bacis mollibus, nascitur in opacis et asperis aquosisque. datur acetabulo pleno interioribus feminarum morbis. - ampelos agria vocatur herba foliis duris, cineracei coloris, qualem in satis diximus, viticulis longis, callosis, rubentibus qualiter flos quam iovis flammam appellamus. in uvolis fert semen simile punici mali acinis. radix eius decocta in aquae cyathis ternis, additis vini coi cyathis ii, alvum solvit leniter ideoque hydropicis datur. uvolae vitia cutis in facie mulierum emendant. ischiadicos quoque uti hac herba prodest tusa cum foliis et inlita cum suco suo.

absinthii genera plura sunt: santonicum appellatur e galliae civitate, ponticum e ponto, ubi pecora pinguescunt illo et ob id sine felle reperiuntur, neque aliud praestantius, multoque italicum amarius, sed medulla pontici dulcis. de usu eius convenit, herbae facillimae atque inter paucas utilissimae, praeterea sacris populi romani celebratae peculiariter, siquidem latinarum feriis quadrigae certant in capitolio victorque absinthium bibit, credo,

sanitatem praemio dari honorifice arbitratis maioribus. stomachum corroborat, et ob hoc sapor eius in vina transfertur, ut diximus. bibitur et decoctum aqua ac postea nocte et die refrigeratum sub diu; decoci vi drachmis foliorum cum ramis suis in caelestis aquae sextariis iii oportet, nec non salem addi vetustissimi usus est. bibitur et madefacti dilutum; ita enim appelletur hoc genus. diluti ratio ut, quisquis fuerit modus aquae, tegatur per triduum. tritum raro in usu est, sicut et sucus expressi. exprimitur autem, cum primum semen turgescit, madefactum aqua triduo recens aut siccum vii diebus, dein coctum in ae+neo vaso ad tertias x heminis in aquae sextariis xlv iterumque percolatum, herba electa, coquitur ad crassitudinem mellis, qualiter ex minore centauro quaeritur sucus. sed hic absinthii inutilis stomacho capitique est, cum sit ille decoctus saluberrimus. namque adstringit stomachum bilemque detrahit, urinam ciet, alvum emollit et in dolore sanat, ventris animalia pellit, malaciam stomachi et inflationes discutit cum sile et nardo gallico, aceti exiguo addito, fastidia absterget, concoctiones adiuvat, cruditates detrahit cum ruta et pipere et sale. antiqui purgationis causa dabant cum marinae aquae veteris sextario seminis vi drachmas cum iii salis, mellis cyatho; efficacius purgat duplicato sale. diligenter autem teri debet propter difficultatem. quidam et in polenta dedere supra dictum pondus, addito puleio, alii pueris folia in fico sicca, ut amaritudinem fallerent. thoracem purgat cum iride sumptum. in regio morbo crudum bibitur cum apio aut adianto. adversus inflationes calidum paulatim sorbetur ex aqua, iocineris causa cum gallico nardo, lienis cum aceto aut pulte aut fico sumitur. adversatur fungis ex aceto, item visco, cicutae ex vino et muris aranei morsibus, draconi marino, scorpionibus. oculorum claritati multum confert, epiphoris cum passo inponitur, suggillatis cum melle. aures decocti eius vapor suffitu sanat aut, si manent sanie, cum melle tritum. urinam ac menses ciet iii iiiiue ramuli cum gallici nardi radice una, cyathis aquae vi, menses privatim cum melle sumptum et in vellere adpositum. anginae subvenit cum melle et nitro. epinyctidas ex aqua sanat, vulnera recentia prius quam aqua tangantur inpositum, praeterea capitis ulcera. peculiariter ilibus inponitur cum cypria cera aut cum fico. sanat et pruritus. non est dandum in febris. nausiam maris arcet in navigationibus potum, inguinum tumorem in ventrali habitum. somnos adlicit olfactum aut inscio sub capite positum. vestibis insertum tineas arcet. culices ex oleo perunctis abigit et fumo, si uratur. atramentum librarium ex diluto eius temperatum litteras a musculis tuetur. capillum denigrat absinthii cinis unguento rosaceoque permixtus. - est et absinthium marinum, quod quidam seriphum vocant, probatissimum in taposiri aegypti. huius ramum isiaci praeferre sollemne habent. angustius priore minusque amarum, stomacho inimicum, alvum mollit pellitque animalia interaneorum. bibitur cum oleo et sale aut in farinae trimestris sorbitione dilutum. coquitur quantum manus capiat in aquae sextario ad dimidias.

balloten alio nomine porrum nigrum graeci vocant, herbam fruticosam angulosis caulibus, nigris, hirsutis, foliis vestientibus maioribus quam porri et

nigrioribus, graveolentibus. vis eius efficax adversus canis morsus ex sale foliis tritis inpositae, item ad condylomata coctis cinere in folio oleris. purgat et sordida ulcera cum melle. - botrys fruticosa herba est luteis ramulis. semen circa totos nascitur, folia cichorio similia. invenitur in torrentium ripis. medetur orthopnoicis. hoc cappadoces ambrosiam vocant, alii artemisiam. - brabilla spissandi vim habet cotonei mali modo, nec amplius de ea tradunt auctores. - bryon marinum herba sine dubitatione est lactucae foliis similis, rugosa velut contracta, sine caule ab una radice exeuntibus foliis. nascitur in scopulis maxime testisque terra comprehensis. praecipua siccandi spissandique vis ei et collectiones inflammationesque omnes inhibendi, praecipue podagrae et quicquid refrigerari opus sit. - bupleuri semen ad ictus serpentium dari reperio foverique plagas decocta ea herba adiectis foliis mori aut origani.

catanancen thessalam herbam, qualis sit, describi a nobis supervacuum est, cum sit usus eius ad amatoria tantum. illud non ab re est dixisse ad detegendas magicas vanitates, electam ad hunc usum coniectura, quoniam arescens contraheret se ad speciem unguium milui exanimati. eadem ex causa et cemos silebitur nobis. - calyx duorum generum est. una similis aro nascitur in arationibus, colligitur ante quam inarescat. usus eosdem habet quos aris, at bibitur radix quoque huius ad exinaniendas alvos mensesque mulierum, item caules cum foliis in leguminibus decocti sanant tenesmon. alterum genus eius quidam anchusam vocant, alii rhinocliam. folia lactucae longiora, plumosa, radice rubra, quae ignes sacros cum flore polentae sanat inposita, iocineris autem vitia in vino albo pota. - circaea trychno sativo similis est, flore nigro, pusillo, parvo semine milii nascente in quibusdam corniculis, radice semipedali, triplici fere aut quadruplici, alba, odorata, gustus calidi. nascitur in apricis saxis. diluitur in vino bibiturque ad dolorem vulvae et vitia - macerari oportet in sextariis iii quadrantem radice tusae nocte et die - et trahit eadem potione secundas, semine lac minuit in vino aut mulsa aqua pota. - cirsion cauliculus est tener ii cubitorum, triangulo similis, foliis spinosis circumdatus. spinae molles sunt; folia bovis linguae similia, minora, subcandida, in cacumine capitula purpurea, quae solvuntur in lanugines. hanc herbam radicemve eius adalligatam dolores varicum sanare tradunt. - crataegonon spicae tritici simile est, multis calamis ex una radice emicantibus multorumque geniculorum, in opacis, semine milii, vehementer aspero gustu, quod si bibant ex vino ante cenam iii obolis in cyathis aquae totidem mulier ac vir ante conceptum diebus xl, virilis sexus partum futurum aiunt. et alia est crataegonos, quae thelygonos vocetur; differentia intellegitur lenitate gustus. sunt qui florem crataegoni bibentes mulierum intra xl diem concipere tradant. eadem sanant ulcera vetera nigra cum melle et explent sinus ulcerum et atrophae carnosiora faciunt, purulenta expurgant; panos discutiunt, podagras collectionesque omnes leniunt, peculiariter mammarum. theophrastus arboris genus intellegi voluit crataegon sive crataegona, quam itali aquifolium vocant. - crocodileon chamaeleonis herbae nigrae figuram habet, radice longa, aequaliter crassa, odoris asperi. nascitur in sabuletis. pota sanguinem per nares

pellit copiosum crassumque; ita et lienes consumere dicitur. - cynosorchim aliqui orchim vocant, foliis oleae, mollibus, ternis per semipedem longitudinis in terra stratis, radice bulbosa, oblonga, duplici ordine, superiore quae durior est, inferiore quae mollior. eduntur, ut bulbi coctae, in vineis fere inventae. ex his radicibus si maiorem edant viri, mares generari dicunt, si minorem feminae, alterum sexum. in thessalia molliorem in lacte caprino viri bibunt ad stimulandos coitus, duriores vero ad inhibendos. adversantur altera alteri. - chrysolachanum in pineto lactucae simile nascitur. sanat nervos incisos, si confestim inponatur. et alibi genus chrysolachani traditur, flore aureo, foliis oleris. coctum estur ut olus molle. haec herba adalligata morbum regium habentibus ita, ut spectari ab his possit, sanare id malum traditur. de chrysolachano nec satis dici scio nec plura reperio. namque et hoc vitio laborare proximi utique herbarii nostri, quod ipsis notas veluti vulgares strictim et nominibus tantum indicavere, tamquam coagulo terrae alvum sisti, stranguriam dissolvi, si bibatur ex aqua aut vino, cuculli folia trita cum aceto serpentium ictibus et scorpionum mederi. quidam hanc alio nomine strumum appellant, alii graece strychnum. acinos habet nigros; ex his cyathus suci cum mulsi ii medetur lumbis, item capitis dolori cum rosaceo infusus, ipsa strumae inlita. - peculiaris est alpinis maxime fluminibus conferva appellata a conferuminando, spongea aquarum dulcium verius quam muscus aut herba, villosae densitatis atque fistulosae. curatum ea scio omnibus fere ossibus confractis prolapsum ex arbore alta putatorem, circumdata universo corpori, aquam suam adspergentibus, quotiens inaresceret, raroque nec nisi deficientem herbam mutationis causa resolventibus, convaluisse vix credibili celeritate. - cocco cnidio color cocci, magnitudo grano piperis maior, vis ardens; itaque in pane devoratur, ne adurat gulam transitu. vis praesentanea contra cicutam, sistit alvum.

dipsacos folia habet lactucae bullasque spinosas in dorsi medio, caulem ii cubitorum iisdem spinis horridum, genicula eius binis foliis amplexentibus concavo alarum sinu, in quo subsistit ros salsus. in cacumine capitula sunt echinata spinis. nascitur in aquosis. sanat rimas sedis, item fistulas decocta in vino radice usque, dum sit crassitudo cerae, ut possit in fistulas collyrium mitti, item verrucas omnium generum. quidam et alarum, quas supra diximus, sucum inlinunt iis. - dryopteris felici similis in arboribus nascitur, tenui foliorum subdulcium incisura, radice hirsuta. vis ei caustica, et ideo psilotrum est radix tusa, inlinitur enim usque, dum sudores evocet, iterum et tertium ita, ne sudor abluatur. - drabe phono similis herba est, cauliculis tenuibus, cubitalibus, circumdatis utrimque foliis pollicari amplitudine, qualia oxymyrsines, sed candidioribus mollioribusque, flore candido sabuci. edunt cauliculos decoctos, semine vero eius pro pipere utuntur.

elatine folia habet casiae, pusilla, pilosa, rotunda, semipedalibus ramulis quinis senisque, a radice statim foliosis. nascitur in segete, acerba gustu et ideo oculorum fluctionibus efficax foliis cum polenta tritis et inpositis, subdito linteolo. eadem cum lini semine cocta sorbitionis usu dysinteria liberat. -

empetros, quam nostri calcifragam vocant, nascitur in montibus maritimis, fere in saxo. quae propius mari fuit, salsa est potaque trahit bilem ac pituitas; quae longius magisque terrena, amarior sentitur. trahit aquam; sumitur autem in iure aliquo aut in hydromelite. vetustate vires perdit, recens urinas ciet decoctum in aqua vel tritum calculosque frangit. qui fidem promisso huic quaerunt, adfirmant lapillos, qui subfervefiant, una rumpi. - epicactis ab aliis elleborine vocatur, parva herba, exiguis foliis, iocineris vitiis utilissima et contra venena pota. - epimedion caulis est non magnus, hederæ foliis denis atque duodenis, numquam florens, radice tenui, nigra, gravi odore ac ... in umidis nascitur. et huic spissandi refrigerandique natura, feminis cavenda. folia in vino trita virginum mammas cohibent. - enneaphyllon longa folia novena habet, causticae naturae. inponitur lana circumdatum, ne urat latius - continuo pusulas excitat - , lumborum doloribus et coxendicum utilissimum.

felicitis duo genera nec florem habent nec semen. pterim vocant graeci, alii blachnon, cuius ex una radice conplures exeunt felices bina etiam cubita excedentes longitudine, non graves odore; hanc marem existimant. alterum genus thelypterim graeci vocant, alii nymphæam pterim; est autem singularis atque non fruticosa, brevior molliorque et densior, foliis ad radicem canaliculata. utriusque radice sues pinguescunt. folia utriusque lateribus pinnata, unde nomen graeci inposuere. radices utriusque longae in oblicum, nigrae, praecipue cum inaruere; siccari autem eas sole oportet. nascuntur ubique, sed maxime frigido solo. effodi debent vergiliis occidentibus. usus radicis in trimatu tantum, neque ante nec postea. pellunt interaneorum animalia, ex his taenias cum melle, cetera ex vino dulci triduo potae, utraque stomacho inutilissima. alvum solvit primo bilem trahens, mox aquam, melius taenias cum scamonii pari pondere. radix eius pondere ii obolorum ex aqua post unius diei abstinentiam bibitur, melle praegustato contra rheumatismos. neutra danda mulieribus, quoniam gravidis abortum, ceteris sterilitatem facit. farina earum ulceribus taetris inspergitur, iumentorum quoque in cervicibus. folia cimicem necant, serpentem non recipiunt; ideo substerni utile est in locis suspectis, usta etiam fugant nidore. fecere medici huius quoque herbae discrimen: optima macedonica est, secunda cassiopica. - femur bubulum appellatur herba, nervis et ipsa utilis recens in aceto ac sale trita.

galeopsis aut, ut alii, galeobdolon vel galion caulem et folia habet urticae leviora et quae gravem odorem trita reddant, flore purpureo. nascitur circa saepes ac semitas ubique. folia caulesque duritias et carcinomata ex aceto trita et inposita, item strumas, panos, parotidas discutiunt. ex usu est et decoctae suco fovere. putrescentia quoque et gangraenas sanat cum sale. - glaux antiquitus eugalacton vocabatur, cytiso et lenticulae foliis similis; aversa candidiora. rami in terra serpunt quini seni, admodum tenues, a radice. flosculi purpurei exeunt. invenitur iuxta mare. coquitur in sorbitione similaginis ad excitandam ubertatem lactis; eam qui hauserint, balineis uti convenit. glaucion in syria et parthia nascitur, humilis herba, densis foliis fere papaveris, minoribus tamen sordidioribusque, odoris taetri, gustus amari cum

adstrictione. granum habet crocei coloris. hoc in olla fictili luto circumlita in clibanis calfaciunt, deinde exempto sucum exprimunt eiusdem nominis. usus et suci et foliorum, si terantur, adversus epiphoras, quae universo impetu cadant. hinc temperatur collyrium, quod medici dia glauciu vocant. - (lactis quoque ubertas intermissa restituitur; sumitur huius rei causa ex aqua). - glycy-side, quam aliqui paeoniam aut pentorobon vocant, caulem habet ii palmorum, comitantibus ii aut iii, subrutilum, cute lauri, folia qualia isatis, pinguiora rotundioraque et minora, semen in siliquis, aliud grano rubente, aliud nigro. duo autem genera sunt: femina existimatur cuius radicibus ceu balani longiores circiter viii aut vi adhaerent. mas plures non habet, quoniam una radice nixus est palmi altitudine, candida, quae gustu adstringit. feminae folia murræ redolent et densiora sunt. nascuntur in silvis. tradunt nocte effodiendas, quoniam interdum periculosum sit pico martio inpetum in oculos faciente; radix vero cum effodiatur, periculum esse, ne sedes procidat, magna vanitate ad ostentationem rei fictum arbitror. usus in iis diversus. rubra grana rubentes menses sistunt xv fere pota in vino nigro. nigra grana vulvis medentur ex passo aut vino totidem pota. radix omnes ventris dolores sedat in vino alvumque purgat, sanat opisthotonum, morbum regium, renes, vesicam, arteriam autem et stomachum decocta in vino, alvumque sistit. estur etiam in alimentis, sed in medendo iiii drachmae satis sunt. grana nigra auxiliantur et suppressionibus nocturnis in vino pota quo dictum est numero, stomachicis vero et rosionibus et esse ea et inlinere prodest. suppurationes quoque discutiuntur, recentes nigro semine, veteres rubro. utrumque auxiliatur a serpente percussis et pueris contra calculos incipientes stranguria. - gnaphalium aliqui chamaezelon vocant, cuius foliis albis mollibusque pro tomento utuntur; sane et similia sunt. datur in vino austero ad dysinteriam, ventris solutiones mensesque mulierum sistit. infunditur autem tenesmo. inlinitur et putrescentibus ulcerum. - gallidragam vocat xenocrates leucacantho similem, palustrem et spinosam, caule ferulaceo, alto, cui summo capite inhaereat simile ovo. in hoc crescente aestate vermiculos nasci tradit, quos pyxide conditos adalligari cum pane brachio ab ea parte, qua dens doleat, mireque ilico dolorem tolli. valere non diutius anno et ita, si terram non adtigerint.

holcus in saxis nascitur siccis. aristas habet in cacumine, tenui culmo, quale hordeum restibile. haec circa caput alligata vel circa lacertum educit e corpore aristas. quidam ob id aristida vocant. - hyoseris intubo similis, sed minor et tactu asperior, vulneribus contusa praeclare medetur. - holosteon sine duritia est herba, ex adverso appellata a graecis sicut fel dulce, radice tenuis usque in capillamenti speciem, longitudine iiii digitorum, ceu gramen foliis angustis, adstringens gustu. nascitur in collibus terrenis. usus eius ad vulsa, rupta in vino potae. vulnere quoque conglutinat, nam et carnes, dum cocuntur, addita. - hippophaeston nascitur in spinis, ex quibus fiunt ae+nae fulloniae, sine cauliculo, sine flore, capitulis tantum inanibus et foliis parvis, multis, herbacei coloris. radiculæ albae, molles. sucus earum exprimitur aestate ad

solvendam alvum iii obolis, maxime in comitialibus morbis et tremulis, hydropicis, contra vertigines, orthopnoeas, paralysis incipientes. - hypoglossa folia habet figura silvestris myrti, coma spinosa, et in his ceu linguas folio parvo exeunte de foliis. capitis dolores corona ex iis inposita minuit. - hypecoon in segetibus nascitur, foliis rutae. natura eius eadem quae papaveris suco.

idaee herbae folia sunt quae oxymyrsines. adhaerent iis velut pampini, in quibus flos. ipsa alvum mensesque et omnem abundantiam sanguinis sistit spissandi cohibendique natura. - isopyron aliqui phaselion vocant, quoniam folium, quod est aneso simile, in passeoli pampinos torquetur. capitula sunt in summo caule tenuia, plena seminis melanthi, contra tussim et cetera pectoris vitia cum melle aut aqua mulsa, item iocineri utilissimi.

lathyris folia habet multa lactucae similia, tenuiora, germina multa, in quibus semen tuniculis continetur, ut capparitis, quae cum inaruere, eximuntur grana piperis magnitudine, candida, dulcia, facilia purgatu. haec vicena in aqua pura aut mulsa pota hydropicos sanant; trahunt et bilem. qui vehementius purgari volunt, cum folliculis ipsis sumunt ea, nam stomachum laedunt; itaque inventum est ut cum pisce aut iure gallinacei sumerentur. - leontopetalon alii rapadion vocant, folio brassicae, caule semipedali. alae numerosas, semen in cacumine in siliquis ciceris modo, radix rapo similis, grandis, nigra. nascitur in arvis. radix adversatur omnibus serpentium generibus ex vino pota, nec alia res celerius proficit. datur et ischiadicis. - lycapsos longioribus quam lactucae foliis crassioribusque, cauli longo hirsutis adgnatis, multis, cubitalibus, flore parvo, purpureo; nascitur in campestribus. inlinitur cum farina hordeacea igni sacro; sudores in febribus movet suco aquae calidae admixto. - inter omnes herbas lithospermo nihil est mirabilius. aliqui exonychon vocant, alii Διὸς πυρόν, alii Ἡρακλέους. herba quincuncialis fere, foliis duplo maioribus quam rutae, ramulis surculosis, crassitudine iunci. gerit iuxta folia singulas veluti barbulas et in earum cacuminibus lapillos candore et rotunditate margaritarum, magnitudine ciceris, duritia vero lapidea. ipsi, qua pediculis adhaereant, cavernulas habent et intus semen. nascitur et in italia, sed laudatissimum in creta, nec quicquam inter herbas maiore equidem miraculo aspexi. tantus est decor velut aurificum arte alternis inter folia candicantibus margaritis, tam exquisita difficultas lapidis ex herba nascentis. iacere atque humi serpere auctores tradunt; ego volsam, non haerentem vidi. his lapillis drachmae pondere potis in vino albo calculos frangi pellicque constat et stranguriam discuti. neque in alia herbarum fides est certior, ad quam medicinam nata sit, talis autem eius species, ut etiam sine auctore visu statim nosci possit. - lapis vulgaris iuxta flumina fert muscum siccum, canum. hic fricatur altero lapide addita hominis saliva; illo lapide tangitur inpetigo. qui tangit, dicit:

φεῦγετε κανθαριδες, λύκος ἄγριος αἶμα διώκει. limeum herba appellatur a gallis, qua sagittas in venatu tingunt medicamento, quod venenum cervarium vocant. ex hac in iii modios salivati additur quantum in unam sagittam addi

solet; ita offa demittitur boum faucibus in morbis. alligari postea ad praesepia oportet, donec purgentur - insanire enim solent - ; si sudor insequetur, aqua frigida perfundi. - leuce mercuriali similis nomen ex causa accepit, per medium folium candida linea transcurrente, quare mesoleucon quidam vocant. sucus eius fistulas sanat, ipsa contrita carcinomata. fortassis eadem sit quae leucas appellatur, contra marina omnia venena efficax. speciem eius auctores non tradunt nec aliud quam silvestrem latioribus foliis esse, efficaciorē hanc semine aciore. - leucographis qualis esset, scriptum non repperi, quod eo magis miror, quoniam utilis proditur sanguinem excreantibus iii obolis cum croco, item coeliacis, trita ex aqua et adposita profluvio feminarum, oculorum quoque medicamentis et explendis ulceribus, quae fiant in teneris partibus.

medion folia habet iridis sativae, caulem tripedalem et in eo florem grandem, purpureum, rotundum, semine minuto, radicem semipedalem. in saxis opacis nascitur. radix drachmis ii cum melle menses feminarum sistit ecligmate per aliquot dies sumpto. semen quoque in vino contra abundantiam feminarum datur. - myosota sive myosotis levis herba, caulibus pluribus ab una radice, aliquatenus rubentibus, concavis ab imo, foliis angustis, oblongis, dorso acuto, nigris, per intervalla adsidue geminatis, tenuibus cauliculis ex alis prodeuntibus, flore caeruleo. radix digitali crassitudine multis capillamentis fimbriata. vis ei septica et exulceratrix, ideoque aegilopas sanat. tradunt aegypti, mensis, quem thoti vocant, die xxviii fere in augustum mensem incurrente si quis huius herbae suco inungatur mane, priusquam loquatur, non lippiturum eo anno. - myagros herba ferulacea est, foliis similis rubiae, tripedanea. semen oleosum, quod et fit ex eo. medetur oris ulceribus perunctis hoc suco.

herba, quae vocatur nyma, iii foliis longis, intubaceis, inlita cicatrices ad colorem reducit. - natrix vocatur herba, cuius radix evulsa virus hirci redolet. hac in piceno feminis abigunt quos mira persuasione fatuos vocant; ego species lymphantium hoc modo animorum esse crediderim, quae tali medicamento iuventur.

odontitis inter feni genera est, cauliculis densis ab eadem radice, geniculatis, triangulis, nigris. in geniculis folia parva habet, longiora tamen quam polygonum, semen in alis hordeo simile, florem purpureum, pusillum. nascitur in pratis. decoctum cauliculorum eius in vino austero quantum manus capiat dentium dolori medetur ita, ut contineatur ore. - othonna in syria nascitur, similis eruae perforatis crebro foliis, flore croci; quare quidam anemonen vocaverunt. sucus eius oculorum medicamentis convenit; mordet enim leniter et calefacit adstringitque siccando, purgat cicatrices et nubeculas et quicquid obstat. quidam tradunt lavari atque ita siccata digerere in pastillos. - onosma longa folia habet fere ad iii digitos, in terra iacentia ad similitudinem anchusae, ... similis sive caule sive flore sive semine. praegnas, si edit eam aut supergradiatur, abortum facere dicitur. - onoprados cum ederunt, asini crepitus reddere dicuntur. trahit urinas et menses, alvum sistit, suppurationes et collectiones discutit. - osyris ramulos fert nigros, tenues, lentos et in his

folia nigra ceu lini semenque in ramulis nigrum initio, dein colore mutato rubescens. smegmata mulieribus faciunt ex iis. radicum decoctum potu sanat arquatos. eadem, priusquam maturescat semen, concisae et sole siccatae alvum sistunt; post maturitatem vero collectae et in sorbitione decoctae rheumatismis ventris medentur et per se tritae ex aqua caelesti bibuntur. - oxys folia terna habet. datur ad stomachum dissolutum. edunt et qui enterocelen habent.

polyanthemum, quam quidam batrachion appellant, caustica vi exulcerat, cicatrices et ad colorem reducit, eademque vitiligines concorporat. - polygonum graeci vocant quam nos sanguinariam. non attollitur a terra foliis rutae similis gramine. sucus eius infusus naribus supprimit sanguinem et potus cum vino cuiuslibet partis profluvium excreationesque cruentas inhibet. qui plura genera polygoni faciunt, hanc marem intellegi volunt appellarique a multitudine seminis aut densitate fruticis, alii polygonaton a frequentia geniculorum, alii thalattiada, alii carcinothron, alii clema, multi myrtopetalum. nec non inveniuntur qui hanc feminam esse dicant, marem autem maiorem minusque nigram et geniculis densiorem, semine sub omnibus foliis turgescente. quocumque haec modo se habent, vis earum est spissare ac refrigerare. semine alvum solvunt, largius sumpto urinam cient, rheumatismos cohibent, qui si non fuere, non prosunt. stomachi fervori folia inponuntur, vesicae dolori inlinuntur et ignibus sacris. sucus et auribus purulentis instillatur et oculorum dolori. per se datur et in febribus ante accessiones ii cyathis, in tertianis quartanisque praecipue, item cholericis, dysintericis et in solutione stomachi. tertium genus orion vocant, in montibus nascens, harundini tenerae simile, uno caule, densis geniculis et in se infarctis, foliis autem piceae, radicis supervacuae, inefficacius quam superiora, peculiare ischiadicis. quartum genus silvestre appellatur, paene arboris frutice, radice lignosa, stirpe cedri rubicunda, ramis sparti binum palmarum, nigris geniculorum ternis quaternisque articulis. huic quoque spissandi natura; sapor mali cotonei. decoquitur in aqua ad tertias aut aridi farina inspergitur et oris ulceribus et adtrititis partibus. propter gingivarum vero vitia ipsa commanducatur. nomas sistit omniaque, quae serpunt aut difficilem cicatricem habent, privatim vero sanat a nive facta ulcera. herbarii et ad anginas utuntur illa et in capitis dolore coronam ex ea inponunt et contra epiphoras collo circumdant; in tertianis quidem sinistra manu evulsam adalligant, adeo contra profluvia sanguinis, nec ullam magis aridam quam polygonum servant.

pancratium aliqui scillam pusillam appellare malunt, foliis albi lili longioribus crassioribusque, radice bulbi magni, colore rufo. alvum solvit suco cum farina ervi sumpto, ulcera purgat. hydropicis, splenicis cum melle datur. alii decocunt eam, donec aqua dulcis fiat, eaque effusa radicem terentes digerunt in pastillos sole siccatos et postea utuntur ad capitis ulcera et cetera, quae repurganda sint, item ad tussim, quantum iii digitis adprehenderint in vino dantes, et ad lateris dolores aut peripneumonicis ecligmate. dant et propter ischiada in vino bibendam et propter tormina mensesque ciendos. -

peplis, quam aliqui sycen, alii meconion, alii mecona aphrode vocant, ex una radice tenui fruticat foliis rutae paulo latioribus. semen est sub foliis, rotundum, minus candido papavere. inter vites fere colligitur messibus siccaturque cum fructu suo, subiectis in quae excidat. hoc poto alvus solvitur, bilis ac pituita detrahitur. media potio est acetabuli mensura in aquae mulsae heminis iii. et cibus inspergitur obsoniisque ad molliendam alvum. - periclymenon fruticat et ipsa ex intervallo ii folia habens subcandida, mollia, in cacumine autem semen inter folia durum et quod difficile vellatur. nascitur in arvis ac saepibus circumvolvens se adminiculis quibuscumque. semen eius in umbra siccatum tunditur et in pastillos digeritur; hi resoluti dantur in vini albi cyathis ternis tricenis diebus ad lienem, eumque urina cruentata aut per alvum absumit, quod intellegitur a decimo statim die. urinam cient et folia decocta, quae et orthopnoicis prosunt. partum quoque adiuvant secundasque pellunt pota simili modo. - pelecynon in segetibus diximus nasci, fruticosam cauliculis, foliis ciceris. semen in siliquis fert corniculorum modo aduncis ternis quaternisve, quale git novimus, amarum, stomacho utile. additur in antidota. - polygala palmum altitudine inplet, in caule summo foliis lenticulae, gustu adstricto. quae pota lactis abundantiam facit. - poterion aut, ut alii vocant, phrynon vel neuras large fruticat, spinis retorrida, lanugine spissa, foliis parvis, rotundis, ramulis longis, mollibus, lentis, tenuibus, flore longo, herbacei coloris. seminis nullus usus; est gustu acuto et odorato. invenitur in aquosis collibus. radices habet ii aut iii binum cubitorum in altitudinem, nervosas, candidas, firmas. circumfoditur autumnis et praecisa radice dat sucum cummi similem. radix mira vulneribus sanandis traditur praecipueque nervis vel praecisis inlita. decoctum quoque eius cum melle potum dissolutiones nervorum et infirmitates et incisuras iuvat. - phalangitis a quibusdam phalangion vocatur, ab aliis leucanthemum vel, ut in quibusdam exemplaribus invenio, leucacantha. ramuli sunt ei numquam pauciores ii, in diversa tendentes, flos candidus, lilio rubro similis, semen nigrum, latum, ad lenticulae dimidiae figuram multo tenuius, radice tenui, herbacei coloris. huius folio vel flore vel semine auxiliantur contra scorpionum phalangiorumque et serpentium ictus, item contra tormina. - phyteuma quale sit, describere supervacuum habeo, cum sit usus eius tantum ad amatoria. - phyllon a graecis vocatur herba in saxosis montibus. femina magis herbacei coloris, caule tenui, radice parva. semen papaveri rotundo simile. haec sui sexus facit partus, mares autem mas, semine tantum differens, quod est incipientis olivae. utrumque bibitur in vino. - phellandron nascitur in palustribus folio apii. bibitur semen eius propter calculos et vesicae incommoda. - phaleris thyrsum habet longum, tenuem ceu calamum, in summo florem inclinatum, semen simile sesamae. et hoc calculos frangit potum ex vino vel aceto vel cum melle et lacte; idem et vitia vesicae sanat. - polyrrhizon folia habet myrti, radices multas. hae tusae dantur e vino contra serpentes, prosunt et quadrupedibus. - proserpinaca herba vulgaris est, eximii adversus scorpiones remedii. eadem contrita, addita muria e menis et oleo, anginam eximie curari tradunt,

praeterea et quantalibet lassitudine recreari defessos, etiam cum obmutuerint, si subiciatur linguae; si devoretur, vomitionem sequi salutare.

rhcoma adfertur ex iis quae supra pontum sunt regionibus. radix costo nigro similis, minor et rufior paulo, sine odore, calfaciens gustu et adstringens. eadem trita vini colorem reddit ad crocum inclinantem. inlita collectiones inflammationesque sedat, vulnera sanat, epiphoras oculorum sedat ex passo, insignita cum melle et alia liventia ex aceto. farina eius inspergitur contra cacoe+the et sanguinem reicientibus drachmae pondere in aqua, dysintericis autem et coeliacis, si febris careant, in vino, sin aliter, ex aqua. facilius teritur nocte antecedente madefacta. datur et decoctum eius bibendum duplici mensura ad rupta, convolsa, contusis, ex sublimi devolutis. si pectoris sint dolores, additur piperis aliquid et murræ; si dissolutio stomachi, ex frigida aqua sumitur; sic et in tussi vetere ac purulentis excreationibus, item hepaticis, splenicis, ischiadicis. at renium vitia, suspiria, orthopnoeas, arteriae scabritias sanat ex passo iii obolis potis trita aut decoctum eius. lichenas quoque ex aceto inposita purgat. bibitur contra inflationes et perfrictiones, febres frigidas, singultus, tormina, herpetas, capitis gravitates, melancholicas vertigines, lassitudinum dolores et convulsiones. - circa ariminum nota est herba quam resedam vocant. discutit collectiones inflammationesque omnes. qui curant ea, addunt haec verba: "reseda, morbos reseda; scisne, scisne, quis hic pullus egerit radices nec caput nec pedes habeat." haec ter dicunt totiensque despuunt.

stoechas in insulis tantum eiusdem nominis gignitur, odorata herba, coma hysopi, amara gustu. menses ciet potu, pectoris dolores levat. antidotis quoque miscetur. - solanum graeci στῦχον vocant, ut tradit cornelius celsus. huic vis reprimendi refrigerandique. - smyrnion caulem habet apii, folia latiora et maxime circa stolones multos, quorum a sinu exiliunt, pingua et ad terram infracta, odore medicato cum quadam acrimonia iucundo, colore in luteum languescente, capitibus caulium orbiculatis ut apii, semine rotundo nigroque; arescit incipiente aestate. radix quoque odorata, gustu acri mordet, sucosa, mollis. cortex eius foris niger, intus pallidus. odor murræ habet qualitatem, unde et nomen. nascitur et in saxosis collibus et in terrenis. usus eius calfacere, extenuare. urinam et menses ciet folia et radix et semen. alvum sistit. radix collectiones et suppurationes non veteres, item duritias discutit inlita, prodest et contra phalangia ac serpentes admixto cachry aut polio aut melissophyllo in vino pota, sed particulatim, quoniam universitate vomitiones movet; qua de causa aliquando cum ruta datur. medetur tussi et orthopnoeae semen vel radix, item thoracis aut lienis aut renium aut vesicae vitiis, radix autem ruptis, convolsis. partus quoque adiuvat et secundas pellit. datur et ischiadicis cum crethmo in vino. sudores ciet et ructus, ideo inflationem stomachi discutit. vulnera ad cicatricem perducit. exprimitur et sucus radici utilis feminis et thoracis praecordiorumque desideriiis, calfacit enim et concoquit et purgat. semen peculiariter hydropicis datur potui, quibus et sucus inlinitur. et in malagmate cortice arido et ad obsonia utuntur cum mulso et

oleo et garo, maxime in elixis carnibus. - sinon concoctiones facit, sapore simillima piperi. eadem in dolore stomachi efficax.

telephion porcilacae similis est et caule et foliis. rami a radice septeni octonique fruticant foliis crassis, carnosis. nascitur in cultis et maxime inter vites. inlinitur lentigini et, cum inaruit, deteritur. inlinitur et vitiligini ternis fere mensibus senis horis noctis aut diei et ut postea farina hordeacea inlinatur. medetur et vulneribus et fistulis. - trichomanes adianto simile est, exilius modo nigriusque, foliis lenticulae, densis, parvis, adversis inter se. decoctum eius strangurias sanat in vino albo potum addito cumino rustico, lienem. cohibet capillos fluentes aut, si effluxerint, reparat alopeciasque densat tritum in oleo et inlitum. sternumenta quoque gustatu movet. - thalictrum folia coriandri habet, pinguiora paulo, caulem papaveris. nascitur ubique, praecipue campestribus. medentur ulceribus folia cum melle. - thlaspi duorum generum est: angustis foliis, digitali latitudine et longitudine, in terram versis, in cacumine divisis, cauliculo semipedali non sine ramis, ... peltarum specie semine incluso, lenticulae effigie, nisi quod infringitur, unde nomen. flos albicat. nascitur in semitis et saepibus. semen asperi gustus bilem et pituitam utrimque extrahit; modus sumendi acetabuli mensura. prodest et ischiadicis infusum. potione sanguinem trahit, menses quoque ciet, sed partus necat. alterum thlaspi aliqui persicon napy vocant, latis foliis, radicibus magnis, et ipsum utile ischiadicorum infusioni. prodest et inguinibus utrumque. praecipitur, ut qui colligat dicat, sumere se contra inguina et contra omnes collectiones et contra vulnera, una manu tollat. - trachinia herba qualis sit, non traditur. credo falsum et promissum democriti portentosum esse, adalligatam triduo absumere lienes. - tragonis sive tragion nascitur in cretae tantum insulae maritimis, iunipiro similis et semine et folio et ramis. sucus eius lacteus in cummim spissatus vel semen in potione ... spicula e corpore eicit; tunditur recens et cum vino inlinitur aut siccae farina cum melle. eadem lactis abundantiam facit mammisque unice medetur. - est et alia herba tragos, quam aliqui scorpion vocant, semipedem alta, fruticosa, sine foliis, pusillis racemis rubentibus grani tritici, acuto cacumine, et ipsa in maritimis nascens. huius racemorum x et xii cacumina trita ex vino pota coeliacis, dysintericis, sanguinem excreantibus mensumque abundantiae auxiliantur. - est et tragopogon, quem alii comen vocant, caule parvo, foliis croci, radice longa, dulci, super caulem calice lato, nigro. nascitur in asperis manditurque, sine usu.

et de herbis quidem memoria digna hactenus accepimus aut comperimus. in fine earum admonere non ab re iudicamus, alias aliis virium aetates esse. longissimo tempore durat elaterium, ut diximus, chamaeleon niger xl annis, centaurium non ultra xii, peucedanum et aristolochia ad vi, vitis silvestris anno, in umbra si servantur. et animalium quidem exterorum nullum aliud radices a nobis dictas adtingit excepta sphondyle, quae omnes persequitur. genus id serpentis est.

ne illud quidem dubitatur, omnium radicum vim effectusque minui, si

fructus prius ematurescant, item seminum ante radice propter sucum incisa. resolvitur autem omnium vis consuetudine, et desinunt prodesse, cum opus est, quae cottidie in usu fuere, aequae quam nocere. omnes vero herbae vehementiores effectum viribusque sunt in frigidis et in aquiloniis, item siccis.

sunt et gentium differentiae non mediocres, sicut accipimus de taeniis lumbricisque, inesse aegypti, arabiae, syriae, ciliciae populis, e diverso threciae, phrygiae omnino non innasci. minus id mirum quam quod in confinio atticae et boeotiae thebanis innascuntur, cum absint atheniensibus. quae contemplatio aufert nos ad ipsorum animalium naturas ingenitasque iis vel certiores morborum omnium medicinas. rursus enim cum rerum parens nullum animal ad hoc tantum, ut pasceretur aut alia satiare, nasci voluit artesque salubres inseruit et visceribus, quippe cum surdis etiam rebus insereret, tum vero illa animae auxilia praestantissima ex alia anima esse voluit, contemplatione ante cuncta mirabili.

LIBER XXVIII

dictae erant naturae omnium rerum inter caelum ac terram nascentium, restabantque quae ex ipsa tellure fodiuntur, si non herbarum ac fruticum tractata remedia auferrent transversos ex ipsis animalibus, quae sanantur, reperta maiore medicina. quid ergo dixerimus herbas et florum imagines ac pleraque inventu rara ac difficilia, iidem tacebimus, quid in ipso homine prosit homini, ceteraque genera remediorum inter nos viventia, cum praesertim nisi carenti doloribus morbisque vita ipsa poena fiat minime vero, omnemque insumemus operam, licet fastidii periculum urgeat, quando ita decretum est, minorem gratiae quam utilitatum vitae respectum habere. quin immo externa quoque et barbaros etiam ritus indagabimus. fides tantum auctores appellet, quamquam et ipsi consensu prope iudicii ista eligere laboravimus potiusque curae rerum quam copiae institimus. illud admonuisse perquam necessarium est, dictas iam a nobis naturas animalium et quae cuiusque essent inventa - neque enim minus profuere medicinas reperiendo quam prosunt praebendo - , nunc quae in ipsis auxiliuntur indicari, neque illic in totum omissa; itaque haec esse quidem alia, illis tamen conexa.

incipiemus autem ab homine ipsum sibi exquirente, immensa statim difficultate obvia. sanguinem quoque gladiatorum bibunt, ut viventibus poculis, comitiales morbi, quod spectare facientes in eadem harena feras quoque horror est. at, hercule, illi ex homine ipso sorbere efficacissimum putant calidum spirantemque et vivam ipsam animam ex osculo vulnerum, cum plagis omnino ne ferarum quidem admoveri ora mos sit humanus. alii medullas crurum quaerunt et cerebrum infantium. nec pauci apud graecos singulorum viscerum membrorumque etiam sapores dixere, omnia persecuti ad resigmina unguium, quasi vero sanitas videri possit feram ex homine fieri morboque dignum in ipsa medicina, egregia, hercules, frustratione, si non prosit. aspici humana exta nefas habetur: quid mandi quis ista invenit, osthane tecum enim res erit, eversor iuris humani monstrorumque artifex, qui primus ea condidisti, credo, ne tui vita oblivisceretur. quis invenit singula membra humana mandere qua coniectura inductus quam potest medicina ista originem habuisse quis veneficia innocentiora fecit quam remedia esto, barbari externique ritus invenerant: etiamne graeci suas fecere has artes extant commentationes democriti ad aliud noxii hominis ex capite ossa plus prodesse, ad alia amici et hospitis. iam vero vi interempti dente gingivas in dolore scariphari Apollonius efficacissimum scripsit, meletos oculorum suffusiones felle hominis sanari, artemon calvaria interfecti neque cremati propinavit aquam e fonte noctu comitialibus morbis. ex eadem suspensio interempti catapotia fecit contra canis rabiosi morsus antaeus. atque etiam quadrupedes homine sanavere, contra inflationes boum perforatis cornibus inserentes ossa humana, ubi homo occisus esset aut crematus, siliginem, quae pernocrasset, suum morbis dando. procul a nobis nostrisque litteris absint ista.

nos auxilia dicemus, non piacula, sicubi lactis puerperarum usus mederi poterit, sicubi saliva tactusve corporis, ceteraque similia. vitam quidem non adeo expetendam censemus, ut quoquo modo trahenda sit. quisquis es, talis aequae moriere, tamquam obscaenus vixeris aut nefandus. quapropter hoc primum quisque in remediis animi sui habeat, ex omnibus bonis, quae homini tribuit natura, nullum melius esse tempestiva morte, idque in ea optimum, quod illam sibi quisque praestare possit.

ex homine remediorum primum maximae quaestionis et semper incertae est, polleantne aliquid verba et incantamenta carminum. quod si verum est, homini acceptum fieri oportere conveniat, sed viritum sapientissimi cuiusque respuit fides, in universum vero omnibus horis credit vita nec sentit. quippe victimas caedi sine precatione non videtur referre aut deos rite consuli. praeterea alia sunt verba inpetritis, alia depulsoriis, alia commendationis, videmusque certis precationibus obsecrasse summos magistratus et, ne quod verborum praetereatur aut praeposterum dicatur, de scripto praeire aliquem rursusque alium custodem dari qui adtendat, alium vero praeponi qui favere linguis iubeat, tibicinem canere, ne quid aliud exaudiat, utraque memoria insigni, quotiens ipsae dirae obstrepentes nocuerint quotiensve precatio erraverit; sic repente extis adimi capita vel corda aut geminari victima stante. durat inmenso exemplo deciorum patris filii, quo se devovere, carmen; extat tucciae vestalis incesti de precatio, qua usa aquam in cribro tulit anno urbis dxviii. boario vero in foro graecum graecamque defossos aut aliarum gentium, cum quibus tum res esset, etiam nostra aetas vidit. cuius sacri precationem, qua solet praeire xv virum collegii magister, si quis legat, profecto vim carminum fateatur, omnia ea adprobantibus dcccxxx annorum eventibus. vestales nostras hodie credimus nondum egressa urbe mancipia fugitiva retinere in loco precatione, cum, si semel recipiatur ea ratio, et deos preces aliquas exaudire aut ullis moveri verbis, confitendum sit de tota coniectatione.

prisci quidem nostri perpetuo talia credidere, difficillimumque ex his, etiam fulmina elici, ut suo loco docuimus. l. piso primo annalium auctor est, tullum hostilium regem ex numae libris eodem, quo illum, sacrificio iovem caelo devocare conatum, quoniam parum rite quaedam fecisset, fulmine ictum, multi vero magnarum rerum fata et ostenta verbis permutari. cum in tarpeio fodientes delubro fundamenta caput humanum invenissent, missis ob id ad se legatis etrusiae celeberrimus vates olenus calenus, praeclarum id fortunatumque cernens, interrogatione in suam gentem transferre temptavit, scipione determinata prius templi imagine in solo ante se: “hoc ergo dicitis, romani hic templum iovis optimi maximi futurum est, hic caput invenimus” constantissima annalium adfirmatione, transiturum fuisse fatum in etrusiam, ni praemoniti a filio vatis legati respondissent: “non plane hic, sed romae inventum caput dicimus.” iterum id accidisse tradunt, cum in fastigium eiusdem delubri praeparatae quadrigae fictiles in fornace crevissent, iterum simili modo retentum augurium.

haec satis sint, exemplis ut appareat, ostentorum vires et in nostra potestate esse ac, prout quaeque accepta sint, ita valere. in augurum certe disciplina constat neque diras neque ulla auspicia pertinere ad eos, qui quamque rem ingredientibus observare se ea negaverint, quo munere divinae indulgentiae maius nullum est. quid non et legum ipsarum in duodecim tabulis verba sunt: “qui fruges excantassit,” et alibi: “qui malum carmen incantassit” verrius flaccus auctores ponit, quibus credat in obpugnationibus ante omnia solitum a romanis sacerdotibus evocari deum, cuius in tutela id oppidum esset, promittique illi eundem aut ampliorem apud romanos cultum. et durat in pontificum disciplina id sacrum, constatque ideo occultatum, in cuius dei tutela roma esset, ne qui hostium simili modo agerent. defigi quidem diris precationibus nemo non metuit. huc pertinet ovorum, quae exorbuerit quisque, calices coclearumque protinus frangi aut isdem coclearibus perforari. hinc theocriti apud graecos, catulli apud nos proximeque vergilii incantamentorum amatoria imitatio. multi figlinarum opera rumpi credunt tali modo, non pauci etiam serpentes, ipsas recanere et hunc unum illis esse intellectum, contrahique marsorum cantu etiam in nocturna quiete. iam parietes incendiorum deprecationibus conscribuntur. neque est facile dictu, externa verba atque ineffabilia abrogent fidem validius an latina et inopinata, quae inridicula videri cogit animus semper aliquid inmensum exspectans ac dignum deo movendo, immo vero quod numini imperet. dixit homerus profluvium sanguinis vulnerato femine ulixen inhibuisse carmine, theophrastus ischiadicos sanari, cato prodidit luxatis membris carmen auxiliare, M. Varro podagris. caesarem dictatorem post unum ancipitem vehiculi casum ferunt semper, ut primum consedisset, id quod plerosque nunc facere scimus, carmine ter repetito securitatem itinerum aucupari solitum.

libet hanc partem singulorum quoque conscientia coarguere. cur enim primum anni incipientis diem laetis precationibus invicem faustum ominamur cur publicis lustris etiam nomina victimas ducentium prospera legimus cur effascinationibus adoratione peculiari occurrimus, alii graecam nemesin invocantes, cuius ob id romae simulacrum in capitolio est, quamvis latinum nomen non sit cur ad mentionem defunctorum testamur, memoriam eorum a nobis non sollicitari cur in pares numeros ad omnia vehementiores credimus, idque in febris diebus observatione intellegitur cur ad primitias pomorum haec vetera esse dicimus, alia nova optamus cur sternuentes salutamus quod etiam tiberium caesarem, tristissimum, ut constat, hominum, in vehiculo exegisse tradunt, et aliqui nomine quoque consalutare religiosius putant quin et absentes tinnitu aurium praesentire sermones de se receptum est. attalus adfirmat, scorpione viso si quis dicat “duo”, cohiberi nec vibrare ictus. et quoniam scorpio admonuit, in africa nemo destinat aliquid nisi praefatus africanam, in ceteris vero gentibus deos ante obtestatus, ut velint. nam si mensa adsit, anulum ponere translaticium videmus, quoniam etiam mutas religiones pollere manifestum est. alius saliva post aurem digito relata sollicitudinem animi propitiat. pollices, cum faveamus, premere etiam proverbio iubemur. in

adorando dextram ad osculum referimus totumque corpus circumagimus, quod in laevum fecisse galliae religiosius credunt. fulgetras poppysmis adorare consensus gentium est. incendia inter epulas nominata aquis sub mensam profusis abominamur. recedente aliquo ab epulis simul verri solum aut bibente conviva mensam vel repositorium tolli inauspicatissimum iudicatur. servi sulpicii principis viri commentatio est quamobrem mensa linquenda non sit, nondum enim plures quam convivae numerabantur. nam sternumento revocari ferculum mensamve, si non postea gustetur aliquid, inter diras habetur. ... aut omnino inane esse haec instituire illi, qui omnibus negotiis horisque interesse credebant deos et ideo placatos etiam vitiis nostris reliquerunt. quin et repente conticescere convivium adnotatum, set non nisi in pari praesentium numero, isque famae labor est ad quemcumque eorum pertinens. cibus etiam e manu prolapsus reddebatur utique per mensas, vetabantque munditiarum causa deflare, et sunt condita auguria, quid loquenti cogitative id acciderit, inter execratissima, si pontifici accidat dicis causa epulanti. in mensa utique id reponi adolerique ad larem piatio est. medicamenta, priusquam adhibeantur, in mensa forte deposita negant prodesse. ungues resecari nundinis romanis tacenti atque a digito indice multorum persuasionem religiosum est, capillum vero contra deflavia ac dolores capitis xvii luna atque xxviii. pagana lege in plerisque italiae praediis cavetur, ne mulieres per itinera ambulantes torqueant fusos aut omnino detectos ferant, quoniam adversetur id omnium spei, praecipue frugum. m. servilius nonianus princeps civitatis non pridem in metu lippitudinis, priusquam ipse eam nominaret aliusve ei praediceret, duabus litteris graecis *r*a chartam inscriptam circumligatam lino subnectebat collo, mucianus ter consul eadem observatione viventem muscam in linteolo albo, his remediis carere ipsos lippitudine praedicantes. carmina quidem extant contra grandines contraque morborum genera contraque ambusta, quaedam etiam experta, sed prodendo obstat ingens verecundia in tanta animorum varietate. quapropter de iis ut cuique libitum fuerit opinetur.

hominum monstificas naturas et veneficos aspectus diximus in portentis gentium et multas animalium proprietates, quae repeti supervacuum est. quorundam hominum tota corpora prosunt, ut ex iis familiis, quae sunt terrori serpentibus, tactu ipso levant percussos suctuve modo, quorum e genere sunt psylli marsique et qui ophiogenes vocantur in insula cypro, ex qua familia legatus euagon nomine a consulibus romae in dolium serpentium coniectus experimenti causa circummulcentibus linguis miraculum praebuit. signum eius familiae est, si modo adhuc durat, vernis temporibus odoris virus. atque eorum sudor quoque medebatur, non modo saliva. nam in insula nili tentyri nascentes tanto sunt crocodilis terrori, ut vocem quoque eorum fugiant. horum omnium generum insita repugnantia interventum quoque mederi constat, sicuti adgravari vulnera introitu eorum, qui umquam fuerint serpentium canisve dente laesi. iidem gallinarum incubitus, pecorum fetus abortu vitiant; tantum remanet virus ex accepto semel malo, ut venefici fiant venena passi.

remedio est ablui prius manus eorum aquaque illa eos, quibus medearis, inspergi. rursus a scorpione aliquando percussi numquam postea a crabronibus, vespis apibusve feriuntur. minus miretur hoc qui sciat, vestem a tineis non attingi, quae fuerit in funere, serpentes aegre praeterquam laeva manu extrahi. e pythagorae inventis non temere fallere, inpositivorum nominum inparem vocalium numerum clauditates oculive orbitatem ac similes casus dextris adsignare partibus, parem laevis. ferunt difficiles partus statim solvi, cum quis tectum, in quo sit gravida, transmiserit lapide vel missili ex iis, qui iii animalia singulis ictibus interfecerint, hominem, aprum, ursum. probabilius id facit hasta velitaris evulsa corpori hominis, si terram non attigerit; eosdem enim inlata effectus habet. sic et sagittas corpori eductas, si terram non attigerint, subiectas cubantibus amatorium esse orpheus et archelaus scribunt, quin et comitalem morbum sanari cibo e carne ferae occisae eodem ferro, quo homo interfectus sit. quorundam partes medicae sunt, sicuti diximus de pyrrhi regis pollice, et elide solebat ostendi pelopis os ulnamque eam eburneam adfirmabant. - (naevos in facie tondere religiosum habent etiam nunc multi). -

omnium vero in primis ieiunam salivam contra serpentes praesidio esse docuimus, sed et alios efficaces eius usus recognoscat vita. despuimus comitiales morbos, hoc est contagia regerimus. simili modo et fascinationes repercutimus dextraeque clauditis occursum. veniam quoque a deis spei alicuius audacioris petimus in sinum spuendo, et iam eadem ratione terna despuere precatione in omni medicina mos est atque ita effectus adiuvere, incipientes furunculos ter praesignare ieiuna saliva. mirum dicimus, sed experimento facile: si quem paeniteat ictus eminus comminusve inlati et statim expuat in mediam manum qua percussit, levatur ilico in percusso culpa. hoc saepe delumbata quadrupede adprobatur statim a tali remedio correcto animalis ingressu. quidam vero adgravant ictus ante conatum simili modo saliva in manum ingesta. credamus ergo et lichenas leprasque ieiunae inlitu adsiduo arceri; item lippitudines matutina cottidie velut inunctione, carcinomata malo terrae subacto, cervicis dolores saliva ieiuni dextra manu ad dextrum poplitem relata, laeva ad sinistrum; si quod animal aurem intraverit et inspuatur, exire. inter amuleta est editae quemque urinae inspuere, similiter in calciamentum dextri pedis, priusquam induatur, item cum quis transeat locum, in quo aliquod periculum adierit. marcion zmyrnaeus, qui de simplicibus effectibus scripsit, rumpi scolopendras marinas sputo tradit, item rubetas aliasque ranas, ofilius serpentes, si quis in hiatum earum expuat, salpe torporem sedari quocumque membro stupente, si quis in sinum expuat aut si superiores palpebras saliva tangat. cur non et haec credamus rite fieri, extranei interventu aut, si dormiens spectetur infans, a nutrice terna adspui in os quamquam religione eum tutatur et fascinus, imperatorum quoque, non solum infantium, custos, qui deus inter sacra romana a vestalibus colitur, et currus triumphantium, sub his pendens, defendit medicus invidiae, iubetque eosdem respicere similis medicina linguae, ut sit exorata a tergo fortuna gloriae

carnifex.

morsus hominis inter asperrimos quosque numeratur. medentur sordes ex auribus ac, ne quis miretur, et scorpionum ictibus serpentiumque statim inpositae, melius e percussi auribus. produnt ita et reduvias sanari, serpentium vero ictum contusi dentis humani farina.

capillus puero qui primum decisis est, podagrae inpetus dicitur levare circumligatus; et in totum inpubium inpositus, virorum quoque, capillus canis morsibus medetur ex aceto et capitum vulneribus ex oleo aut vino; si credimus, e revulso cruci quartanis, combustus utique capillus carcinomati. pueri qui primus ceciderit dens, ut terram non attingat, inclusus in armillam et adsidue in brachio habitus muliebrum locorum dolores prohibet. - pollex in pede praeligatus proximo digito tumores inguinum sedat, in manu dextera ii medii lino leviter colligati destillationes atque lippitudines arcent. quin et eiectus lapillus calculoso alligatusque supra pubem levare ceteros dicitur ac iocineris etiam dolores et celeritatem partus facere; adicit granius efficaciorum ad hoc esse ferro exemptum. partus accelerat et mas, ex quo quaeque conceperit, si cinctu suo soluto feminam cinxerit, dein solverit adiecta precatione, et cinxisse eundem et soluturum, atque abierit.

sanguine ipsius hominis ex quacumque parte emissio efficacissime anginam inlini tradunt orpheus et archelaus, item ora comitali morbo conlapsorum, exurgere enim protinus; quidam, si pollices pedum pungantur eaeque guttae referantur in faciem, aut si virgo dextro pollice attingat, hac coniectura censentes virgines carnes edendas. - aeschines atheniensis excrementorum cinere anginis medebatur et tonsillis uvisque et carcinomatis. hoc medicamentum vocabat botryon. - multa genera morborum primo coitu solvuntur primoque feminarum mense aut, si hoc non contingit, longinqua fiunt, maximeque comitiales. quin et a serpente, a scorpione percussos coitu levare produnt, verum feminas venere ea laedi. - oculorum vitia fieri negant nec lippire eos, qui, cum pedes lavent, aqua inde ter oculos tangant.

inmatura morte raptorum manu strumas, parotidas, guttura tactu sanari adfirmant, quidam vero cuiuscumque defuncti, dumtaxat sui sexus, laeva manu aversa. et ligno fulgure icto reiectis post terga manibus demorderi aliquid et ad dentem, qui doleat, admoveri remedio esse produnt. sunt qui praecipiant dentem suffiri dente hominis sui sexus et eum, qui caninus vocetur, insepulto exemptum adalligari. - terram e calvaria psilotrum esse palpebrarum tradunt, herba vero, si qua ibi genita sit, commanducata dentes cadere, ulcera non serpere osse hominis circumscripta. alii e tribus puteis pari mensura aquas miscent et prolibant novo fictili, relicum dant in tertianis accessu febrium bibendum. iidem in quartanis fragmentum clavi a cruce involutum lana collo subnectunt aut spartum e cruce, liberatoque condunt caverna, quam sol non attingat. magorum haec commenta sunt, ut cotem, qua ferramenta saepe exacuta sint, subiectam ignari cervicalibus de veneficio deficientis evocare indicium, ut ipse dicat, quid sibi datum sit et ubi et quo tempore, auctorem tamen non nominare. fulmine utique percussum

circumactum in vulnus hominem loqui protinus constat. inguinibus medentur aliqui liceum telae detractum alligantes novenis septenisve nodis, ad singulos nominantes viduam aliquam atque ita inguini adalligantes. liceo et clavum aliudve, quod quis calcaverit, alligatum ipsos iubent gerere, ne sit dolori vulnus. verrucas abolent a vicensima luna in limitibus supini ipsam intuentes ultra caput manibus porrectis et, quicquid adprehendere, eo fricantes. clavum corporis, cum cadit stella, si quis destringat, vel cito sanari aiunt, cardinibus ostiorum aceto adfusus lutum fronti inlitum capitis dolorem sedare, item laqueum suspendiosi circumdatum temporibus. si quid e pisce haeserit in faucibus, cadere demissis in aquam frigidam pedibus; si vero ex aliis ossibus, inpositis capiti ex eodem vase ossiculis; si panis haereat, ex eodem in utramque aurem addito pane.

quin et sordes hominis in magnis fecere remediis quaestus gymnici graecorum, quippe ea strigmenta molliunt, calfaciunt, discutunt, complent, sudore et oleo medicinam facientibus. volvis inflammatis contractisque admoventur; sic et menses cient, sedis inflammationes et condylomata leniunt, item nervorum dolores, luxata, articulorum nodos. efficaciora ad eadem strigmenta a balneis, et ideo miscentur suppuratoriis medicamentis. nam illa, quae sunt e ceromate permixta caeno, articulos tantum molliunt, calfaciunt, discutunt efficacius, sed ad cetera minus valent. excedit fidem inprudens cura, qua sordes virilitatis contra scorpionum ictus singularis remedii celeberrimi auctores clamant, rursus in feminis qua infantium alvo editas in utero ipso contra sterilitatem subdi censent; meconium vocant. immo etiam ipsos gymnasiolorum rasere parietes, et illae quoque sordes excafactoriam vim habere dicuntur; panos discutunt, ulceribus senum puerorumque et desquamatis ambustisve inlinuntur.

eo minus omitti convenit ab animo hominis pendentes medicinas. abstinere se cibo omni aut potu, alias vino tantum aut carne, alias balneis, cum quid eorum postulet valetudo, in praesentissimis remediis habetur. his adnumeratur exercitatio, intentio vocis, ungui, fricari cum ratione; vehemens enim fricatio spissat, lenis mollit, multa adimit corpus, auget modica. in primis vero prodest ambulatio, gestatio et ea pluribus modis, equitatio stomacho et coxis utilissima, phthisi navigatio, longis morbis locorum mutatio, item somno sibi mederi aut lectulo et rara vomitione. supini cubitus oculis conducunt, at proni tussibus, in latera adversus destillationes. aristoteles et fabianus plurimum somnari circa ver et autumnum tradunt, magisque supino cubitu, at prono nihil, theophrastus celerius concoqui dextri lateris incubitu, difficilius a supinis. sol quoque, remediorum maximum, ab ipso sibi praestari potest, sicuti linteorum strigiliumque vehementia. perfundere caput calida ante balnearum vaporationem et postea frigida saluberrimum intellegitur; item praesumere cibis et interponere frigidam eiusdemque potu somnos antecedere et, si libeat, interrompere. notandum nullum animal aliud calidos potus sequi, ideoque non esse naturales. mero ante somnos colluere ora propter halitus, frigida matutinis inpari numero ad cavendos dentium dolores, item posca oculos

contra lippitudines certa experimenta sunt, sicut totius corporis valetudini in varietate victus inobservata. hippocrates tradit non prandentium celerius senescere exta; verum id remediis cecinit, non epulis, quippe multo utilissima est temperantia in cibis. l. lucullus hanc de se praefecturam servo dederat, ultimoque probro manus in cibis triumphali seni deiciebatur vel in capitolio epulanti, pudenda re servo suo facilius parere quam sibi.

sternumenta pinna gravedinem emendant et si quis mulae nares, ut tradunt, osculo attingat, sternumenta et singultum. ad hoc Varro suadet palmam altera manu scalpere; plerique anulum e sinistra in longissimum dextrae digitum transferre, in aquam ferventem manus mergere. theophrastus senes laboriosius sternuere dicit.

venerem damnavit democritus, ut in qua homo alius exiliret ex homine. et, hercules, raritas eius utilior. athletae tamen torpentes restituuntur venere, vox revocatur, cum e candida declinat in fuscam. medetur et lumborum dolori, oculorum hebetationi, mente captis ac melancholicis.

adsidere gravidis vel, cum remedia alicui adhibeantur, digitis pectinatim inter se inplexis veneficium est, idque conpertum tradunt alcmena herculem pariente; peius, si circa unum ambove genua; item poplites alternis genibus inponi. ideo haec in consiliis ducum potestatumve fieri vetuere maiores velut omnem actum impeditentia, vetuere vero et sacris votisve simili modo interesse; capita autem aperiri aspectu magistratuum non venerationis causa iussere, sed, ut Varro auctor est, valetudinis, quoniam firmiora consuetudine ea fierent. - cum quid oculo inciderit, alterum conprimi prodest, cum aqua dextrae auriculae, sinistro pede exultari capite in dextrum umerum devexo, invicem e diversa aure; si tussim concitet saliva, in frontem ab alio adflari; si iaceat uva, verticem morsu alterius suspendi; in cervicium dolore poplites fricari aut cervicem in poplitum; pedes in humo deponi, si nervi in his cruribusve tendantur in lectulo, aut, si in laeva parte id accadat, sinistrae plantae pollicem dextra manu adprehendi, item e diverso; extremitates corporis velleribus perstringi contra horrores sanguinemve narium inmodicum, ... lino vel papyro principia genitalium, femur medium ad cohibenda urinae profluvia; in stomachi solutione pedes pressari aut manus in ferventem aquam demitti. - iam et sermoni parci multis de causis salutare est. triennio maecenatem melissum accepimus silentium sibi imperavisse a convulsione reddito sanguine. nam eversos scandentesque ac iacentes si quid ingruat contraque ictus spiritum cohibere singularis praesidii est, quod inventum esse animalis docuimus. - clavum ferreum defigere in quo loco primum caput fixerit corruens morbo comitali, absolutorium eius mali dicitur. contra renium aut lumborum, vesicae cruciatus in balnearum soliis pronos urinam reddere mitigatorium habetur. - vulnera nodo herculis praeligare mirum quantum ocior medicina est, atque etiam cottidiani cinctus tali nodo vim quandam habere utilem dicuntur, quippe cum herculaneum prodiderit numerum quoque quaternarium demetrius condito volumine et quare quaterni cyathi sextariive non essent potandi. contra lippitudines retro aures fricare

prodest et lacrimosis oculis frontem. - augurium ex homine ipso est non timendi mortem in aegritudine, quamdiu oculorum pupillae imaginem reddant.

magna et urinae non ratio solum, sed etiam religio apud auctores invenitur digestae in genera, spadonum quoque ad fecunditatis veneficia. verum ex iis, quae referre fas sit, inpubium puerorum contra salivas aspidum, quas ptyadas vocant, quoniam venena in oculos hominum expuant, contra oculorum albugines, obscuritates, cicatrices, argema, palpebras et cum ervi farina contra adustiones, contra aurium pura vermiculosque, si decoquatur ad dimidias partes cum porro capitato novo fictili. vaporatio quoque ea menses feminarum ciet. salpe fovet illa cum ... oculos firmitatis causa, inlinit sole usta cum ovi albo, efficacius struthocameli, binis horis. hac et atramenti liturae abluuntur. virilis podagris medetur argumento fullonum, quos ideo temptari eo morbo negant. veteri miscetur cinis ostreorum adversus eruptiones in corpore infantium et omnia ulcera manantia. ea exesis, ambustis, sedis vitiis, rhagadiis et scorpionum ictibus inlinitur. obstetricum nobilitas non alio suco efficacius curari pronuntiavit corporum pruritus, nitro addito ulcera capitum, porrigines, nomas, praecipue genitalium. sua cuique autem, quod fas sit dixisse, maxime prodest, confestim perfuso canis morsu, echinorumque spinis inhaerentibus et in spongea lanisve inposita, aut adversus rabidi canis morsus cinere ex ea subacto, contraque serpentium ictus. nam contra scolopendras mirum proditur vertice tacto urinae suae gutta liberari protinus laesos. - auguria valetudinis ex ea traduntur, si mane candida, dein rufa sit; illo modo concoquere, hoc concoxisse significatur. mala signa rubrae, pessima nigrae, mala bullantis. crassa, in qua quod subsidit album est, significat circa articulos aut viscera dolorem imminere; eadem viridis morbum viscerum, pallida bilis, rubens sanguinis. mala et in qua veluti furfures atque nubeculae apparent. diluta quoque alba vitiosa est, mortifera vero crassa gravi odore et in pueris tenuis ac diluta. - magi vetant eius causa contra solem lunamque nudari aut umbram cuiusquam ab ipso respergi. hesiodus iuxta obstantia reddi suadet, ne deum aliquem nudatio offendat. osthanes contra mala medicamenta omnia auxiliari promisit matutinis suam cuique instillatam in pedem.

quae ex mulierum corporibus traduntur, ad portentorum miracula accedunt, ut sileamus divisa membratim scelera abortus, mensum piacula quaeque alia non obstetrices modo, verum etiam ipsae meretrices prodidere: capilli si crementur, odore serpentes fugari; eodem nidore vulvae morbo strangulatas respirare; cinere eo quidem, si in testa sint cremati vel cum spuma argenti, scabritias oculorum ac pruriges emendari, item verrucas et infantium ulcera, cum melle capitis quoque vulnera et omnium ulcerum sinus, addito melle ac ture panos, podagras, cum adipe suillo sacrum ignem, sanguinem sisti inlito, item fornicationes corporum.

de lactis usu convenit dulcissimum esse mollissimumque et in longa febri coeliacisque utilissimum, maxime eius, quae iam infantem removerit. et in malacia stomachi, in febribus, rosionibus efficacissimum experiuntur; item

mammarum collectionibus cum ture, oculo ab ictu cruore suffuso et in dolore aut epiphora, si inmulgeatur, plurimum prodest, magisque cum melle et narcissi suco aut turis polline, superque in omni usu efficacius eius, quae marem enixa sit, multoque efficacissimum eius, quae geminos mares, et si vino ipsa cibusque acrioribus abstineat. mixto praeterea ovorum candido liquore madidaque lana frontibus inpositum fluctiones oculorum suspendit. etiam si rana saliva sua oculum asperserit, praecipuum est remedium, et contra morsum eiusdem bibitur instillaturque. eum, qui simul matris filiaeque lacte inunctus sit, liberari omni oculorum metu in totam vitam adfirmant. aurium quoque vitiis medetur admixto modice oleo aut, si ab ictu doleant, anserino adipe tepefactum. si sit odor gravior, ut plerumque fit longis vitiis, diluto melle lana includitur. et contra regium morbum in oculis relictum instillatur cum elaterio. peculiariter valet potum contra venena, quae data sint e marino lepore, buprestis aut etiam, ut aristoteles tradit, dorycnio, et contra insaniam, quae facta sit hyoscyami potu. podagris quoque iubent inlini cum cicuta, alii cum oesypo et adipe anserino, qualiter et vulvarum doloribus inponitur. alvum etiam sistit potu, ut rabirius scribit, et menses ciet. eius vero, quae feminam enixa sit, ad vitia tantum in facie sananda praevalet. pulmonum quoque incommoda lacte mulieris sanantur; cui si admisceatur inpubis pueri urina et mel atticum, omnia coclearium singulorum mensura, vermes quoque aurium eici invenio. eius, quae marem pepererit, lacte gustato canes rabiosos negant fieri.

mulieris quoque salivam ieiunam potentem diiudicant cruentatis oculis et contra epiphoras, si ferventes anguli oculorum subinde madefiant, efficacius, si cibo vinoque se pridie ea abstinerit. invenio et fascia mulieris alligato capite dolores minui. post haec nullus est modus. iam primum abigi grandines turbinesque contra fulgura ipsa mense nudato; sic averti violentiam caeli, in navigando quidem tempestates etiam sine menstruis. ex ipsis vero mensibus, monstrificis alias, ut suo loco indicavimus, dira et infanda vaticinantur, e quibus dixisse non pudeat, si in defectus lunae solisve congruat vis illa, inremediabilem fieri, non segnius et in silente luna, coitusque tum maribus exitiales esse atque pestiferos, purpuram quoque eo tempore ab iis pollui; tanto vim esse maiorem. quocumque autem alio menstruo si nudatae segetem ambient, urucas et vermiculos scarabaeosque ac noxia alia decidere metrodorus scepisius in cappadocia inventum prodit ob multitudinem cantharidum; ire ergo per media arva relectis super clunes vestibis. alibi servatur, ut nudis pedibus eant capillo cinctoque dissoluto. cavendum ne id oriente sole faciant, sementiva enim arescere, item novella tactu in perpetuum laedi, rutam et hederam, res medicatissimas, ilico mori. multa diximus de hac violentia, sed praeter illa certum est, apes tactis alvariis fugere; lina, cum coquantur, nigrescere; aciem in cultris tonsorum hebetari; aes contactu grave virus odoris accipere et aeruginem, magis si decrescente luna id accadat; equas, si sint gravidae, tactas abortum pati, quin et aspectu omnino, quamvis procul visas, si purgatio illa post virginitatem prima sit aut in virgine aetatis

sponte manet. bitumen in iudaea nascens sola hac vi superari filo vestis contactae docuimus. ne igni quidem vincitur, quo cuncta, cinisque etiam ille, si quis aspergat lavandis vestibus, purpuras mutat, florem coloribus adimit, ne ipsis quidem feminis malo suo inter se immunibus: abortus facit inlitu aut si omnino praegnas supergradiatur. quae lais et elephantis inter se contraria prodidere de abortivo carbone e radice brassicae vel myrti vel tamaricis in eo sanguine extincto, itemque asinas tot annis non concipere, quot grana hordei contacta ederint, quaeque alia nuncupavere monstrifica aut inter ipsa pugnancia, cum haec fecunditatem fieri isdem modis, quibus sterilitatem illa, praenuntiaret, melius est non credere. bithus durrachinus hebetata aspectu specula recipere nitorem tradit isdem aversa rursus contuentibus, omnemque vim talem resolvi, si mullum pisceum secum habeant; multi vero inesse etiam remedia tanto malo: podagris inlini, strumas et parotidas et panos, sacros ignes, furunculos, epiphoras tractatu mulierum earum leniri; lais et salpe canum rabiosorum morsus et tertianas quartanasque febres menstruo in lana arietis nigri argenteo brachiali incluso, diotimus thebanus vel omnino vestis ita infectae portiuncula ac vel licio brachiali inserto. sotira obstetrix tertianis quartanisque efficacissimum dixit plantas aegri subterlini, multoque efficacius ab ipsa muliere et ignorantis; sic et comitiales excitari. icatidas medicus quartanas finire coitu, incipientibus dumtaxat menstruis, spondit. inter omnes vero convenit, si aqua potusque formidetur a morsu canis, supposita tantum calici lacinia tali statim metum eum discuti, videlicet praevalente sympathia illa graecorum, cum rabiem canum eius sanguinis gustatu incipere dixerimus. cinere eo iumentorum omnia ulcera sanari certum est addita caminorum farina et cera, maculas autem e veste eas non nisi eiusdem urina ablui, cinerem per se rosaceo mixtum feminarum praecipue capitis dolores sedare inlitum fronti, asperrimamque vim profluvii eius esse per se annis virginitate resoluta. id quoque convenit, quo nihil equidem libentius crediderim, tactis omnino menstruo postibus inritas fieri magorum artes, generis vanissimi, ut aestimare licet. ponam enim vel modestissimum e promissis eorum, ex homine siquidem resigmina unguium e pedibus manibusque cera permixta ita, ut dicatur tertianae, quartanae vel cotidianae febris remedium quaeri, ante solis ortum alienae ianuae adfigi iubent ad remedia in his morbis, quanta vanitate, si falsum est, quanta vero noxia, si transferunt morbos! innocentiores ex his omnium digitorum resigmina unguium ad cavernas formicarum abici iubent eamque, quae prima coeperit trahere, correptam subnecti collo; ita discuti morbum.

haec sunt quae retulisse fas sit, ac pleraque ex iis non nisi honore dicto, reliqua intestabilia, infanda, ut festinet oratio ab homine fugere. in ceteris claritates animalium aut operum sequemur.

elephanti sanguis, praecipue maris, fluctiones omnes, quas rheumatismos vocant, sistit. ramentis eboris cum melle attico, ut aiunt, nubeculae in facie, scobe paronychia tolluntur. proboscidis tactu capitis dolor levatur, efficacius si et sternuat. dextra pars proboscidis cum lemnia rubrica adalligata inpetus

libidinum stimulat. sanguis et syntecticis prodest, iocurque comitialibus morbis.

leonis adipēs cum rosaceo cutem in facie custodiunt a vitiis candoremque; sanant et adusta nivibus articularumque tumores. magorum vanitas perunctis adipe eo faciliorem gratiam apud populos regesve promittit, praecipue tamen eo pingui, quod sit inter supercilia, ubi esse nullum potest. similia dentis, maxime a dextera parte, villique e rostro inferiore promissa sunt. fel aqua addita claritatem oculis inunctis facit et cum adipe eiusdem comitiales morbos discutit levi gustu et ut protinus qui sumpsere cursu id digerant. cor in cibo sumptum quartanis medetur; adips cum rosaceo cotidianis febribus. perunctos eo bestiae fugiunt; resistere etiam insidiis videtur.

cameli cerebrum arefactum potumque ex aceto comitialibus morbis aiunt mederi, item fel cum melle potum, hoc et anginae; cauda arefacta solvi alvum, fimi cinere crispari capillum cum oleo. et dysintericis prodest inlitus cinis potusque, quantum iii digitis capiatur, et comitialibus morbis. urinam fullonibus utilissimam esse tradunt, itemque ulceribus manantibus barbaros servare eam quinquennio et heminis pota ciere alvum; saetas e cauda contortas et sinistro brachio alligatas quartanis mederi.

hyaenam magi ex omnibus animalibus in maxima admiratione posuerunt, utpote cui et ipsi magicas artes dederint vimque, qua alliciat ad se homines mentes alienans. permutationes sexus annua vice diximus ceteraque monstifica naturae eius; nunc persequemur quaecumque medicinis produntur. praecipue pantheris terrori esse traditur, ut ne contentur quidem resistere, et aliquid e corio eius habentem non adpeti, mirumque dictu, si pelles utriusque contrariae suspendantur, decidere pilos pantherae. cum fugiant venantem, declinare ad dexteram, ut praegressi hominis vestigia occupent; quod si successerit, alienari mentem ac vel ex equo hominem decidere; at si in laeva detorserit, deficientis argumentum esse celeremque capturam, facilius autem capi, si cinctus suos venator flagellumque inperitans equo septenis alligaverit nodis. mox, ut est sollers ambagibus vanitas magorum, capi iubent geminorum signum transeunte luna singulosque prope pilos servari; capitis dolori inligatam cutem prodesse, quae fuerit in capite eius; lippitudini fel inlitum frontibus aut, ne omnino lippiat, decoctum cum mellis attici cyathis iii et croci uncia inunctum; sic et caligines discuti et suffusiones; claritatem excitari melius inveterato medicamento, adservari autem in cypria pyxide; eodem sanari argema, scabritias, excrescentia in oculis, item cicatrices, glaucomata vero iocineris recentis inassati sanie cum despumato melle inunctis. dentes eius dentium doloribus tactu prodesse vel alligatos numeri ordine, umerorum et lacertorum doloribus; eiusdem dentes, sed e sinistra parte rostri, inligatos pecoris aut capri pelle stomachi cruciatibus; pulmones in cibo sumptos coeliacis vel ventriculi cinerem cum oleo inlitum; nervis medullas e dorso cum oleo vetere ac felle; febribus quartanis iocur degustatum ter ante accessiones; podagris spinae cinerem cum lingua et dextro pede vituli marini addito felle taurino, omnia pariter cocta atque inlita hyaenae pelle; in eodem

morbo prodesse et fel cum lapide assio; tremulis, spasticis, exilientibus et quibus cor palpitet aliquid ex corde coctum mandendum ita, ut reliquae partis cinis cum cerebro hyaenae inlinatur; pilos etiam auferri hac conpositione inlita vel per se felle, evulsis prius qua renasci non libeat; sic et palpebris inutiles tolli; lumborum doloribus carnes e lumbis edendas inlinendasque cum oleo; sterilitatem mulierum emendari oculo cum glycyrrhiza et aneto sumpto in cibo, promisso intra triduum conceptu. contra nocturnos pavores umbrarumque terrorem unus e magnis dentibus lino alligatus succurrere narratur. suffiri furentes eodem et circumligari ante pectus suum cum adipe renium aut iocinere aut pelle praecipiunt. mulieri candida a pectore hyaenae caro et pili septeni et genitale cervi, si inligentur dorcadis pelle e collo suspensa, continere partus promittuntur; venerem stimulare genitalia ad sexus suos in melle sumpta, etiamsi viri mulierum coitus oderint; quin immo totius domus concordiam eodem genitali et articulo spinae cum adhaerente corio adservatis constare. hinc spinae articulum scite nodum atlantion vocant; est autem primus. in comitialium quoque remediis habent eum. adipe accenso serpentes fugari dicunt; maxilla comminuta in aneso et in cibo sumpta horrores sedari; eodem suffitu mulierum menses evocari. tantumque est vanitatis, ut, si ad brachium alligetur superior e dextra parte rostri dens, iaculantium ictus deerraturos negent. palato eiusdem arefacto et cum alumine aegyptio calefacto ac ter in ore permutato faectores et ulcera oris emendari, eos vero, qui linguam in calciamento sub pede habeant, non latrari a canibus; sinistra parte cerebri naribus inlita morbos perniciosos mitigari sive hominum sive quadripedum; frontis corium fascinationibus resistere, cervicis carnes, sive mandantur sive arefactae bibantur, lumborum doloribus; nervis a dorso armisque suffiendos nervorum dolores; pilos rostri admotos mulierum labris amatorium esse; iocur in potu datum torminibus et calculis mederi. nam cor in cibo potuve sumptum omnibus doloribus corporum auxiliari, lienem lienibus, omentum ulcerum inflammationibus cum oleo, medullas doloribus spinae et nervorum lassitudini; renium nervos potos in vino cum ture fecunditatem restituere ademptam veneficio; vulvam cum mali punici dulcis cortice in potu datam prodesse mulierum vulvae; adipe a lumbis suffiri parientes difficulter et statim parere; e dorso medullam adalligatam contra vanas species opitulari, spasticis genitale e maribus suffitu, item lippientibus, ruptis, et contra inflammationes adversos pedes tactu, laevos dexteris partibus, dexteros laevis; sinistram pedem superlatum parturienti letalem esse, dextro inlato facile eniti. membranam, quae fel continuerit, cardiacis potam in vino vel in cibo sumptam contra ... succurrere; vesicam in vino potam contra urinae incontinentiam; quae autem in vesica inventa sit urina, additis oleo ac sesamis et melle haustam prodesse stomachi acrimoniae veteri. costarum primam et octavam suffitu ruptis salutare esse; ex spina vero parturientibus ossa; sanguinem cum polenta sumptum torminibus; eodem tactis postibus ubicumque magorum infestari artes, non elici deos nec conloqui, sive lucernis sive pelvi sive aqua sive pila sive quo alio genere temptetur; carnes si edantur,

contra rabidi canis morsus efficaces esse, etiamnum iocur efficacious. carnes vel ossa hominis, quae in ventriculo occisae inveniantur, suffitu podagricis auxiliari; si ungues inveniantur in iis, mortem alicuius capientium significari; excrementa sive ossa reddita, cum interematur, contra magicas insidias pollere; fimum, quod in intestinis inventum sit, arefactum ad dysintericos valere, potum inlitumque cum adipe anserino toto corpore opitulari laesis malo medicamento; a cane vero morsis adipem inlitum et corium substratum; rursus tali sinistri cinere decocto cum sanguine mustelae perunctos omnibus odio venire; idem fieri oculo decocto. super omnia est, quod extremam fistulam intestini contra ducum ac potestatum iniquitates commonstrant et ad successus petitionum iudiciorumque ac litium eventus, si omnino tantum aliquis secum habeat; eiusdem cavernam sinistro lacerto alligatam, si quis mulierem prospiciat, amatorium esse tam praesens, ut ilico sequatur; eiusdem loci pilorum cinerem ex oleo inlitum viris, qui sint probrosae mollitiae, severos, non modo pudicos, mores induere.

proxime fabulosus est crocodilus, ingenio quoque ille, cui vita in aqua terraque communis. duo enim genera eorum. illius e dextra maxilla dentes adalligati dextro lacerto coitus, si credimus, stimulant; canini dentes febris stas arcent ture repleti - sunt enim cavi - ita ne diebus v ab aegro cernatur qui adalligaverit. idem pollere e ventre exemptos lapillos adversus febrium horrores venientes tradunt. eadem de causa aegypti perungunt adipe aegros suos. alter illi similis, multum infra magnitudine, in terra tantum odoratissimisque floribus vivit; ob id intestina eius diligenter exquiruntur iucundo nidore referta; crocodileam vocant, oculorum vitiis utilissimam cum porri suco inunctis et contra suffusiones vel caligines. inlita quoque ex oleo cyprino molestias in facie nascentes tollit, ex aqua vero morbos omnes, quorum natura serpit in facie, nitoremque reddit; lentigines tollit ac varos maculasque omnes. et contra comitiales morbos bibitur ex aceto mulso binis obolis. adposita menses ciet. optima quae candidissima et friabilis minimeque ponderosa, cum teratur inter digitos, fermentescens. lavatur ut cerussa. adulterant amylo aut cimolia, sed maxime sturnorum fimo qui captos oryza tantum pascunt. felle inunctis oculis ex melle contra suffusiones nihil utilius praedicant. intestinis et reliquo corpore eius suffiri vulva laborantes salutare tradunt, item velleribus circumdari vapore eiusdem infectis. corii utriusque cinis ex aceto inlitus iis partibus, quas secari opus sit, aut nidor cremati sensum omnem scalpelli aufert. sanguis utriusque claritatem visus inunctis excitat, cicatrices oculorum emendat. corpus ipsum excepto capite pedibusque elixum manditur ischiadicis tussimque veterem sanat, praecipue in pueris, item lumborum dolores. habent et adipem, quo tactus pilus defluit. hic perunctos a crocodilis tuetur instillaturque morsibus. cor adnexum in lana ovis nigrae, cui nullus alius colos incursaverit, et primo partu genitae quartanas abigere dicitur.

iungemus illis simillima et peregrina aequae animalia priusque chamaeleonem, peculiari volumine dignum existimatum democrito ac per

singula membra desecratum, non sine magna voluptate nostra cognitissimis proditiisque mendaciis graecae vanitatis. similis et magnitudine est supra dicto crocodilo, spinae tantum acutius curvatura et caudae amplitudine distans. nullum animal pavidius existimatur et ideo versicoloris esse mutationis. vis eius maxima contra accipitrum genus. detrahare enim supervolantem ad se traditur et voluntarium praebere lacerandum ceteris animalibus. caput eius et guttur, si roboreis lignis accendantur, imbrium et tonitruum concursus facere democritus narrat, item iocur in tegulis ustum. reliqua ad veneficia pertinentia quae dicit, quamquam falsa existimantes, omitemus, praeterquam ubi inrisu coarguent eum: dextro oculo, si viventi eruatur, albugines oculorum cum lacte caprino tolli, lingua adalligata pericula puerperii; eundem salutarem esse parturientibus, si sit domi, si vero inferatur, perniciosissimum. linguam, si viventi exempta sit, ad iudiciorum eventus pollere, cor adversus quartanas inligatum lana nigra primae tonsurae. pedem e prioribus dextrum pelle hyaenae adalligatum sinistro brachio contra latrocinia terroresque nocturnos pollere, item dextram mamillam contra formidines pavoresque; sinistram vero pedem torreretur in furno cum herba, quae aequae chamaeleon vocetur, additoque unguento pastillos eos in ligneum vas conditos praestare, si credimus, ne cernatur ab aliis qui id habeat. armum dextrum ad vincendos adversarios vel hostes valere, utique si abiectos eiusdem nervos calcaverit; sinistram vero quibus monstris consecret, qualiter somnia quae velis ac quibus velis mittantur, pudet referre: omnia ea dextro pede resolvere, sicut sinistro latere lethargos, quos fecerit dexter. set capitis dolores insperso vino, in quo latus alterutrum maceratum sit, sanari; si feminis sinistri vel pedis cinere misceatur lac suillum, podagricos fieri inlitis pedibus. felle glaucomata et suffusiones corrigi prope creditur tridui inunctione, serpentes fugari ignibus instillato, mustelas contrahi in aquam coiecto, corpori vero inlito detrahi pilos. idem praestare narrat iocur cum ranae rubetae pulmone inlito; praeterea iocinere amatoria dissolvere, melancholicos autem sanari, si ex corio chamaeleonis sucus herbae heleniae bibatur; intestina et fartum eorum, cum animal id nullo cibo vivat, simiarum urina una inlita inimicorum ianuae odium omnium hominum his conciliare; cauda flumina et aquarum impetus sisti, serpentes soporari; eadem medicata cedro et murra inligataque gemino ramo palmae percussam aquam discuti, ut quae intus sint omnia appareant; utinamque eo ramo contactus esset democritus, quoniam ita loquacitates inmodicas promisit inhiberi. palamque est virum alias sagacem et vitae utilissimum nimio iuvandi mortales studio prolapsum.

ex eadem similitudine est scincus - et quidam terrestrem crocodilum esse dixerunt - , candidior autem et tenuiore cute. praecipua tamen differentia dinoscitur a crocodilo, squamarum serie a cauda ad caput versa. maximus indicus, deinde arabicus. adferuntur salsi. rostrum eius et pedes in vino albo poti cupiditates veneris accendunt, utique cum satyrio et erucae semine singulis drachmis omnium ac piperis ii admixtis ita pastilli singularum drachmarum bibantur. per se laterum carnes obolis binis cum murra et pipere

pari modo potae efficaciores ad idem creduntur. prodest et contra sagittarum venena, ut Apelles tradit, ante posteaque sumptus. in antidota quoque nobilia additur. sextius plus quam drachmae pondere in vini hemina potum perniciem adferre tradit, praeterea eiusdem decocti ius cum melle sumptum venerem inhibere.

est crocodilo cognatio quaedam amnis eiusdem geminique victus cum hippopotamio, repertore detrahendi sanguinis, ut diximus, plurimo autem super saiticam praefecturam. huius corii cinis cum aqua inlitus panos sanat, adips frigidas febres, item fimum suffitu, dentes e parte laeva dolorem dentium scariphatis gingivis. pellis eius e sinistra parte frontis inguini adalligata venerem inhibet, eiusdem cinis alopecias explet. testiculi drachma ex aqua contra serpentes bibitur. sanguine pictores utuntur.

peregrinae sunt et lynces, quae clarissime quadripedum omnium cernunt. ungues earum omnes cum corio exuri efficacissime in carpatho insula tradunt. hoc cinere poto propudia virorum, eiusdem aspersu feminarum libidines inhiberi, item pruritus corporum, urina stillicidia vesicae. itaque eam protinus terra pedibus adgesta obruere traditur. eadem autem et iugulorum dolori monstratur in remedio. hactenus de externis.

nunc praevertemur ad nostrum orbem, primumque communia animalium remedia atque eximia dicemus, sicuti e lactis usu. utilissimum cuique maternum. concipere nutrices exitiosum est; hi sunt enim infantes, qui colostrati appellantur, densato lacte in casei speciem. est autem colostrum prima a partu spongea densitas lactis. maxime autem alit quodcumque humanum, mox caprinum, unde fortassis fabulae iovem ita nutritum dixere. dulcissimum ab hominis camelinum, efficacissimum ex asinis. magnorum animalium et corporum facilius redditur. stomacho adcommodatissimum caprinum, quoniam fronde magis quam herba vescuntur, bubulum medicatius, ovillum dulcius et magis alit, stomacho minus utile, quoniam est pinguius. omne autem vernum aquatius aestivo et de novellis. probatissimum vero quod in ungue haeret nec defluit; innocentius decoctum, praecipue cum calculis marinis. alvus maxime solvitur bubulo, minus autem inflat quodcumque decoctum. usus lactis ad omnia intus exulcerata, maxime renes, vesicam, interanea, fauces, pulmones, foris pruritus cutis, eruptiones pituitae poti ab abstinentia nam ut in arcadia bubulum biberent phthisici, syntectici, cachectae, diximus in ratione herbarum. sunt inter exempla qui asinum bibendo liberati sint podagri chiragraeque. medici speciem unam addidere lactis generibus, quod schiston appellavere. id fit hoc modo: fictili novo fervet, caprinum maxime, ramisque ficulneis recentibus miscetur additis totidem cyathis mulsi, quot sint heminae lactis. cum fervet, ne circumfundatur, praestat cyathus argenteus cum frigida aqua demissus ita, ne quid infundat. ablatum deinde igni refrigeratione dividitur et discedit serum a lacte. quidam et ipsum serum iam multo potentissimum decocunt ad tertias partes et sub diu refrigerant. bibitur autem efficacissime heminis per intervalla, satis, diebus quinae; melius a potu gestari. datur comitialibus, melancholicis, paralyticis, in

leprisi, elephantiasi, articulariis morbis. infunditur quoque lac contra rosiones a medicamentis factas et, si urat dysinteria, decoctum cum marinis lapillis aut cum tisana hordeacia. item ad intestinorum rosiones bubulum aut ovillum utilius. recens quoque dysintericis infunditur, ad colum autem crudum, item vulvae et propter serpentium ictus potissime pityocampis, bupresti, cantharidum aut salamandrae venenis, privatim bubulum iis, qui colchicum biberint aut cicutam aut dorycnium aut leporem marinum, sicut asininum contra gypsum et cerussam et sulphur et argentum vivum, item durae alvo in febris. gargarizatur quoque faucibus exulceratis. utilissime et bibitur ab imbecillitate vires recolligentibus, quos atrophos vocant, in febris etiam, quae careat dolore capitis. pueris ante cibum lactis asinini heminam dari aut si exitus cibi rosiones sentirent, antiqui in arcanis habuerunt, si hoc non esset, caprini. bubuli serum orthopnoicis prodest ante cetera addito nasturtio. inunguntur etiam oculi in lactis heminas additis sesamae drachmis iiii tritis in lippitudine. caprino lienes sanantur, post bidui inedia tertio die hedera pastis capris, per triduum potio sine alio cibo. lactis usus alias contrarius capitis doloribus, hepaticis, splenicis, nervorum vitio, febres habentibus, vertigini praeterquam purgationis gratia, gravedini, tussientibus, lippis. ovillum utilissimum tenesmo, dysinteriae; nec non phthisicis hoc et mulieris saluberrimum qui dicerent fuerunt.

de generibus caseorum diximus, cum de uberibus singulisque membris animalium diceremus. sextius eosdem effectus equino quos bubulo tradit; hunc vocant hippacen. stomacho utiles qui non sunt salsi, id est recentes. veteres alvum sistunt corpusque minuunt, stomacho inutiliores; et in totum salsa minuunt corpus, alunt mollia. caseus recens cum melle suggillata emendat, mollis alvum sistit, sedat tormina pastillis in vino austero decoctis rursusque in patina tostis cum melle. saprum vocant qui cum sale et sorbis siccis e vino tritus potusque medetur coeliacis. genitalium carbunculis caprinus tritus inpositus, item acidus cum oxymelite maculis in balneo inlitus oleo interlinitur.

e lacte fit et butyrum, barbararum gentium lautissimus cibus et qui divites a plebe discernat. plurimum e bubulo - et inde nomen - , pinguissimum ex ovibus fit et caprino, sed hieme calefacto lacte, aestate expresso tantum, crebro iactatu in longis vasis angusto foramine spiritum accipientibus sub ipso ore alias praeligato. additur paulum aquae, ut acescat. quod est maxime coactum, in summo fluitat; id exemptum addito sale oxygala appellant. relicum decocunt in ollis; ibi quod supernatat, butyrum est, oleosum natura. quo magis virus resipit, hoc praestantius iudicatur. pluribus conpositionibus miscetur inveteratum. natura eius adstringere, mollire, replere, purgare.

oxygala fit et alio modo, acido lacte addito recens, quod velint acescere, utilissimum stomacho. effectus dicemus suis locis.

proxima in communibus adipi laus est, sed maxime suillo, apud antiquos etiam religiosius. certe novae nuptae intrantes etiam nunc sollemne habent postes eo attingere. inveteratur duobus modis, cum sale aut sincerus; tanto fit

utilior. axungiam graeci etiam appellavere iam in voluminibus suis. neque est occulta virium causa, quoniam id animal herbarum radicibus vescitur; itaque etiam fimo innumeri usus. quam ob rem non de alia loquemur sue. multo efficacior e femina et quae non pepererit, multo vero praestantior in apris esse dicitur usus axungiae ad emollienda, excalfacienda, discutienda purgandaque. medicorum aliqui admixto anseris adipe taurorumque sebo et oesypo ad podagras uti iubent; si vero permaneat dolor, cum cera, myrto, resina, pice. sincera axungia medetur ambustis vel nive, pernionibus autem cum hordei cinere et galla pari modo. prodest et confricatis membris, itinerumque lassitudines et fatigationes levat. ad tussim veterem recens decoquitur quadrantis pondere in vini cyathis iii addito melle. vetus etiam phthisis pilulis sumpta sanat, quae sine sale inveterata est. omnino enim non nisi ad ea, quae purganda sint aut quae non sint exulcerata, salsa recipitur. quidam quadrantes axungiae et mulsu in vini cyathis ternis decocunt contra phthisis, quarto quoque die picem liquidam in ovo sumi iubent. circumligatur et lateribus, pectori, scapulis eorum, qui phthisim sentiunt, tantaque est vis, ut genibus etiam adalligata redeat in os sapor eamque expuere videantur. e sue, quae non pepererit, aptissime utuntur ad cutem mulieres, contra scabiem vero quivis admixto iumentorum sebo pro parte tertia et pice pariterque subfervefactis. sincera partus in abortum vergentes nutrit collyrii modo subdita. cicatrices concolores facit cerussa admixta vel argenti spuma, at cum sulphure unguum scrabritias emendat. medetur et capillo fluenti et ulceribus in capite mulierum cum gallae parte quarta et infumata pilis oculorum. datur et phthisicis unciatim cum vini veteris hemina decocta, donec iii unciae e toto restent; aliqui et mellis exiguum adiciunt. panis inlinitur cum calce, item furunculis duritiaeque mammarum. rupta et convulsa et spasmata et luxata sanat, clavos et rimas callique vitia cum helleboro albo, parotidas admixta farina salsamentariae testae, quo genere proficit et ad strumas. pruritus et papulas in balineo perunctis tollit, alioque etiamnum modo podagricis prodest mixto oleo vetere, contrito una sarcophago lapide et quinquefolio tuso in vino vel cum calce aut cum cinere. fit et peculiare emplastrum lxxv #1108 ponderi c spumae argenteae mixtis, utilissime contra ulcerum inflammationes adipe verrino. et inungi putant utile, quaeque serpant inlinere cum resina. antiqui axibus vehiculorum perungendis maxime ad faciliorem circumactum rotarum utebantur, unde nomen, sic quoque utili medicina cum illa ferrugine rotarum ad sedis vitia virilitatisque et per se axungia. medici antiqui maxime probabant renibus detractam exemptisque venis aqua caelesti fricabant crebro decoquebantque fictili novo saepius, tum demum adservantes. convenit salsam magis mollire, excalfacere, discutere, utilioremque esse vino lotam. masurius palmam lupino adipi dedisse antiquos tradidit. ideo novas nuptas illo perunguere postes solitas, ne quid mali medicamenti inferretur.

quae ratio adipis, eadem in iis, quae ruminant, sebi est, aliis modis, non minoris potentiae. perficitur omne exemptis venis aqua marina vel salsa lotum, mox in pila tusum aspersa marina crebro; postea coquitur, donec odor

omnis aboleatur, mox adsiduo sole ad candorem reducitur. a renibus autem omne laudatissimum est. si vero vetus revocetur ad curam, liquefieri prius iubent, mox frigida aqua lavari saepius, dein liquefacere adfuso vino quam odoratissimo. eodemque modo iterum ac saepius cocunt, donec virus evanescat. multi privatim sic taurorum leonumque ac pantherarum et camelorum pingua curari iubent. usus dicitur suis locis.

communis et medullarum est. omnes molliunt, explent, siccant, exalfaciunt. laudatissima e cervis, mox vitulina, dein hircina et caprina. curantur ante autumnum. recentes lotae siccataeque in umbra, per cribrum dein liquatae per lintea exprimuntur ac reponuntur in fictili locis frigidis.

inter omnia autem communia animalium vel praestantissimum effectum fel est. vis eius exalfacere, mordere, scindere, extrahere, discutere. minorum animalium subtilius intellegitur et ideo ad oculorum medicamenta utilius existimatur. taurino praecipua potentia, etiam in aere pelvibusque aureo colore obducendis. omne autem curatur recens praeligato ore lino crasso, demissum in ferventem aquam semihora, mox siccatum sine sole atque in melle conditum. damnatur equinum tantum inter venena. ideo flamine sacrorum equum tangere non licet, cum romae publicis sacris equus etiam immoletur.

quin et sanguis eorum septicam vim habet; item equarum, praeterquam virginum, erodit, emarginat ulcera. taurinus quidem recens inter venena est excepta aegira. ibi enim sacerdos terrae vaticinatura sanguinem tauri bibit prius quam in specus descendat. tantum potest sympathia illa, de qua loquimur, ut aliquando religione aut loco fiat. drusus tribunus plebei traditur caprinum bibisse, cum pallore et invidia veneni sibi dati insimulare q. caepionem inimicum vellet. hircorum sanguini tanta vis est, ut ferramentorum subtilitas non aliter acrius induretur, scabritia poliatur vehementius quam lima. non igitur et sanguis animalium inter communia dici potest, et ideo suis quisque dicitur effectibus.

digeremus enim in mala singula usus primumque contra serpentes. exitio his esse cervos nemo ignorat ut, si quae sunt, extractas cavernis mandentes. nec vero ipsi spirantesque tantum adversantur, sed membratim quoque. fugari eas nidore cornus eorum, si uratur, dictum est; at e summo gutture ustis ossibus congregari dicuntur. pelles eiusdem animalis substratae securos praestant ab eo metu somnos, coagulum ex aceto potum ab ictu; et si omnino tractatum sit, eo die non ferit serpens. testes quoque eius inveterati vel genitale vetus maris salutariter dantur in vino; item venter, quem centipellionem vocant. fugiunt et omnino dentem cervi habentes aut medulla perunctos sebove cervi aut vituli. summis autem remediis praefertur hinnulei coagulum matris utero execti, ut indicavimus. sanguine cervino, si una urantur dracontion et cunilago et anchusa lentisci ligno, contrahi serpentes tradunt, dissipari deinde, si sanguine detracto adiciatur pyrethrum. invenio apud auctores graecos, animal cervo minus et pilo demum simile, quod ophion vocaretur, sardiniam tantum ferre solitam. hoc interisse arbitror et ideo medicinas ex eo omitto. - apri quoque cerebrum contra eas laudatur cum

sanguine, iocur etiam inveteratum cum ruta potum ex vino, item adipis cum melle resinaque, simili modo verrinum iocur et fellis dumtaxat fibra #1108 iiii pondere vel cerebrum in vino potum. - caprarum cornu vel pilis accensis fugari serpentes dicunt, cineremque e cornu potum vel inlitum contra ictus valere, item lactis haustus cum uva taminia vel urinae cum aceto scillite, caseum caprinum cum origano inpositum vel sebum cum cera. milia praeterea remediorum ex eo animali demonstrantur, sicut apparebit, quod equidem miror, cum febris negetur carere. amplior potentia feris eiusdem generis, quod numerosissimum esse diximus, alia vero et hircis. democritus etiamnum effectus auget eius, qui singularis natus sit. fimo quoque caprarum in aceto decocto inlini ictus serpentium placet et recentis cinere in vino, atque in totum difficilius sese recolligentes a serpentium ictu in caprilibus optime convalescunt. qui efficacius volunt mederi, occisae caprae alvum dissectam cum fimo intus reperto inligant statim. alii carnem recentem haedorum cum pilo suffiunt eodemque nidore fugant serpentes. utuntur et pelle eorum recenti, ad plagas et carne et fimo equi in agro pasti, coagulo leporis ex aceto contraque scorpionem et murem araneum; aiunt non feriri leporis coagulo perunctos. a scorpione percussis fimum caprae efficacius aceto decoctum auxiliatur, lardum iusque decocti potum et iis, qui buprestim hauserint. quin etiam si quis asino in aurem percussus a scorpione se dicat, transire malum protinus tradunt, venenataque omnia accenso pulmone eius fugere. et fimo vituli suffiri percussos a scorpione prodest.

canis rabiosi morsu facta volnera circumcidunt ad vivas usque partes quidam carnemque vituli admovent et ius ex eodem carnis decoctae dant potui aut axungiam cum calce tusam, hirci iocur, quo inposito ne temptari quidem aquae metu adfirmant. laudant et caprae fimum ex vino inlitum, melis et cuculi et hirundinis decoctum et potum. ad reliquos bestiarum morsus caprinum caseum siccum cum origano inponunt et bibi iubent, ad hominis morsus carnem bubulam coctam, efficacius vituli, si non ante quintum diem solvant.

veneficiis rostrum lupi resistere inveteratum aiunt ob idque villarum portis praefigunt. hoc idem praestare et pellis e cervice solida manica existimatur, quippe tanta vis est animalis praeter ea, quae retulimus, ut vestigia eius calcata equis adferant torporem. - iis, qui argentum vivum biberint, lardum remedio est. - asinino lacte poto venena restinguntur, peculiariter si hyoscyamum potum sit aut viscum aut cicuta aut lepus marinus aut opocarpatum aut cerussa aut dorycnium et si coagulum alicui nocuerit, nam id quoque venenum est in prima lactis coagulatione. multos et alios usus eius dicemus, sed meminisse oportebit recenti utendum aut non multo postea tepefacto; nullum enim celerius evanescit. ossa quoque asini confracta et decocta contra leporis marini venenum dantur. omnia eadem onagris efficaciora. - de equiferis non scripserunt graeci, quoniam terrae illae non gigneant, verum tamen fortiora omnia eadem quam in equis intellegi debent. lacte equino venena leporis marini et toxica expugnantur. nec uros aut bisontes habuerunt graeci in

experimentis, quamquam bove fero refertis indiae silvis; pro portione tamen eadem efficaciora omnia ex his credi par est. sic quoque lacte bubulo cuncta venena expugnari tradunt, maxime supra dicta et si ephemerum inpactum sit aut si cantharides datae; omnia vomitione egeri, sic et caprino iure cantharidas. contra ea vero, quae exulceratione enecant, sebum vitulinum vel bubulum auxiliatur. nam contra sanguisugas potas butyrum remedio est cum aceto ferro calefacto, quod et per se prodest contra venena, nam si oleum non sit, vicem eius repraesentat. multipedae morsus cum melle sanat. omasi quoque iure poto venena supra dicta expugnari putant, privatim vero aconita et cicutas, itemque vitulino sebo. - caprinus caseus recens iis, qui viscum biberint, lac contra cantharidas remedio est, contra ephemerum potum cum taminia uva. sanguis caprinus decoctus cum medulla contra toxica venena sumitur, haedinus contra reliqua, coagulum haedi contra viscum et chamaeleonem album sanguinemque taurinum, contra quem et leporis coagulum est ex aceto, contra pastinacam vero et omnium marinorum ictus vel morsus coagulum leporis vel haedi vel agni drachmae pondere ex vino. leporis coagulum et contra venena additur antidotis. papilio quoque lucernarum luminibus advolans inter mala medicamenta numeratur; huic contrarium est iocur caprinum, sicut fel veneficiis ex mustella rustica factis. hinc deinde praevertemur ad genera morborum.

capilli defluvia ursinus adips admixto ladano et adianto continet alopeciasque emendat et raritatem superciliorum cum fungis lucernarum ac fuligine, quae est in rostris earum, porriginem cum vino. prodest ad hanc et cornus cervini cinis e vino utque non taedia animalium capillis increscant, item fel caprinum cum creta cimolia et aceto sic, uti paulum capiti inarescant, item fel scrofinum, urina tauri. si vero vetus sit, furfures etiam adiecto sulphure emendat. cinere genitalis asini spissari capillum putant et a canitie vindicari, si rasis inlinatur plumboque tritus cum oleo, densari et asinini pulli illitum urina; admiscent nardum fastidii gratia. alopecias felle taurino cum aegyptio alumine tepefacto inlinunt. ulcera capitis manantia urina tauri efficaciter sanat, item hominis vetus, si cyclaminum adiciatur et sulphur, efficacius tamen vitulinum fel, quo cum aceto calefacto et lendes tolluntur. sebum vitulinum capitis ulceribus cum sale tritum utilissimum. laudatur et vulpium adips, sed praecipue felium fimum cum sinapis pari modo inlitum, caprini cornus farina vel cinis, magisque hircini, addito nitro et tamaricis semine et butyro oleoque, prius capite raso; mire continent ita fluentem capillum, sicuti carnis cinere ex oleo inlita supercilia nigrescunt. lacte caprino lendes tolli tradunt, fimo cum melle alopecias expleri, item ungularum cinere cum pice. fluentem capillum continet leporinus cinis cum oleo myrteo. - capitis dolorem sedat pota aqua, quae relictas est e bovis aut asini potu, et, si credimus, vulpis masculae genitale circumligatum, cornus cervini cinis inlitus ex aceto aut rosaceo aut ex irino. -

oculorum epiphoras bubulo sebo cum oleo cocto inlinunt; cervini cornus cinere scabritias ex eodem inungunt, mucrones autem ipsos efficaciores putant. lupi excrementis circumlini suffusiones prodest, cinere eorum cum

attico melle inungui obscuritates, item felle ursino, epinyctidas adipe apruno cum rosaceo. ungulae asininae cinis inunctus e suo lacte oculorum cicatrices et albugines tollit. medulla bubula e dextro crure priore trita cum fuligine pilis et palpebrarum vitiis angulorumque occurrit - calliblephari modo fuligo in hoc usu temperatur, optime ellychnio papyraceo oleoque sesamino fuligine in novum vas pinnis detera - , efficacissime tamen evollos ibi pilos coercet. felle tauri cum ovi albo collyria fiunt, aquaque dissoluta inungunt per quadriduum. sebum vituli cum anseris adipe et ocimi suco genarum vitiis aptissimum est. eiusdem medullae cum pari pondere cerae et olei vel rosacei addito ovo duritiae genarum inlinuntur. caseo molli caprino inposito ex aqua calida epiphorae sedantur; si tumor sit, ex melle; utrumque sero calido fovendum. sicca lippitudo lumbulis suum exustis atque contritis et inpositis tollitur. capras negant lippire, quoniam quasdam herbas edint, item dorcadas; ob id fimum earum cera circumdatum nova luna devorari iubent. et quoniam noctu quoque aequae cernant, sanguine hircino lusciosos sanari putant, nyctalopas a graecis dictos, caprae vero iocinere in vino austero decocto. quidam inassati iocineris sanie inungunt aut felle caprae, carnesque vesci eas et, dum coquantur, oculos vaporari iis praecipiunt; id quoque referre arbitrantur, ut rutili coloris fuerit. volunt et suffiri oculos iocinere in ollis decocto, quidam inassato. fel quidem caprinum pluribus modis adsumunt, cum melle contra caligines, cum veratri candidi tertia parte contra glaucomata, cum vino contra cicatrices et albugines et caligines et pterygia et argema, ad palpebras vero evolso prius pilo cum suco oleris ita, ut unctio inarescat, contra ruptas tuniculas cum lacte mulieris. ad omnia inveteratum fel efficacius putant. nec abdicant fimum ex melle inlitum epiphoris, contraque dolores medullam, item pulmonem leporis, et ad caligines fel cum passo aut melle. lupino quoque adipe vel medulla suum fricari oculos contra lippitudines praecipiunt. nam vulpinam linguam habentes in armilla lippituros negant.

aurium dolori et vitiis medentur urina apri in vitreo servata, fel apri vel suis vel bubulum cum oleo cedrino et rosaceo aequis portionibus, praecipue vero taurinum cum porri suco tepidum vel cum melle, si suppurent, contraque odorem gravem per se, tepefactum in malicorio. rupta in ea parte cum lacte mulierum efficaciter sanat. quidam et in gravitate aures sic perluendas putant, alii cum senecta serpentium et aceto - includunt lana - collutas ante calida aqua aut, si maior sit gravitas, verrinum fel cum murra et ruta in malicorio excafactum infundunt, lardum quoque pingue; item fimum asini recens cum rosaceo instillatur, omnia tepefacta. utilior equi spuma vel equini fimi recentis cinis cum rosaceo, butyrum recens, sebum bubulum cum adipe anserino, urina caprae vel tauri aut fullonia vetus, calfactae vapore per lagoenae collum subeunte - admiscet aceti tertiam partem et aliquid murræ - , vituli, qui nondum herbam gustaverit, fimum mixto felle eiusdem et cute, quam relinunt angues, excalefactis prius auribus; lana autem medicamina ea includuntur. prodest et sebum vituli cum anseris adipe et ocimi suco, eiusdem medulla admixto cumino trito infusa, virus verrinum e scrofa exceptum, priusquam

terram attingat, contra dolores; auribus fractis glutinum e naturis vitulorum factum et in aqua liquatum; aliis vitiis adips vulpium, item fel caprinum cum rosaceo tepido aut porri suco aut, si rupta sint aliqua ibi, e lacte mulieris; si gravitas audiendi, fel bubulum cum urina caprae vel hirci, vel si pus sit. in quocumque autem usu putant efficaciora haec in cornu caprino per dies xx infumata. laudant et coagulum leporis tertia parte #1108 dimidiaque sacopenii in ammineo vino. - parotidas ursinus adips comprimit pari pondere cerae et taurini sebi - addunt quidam hypocisthidem - , et per se butyrum inlitum, si prius foveantur feni graeci decocti suco, efficacius cum strychno. prosunt et vulpium testes et taurinus sanguis aridus tritus, urina caprae calefacta instillata auribus, fimum eiusdem cum axungia inlitum.

dentes mobiles confirmat cervini cornus cinis doloresque eorum mitigat, sive infricentur sive colluantur. quidam efficaciorum ad omnes eosdem usus crudi cornus farinam arbitrantur. dentifricia utroque modo fiunt. magnum remedium est et in luporum capitis cinere. certum est in excrementis eorum plerumque inveniri ossa; haec adalligata eundem effectum habent, item leporina coagula per aurem infusa contra dolores. et capitis eorum cinis dentifricium est adiectoque nardo mulcet graveolentiam oris. aliqui murinorum capitum cinerem miscuisse malunt. reperitur in latere leporis os acui simile; hoc scariphare dentes in dolore suadent. talus bubulus accensus eos, qui labent cum dolore, admotus confirmat; eiusdem cinis cum murra dentifricium est. ossa quoque ex ungulis suum combusta eundem usum praebent, item ossa ex acetabulis pernarum, circa quae coxendices vertuntur. isdem sanari demissis in fauces iumentorum verminationes notum est, sed et combustis dentes confirmari, asinino quoque lacte percussu vexatos aut dentium eiusdem cinere, item lichene equi cum oleo infuso per aurem. est autem hoc non hippomanes, quod alioqui noxium omitto, sed in equorum genibus ac super ungulas. praeterea in corde equorum invenitur os dentibus caninis maximis simile; hoc scariphari dolorem aut exempto dente mortui equi maxillis ad numerum eius, qui doleat, demonstrant. equarum virus a coitu in ellychniis accensum anaxilaus prodidit lichenis equinorum capitum vires repraesentare monstrifice, similiter ex asinis. nam hippomanes tantas in veneficio vires habet, ut adfusus aeris mixturae in effigiem equae olympiae admotos mares equos ad rabiem coitus agat. medetur dentibus et fabrile glutinum in aqua decoctum inlitum et mox paulo detractum ita, ut confestim conluantur vino, in quo decocti sint cortices mali punici dulcis. efficax habetur et caprino lacte conlui dentes vel felle taurino. talorum caprae recentium cinis dentifricio placet et omnium fere villaticarum quadrupedum, ne saepius eadem dicantur.

cutem in facie erugari et tenerescere candore lacte asinino putant, notumque est quasdam cottidie septies genas custodito numero fovere. poppaea hoc neronis principis instituit, balnearum quoque solia sic temperans, ob hoc asinarum gregibus eam comitantibus. impetus pituitae in facie butyro inlito tolluntur, efficacius cum cerussa, sincero vero ea vitia, quae serpunt,

superinposita farina hordeacea, ulcera in facie membrana e partu bovis madida. frivolum videatur, non tamen omittendum propter desideria mulierum, talum candidi iuveni xl diebus noctibusque, donec resolvatur in liquorem, decoctum et inlitum linteolo candorem cutisque erugationem praestare. fimo taurino malas rubescere aiunt, non ut crocodileam inlini melius sit; foveri frigida et ante et postea iubent. testas et quae decolorem faciunt cutem fimum vituli cum oleo et cummi manu subactum emendat; ulcera oris ac rimas sebum vituli vel bovis cum adipe anserino et ocimi suco. est et alia mixtura sebo vituli cum medulla cervi et albae spinae foliis una tritis. idem praestat et medulla cum resina vel, si vaccina sit, et ius e carne vaccina. lichenas oris praestantissime vincit glutinum factum e genitalibus vitulorum, liquatum aceto cum sulphure vivo, ramo ficulneo permixtum, ita ut bis die recens inlinatur, item lepras ex melle et aceto decoctum, quas et iocur hirci calidum inlitum tollit, sicut elephantiasin fel caprinum; etiamnum lepras ac furfures tauri fel addito nitro, urina asini circa canis ortum; maculas in facie fel utriusque per sese aqua infractum evitatisque solibus ac ventis post detractam cutem. similis effectus et in taurino vitulinove felle cum semine cunilae, cinere e cornu cervino, si canicula exoriente conburatur. asinino sebo cicatricibus, a lichene leprisque maxime, color redditur. hirci fel et lentigines tollit admixto caseo cum vivo sulphure spongeaeque cinere, ut sit mellis crassitudo. aliqui inveterato felle maluere uti, mixtis calidis furfuribus pondere oboli unius iiiiue mellis, prius defricatis maculis. efficax eiusdem et sebum cum melanthio et sulphure et iride, labrorum fissuris cum anserino adipe ac medulla cervina resinaque et calce. - invenio aput auctores iis, qui lentigines habeant, negari magices sacrificiorum usus. -

lacte bubulo aut caprino tonsillae et arteriae exulceratae iuvantur. gargarizatur tepidum, ut est usus, expressum aut calefactum. caprinum utilius cum malva decoctum et sale exiguo. linguae exulcerationi et arteriarum prodest ius omasi gargarizatum, tonsillis autem privatim renes vulpium aridi cum melle triti inlitique, anginae fel taurinum vel caprinum cum melle, iocur melis ex aqua. oris gravitatem ulceraque butyrum emendat. spinam aliudve quid faucibus adhaerens felis extrinsecus fimo perfricatis aut reddi aut delabi tradunt. strumas discutit fel aprunum vel bubulum tepidum inlitum - nam coagulum leporis e vino in linteolo exulceratis dumtaxat inponitur - , discutit et ungulae asini vel equi cinis ex oleo vel aqua inlitus et urina calefacta et bovis ungulae cinis ex aqua, fimum quoque fervens ex aceto, item sebum caprinum cum calce aut fimum ex aceto decoctum, testes volpini. prodest et sapo, galliarum hoc inventum rutilandis capillis. fit ex sebo et cinere, optimus fagino et caprino, duobus modis, spissus ac liquidus, uterque apud germanos maiore in usu viris quam feminis.

cervicium dolores butyro aut adipe ursino perfricentur, rigores bubulo sebo, quod et strumis prodest cum oleo. dolorem inflexibilem - opisthotonum vocant - levat urina caprae auribus infusa aut fimum cum bulbis inlitum; ungues contusos fel cuiuscumque animalis circumligatum; pterygia digitorum

fel tauri aridum aqua calida dissolutum. quidam adiciunt sulphur et alumen pari pondere omnium.

tussim iocur lupi ex vino tepido sanat, ursinum fel admixto melle aut ex cornus bubuli summis partibus cinis vel saliva equi triduo pota - eum mori tradunt - , pulmo cervinus cum gula sua arefactus in fumo, dein tusus ex melle cottidiano ecligmate; efficacior ad id subulo cervorum generis. sanguinem expuentes cervini cornus cinis, coagulum leporis tertia parte denarii cum terra samia et vino myrteo potum sanat; eiusdem fimi cinis in vino vesperi potus nocturnas tussis, pili quoque leporis suffiti extrahunt pulmonibus difficiles excreationes. purulentas autem exulcerationes pectoris pulmonisque et a pulmone graveolentiam halitus butyrum efficacissime iuvat cum pari modo mellis attici decoctum, donec rufescat, et matutinis sumptum ad mensuram lingulae; quidam pro melle laricis resinam addere maluerunt. si sanguis reiciatur, efficacem tradunt bubulum sanguinem, modice et cum aceto sumptum. nam de taurino credere temerarium est; sed glutinum taurinum iii obolis cum calida aqua bibitur in vetere sanguinis excreatione.

stomachum exulceratum lactis asinini potus reficit, item bubuli; rosiones eius caro bubula mixto aceto et vino cocta; rheumatismos cornus cervini cinis; sanguinis excreationes haedinus sanguis recens ad cyathos ternos cum aceto acri pari modo fervens potus, coagulum tertia parte ex aceto potum; iocineris dolores lupi iocur aridum ex mulso, asini iocur aridum cum petroselini partibus ii ac nucibus iii ex melle tritum et in cibo sumptum, sanguis hircinus cibo aptatus. suspiriosis ante omnia efficax est potus equiferorum sanguinis, proxime lactis asinini tepidi, bubuli decocti ita, ut serum ex eo bibatur, addito in iii heminas cyatho nasturtii albi perfusi aqua, dein melle diluti. iocur quoque vulpinum aut pulmo in vino nigro aut fel ursinum in aqua laxat meatus spirandi.

lumborum dolores et quaecumque alia molliri opus sit ursino adipe perfricari convenit, cinerem apruni aut suilli fimi inveterati aspergi potioni vini. - (adferunt et magi sua commenta: primum omnium rabiem hircorum, si mulceatur barba, mitigari, eadem praecisa non abire eos in alienum gregem). ischiadicis fimum bubulum inponunt calfactum in foliis cinere ferventi. huic admiscunt fimum caprinum et subdito linteolo uncto cava manu, quantum pati possit, fervens sustineri iubent ita, ut si laeva pars doleat, haec medicina in dextera manu fiat aut e contrario, fimumque ad eum usum acus aereae punctu tolli iubent. modus est curationis, donec vapor ad lumbos pervenisse sentiat; postea manum porro tuso inlinunt, item lumbos ipso fimo cum melle. suadent in eo dolore et testes leporis devorare. in renium dolore leporis renes crudos devorari iubent aut certe coctos ita, ne dente contingantur. ventris quidem dolore temptari negant talum leporis habentes.

lienem sedat fel apri vel suis potum, cervini cornus cinis in aceto, efficacissime tamen inveteratus lien asini ita, ut in triduo sentiat utilitas. asinini pulli fimum, quod primum edidit - poleam vocant - , syri dant in aceto mulso. datur et equi lingua inveterata ex vino praesentaneo medicamento, ut

didicisse se ex barbaris caecilius bion tradidit, et lien bubulus simili modo, recens autem assus vel elixus in cibo. in vesica quoque bovis alii capita xx tusa cum aceti sextario imponuntur ad lienis dolores. eadem ex causa emi lienem vituli, quanti indicatus sit, iubent magi nulla pretii cunctatione, quoniam hoc quoque religiose pertineat, divisumque per longitudinem adnecti tunicae utrimque et induentem pati decidere ad pedes, dein collectum arefacere in umbra. cum hoc fiat, simul residere lienem aegri vitiatum liberarique eum morbo dicitur. prodest et pulmo vulpium cinere siccatus atque in aqua potus, item haedorum lien impositus.

alvum sistit cervi sanguis, item cornus cinis, iocur aprunum ex vino potum citra salem recensque, item assum, vel suillum, hircinum decoctum ad quintas hemina in vino, coagulum leporis in vino ciceris magnitudine aut, si febris sit, ex aqua - aliqui et gallam adiciunt, alii per se leporis sanguine contenti sunt - , lac coctum, equini fimi cinis in aquae potu, taurini cornus veteris e parte ima cinis inspersus potioni aquae, sanguis hircinus carbone decoctus, corium caprinum cum suo pilo decoctum suco epoto, coagulum equi et sanguis caprinus vel medulla vel iocur. - alvum solvit fel lupi cum elaterio umbilico inlitum vel lactis equini potus, item caprini cum sale et melle, caprae fel cum cyclamini suco et aluminis momento - aliqui et nitrum et aquam adiecisse malunt - , fel tauri cum absinthio tritum ac subditum pastillo, butyrum largius sumptum. - coeliacis et dysintericis medetur iocur vaccinum, cornus cervini cinis iii digitis captus in potionem aquae, coagulum leporis subactum in pane, si vero sanguinem detrahant, in polenta, apruni vel suilli vel leporini fimi cinis inspersus potioni tepidi vini. vituli quoque ius vulgariter dari inter auxilia coeliacorum et dysintericorum tradunt. lactis asinini potus utilior addito melle, nec minus efficax fimi cinis ex vino utrique vitio, item polea supra dicta, equi coagulum, quod aliqui hippacen appellant, etiam si sanguinem detrahant, vel fimi cinis dentiumque eiusdem tusorum farina salutare et bubuli lactis decocti potus. dysintericis addi mellis exiguum praecipiunt et, si tormina sint, cornus cervini cinerem aut fel taurinum cumino mixtum et cucurbitae carnes umbilico inponere. caseus recens vaccinus inmittitur ad utrumque vitium, item butyrum heminis iiii cum resinae terebinthinae sextante aut cum malva decocta aut cum rosaceo. datur et sebum vitulinum aut bubulum, item medulla - et coquitur cum farinae ceraeque exiguo et oleo, ut sorberi possit, medulla et in pane subigitur - , lac caprinum ad dimidias partes decoctum; si sint et tormina, additur protropum. torminibus satis esse remedii in leporis coagulo poto e vino tepido vel semel arbitrantur aliqui; cautiores et sanguine caprino cum farina hordeacea et resina ventrem inlinunt. ad omnes epiphoras ventris inlini caseum mollem suadent, veterem autem in farinam tritum coeliacis et dysintericis dari, cyathis casei in cyathis vini cibarii iii. sanguis caprinus decoctus cum medulla dysintericis, iocur assum caprae coeliacis subvenit, magisque etiam hirci, in vino austero decoctum potumque vel ex oleo myrteo umbilico inpositum. quidam decocunt a iii sextariis aquae ad heminam addita ruta. utuntur et liene asso caprae hircive et sebo hirci in pane, qui cinere

coctus sit, caprae a renibus maxime, ut per se hauriatur protinusque modice frigida. sorberi iubent aliqui et in aqua decoctum sebum admixta polenta et cumino et aneto acetoque. inlinunt et ventrem coeliacis fimo cum melle decocto. utuntur ad utrumque vitium et coagulo haedi in vino myrtite fabae magnitudine potio et sanguine eiusdem in cibum formato, quem sanguiculum vocant. infundunt dysintericis et glutinum taurinum aqua calida resolutum. inflationes discutit vitulinum fimum in vino decoctum. - intestinorum vitiis magnopere prodest coagulum cervorum decoctum cum lente betaeque atque ita in cibo sumptum, leporis pilorum cinis cum melle decoctus, lactis caprini potus decocti cum malva exiguo sale addito; si et coagulum addatur, maioribus emolumentis fiat. eadem vis est et in sebo caprino in sorbitione aliqua, uti protinus hauriatur frigida aqua. item feminum haedi cinis rupta intestina sarcire mire traditur, fimum leporis cum melle decoctum et cottidie fabae magnitudine sumptum ita, ut deploratos sanaverint. laudant et caprini capitis cum suis pilis discociti sucum.

tenesmos, id est crebra et inanis voluntas desurgendi, tollitur potio lacte asinino, item bubulo. - taenearum genera pellit cervini cornus cinis potus. - quae in excrementis lupi diximus inveniri ossa, si terram non attigerint, colo medentur adalligata brachio. polea quoque supra dicta magnopere prodest decocta in sapa, item suilli fimi farina addito cumino in aqua rutae decoctae, cornus cervini teneri cinis cocleis africanis cum testa sua tuis mixtus in vini potione.

vesicae calculorumque cruciatibus auxiliatur urina apri et ipsa vesica pro cibo sumpta, efficacius, si prius fumo maceretur utrumque. vesicam elixam mandi oportet, et a muliere feminae suis. inveniuntur in iocineribus eorum lapilli aut duritiae lapillis similes, candidae, sicut in vulgari sue, quibus contritis atque in vino potis pelli calculos aiunt. ipsi apro tam gravis urina sua est, ut nisi egesta fugae non sufficiat ac velut devinctus opprimatur; exuri illa tradunt eos. leporis renes inveterati in vino poti calculos pellunt. in pernae suum articulo os diximus, quod decoctum ius facit urinae utile. asini renes inveterati tritique ex vino mero dati vesicae medentur. calculos expellunt lichenes equini ex vino aut mulso poti diebus xl. prodest et ungulae equinae cinis in vino aut aqua, item fimum caprarum in mulso, efficacius silvestrium, pili quoque caprini cinis; verendorum carbunculis cerebrum apri vel suis sanguisque. vitia vero, quae in eadem parte serpunt, iocur eorum combustum, maxime iunipiri ligno, cum charta et arrhenico sanat, fimi cinis, fel bubulum cum alumine aegyptio ac murra ad crassitudinem mellis subactum, insuper beta ex vino cocta inposita, caro quoque; manantia vero ulcera sebum cum medulla vituli in vino decoctum, fel caprinum cum melle rubique suco, vel si serpent; fimum etiam prodesse cum melle dicunt aut cum aceto et per se butyrum. - testium tumor sebo vituli addito nitro cohibetur vel fimo eiusdem ex aceto decocto. - urinae incontinentiam cohibet vesica apruna, si assa mandatur, ungularum apri vel suis cinis potioni inspersus, vesica feminae suis combusta ac pota, item haedi, vel pulmo, cerebrum leporis in vino, eiusdem

testiculi tosti vel coagulum cum anserino adipe in polenta, renes asini in mero triti potique. magi verrini genitalis cinere potio ex vino dulci demonstrant urinam facere in canis cubili ac verba adicere, ne ipse urinam faciat ut canis in suo cubili. rursus ciet urinam vesica suis, si terram non attigerit, inposita pubi.

sedis vitiis praeclare prodest fel ursinum cum adipe; quidam adiciunt spumam argenti ac tus. prodest et butyrum cum adipe anserino ac rosaceo; modum ipsae res statuunt, ut sint inlitu faciles. praeclare medetur et taurinum fel in linteolis conceptis rimasque perducit ad cicatricem. inflationibus in ea parte sebum vituli, maxime ab inguinibus, cum ruta; ceteris vitiis medetur sanguis caprinus cum polenta, item fel caprinum condylomatis per se, item fel lupinum ex vino. panos et apostemata in quacumque parte sanguis ursinus discutit, item taurinus aridus tritus. praecipuum tamen remedium traditur in calculo onagri, quem dicitur, cum interficiatur, reddere urina liquidiorum initio, sed in terra spissantem se; hic adalligatus femini omnes impetus discutit omni que suppuratione liberat. est autem rarus inventu nec ex omni onagro, sed mire celebrant remedio. prodest et urina asini cum melanthio et ungulae equinae cinis cum oleo et aqua inlitus, sanguis equi, praecipue admissarii, sanguis bubulus, item fel. caro quoque eosdem effectus habet calida inposita et ungulae cinis ex aqua aut melle, urina caprarum, hircorum quoque carnes in aqua decoctae aut fimum ex iis cum melle decoctum, fel verrinum, urina suum in lana inposita. - femina adteri adurique equitatu notum est; utilissimum est ad omnes inde causas spumam equi ex ore inguinibus inlinere. - inguina et ex ulcerum causa intumescunt. remedio sunt equi saetae iii totidem nodis alligatae intra ulcus.

podagris medetur ursinus adips taurinumque sebum, pari pondere et cerae. addunt quidam hypocisthidem et gallam. alii hircinum praeferunt sebum cum fimo caprae et croco, sinapi, item caulibus hederarum tritis ac perdicio vel flore cucumeris silvestris. item bovis fimum cum aceti faece magnificant et vituli, qui nondum herbam gustaverit, fimum aut per se sanguinem tauri, vulpem decoctam vivam, donec ossa tantum restent, lupumve vivum oleo cerati modo incoctum, sebum hircinum cum helxines parte aequa, sinapis tertia, fimi caprini cinerem cum axungia. quin et ischiadicos uri sub pollicibus pedum eo fimo fervente utilissime tradunt, articulorumque vitiis fel ursinum utilissimum esse et pedes leporis adalligatos, podagras quidem mitigari pede leporis viventi absciso, si quis secum adsidue habeat. - perniones ursinus adips rimasque pedum omnes sarcit, efficacius alumine addito, sebum caprinum, dentium equi farina, aprunum vel suillum fel cum adipe, pulmo inpositus et si subtriti sint contunsive offensatione, si vero adusti frigore, leporini pili cinis; eiusdem pulmo contusis dissectus aut pulmonis cinis. sole adusta sebo asinino aptissime curantur, item bubulo cum rosaceo. - clavos et rimas callique vitia fimum apri vel suis recens inlitum ac tertio die solutum sanat, talorum cinis, pulmo aprunus aut suillus aut cervinus; adtritum calciamentorum urina asini cum luto suo inlita; clavos sebum bubulum cum turis polline; perniones vero corium combustum; melius, si ex vetere calciamento; iniurias e calceatu ex

oleo corii caprini cinis. - varicum dolores sedat fimi vitulini cinis cum lili bulbis decoctus addito melle modico, itemque omnia inflammata et suppurationes minantia. eadem res et podagris prodest et articulariis morbis, e maribus praecipue vitulis; articularum adtritis fel aprorum vel suum linteo calefacto inpositum, vituli, qui nondum herbam gustaverit, fimum, item caprinum cum melle in aceto decoctum. - ungues scabros sebum vituli emendat, item caprinum admixta sandaraca. - verrucas vero aufert fimi vitulini cinis ex aceto, asini urina et lutum.

comitali morbo testes ursinos edisse prodest vel aprunos bibisse ex lacte equino aut ex aqua, item aprunam urinam ex aceto mulso, efficacius quae inaruerit in vesica sua. dantur et suum testiculi inveterati tritique in suis lacte, praecedente vini abstinencia et sequente continuis quinis diebus. dantur et leporis sale custoditi pulmones cum turis tertia parte in vino albo per dies xxx, item coagula eiusdem; asini cerebrum ex aqua mulsa, infumatum prius in foliis, semuncia per dies vii, ungularum eius cinis coclearibus binis toto mense potus, item testes sale adservati et inspersi potioni in asinarum maxime lacte vel ex aqua. membrana partus earum, praecipue si marem pepererint, olefactata accedente morbo comitialium resistit. sunt qui e mare nigroque cor edendum cum pane sub diu prima aut secunda luna praecipiant, alii carnem, aliqui sanguinem aceto dilutum per dies xl bibendum. quidam urinam aquae ferrariae ex officinis miscent eademque potione et lymphatis medentur. comitalibus datur et lactis equini potus, lichen equi in aceto mulso bibendus; dantur et carnes caprinae in rogo hominis tostae, ut volunt magi, sebum earum cum felle taurino pari pondere decoctum et in folliculo fellis reconditum ita, ne terram attingat, potum vero ex aqua sublime. morbum ipsum deprehendit caprini cornus vel cervini usti nidor. - sideratis urina pulli asinini nardo admixto perunctione prodesse dicitur.

regio morbo cornus cervini cinis, sanguis asini ex vino, item fimum asinini pulli, quod primum edidit a partu, datum fabae magnitudine e vino medetur intra diem tertium. eadem et ex equino pullo similiterque vis est.

fractis ossibus praesentaneus maxillarum apri cinis vel suis; item lardum elixum atque circumligatum mira celeritate solidat. costis quidem fractis laudatur unice caprinum fimum ex vino vetere: aperit, extrahit, persanat.

febres arcet cervorum caro, ut diximus; eas quidem, quae certo dierum numero redeunt, oculus lupi dexter salsus adalligatusque, si credimus magis. est genus februm, quod amphemerinon vocant; hoc liberari tradunt, si quis e vena auris asini iii guttas sanguinis in ii heminis aquae hauserit. quartanis magi excrementa felis cum digito bubonis adalligari iubent et, ne recidant, non removeri septeno circumitu. quis hoc, quaeso, invenire potuit quae est ista mixtura cur digitus potissimum bubonis electus est modestiores iocur felis decrescente luna occisae inveteratum sale ex vino bibendum ante accessiones quartanae dixere. iidem magi fimi bubuli cinere consperso puerorum urina inlinunt digitos pedum manuumque. leporis cor adalligant, coagulum ante accessiones propinant. datur et caseus caprinus recens cum melle diligenter

sero expresso.

melancholicis fimum vituli in vino decoctum remedio est. - lethargicos excitat asini lichen naribus inlitus ex aceto, caprini cornus nidor aut pilorum, iocur aprunum; itaque et veteriosis datur. - phthisicis medentur iocur lupi ex vino macro, suis feminae herbis pastae laridum, carnes asininae ex iure sumptae; hoc genere maxime in achaia curant id malum. fimi quoque aridi, sed pabulo viridi pasto bove, fumum harundine haustum prodesse tradunt bubulive cornus mucronem exustum ii coclearium mensura addito melle pilulis devoratis. caprae sebo in pulte alicacia et phthisim et tussim sanari vel recenti cum mulso liquefacto ita, ut uncia in cyathum addatur rutaeque ramo permisceatur, non pauci tradunt. rupicaprae sebi cyatho et lactis pari mensura deploratum phthisicum convaluisse certus auctor adfirmat. sunt qui et suum fimi cinerem profuisse scripserint in passo et cervi pulmonem, maxime subulonis, siccatum fumo tritumque in vino.

hydropicis auxiliatur urina e vesica apri paulatim data in potu, efficacius quae inaruerit cum vesica sua, fimi taurini maxime, sed et bubuli - de armentivis loquor - , quod bolbiton vocant, cinis coclearium iii in mulsi hemina, bovis feminae in mulieribus, ex altero sexu in viris, quod veluti mysterium occultarunt magi, fimum vituli masculi inlitum, fimi vitulini cinis cum semine staphylini aequa portione ex vino, sanguis caprinus cum medulla. efficaciorum putant hirci, utique si lentisco pascat.

igni sacro ursinus adips inlinitur, maxime qui est ad renes, vitulinum fimum recens vel bubulum, caseus caprinus siccus cum porro, ramenta pellis cervinae delecta pumice ex aceto trita; rubori cum prurigine equi spuma aut ungulae cinis; eruptionibus pituitae asinini fimi cinis cum butyro; papulis nigris caseus caprinus siccus ex melle et aceto in balneis, oleo remoto; pusulis suilli fimi cinis aqua inlitus vel cornus cervini cinis, luxatis recens fimum aprunum vel suillum, item vitulinum, verris spuma recens cum aceto, fimum caprinum cum melle, bubula caro inposita; ad tumores fimum suillum sub testo calefactum tritumque cum oleo. duritias corporum omnes mollit optime adips e lupis inlitus. in iis, quae rumpere opus sit, plurimum proficit fimum bubulum in cinere calefactum aut caprinum in vino vel aceto decoctum; in furunculis sebum bubulum cum sale aut, si dolores sint, cum oleo liquefactum sine sale, simili modo caprinum; in ambustis ursinus adips cum lili radicibus, aprunum aut suillum fimum inveteratum, saetarum ex his e penicillis tectoriis cinis cum adipe tritus, tali bubuli cinis cum cera et medulla cervina, fel tauri, fimum leporis et caprarum fimum. sine cicatrice sanare dicitur glutinum. praestantissimum fit ex auribus taurorum et genitalibus, nec quicquam efficacius prodest ambustis, sed adulteratur nihil aequae, quibusvis pellibus inveteratis calciamentisque etiam decoctis. rhodiaceum fidelissimum, eoque pictores et medici utuntur; id quoque quo candidius, eo probatius; nigrum et lignosum damnatur.

nervorum doloribus fimum caprinum decoctum in aceto cum melle utilissimum putant vel putrescente nervo. spasmoda et percussu vitata fimo

apruno curant vere collecto et arefacto; sic et quadrigas agentes tractos rotave vulneratos et quoquo modo sanguine contuso, vel si recens inlinatur. sunt qui incoxisse aceto utilius putent. quin et in potu farinam eam ruptis convulsisque, eversis ex aceto salutarem promittunt. reverentiores cinerem eius ex aqua bibunt, feruntque et neronem principem hac potione recreari solitum, cum sic quoque se trigario adprobare vellet. proximam suillo fimo vim putant.

sanguinem sistit coagulum cervinum ex aceto, item leporis, huius quidem et pilorum cinis, item e fimo asini cinis inlitus - efficacior vis e maribus aceto admixto et in lana ad omne profluvium inposito - , similiter ex equino, capitis et feminum aut fimi vitulorum cinis inlitus ex aceto, item caprini cornus vel fimi ex aceto. hircini vero iocineris dissecti sanies efficacior, et cinis utriusque ex vino potus vel naribus ex aceto inlitus, hircini quoque utris, vinarii dumtaxat, cinis cum pari pondere resinae, quo genere sistitur sanguis et vulnus glutinatur. haedinum quoque coagulum ex aceto et feminum eius combustorum cinis similiter pollere traduntur.

ulcera sanat in tibiis cruribusque ursinus adips admixta rubrica; quae vero serpant, fel aprunum cum resina et cerussa, maxillarum apri vel suum cinis, fimum suum inlitum siccum, item caprinum ex aceto subactum et subfervefactum. cetera purgantur et explentur butyro, cornus cervini cinere vel medulla cervi, felle taurino cum cyprino oleo aut irino. fimum recens suum vel inveterati farina inlinuntur vulneribus ferro factis. phagedaenis et fistulis inmittitur fel tauri cum suco porri aut lacte mulierum vel sanguis aridus cum cotyledone herba. carcinomata curat coagulum leporis cum pari pondere capparis adpersum vino, gangraenas ursinum fel pinna inlitum, asini unguarum cinis ea quae serpunt ulcera inspersus. sanguis equi adrodit carnes septica vi, item fimi equini inveterati favilla; ea vero, quae phagedaenas vocant in ulcerum genere, corii bubuli cinis cum melle. caro vituli recentia vulnera non patitur intumescere, fimum bubulum cum melle. fimi vitulini cinis sordida ulcera et quae cacoe+the vocant et lacte mulieris sanant; recentes plagas ferro inlatas glutinum taurinum liquefactum, tertio die solutum. caseus caprinus siccus ex aceto ac melle purgat ulcera; quae vero serpant, cohibet sebum cum cera, idem addita pice ac sulphure percurat. similiter proficit ad cacoe+the haedi feminum cinis e lacte mulieris, et adversus carbunculos suis feminae cerebrum tostum inlitumque.

scabiem hominis asininae medullae maxime abolent et urina eiusdem cum suo luto inlita, butyrum etiam, quod in iumentis proficit cum resina calida, glutinum taurinum in aceto liquefactum addita calce, fel caprinum cum aluminis cinere; boas fimum bubulum, unde et nomen traxere. canum scabies sanatur bubulo sanguine recenti iterumque, cum inarescat, inlito et postero die abluto cinere lixivo.

spinae et similia corpori extrahuntur felis excrementis, item caprae ex vino, coagulo quocumque, sed maxime leporis, cum turis polline et oleo aut cum visci pari pondere aut cum propoli. - cicatrices nigras sebum asininum reducit ad colorem, fel vituli extenuat calefactum. medici adiciunt murrā et mel et

crocum aereaque pyxide condunt; aliqui et florem aeris admiscunt.

mulierum purgationes adiuuat fel tauri in lana sucida adpositum - olympias thebana addit oesypum et nitrum - , cornus cervini cinis potus, item vulva laborantes inlitis quoque et fel taurinum cum opio adpositum obolis binis. vulvas et pilo cervino suffire prodest. tradunt cervas, cum senserint se gravidas, lapillum devorare, quem in excrementis repertum aut in vulva - nam et ibi invenitur - custodire partus adalligatum. inveniuntur et ossicula in corde et in vulva perquam utilia gravidis parturientibusque. nam de pumice, qui in vaccarum utero simili modo invenitur, diximus in natura boum. lupi adipis inlitis vulvas mollit, dolores earum iocur, carnes vero lupi edisse parituris prodest aut si incipientibus parturire sit iuxta qui ederit, adeo ut etiam contra inlatas noxias valeat. eundem supervenire perniciosum est. magnus et leporis usus mulieribus. vulvas adiuvat pulmo aridus potus, profluvia iocur cum samia terra ex aqua potum, secundas coagulum - caventur pridiana balnea - , inlitum quoque cum croco et porri suco; in vellere adpositum abortus mortuos expellit. si vulva leporum in cibis sumatur, mares concipi putant; hoc et testiculis eorum et coagulo profici; conceptum leporis utero exemptum iis, quae parere desierint, restibilem fecunditatem adferre. sic conceptus leporis saniem et viro magi propinant, item virgini viiii grana fimi, ut stent perpetuo mammae. coagulum quoque ob id cum melle inlinunt, sanguinem ubi evolsos pilos renasci nolunt. inflationi vulvae fimum aprunum suillumve cum oleo inlini prodest. efficacius sistit farina aridi, ut aspergatur potioni, vel si gravidae aut puerperae torqueantur. lacte suis poto cum mulso adiuvantur partus mulierum; per se vero potum deficientia ubera puerperarum replet. eadem circumlita sanguine feminae suis minus crescunt. si doleant, lactis asinini potu mulcentur, quod addito melle sumptum et purgationes earum adiuvat. sanat et vulvarum exulcerationes eiusdem animalis sebum inveteratum et in vellere adpositum duritias vulvarum emollit. per se vero recens vel inveteratum ex aqua inlitum psilotri vim optinet. eiusdem animalis lien inveteratus ex aqua inlitis mammis abundantiam facit, vulvas suffitu corrigit. ungulae asinae suffitio partum maturat, ut vel abortus evocetur, nec aliter adhibetur, quoniam viventem partum necat. eiusdem animalis fimum si recens inponatur, profluvia sanguinis mire sedare dicitur, nec non et cinis eiusdem fimi, qui et vulvae prodest inpositus. equi spuma inlita per dies xl, priusquam primum nascantur, pili restinguntur, item cornus cervini decocto; melius, si recentia sint cornua. lacte equino iuvantur vulvae collutae. quod si mortuus partus sentiatur, lichen equae e dulci potus eicit, item ungula suffitu aut fimum aridum. vulvas procidentes butyrum infusum sistit. induratum vulvam aperit fel bubulum rosaceo admixto, foris vellere cum resina terebinthina inposito. aiunt et suffitu fimi e mare bove procidentes vulvas reprimi, partus adiuvari, conceptus vero vaccini lactis potu. sterilitatem a partus vexatione fieri certum est. hanc emendari olympias thebana adfirmat felle tauri et adipe serpentium et aerugine ac melle medicatis locis ante coitus. vitulinum quoque fel in purgationibus sub coitu adpersum vulvae etiam

duritiās veteres emollit et profluvium minuit umbilico peruncto atque in totum vulvae prodest. modum statuunt fellis pondere #1108, opii tertiam, admixto amygdalino oleo, quantum satis esse appareat; haec in vellere inponunt. masculi fel vituli cum mellis dimidio tritum servatur ad vulvas. carnem vituli si cum aristolochia inassatam edant circa conceptum, marem parituras promittunt. medulla vituli in vino et aqua decocta cum sebo exulcerationibus vulvarum inposita prodest, item adips vulpium excrementumque felium, hoc cum resina et rosaceo inpositum. caprino cornu suffiri vulvam utilissimum putant. silvestrium caprarum sanguis cum palma marina pilos detrahit; ceterarum vero fel callum vulvarum emollit inspersum et a purgatione conceptus facit. sic quoque psilotri vis efficitur; evulsis pilis triduo servatur inlitum. profluvium quamvis inmensum urinae caprae potu sisti obstetrices promittunt et si fimum inlinatur. membrana caprarum, in qua partus editur, inveterata potuque sumpta in vino secundas pellit. haedorum pilis suffiri vulvas utile putant et in profluvio sanguinis coagulum bibi aut cum hyoscyami semine inponi. e bove silvestri nigro si sanguine ricini lumbi perungantur mulieri, taedium veneris fieri dicit osthanes, idem amoris potu hirci urinae admixto propter fastidium nardo.

infantibus nihil butyro utilius per se et cum melle, privatim et in dentitione et ad gingivas et ad oris ulcera. dens lupi adalligatus infantium pavores prohibet dentiendique morbos, quod et pellis lupina praestat. dentes quidem eorum maximi equis quoque adalligati infatigabilem cursum praestare dicuntur. leporum coagulo ubere inlito sistitur infantium alvus. iocur asini admixta modice panace instillatum in os a comitialibus morbis et aliis infantes tuetur; hoc xl diebus fieri praecipiunt. et pellis asini iniecta in pavidos infantes facit. dentes, qui equis primum cadunt, facilem dentitionem praestant adalligati infantibus; efficacius, si terram non attingere. lien bubulus in melle et datur et inlinitur ad lienis dolores; sedat ulcera manantia cum melle lien vituli, in vino decoctus tritusque et inlitus ulcuscula oris. cerebrum caprae magi per anulum aureum traiectum, priusquam lac detur, infantibus instillant contra comitiales ceterosque infantium morbos. caprinum fimum inquietos infantes adalligatum panno cohibet, maxime puellas. lacte caprino aut cerebro leporum perunctae gingivae faciles dentitiones faciunt.

somnos fieri lepore sumpto in cibis cato arbitrabatur, vulgus et gratiam corpori in viiii dies, frivolo quidem ioco, cui tamen aliqua debeat subesse causa in tanta persuasione. magi felle caprae, sacrificatae dumtaxat, inlito oculis vel sub pulvino posito somnum allici dicunt. - sudores inhibet cornus caprini cinis e myrteo oleo perunctis.

coitus stimulat fel aprunum inlitum, item medullae suum haustae, sebum asinum anseris masculi adipe admixto inlitum; item a coitu equi vergilio quoque descriptum virus et testiculi equini aridi, ut potioni interiri possint, dexterve asini testis in vino potus portioneve adalligatus brachchiali; eiusdem a coitu spuma conlecta russeo panno et inclusa argento, ut osthanes tradit. salpe genitale id in oleum fervens mergi iubet septies eoque perungi pertinentes

partes, dalion cinerem ex eodem bibi vel tauri a coitu urinam, luto ipso inlini pubem. at e diverso tauri fimo inlito cohibetur virorum venus. - ebrietatem arcet pulmo apri aut suis assus, ieiunis in cibo sumptus eo die, item haedinus.

mira praeterea traduntur in iisdem animalibus: vestigium equi excussum ungula, ut solet plerumque, si quis collectum reponat, singultus remedium esse recordantibus, quonam loco id reposuerint; iocur luporum equinae ungulae simile esse; rumpi equos, qui vestigia luporum sub equite sequantur; talis suum discordiae vim quandam inesse; in incendiis, si fimi aliquid egeratur e stabulis, facilius extrahi nec recurrere oves bovesque; hircorum carnes virus non resipere, si panem hordeacium eo die, quo interficiantur, ederint laserve dilutum biberint, nullas vero teredinem sentire luna decrescente induratas sale. adeoque nihil omissum est, ut leporem surdum celerius pinguescere reperiamus, animalium vero medicinas: si sanguis profluat iumentis, suillum fimum ex vino infundendum, boum autem morbis sebum, sulphur vivum, alium silvestre, ovum crudum trita in vino danda aut vulpis adipem; carnem caballinam discoctam potu suum morbis mederi, omnium vero quadripedum morbis capram solidam cum corio et ranam rubetam discoctas; gallinaceos non attingi a vulpibus, qui iocur animalis eius aridum ederint, vel si pellicula ex eo collo induta galli inierint; similiter in felle mustelae; boves in cypro contra tormina hominum excrementis sibi mederi; non superti pedes boum, si prius cornua ima pice liquida perunguntur; lupos in agrum non accedere, si capti unius pedibus infractis cultroque adacto paulatim sanguis circa fines agri spargatur atque ipse defodiatur in eo loco, ex quo coeperit trahi; aut si vomerem, quo primus sulcus eo anno in agro ductus sit, excussum aratro focus larum, quo familia conveniet, urat, lupum nulli animalium nociturum in eo agro, quam diu id fiat.

hinc deinde praevertemur ad animalia sui generis, quae aut placida non sunt aut fera.

LIBER XXIX

naturae remediorum atque multitudo instantium ac praeteritorum plura de ipsa medendi arte cogunt dicere, quamquam non ignaros, nulli ante haec latino sermone condita ancepsque, lubricum esse rerum omnium novarum exordium, utique tam sterilis gratiae tantaeque difficultatis in promendo. sed quaestionem occurrere verisimile est omnium, qui haec noscant, cogitationi, quonam modo exoleverint in medicinae usu quae iam parata atque pertinentia erant, mirumque et indignum protinus subit, nullam artium inconstantiorum fuisse aut etiamnunc saepius mutari, cum sit fructuosior nulla. dis primum inventores suos adsignavit et caelo dicavit, nec non et hodie multifariam ab oraculis medicina petitur. auxit deinde famam etiam crimine, ictum fulmine aesculapium fabulata, quoniam tyndareum revocavisset ad vitam - nec tamen cessavit narrare alios revixisse opera sua - , clara troianis temporibus, a quibus fama certior, vulnere tamen dumtaxat remediis.

sequentia eius, mirum dictu, in nocte densissima latuere usque ad peloponnesiacum bellum. tunc eam revocavit in lucem hippocrates, genitus in insula coo in primis clara ac valida et aesculapio dicata. is, cum fuisset mos, liberatos morbis scribere in templo eius dei quid auxiliatum esset, ut postea similitudo proficeret, exscripsisse ea traditur atque, ut Varro apud nos credit, templo cremato iis instituisse medicinam hanc, quae clinice vocatur. nec fuit postea quaestus modus, quoniam prodicus, selymbriae natus, e discipulis eius instituit quam vocant iatralipticen et unctoribus quoque medicorum ac mediastinis vectigal invenit.

horum placita chrysippus ingenti garrulitate mutavit, plurimumque et ex chrysippo discipulus eius erasistratus, aristotelis filia genitus. hic antiocho rege sanato centum talentis donatus est a rege ptolemaeo filio eius, ut incipiamus et praemia artis ostendere.

alia factio ab experimentis se cognominans empiricen coepit in sicilia, acrone agragantino empedoclis physici auctoritate commendato, dissederuntque hae scholae, et omnes eas damnavit herophilus in musicos pedes venarum pulsu discripto per aetatum gradus. deserta deinde et haec secta est, quoniam necesse erat in ea litteras scire; mutata et quam postea asclepiades, ut rettulimus, invenerat. auditor eius themison fuit seque inter initia adscripsit illi, mox procedente vita sua et placita mutavit, sed et illa antonius musa eiusdem auctoritate Divi Augusti, quem contraria medicina gravi periculo exemerat. multos praetereo medicos celeberrimosque ex iis cassios, carpetanos, arruntios, rubrios. [ccl] hs annuae iis mercedes fuere apud principes. q. stertinius inputavit principibus, quod sestertiis quingenis annuis contentus esset, sescena enim sibi quaestu urbis fuisse enumeratis domibus ostendebat. par et fratri eius merces a claudio caesare infusa est, censusque, quamquam exhausti operibus neapoli exornata, heredi hs [ccc] reliquere, quantum aetate eadem arruntius solus. exortus deinde est vettius valens,

adulterio messalinae claudii caesaris nobilitatus, pariterque eloquentiae adsectatores et potentiae nactus novam instituit sectam. eadem aetas neronis principatu ad thessalum transilivit, delentem cuncta placita et rabie quadam in omnis aevi medicos perorantem, quali prudentia ingenioque, aestimari vel uno argumento abunde potest, cum monumento suo, quod est appia via, iatronicen se inscripserit. nullius histrionum equorumque trigarii comitator egressus in publico erat, cum crinas massiliensis arte geminata, ut cautior religiosiorque, ad siderum motus ex ephemeride mathematica cibos dando horasque observando auctoritate eum praecessit, nuperque hs [c] reliquit, muris patriae moenibusque aliis paene non minore summa extructis. hi regebant fata, cum repente civitatem charmis ex eadem massilia invasit damnatis non solum prioribus medicis, verum et balineis, frigidaque etiam hibernis algoribus lavari persuasit. mersit aegros in lacus. videbamus senes consulares usque in ostentationem rigentes, qua de re exstat etiam annaei senecae adstipulatio. nec dubium est omnes istos famam novitate aliqua aucupantes anima statim nostra negotiari. hinc illae circa aegros miserae sententiarum concertationes, nullo idem censente, ne videatur accessio alterius. hinc illa infelicis monumenti inscriptio: “turba se medicorum perisse.” mutatur ars cottidie totiens interpolis, et ingeniorum graeciae flatu inpellimur, palamque est, ut quisque inter istos loquendo polleat, imperatorem ilico vitae nostrae necisque fieri, ceu vero non milia gentium sine medicis degant nec tamen sine medicina, sicuti populus romanus ultra sexcentimum annum, neque ipse in accipiendis artibus lentus, medicinae vero etiam avidus, donec expertam damnavit.

etenim percensere insignia priscorum in his moribus convenit. cassius hemina ex antiquissimis auctor est primum e medicis venisse romam peloponneso archagathum lysaniae filium l. aemilio m. livio cos. anno urbis dxxxv, eique ius quiritium datum et tabernam in compito acilio emptam ob id publice. vulnerarium eum fuisse egregium, mireque gratum adventum eius initio, mox a saevitia secandi urendique transisse nomen in carnificem et in taedium artem omnesque medicos, quod clarissime intellegi potest ex m. catone, cuius auctoritati triumphus atque censura minimum conferunt; tanto plus in ipso est. quam ob rem verba eius ipsa ponemus:

“dicam de istis graecis suo loco, m. fili, quid athenis exquisitum habeam et quod bonum sit illorum litteras inspicere, non perdiscere. vincam nequissimum et indocile genus illorum, et hoc puta vatem dixisse: quandoque ista gens suas litteras dabit, omnia conrumpet, tum etiam magis, si medicos suos hoc mittet. iurarunt inter se barbaros necare omnes medicina, sed hoc ipsum mercede faciunt, ut fides iis sit et facile disperdant. nos quoque dictitant barbaros et spurcius nos quam alios Ὀπικῶν appellatione foedant. interdixi tibi de medicis.”

atqui hic cato sescentesimo quinto anno urbis nostrae obiit, octogensimo quinto suo, ne quis illi defuisse publice tempora aut privatim vitae spatia ad experiendum arbitretur. quid ergo damnatam ab eo rem utilissimam credimus minime, hercules. subicit enim qua medicina se et coniugem usque ad longam

senectam perduxerit, his ipsis scilicet, quae nunc nos tractamus, profiteturque esse commentarium sibi, quo medeatur filio, servis, familiaribus, quem nos per genera usus sui digerimus. non rem antiqui damnabant, sed artem, maxime vero quaestum esse manipretio vitae recusabant. ideo templum aesculapii, etiam cum reciperetur is deus, extra urbem fecisse iterumque in insula traduntur et, cum graecos italia pellerent, diu etiam post catonem, excepisse medicos. augebo providentiam illorum. solam hanc artium graecarum nondum exercet romana gravitas, in tanto fructu paucissimi quirritium attigere, et ipsi statim ad graecos transfugae, immo vero auctoritas aliter quam graece eam tractantibus etiam apud inperitos expertesque linguae non est, ac minus credunt quae ad salutem suam pertinent, si intellegant. itaque, hercules, in hac artium sola evenit, ut cuicumque medicum se professo statim credatur, cum sit periculum in nullo mendacio maius. non tamen illud intuemur; adeo blanda est sperandi pro se cuique dulcedo. nulla praeterea lex, quae puniat inscitiam capitalem, nullum exemplum vindictae. discunt periculis nostris et experimenta per mortes agunt, medicoque tantum hominem occidisse impunitas summa est. quin immo transit convitium et intemperantia culpatur, ultroque qui periire arguuntur. sed decuriae pro more censuris principum examinantur, inquisitio per parietes agitur, et qui de nummo iudicet a gadibus columnisque herculis arcessitur, de exilio vero non nisi xlv electis viris datur tabella: at de iudice ipso quales in consiliumeunt statim occisuri! merito, dum nemini nostrum libet scire, quid saluti suae opus sit. alienis pedibus ambulamus, alienis oculis agnoscimus, aliena memoria salutamus, aliena et vivimus opera, perieruntque rerum naturae pretia et vitae argumenta. nihil aliud pro nostro habemus quam delicias. non deseram catonem tam ambitiosae artis invidiae a me obiectum aut senatum illum, qui ita censebat, idque non criminibus artis arreptis, ut aliquis exspectaverit. quid enim venenorum fertilius aut unde plures testamentorum insidiae iam vero et adulteria etiam in principum domibus, ut eudemi in livia drusi caesaris, item valentis in qua dictum est regina. non sint artis ista, sed hominum: non magis haec urbi timuit cato, ut equidem credo, quam reginas. ne avaritiam quidem arguam rapacesque nundinas pendentibus fatiis et dolorum indicaturam ac mortis arram aut arcana praecepti, squamam in oculis emovendam potius quam extrahendam. per quae effectum est, ut nihil magis pro re videretur quam multitudo grassantium; neque enim pudor, sed aemuli pretia summittunt. notum est ab eodem charmide unum aegrum e provincialibus hs [cc] reconductum,alconti vulnerum medico hs [30c]30 damnato ademisse claudium principem, eidemque in gallia exulanti et deinde restituto adquisitum non minus intra paucos annos. et haec personis inputentur. ne faecem quidem aut inscitiam eius turpem arguamus: ipsorum procerum intemperantiam inmodicis aquarum calidarum devorticulis, imperiosa inedia et ab isdem deficientibus cibo saepius die ingesto, mille praeterea paenitentiae modis, culinarum etiam praeceptis et unguentorum mixturis, quando nullas omisere vitae inlecebras. invehi peregrinas merces conciliarique externa pretia

displacuisse maioribus crediderim equidem, non tamen hoc catonem providisse, cum damnaret artem. theriace vocatur excogitata compositio; luxuria finxit rebus sexcentis, cum tot remedia dederit natura, quae singula sufficerent. mithridatium antidotum ex rebus liiii componitur, inter nullas pondere aequali, et quarundam rerum sexagesima denarii unius imperatur, quo deorum, per fidem, ista monstrante! hominum enim subtilitas tanta esse non potuit; ostentatio artis et portentosa scientiae venditatio manifesta est. ac ne ipsi quidem illa novere, conperique volgo pro cinnabari indica in medicamenta minium addi inscitia nominis, quod esse venenum docebimus inter pigmenta. verum haec ad singulorum salutem pertinent; illa autem, quae timuit cato atque providit, innocentiora multo et parva opinatu, quae procures artis eius de semet ipsi fateantur, illa perdere imperii mores, illa, quae sani patimur, luctatus, ceromata ceu valitudinis causa instituta, balineae ardentes, quibus persuasere in corporibus cibos coqui, ut nemo non minus validus exiret, oboedientissimi vero efferrentur, potus deinde ieiunorum ac vomitiones et rursus perpotationes ac pilorum eviratio instituta resinis eorum, itemque pectines in feminis quidem publicati. ita est profecto: lues morum, nec aliunde maior quam e medicina, vatem prorsus cottidie facit catonem et oraculum: “satis esse ingenia graecorum inspicere, non perdiscere”.

haec fuerint dicenda pro senatu illo sescentisque p. r. annis adversus artem, in qua condicione insidiosissima auctoritatem pessimis boni faciunt, simul contra attonitas quorundam persuasiones, qui prodesse nisi pretiosa non putant. neque enim dubitaverim aliquis fastidio futura quae dicentur animalia, at non vergilio fuit nominare formicas nulla necessitate et curculiones ac “lucifugis congesta cubilia blattis,” non homero inter proelia deorum improbitatem muscae describere, non naturae gignere ista, cum gignat hominem. proinde causas quisque et effectus, non res aestimet.

ordiemur autem confessis, hoc est lanis ovisque, ob id ut rebus praecipuis honos in primis perhibeatur. quaedam etiam sic alienis locis, tamen obiter, dici necesse erit. nec deerat materia pompae, si quicquam aliud intueri liberet quam fidem operis, quippe inter prima proditis etiam ex cinere phoenicis nidoque medicinis, ceu vero id certum esset atque non fabulosum. inridere est vitam remedia post millensimum annum reditura monstrare.

lanis auctoritatem veteres romani etiam religiosam habuere, postes a nubentibus attingi iubentes; praeterque cultum et tutelam contra frigora sucidae plurima praestant remedia ex oleo vinoque aut aceto, prout quaeque mulceri morderive opus sit et adstringi laxarive, luxatis membris dolentibusque nervis inpositae et crebro suffusae. quidam et salem admiscent luxatis; alii cum lana rutam tritam adipemque inponunt, item contusis tumentibusque. halitus quoque oris gratiores facere traditur confricatis dentibus atque gingivis admixto melle. prodest et phreneticis suffitu. sanguinem in naribus sistit cum oleo rosaceo indita et alio modo auribus opturatis spissius. quin et ulceribus vetustis inponitur cum melle. vulnera ex vino vel aceto vel aqua frigida et oleo expressa sanat. arietis vellera luta

frigida ex oleo madefacta in muliebribus malis inflammationes vulvae sedant et, si procidat, suffitu reprimunt. sucida lana inposita subditaque mortuos partus evocat; sistit etiam profluvia earum. et canis rabiosi morsibus inculcata post diem septimum solvitur. reduvias sanat ex aqua frigida. eadem nitro, sulphure, oleo, aceto, pice liquida ferventibus tincta quam calidissima inposita bis die lumborum dolores sedat. sistit et sanguinem ex ariete sucida articulos extremitatum praeligans. laudatissima omnis e collo, natione vero galatica, tarentina, attica, milesia. sucidam inponunt et desquamatis, percussis, lividis, incussis, conlisis, contritis, deiectis, capitis et aliis doloribus, stomachi inflammationi ex aceto et rosaceo. cinis eius inlinitur adtritis, vulneratis, ambustis. et in oculorum medicamenta additur, item in fistulas auresque suppuratas. ad hoc detonsam eam, alii evolsam, decisis summis partibus siccant carpuntque et in fictili crudo componunt ac melle perfundunt uruntque. alii astulis taedae subiectis et subinde interstratis oleo adpersam accendunt cineremque in labellis aqua addita confricant manu et considerare patiuntur, idque saepius mutantes aquam, donec linguam adstringat leniter nec mordeat; tum cinerem reponunt. vis eius septica est efficacissimeque genus purgat.

quin ipsae sordes pecudum sudorque feminum et alarum adhaerentes lanis - oesypum vocant - innumeros prope usus habent. in atticis ovibus genito palma. fit pluribus modis, sed probatissimum lana ab iis partibus recenti concepta aut quibuscumque sordibus sucidis primum collectis lento igni in ae +neo subfervefactis et refrigeratis pinguique, quod supernatet, collecto in fictile vas iterumque decocta priore materia; quae pinguitudo utraque frigida aqua lavatur et in linteo saccatur ac sole torretur, donec candida fiat ac tralucida; tum in stagnea pyxide conditur. probatio, ut sordium virus oleat et manu fricante ex aqua non liquetur, sed albescat ut cerussa. oculis utilissimum contra inflammationes genarumque callum. quidam in testa torrent, donec pinguitudinem amittat, utilius tale existimantes erosis et duris genis, angulis scabiosis et lacrimantibus. ulcera non oculorum modo sanat, sed oris etiam et genitalium cum anserino adipe. medetur et vulvae inflammationibus et sedis rhagadiis et condylomatis cum meliloto ac butyro. reliquos usus eius digeremus. sordes quoque caudarum concretae in pilulas siccatae per se tusaeque in farinam et inlitae dentibus mire prosunt, etiam labantibus, gingivisque, si carcinoma serpat; iam vero pura vellera aut per se inposita caecis doloribus aut accepto sulphure, et cinis eorum genitalium vitiis, tantumque pollent, ut medicamentis quoque superponantur. medentur ante omnia et pecori ipsi, si fastidio non pascantur. cauda enim quam artissime praeligata, evolsa inde lana, statim vescuntur, traduntque quod extra nodum sit e cauda praemori.

lanae habent et cum ovis societatem simul fronti inpositae contra epiphoras. non opus est eas in hoc usu radricula esse curatas neque aliud quam candidum ex ovo infundi ac pollinem turis.

ova per se infuso candido oculis epiphoras cohibent urentesque refrigerant - quidam cum croco praeferunt - et pro aqua miscentur collyriis; infantibus

vero contra lippitudines, ut vix aliud, remedio sunt butyro admixto recenti. eadem cum oleo trita ignes sacros leniunt betae foliis superinligatis. candido ovorum in oculis et pili reclinantur hammoniaco trito admixtoque et vari in facie cum pineis nucleis ac melle modico. ipsa facies inlita sole non uritur. ambusta aquis si statim ovo occupentur, pusulas non sentiunt - quidam admiscunt farinam hordeaciam et salis parum - , ulceribus vero ex ambusto cum candido ovorum tostum hordeum et suillo adipe mire prodest. eadem curatione ad sedis vitia utuntur, infantibus quidem etiam si quid ibi procidat; ad pedum rimas ovorum candido decocto cum cerussae denariorum ii pondere, pari spumae argenti, murrae exiguo, dein vino; ad ignem sacrum candido ovorum ternum cum amylo. aiunt et vulnera candido glutinari calculosque pelli. - lutea ovorum cocta, ut indurescant, admixto croco modice, item melle, ex lacte mulieris inlita dolores oculorum mitigant, vel cum rosaceo et mulso lana oculis inposita, vel cum trito apii semine ac polenta in mulso inlita. prodest et tussientibus per se luteum devoratum liquidum ita, ut dentibus non attingatur, thoracis destillationibus, faucium scabritiae. privatim contra haemorrhoidas morsui inlinitur sorbeturque crudum. prodest et renibus, vesicae rosionibus exulcerationibusque. cruenta excreantibus v ovorum lutea in vini hemina cruda sorbentur, dysintericis cum cinere putaminis sui et papaveris suco ac vino. dantur coeliacis cum uvae passae pinguis pari pondere et malicorii per triduum aequis portionibus, et alio modo lutea ovorum iii, lardi veteris et mellis quadrantibus, vini veteris cyathis iii, trita ad crassitudinem mellis et, cum opus sit, abellanae nucis magnitudine ex aqua pota, item ex oleo fricta terna, totis ovis pridie maceratis in aceto; sic et lintericis, sanguinem autem reicientibus cum iii cyathis musti. utuntur isdem ad liventia, si vetustiora sint, cum bulbis ac melle. sistunt et menses mulierum cocta et e vino pota, inflationes quoque vulvae cruda cum oleo ac vino inlita. utilia sunt et cervicis doloribus cum anserino adipe et rosaceo, sedis etiam vitiis indurata igni, ut calore quoque prosint, et condylomatis cum rosaceo; item ambustis durata in aqua, mox in pruna putaminibus exustis, tum lutea ex rosaceo inlinuntur. fiunt et tota lutea, quae vocant sitista, cum triduo incubita tolluntur. stomachum dissolutum confirmant pulli ovorum cum gallae dimidio ita, ne ante ii horas alius cibus sumatur. dant et dysintericis pullos in ipso ovo decoctos admixta vini austeri hemina et pari modo olei polentaeque. - membrana putamini detracta sive crudo sive cocto laborum fissuris medetur, putaminis cinis in vino potus sanguinis eruptionibus. comburi sine membrana oportet. sic fit et dentifricium. idem cinis et mulierum menses cum murra inlitis sistit. firmitas putaminum tanta est, ut recta nec vi nec pondere ullo frangantur nec nisi paulum inflexa rotunditate. - tota ova adiuvant partum cum ruta et aneto et cumino pota e vino. scabiem corporum ac pruritus oleo et cedria mixtis tollunt, ulcera quoque umida in capite cyclamino admixta. ad puris et sanguinis excreationes ovum crudum cum porri sectivi suco parique mensura mellis graeci calefactum hauritur. dantur et tussientibus cocta et trita cum melle et cruda cum passo oleique pari modo. infunduntur et virilitatis

vitiis singula cum ternis cyathis passi amylique semuncia a balneis; adversus ictus serpentium cocta tritaque adiecto nasturtio inlinuntur. - cibo quot modis iuvent, notum est, cum transmeent faucium tumorem calfactuque obiter foveant. nullus est alius cibus, qui in aegritudine alat neque oneret simulque vim potus et cibi habeat. maceratorum in aceto molliri diximus putamen; talibus cum farina in panem subactis coeliaci recreantur. quidam ita resoluta in patinis torrere utilius putant, quo genere non alvos tantum, sed et menses feminarum sistunt, aut, si maior sit impetus, cruda cum farina et aqua hauriuntur. et per se lutea ex iis decocuntur in aceto, donec indurescant, iterumque cum trito pipere torrentur ad cohibendas alvos. fit et dysintericis remedium singulare ovo effuso in fictile novum eiusdemque ovi mensura, ut paria sint omnia, melle, mox aceto, item oleo confusis crebroque permixtis; quo fuerint ea excellentiora, hoc praesentius remedium erit. alii eadem mensura pro oleo et aceto resinam adiciunt rubentem vinumque; et alio modo temperant, olei tantum mensura pari pineique corticis ii sexagensimis denarii, una eius quod rhum diximus, mellis obolis v simul decoctis, ita ut cibus alius post iiii horas sumatur. torminibus quoque multi medentur ova bina cum alii spicis iiii una terendo vinique hemina calefaciendo atque ita potui dando. et, ne quid desit ovorum gratiae, candidum ex iis admixtum calci vivae glutinat vitri fragmenta; vis vero tanta est, ut lignum perfusum ovo non ardeat ac ne vestis quidem contacta aduratur. de gallinarum autem ovis tantum locuti sumus, cum et reliquarum alitum restent, magnae utilitatis, sicut suis locis dicemus.

praeterea est ovorum genus in magna fama galliarum, omissum graecis. angues enim numerose convoluti salivis faucium corporumque spumis artifice complexu glomerant; urinum appellatur. druidae sibilis id dicunt in sublime iactari sagoque oportere intercipi, ne tellurem attingat; profugere raptorem equo, serpentes enim insequi, donec arceantur amnis alicuius interventu; experimentum eius esse, si contra aquas fluitet vel auro vinctum; atque, ut est magorum sollertia occultandis fraudibus sagax, certa luna capiendum censeat, tamquam congruere operationem eam serpentium humani sit arbitrii. vidi equidem id ovum mali orbiculati modici magnitudine, crusta cartilagineis velut acetabulis brachiorum polypi crebris insigne. druidis ad victorias litium ac regum aditus mire laudatur, tantae vanitatis, ut habentem id in lite in sinu equitem r. e vocontiis a divo claudio principe interemptum non ob aliud sciam. hic tamen complexus anguium et frugifera eorum concordia in causa videtur esse, quare exterae gentes caduceum in pacis argumentis circumdata effigie anguium fecerint; neque enim cristatos esse in caduceo mos est.

de anserum ovis magnae utilitatis ipsoque ansere dicturi hoc in volumine debemus honorem et commageno, clarissimae rei. fit ex adipe anserum - alioqui celeberrimi usus, set ad hoc in commagene syriae parte - cum cinnamo, casia, pipere albo, herba quae commagene vocatur, obrutis nive vasis, odore iucundo, utilissimum ad perfrictiones, convulsiones, caecos aut subitos dolores omniaque, quae acopis curantur, unguentumque pariter et

medicamentum est. fit et in syria alio modo, avium adipe curato ut dicemus, additis erysisceptro, xylobalsamo, phoenice, item tuso calamo singulorum pondere quod sit adipis, in vino bis aut ter subfervefacto. fit autem hieme, quoniam aestate non glaciatur nisi accepta cera. multa praeterea remedia sunt ex anseris, quod miror aequae quam in capris, namque anser corvusque ab aestate in autumnum morbo conflictari dicuntur.

de anserum honore, quem meruere gallorum in capitolium ascensu deprehenso, diximus. eadem de causa supplicia annua canes pendunt, inter aedem iuventutis et summani vivi in furca sabucea armo fixi. sed plura de hoc animali dici cogunt priscorum mores.

catulos lactentes adeo puros existimabant ad cibum, ut etiam placandis numinibus hostiarum vice uterentur iis. genitae manae catulo res divina fit, et in cenis deum etiam nunc ponitur catulina. aditialibus quidem epulis celebrem fuisse plauti fabulae indicio sunt. sanguine canino contra toxica nihil praestantius putant; vomitiones quoque hoc animal monstrasse homini videtur, et alios usus ex eo mire laudatos referemus suis locis. nunc ad institutum ordinem pergemus.

adversus serpentium ictus efficacia habentur fimum pecudis recens in vino decoctum inlitumque, mures dissecti inpositi. quorum natura non est spernenda, praecipue in adsensu siderum, ut diximus, cum lunae lumine fibrarum numero crescente atque decrescente. tradunt magi iocinere muris dato porcis in fico sequi dantem id animal, in homine quoque similiter valere, sed resolvi cyatho olei poto.

mustelarum duo genera; alterum silvestre, distans magnitudine, graeci vocant ictidas. harum fel contra aspidas dicitur efficax, cetero venenum. haec autem, quae in domibus nostris oberrat et catulos suos, ut auctor est cicero, cottidie transfert mutatque sedem, serpentes persequitur. ex ea inveterata sale denari pondus in cyathis iii datur percussis aut ventriculus coriandro fartus inveteratusque et in vino potus, et catulus mustelae etiam efficacius.

quaedam pudenda dictu tanta auctorum adseveratione commendantur, ut praeterire fas non sit, siquidem illa concordia rerum aut repugnantia medicinae gignuntur, veluti cimum, animalis foedissimi et dictu quoque fastidiendi, natura contra serpentium morsus et praecipue aspidum valere dicitur, item contra venena omnia, argumento, quod dicant gallinas, quo die ederint, non interfici ab aspide, carnesque earum percussis plurimum prodesse. ex iis, quae tradunt, humanissimum est inlinere morsibus cum sanguine testudinis, item suffitu eorum abigere sanguisugas adhaerentes haustasque ab animalibus restinguere in potu datis. quamquam et oculos quidam his inungunt tritis cum sale et lacte mulierum auresque cum melle et rosaceo admixtis. eos, qui agrestes sint et in malva nascantur, crematos, cinere permixto rosaceo, infundunt auribus. cetera, quae de his tradunt vomitionum et quartanarum remedia aliorumque morborum, quamquam ovo aut cera aut faba inclusos censeant devorandos, falsa nec referenda arbitror. lethargi tantum medicinae cum argumento adhibent, quoniam vincatur aspidum

somnifica vis, septenos in cyatho aquae dantes, puerilibus annis quaternos. et in stranguria fistulae inposuere. adeo nihil parens illa rerum omnium sine ingentibus causis genuit. quin et adalligatos laevo brachio binos lana subrepta pastoribus resistere nocturnis febribus prodiderunt, diurnis in russeo panno. rursus his adversatur scolopendra suffituque enecat.

aspides percussos torpore et somno necant, omnium serpentium minime sanabiles. sed venenum earum, si sanguinem attigit aut recens vulnus, statim interemit; si inveteratum ulcus, tardius. de cetero potum quantalibet copia non nocet, non enim est tabifica vis; itaque occisa morsu earum animalia cibis innoxia sunt. cunctarer in proferendo ex iis remedio, ni M. Varro lxxxiii vitae anno prodidisset aspidum ictus efficacissime sanari hausta a percussis ipsorum urina.

basilisci, quem etiam serpentes ipsae fugiunt alias olfactu necantem, qui hominem, vel si aspiciat tantum, dicitur interemere, sanguinem magi miris laudibus celebrant: coeuntem picis modo et colore, dilutum cinnabari clariorem fieri. attribuunt ei successus petitionum a potestatibus et a diis etiam precum, morborum remedia, veneficiorum amuleta. quidam et saturni sanguinem appellant.

draco non habet venena. caput eius limini ianuarum subditum propitiatis adoratione diis fortunatam domum facere promittitur, oculis eius inveteratis et cum melle tritis inunctos non expavescere ad nocturnas imagines etiam pavidos, cordis pingue in pelle dorcadum nervis cervinis adalligatum in lacerto conferre iudiciorum victoriae plurimum, spondylum aditus potestatum mulcere, dentes eius inligatos pellibus caprearum cervinis nervis mites praestare dominos potestatesque exorabiles. sed super omnia est compositio, qua invictos faciunt magorum mendacia: cauda draconis et capite, pilis leonis e fronte et medulla eiusdem, equi victoris spuma, canis ungue adalligatis cervino corio nervisque cervi alternatis et dorcadis. quae coarguisse non minus referet quam contra serpentes remedia demonstrasse, quoniam et haec illorum veneficia sunt. draconum adipem venenata fugiunt, item, si uratur ichneumonum; fugiunt et urticis tritis in aceto perunctos.

viperarum caput inpositum, vel alterius quam quae percusserit, sine fine prodest, item si quis ipsam eam in vapore baculo sustineat - aiunt enim recanere - , item si quis exustae eiusdem cinerem inlinat. reverti autem ad percussum serpentem necessitate naturae nigidius auctor est. caput quidam dissecant scite inter aures ad eximendum lapillum, quem aiunt ab ea devorari territa; alii ipso toto capite utuntur. fiunt ex vipera pastilli, qui theriaci vocantur a graecis, ternis digitis mensura utrimque amputatis exemptisque interaneis et livore spinae adhaerente, reliquo corpore in patina ex aqua et aneto discocto spinisque exemptis et addita similagine atque ita in umbra siccatis pastillis, quibus ad multa medicamenta utuntur. significandum videtur e vipera tantum hoc fieri. quidam purgatae ut supra dictum est adipem cum olei sextario decocunt ad dimidias; ex eo, cum opus sit, ternis stillis additis in oleum perunguntur, ut omnes bestiae fugiant eos.

praeterea constat contra omnium ictus quamvis insanabiles ipsarum serpentium exta inposita auxiliari, eosque, qui aliquando viperae iecur coctum hauserint, numquam postea feriri a serpente. neque anguis venenatus est nisi per mensem luna instigatus, et prodest vivus conprehensus et in aqua contusus, si foveantur ita morsus. quin et inesse ei remedia multa creduntur, ut digeremus, et ideo aesculapio dicatur. democritus quidem monstra quaedam ex his confingit, ut possint avium sermones intellegi. anguis aesculapius epidauro romam advectus est vulgoque pascitur et in domibus, ac nisi incendiis semina exurerentur, non esset fecunditati eorum resistere in orbe terrarum. pulcherrimum anguium genus est quod et in aqua vivit; hydri vocantur, nullo serpentium inferiores veneno. horum iecur servatum adversus percusso ab iis auxilium est. - scorpio tritus stelionum veneno adversatur. fit enim e stelionibus malum medicamentum; nam cum immortuus est vino, faciem eorum, qui biberint, lentigine obducit. ob hoc in unguento necant eum insidiantes paelicum formae. remedium est ovi luteum et mel ac nitrum. fel stelionum tritum in aqua mustelas congregare dicitur.

inter omnia venenata salamandrae scelus maximum est. cetera enim singulos feriunt, nec plures pariter interimunt, ut omittam, quod perire conscientia dicuntur homine percusso neque amplius admitti a terra; salamandra populos pariter necare inprovidos potest. nam si arbori inrepsit, omnia poma inficit veneno et eos, qui ederint, necat frigida vi, nihil aconito distans; quin immo si contacto ab ea ligno, lapidi crusta panis inponatur, idem veneficium est vel si in puteum cadat, quippe cum saliva eius quacumque parte corporis, vel in pede imo, respersa omnis in toto corpore defluat pilus. tamen talis ac tanti veneni a quibusdam animalium, ut subus, manditur dominante eadem illa rerum dissidentia. venenum eius restingui primum omnium ab iis, quae vescantur illa, verisimile est, ex iis vero, quae produntur, cantharidum potu aut lacerta in cibo sumpta. cetera adversantia diximus dicemusque suis locis. ex ipsa quae magi tradunt contra incendia, quoniam ignes sola animalium extinguat, si forent vera, iam esset experta roma. sextius venerem accendi cibo earum, si detractis interaneis et pedibus et capite in melle servantur, tradit negatque restingui ignem ab iis.

e volucris in auxilio contra serpentes primus vultur est, adnotatumque minus virium esse nigris. pinnarum ex alis nidore, si urantur, fugari eas dicunt, item cor eius alitis habentes tutos esse ab impetu non solum serpentium, sed etiam ferarum latronumque et regum ira.

carnibus gallinaceorum ita, ut tepebunt avulsae, adpositis venena serpentium domantur, item cerebro in vino poto. parthi gallinae malunt cerebrum plagis inponere. ius quoque ex iis potum praeclare medetur, et in multis aliis usibus mirabile. pantherae, leones non attingunt perunctos eo, praecipue si et alium fuerit incoctum. alvum solvit validius e vetere gallinaceo, prodest et contra longinquas febres et torpentibus membris tremulisque et articulariis morbis et capitis doloribus, epiphoris, inflationibus, fastidiis, incipiente tenesmo, iocineri, renibus, vesicae, contra cruditates,

suspiria. itaque etiam faciendi eius extant praecepta: efficacius coci cum olera marino aut cybio aut cappari aut apio aut herba mercuriali, polypodio aut aneto, utilissime autem in congiis iii aquae ad iii heminas cum supra dictis herbis et refrigeratum sub diu dari, tempestivius antecedente vomitione. non praeteribo miraculum, quamquam ad medicinam non pertinens: si auro liquescenti gallinarum membra misceantur, consumunt id in se; ita hoc venenum auri est. at gallinacei ipsi circulo e ramentis addito in collum non canunt.

auxiliatur contra serpentes et columbarum caro recens concepta et hirundinum, bubonis pedes usti cum plumbagine herba. nec omitam in hac quoque alite exemplum magicae vanitatis, quippe praeter reliqua portentosa mendacia cor eius inpositum mammae mulieris dormientis sinistrae tradunt efficere, ut omnia secreta pronuntiet; praeterea in pugnam ferentes id fortiores fieri. eiusdem ovo ad capillum remedia demonstrant. quis enim, quaeso, ovum bubonis umquam visere potuit, cum ipsam avem vidisse prodigium sit quis utique experiri et praecipue in capillo sanguine quidem pulli bubonis etiam crispari capillum promittunt. cuius generis prope videri possint quae tradunt et de vespertilione, si ter circumlatus domui vivus super fenestram inverso capite adfigatur, amuletum esse, privatimque ovilibus circumlatum totiens et pedibus suspensum super limen. sanguinem quoque eius cum carduo contra serpentium ictus inter praecipua laudant.

phalangium est italiae ignotum et plurium generum: unum simile formicae, sed multo maius, rufo capite, reliqua parte corporis nigra, albis guttis. acerbior huius quam vespae ictus. vivit maxime circa furnos et molas. in remedio est, si quis eiusdem generis alterum percusso ostendat, et ad hoc servantur mortui. inveniuntur et cortices eorum, qui triti et poti medentur; mustelae catuli ut supra. aequae phalangion graeci vocant inter genera araneorum, sed distinguunt lupi nomine. tertium genus est eodem phalangi nomine araneus lanuginosus, grandissimo capite, quo dissecto inveniri intus dicuntur vermiculi duo adalligatique mulieribus pelle cervina ante solis ortum praestare, ne concipiant, ut caecilius in commentariis reliquit. vis ea annua est. quam solam ex omni atocio dixisse fas sit, quoniam aliquarum fecunditas plena liberis tali venia indiget. vocatur et rhox acino nigro similis, ore minimo sub alvo, pedibus brevissimis tamquam imperfectis. dolor a morsu eius qualis a scorpione, urina similis aranei textis. idem erat asterion, nisi distingueretur virgulis albis; huius morsus genua labefactat. peior utroque est caeruleus, lanugine nigra, caliginem concitans et vomitus araneosos. etiamnum deterior a crabrone pinna tantum differens; hic et ad maciem perducit. myrmecion, formicae similis capite, alvo nigra, guttis albis distinguentibus, vesparum dolore torquet. tetragnathii duo genera habent: peior medium caput distinguente linea alba et transversum altera; hic oris tumorem facit. at cinereus posteriore parte candicans lentior, minime autem noxius eodem colore qui telas muscis in parietibus latissime pandit. contra omnium morsus remedio est gallinaceum cerebrum cum piperis exiguo potum in posca, item

formicae v potae, pecudum fimi cinis inlitus ex aceto et ipsi aranei quicumque in oleo putrefacti.

muris aranei morsus sanatur coagulo agni e vino poto, ungulae arietinae cinere cum melle, mustelae catulo ut in serpentibus dictum est. si iumenta momorderit, mus recens cum sale inponitur aut fel vespertilionis ex aceto. et ipse mus araneus contra se remedio est divulsus inpositus. nam si praegnans momordit, protinus dissilit. optimum, si is inponatur, qui momorderit, sed et alios ad hunc usum servant in oleo aut luto circumlitos. est et contra morsum eius remedio terra ex orbita; ferunt enim non transiri ab eo orbitam torpore quodam naturae.

scorpionibus contrarius maxime invicem stelio traditur, ut visu quoque pavorem iis adferat et torporem frigidi sudoris. itaque in oleo putrefaciunt eum et ita vulnera perungunt. quidam oleo illo spumam argenteam decocunt ad emplastri genus atque ita inlinunt. hunc graeci coloten vocant et ascalaboten et galeoten; in italia non nascitur. est enim hic plenus lentigine, stridoris acerbi et araneis vescitur, quae omnia nostris stelionibus aliena sunt.

prodest et gallinarum fimi cinis inlitus, draconis iocur, lacerta divulsa, mus divulsus, scorpio ipse suae plagae inpositus aut assus in cibo sumptus aut potus in meri cyathis ii. proprium est scorpionum quod manus palmam non ferunt, nec visi pilos attingere. lapillus qualiscumque ab ea parte, qua in terra erat, adpositus plagae levat dolorem, item testa, sicut erat terra operata ex aliqua parte, inposita liberare dicitur - non debent respicere qui inponunt et cavere ne sol aspiciat - , vermes terreni triti inpositi. multa et alia ex his remedia sunt, propter quae in melle servantur.

noctua apibus contraria et vespis crabronibusque et sanguisugis; pici quoque martii rostrum secum habentes non feruntur ab iis. adversantur et locustarum minimae sine pinnis, quas attelebos vocant.

est et formicarum genus venenatum, non fere in italia. solipugas cicero appellat, salpugas baetica. his cor vespertilionis contrarium omnibusque formicis.

salamandris cantharidas diximus resistere. sed in his magna quaestio, quoniam ipsae venena sunt potae vesicae cum cruciatu praecipuo. cossinum equitem romanum amicitia neronis principis notum, cum is lichene correptus esset, vocatus ex aegypto medicus ob hanc valetudinem eius a caesare, cum cantharidum potu praeparare voluisset, interemit. verum inlitas prodesse non dubium est cum suco taminiae uvae et sebo ovis vel caprae. ipsarum cantharidum venenum in qua parte sit, non constat inter auctores. alii in pedibus et in capite existimant esse, alii negant. convenit tantum pinnas earum auxiliari, in quacumque parte sit venenum. ipsae nascuntur ex vermiculo in spongea maxime cynorrhodi, quae fit in caule, sed fecundissime in fraxino, ceterae in alba rosa, minus efficaces. potentissimae inter omnes variae luteis lineis, quas in pinnis transversas habent, pingues; multum inertiores minutae, latae, pilosae; inutilissimae vero unius coloris macrae. conduntur in calice fictili non picato et linteo conligato, coniecta et rosa matura, et suspenduntur

super acetum cum sale fervens, donec per linteolum vaporentur, postea reponuntur. vis earum adurere corpus, crustas obducere. eadem pityocampis in picea nascentibus, eadem buprestis, similiterque praeparantur, efficacissimae omnes ad lepras, lichenas. dicuntur et menses ciere et urinam; ideo hippocrates et hydropicis dabat.

cantharides obiectae sunt catoni uticensi, ceu venenum vendidisset in auctione regia, quoniam eas hs lx addixerat. et sebum autem struthocamelinum tunc venisse hs xxx obiter dictum sit, efficacioris ad omnia usus, quam est anserinus adipis.

diximus et mellis venenati genera. contra utuntur melle, in quo apes sint mortuae. idem potum in vino remedium est vitiorum, quae e cibo piscium gignuntur.

in canis rabiosi morsu tuetur a pavore aquae canini capitis cinis inlitus vulneri. oportet autem comburi omnia eodem modo, ut semel dicamus, in vase fictili novo argilla circumlito atque ita in furnum indito. idem et in potione proficit. quidam ob id edendum dederunt. aliqui et vermem e cadavere canino adalligavere menstruave canis in panno subdidere calici aut intus ipsius caudae pilos combustos inseruere vulneri. cor caninum habentem fugiunt canes; non latrant vero lingua canina in calciamento subdita pollici aut caudam mustelae, quae abscisa ea dimissa sit, habentes. est limus salivae sub lingua rabiosi canis, qui datus in potu hydrophobos fieri non patitur; multo tamen utilissime iocur eius, qui in rabie momorderit, datur, si fieri possit, crudum mandendum; sin minus, quoquo modo coctum, aut ius coctis carnibus. est vermiculus in lingua canum, qui vocatur a graecis lytta, quo exempto infantibus catulis nec rabidi fiunt nec fastidium sentiunt. idem ter igni circumlatus datur morsis a rabioso, ne rabidi fiant. et cerebello gallinaceo occurritur, sed id devoratum anno tantum eo prodest. aiunt et cristam galli contritam efficaciter inponi et anseris adipem cum melle. salliantur et carnes eorum, qui rabidi fuerint, ad eadem remedia in cibo dandae. quin et necantur catuli statim in aqua ad sexum eius, qui momorderit, ut iocur crudum devoretur ex iis. prodest et fimum gallinaceum, dumtaxat rufum, ex aceto inpositum et muris aranei caudae cinis ita, ut ipse, cui abscisa sit, vivus dimittatur, glaebula ex hirundinum nido inlita ex aceto, vel pulli hirundinis combusti, membrana sive senectus anguium vernatione exuta cum cancro masculo ex vino trita; hac etiam per se reposita in arcis armariisque tineas necant. mali tanta vis est, ut urina quoque calcata rabiosi canis noceat, maxime ulcus habentibus. remedio est fimum caballinum adpersum aceto et calefactum in fico inpositum. minus hoc miretur qui cogitet lapidem a cane morsum usque in proverbium discordiae venisse. qui in urinam canis suam egresserit, torporem lumborum sentire dicunt. - (lacerta, quam sepa, alii chalcidem vocant, in vino pota morsus suos sanat). -

veneficiis ex mustela silvestri factis contrarium est ius gallinacei veteris large haustum; peculiariter contra aconita addi parum salis oporteat. gallinarum fimum, dumtaxat candidum, in hysopo decoctum aut mulso contra

venena fungorum boletorumque, item inflationes ac strangulationes, quod miremur, cum, si aliud animal gustaverit id fimum, torminibus et inflationibus adficiatur. sanguis anserinus contra lepores marinos valet cum olei aequa portione, idem contra mala medicamenta omnia adversatur cum lemnia rubrica et spinae albae suco, ut pastillorum drachmis quinque et cyathis ternis aquae bibatur. item mustelae catulus, ut supra diximus praeparatus, coagulum quoque agninum adversus omnia mala medicamenta pollet; item sanguis anatum ponticarum; itaque et spissatus servatur vinoque diluitur; quidam feminae anatis efficaciorum putant. simili modo contra venena omnia ciconiarum ventriculus valet, coagulum pecoris, ius ex carne arietum, privatim adversus cantharidas, item lac ovium calidum praeterque his, qui buprestim aut aconitum biberint, columbarum silvestrium fimum privatim contra argenti vivi potum, contra toxica mustela vulgaris inveterata drachmis binis pota.

alopecias replet fimi pecudum cinis cum oleo cyprio et melle, item ungularum muli vel mulae ex oleo myrteo, praeterea, ut Varro noster tradit, murinum fimum, quod ille muscerdas appellat, aut muscarum capita recentia prius folio ficulneo asperatas. alii sanguine muscarum utuntur, alii x diebus cinerem earum inlinunt cum cinere chartae vel nucum ita, ut sit tertia portio e muscis; alii lacte mulierum cum brassica cinerem muscarum subigunt, quidam melle tantum. nullum animal minus docile existimatur minorisve intellectus; eo mirabilius est olympiae sacro certamine nubes earum immolato tauro deo, quem myioden vocant, extra territorium id abire. alopecias cinis et e murium capitibus caudisque et totius muris emendat, praecipue si veneficio acciderit haec iniuria, item irenacei cinis cum melle aut corium combustum cum pice liquida. caput quidem eius ustum per se etiam cicatricibus pilos reddit, alopecias autem in ea curatione praeparari oportet novacula; et sinapi quidam ex aceto uti maluerunt. quae de irenaceo dicuntur, omnia tanto magis valebunt in hystrice. lacertae quoque, ut docuimus combustae cum radice recentis harundinis, quae, ut una cremari possit, minutim findenda est, ita myrteo oleo permixto cinere, capillorum defluvia continent. efficacius virides lacertae omnia eadem praestant, etiamnum utilius admixto sale et adipe ursino et cepa tusa. quidam denas virides in x sextariis olei veteris discocunt, contenti semel in mense unguere. pellium viperinarum cinis alopecias celerrime explet, item gallinarum fimum recens inlitum. corvi ovum in aereo vase permixtum inlitumque deraso capite nigritiam capilli adfert, sed, donec inarescat, oleum in ore habendum est, ne et dentes simul nigrescant, idque in umbra faciendum neque ante quadriduum abluendum. alii sanguine et cerebro eius utuntur cum vino nigro; alii excocunt ipsum et nocte concubia in plumbeum vas condunt. aliqui alopecias cantharide trita inlinunt cum pice liquida, nitro praeparata cute - caustica vis earum, cavendumque ne exulcerent alte - , postea ad ulcera ita facta capita murium et fel murium et fimum cum helleboro et pipere inlini iubent.

lendes tolluntur adipe canino vel anguibus in cibo sumptis anguillarum modo aut eorum vernatione, quam exuunt, pota, porrigines felle ovillo cum

creta cimolia inlito capite, donec inarescat.

capitis doloribus remedio sunt coclearum, quae nudae inveniuntur nondum peractae, ablata capita et his duritia lapidea exempta - est autem calculi latitudine, eaque adalligantur, set minutae fronti inlinuntur tritae, item oesypum - , ossa e capite vulturis adalligata aut cerebrum cum oleo et cedria, peruncto capite et intus naribus inlitis, cornicis cerebrum coctum in cibo sumptum vel noctuae, gallinaceus, si inclusus abstineatur die ac nocte, pari inedia eius, cuius doleat, evulsis collo plumis circumligatisque vel cristis, mustelae cinis inlitis, surculus ex nido milui pulvino subiectus, murina pellis cremata ex aceto inlito cinere, limacis inter duas orbitas inventae ossiculum per aurum, argentum, ebur traiectum in pellicula canina adalligatum, quod remedium pluribus semperque prodest. fracto capiti aranei tela ex oleo et aceto inposita non nisi vulnere sanato abscedit. haec et vulneribus tonstrinarum sanguinem sistit, a cerebro vero profluentem anseris sanguis aut anatis infusus, adeps earundem alitum cum rosaceo. cocleae matutina pascentis harundine caput praecisum, maxime luna plena, lineo panno adalligant capitis doloribus liceo aut cera alba addita fronti inlinunt. et pilos caninos panno adalligant.

cerebrum cornicis in cibo sumptum palpebras gignere dicitur, oesypum cum murra calido specillo inlitum. idem praestare muscarum fimique murini cinerem aequis portionibus, ut efficiatur dimidium pondus denarii, promittitur, additis ii sextis denarii e sibi, ut omnia oesypo inlinantur; item murini catuli triti in vino vetere ad crassitudinem acopi. pilos in iis incommodos evulsos renasci non patitur fel irenaei, ovorum stelionis liquor, salamandrae cinis, lacertae viridis fel in vino albo sole coactum ad crassitudinem mellis in aereo vase, hirundinis pullorum cinis cum lacte tithymalli, spuma coclearum.

glaucomata dicunt magi cerebro catuli septem dierum emendari specillo demisso in dexteram partem, si dexter oculus curetur, in sinistram, si sinister, aut felle recenti axionis; noctuarum est id genus, quibus pluma aurium modo micat. suffusionem oculorum canino felle malebat quam hyaenae curari Apollonius pitanaeus cum melle, item albugines. murium capitum caudaeque cinere ex melle inunctis claritatem visus restitui dicunt, multoque magis gliris aut muris silvestris cinere aut aquilae cerebro vel felle cum attico melle. cinis e capite soricis cum sibi tritus lacrimosis oculis plurimum confert - sibi quid sit dicemus in metallis - , mustelae cinis suffusionibus, item lacertae, hirundinis cerebrum. cocleae tritae fronti inlitae epiphoras sedant sive per se sive cum polline sive cum ture; sic et solatis, id est sole correptis, prosunt. vivas quoque cremare et cinere earum cum melle cretico inungere caligines utilissimum est. iumentorum oculis membrana aspidis, quam exuit vere, cum adipe eiusdem claritatem inunctis facit. viperam vivam in fictili novo comburere addito feniculi suco ad cyathum unum et turis manna una atque ita suffusiones oculorum et caligines inungere utilissimum est; medicamentum id echeon vocatur. fit et collyrium e vipera in olla putrefacta vermiculisque enatis cum croco tritis. et uritur in olla cum sale, quem lingendo claritatem

oculorum consecuntur et stomachi totiusque corporis tempestivitates; hic sal et pecori datur salubritatis causa et in antidotum contra serpentes additur. quidam et ad oculos viperis utuntur in cibis. primum omnium occisae statim salem in os addi iubent, donec liquescat, mox iiii digitorum mensura utrimque praecisa exemptisque interaneis discoquunt in aqua, oleo, sale, aneto et aut statim vescuntur aut pane colligunt, ut saepius utantur. ius praeter supra dicta pediculos e toto corpore expellit pruritusque etiam summae cutis. effectum ostendit et per se capitis viperini cinis - utilissime eo oculos inungunt - itemque adips viperinus. de felle non audaciter suaserim quae praecipiunt, quoniam, ut suo loco docuimus, non aliud est serpentium venenum. anguium adeps aerugini mixtus ruptas oculorum partes sanat, et membrana sive senectus vernatione eorum exuta, si adfricetur, claritatem facit. boae quoque fel praedicatur ad albugines, suffusiones, caligines, adeps similiter ad claritatem.

aquilae, quam diximus pullos ad contuendum solem experiri, felle mixto cum melle attico inunguntur nubeculae et caligationes suffusionesque oculorum. eadem vis est et in vulturino felle cum porri suco et melle exiguo, item in gallinacei felle ad argema et albugines ex aqua diluto, item suffusiones oculorum, maxime candidi gallinacei. fimum quoque gallinaceorum, dumtaxat rubrum, lusciosis inlini monstrant. laudant et gallinae fel et praecipue adipem contra pusulas in pupillis, nec scilicet eius rei gratia saginant. adiuvat mirifice et ruptas oculorum tuniculas admixtis schisto et haematite lapidibus. fimum quoque earum, dumtaxat candidum, in oleo vetere corneisque pyxidibus adservant ad pupillarum albugines. qua in mentione significandum est pavones fimum suum resorbere tradi invidentes hominum utilitatibus. accipiter decoctus in rosaceo efficacissimus ad inunctiones omnium vitiorum putatur, item fimi eius cinis cum attico melle. laudatur et milui iocur, fimum columbarum ex aceto ad aegilopia, similiter ad albugines et cicatrices, fel anserinum, sanguis anatum contusis oculis ita, ut postea oesypo et melle inungantur, fel perdicum cum mellis aequo pondere, per se vero ad claritatem. ex hippocratis putant auctoritate adici, quod in argentea pyxide id servari iubent. ova perdicum in vase aereo decocta cum melle ulceribus oculorum et glaucomatis medentur. columbarum, palumbium, turturum, perdicum sanguis oculis cruore suffusis eximie prodest. in columbis masculae efficaciorum putant; vena autem sub ala ad hunc usum inciditur, quoniam suo calore utilior est. superinponi oportet splenium e melle decoctum lanamque sucidam ex oleo aut vino. earundem avium sanguis nyctalopas sanat et iocur ovium, ut in capris diximus, efficacius fulvae. decocto quoque eius oculos abluere suadent et medulla dolores tumoresque inlinere. bubonis oculorum cinis collyrio mixtus claritatem oculis facere promittitur. turturis fimum albugines extenuat, item coclearum cinis, fimum cenchridis; accipitrum generis hanc graeci faciunt. argema ex melle omnibus, quae supra scripta sunt, sanatur. mel utilissimum oculis, in quo apes sint inmortuae. ciconiae pullum qui ederit, negatur annis multis continuus lippiturus, item qui draconis caput

habeat. huius adipe et melle cum oleo vetere incipientes caligines discuti tradunt. hirundinum pullos plena luna excaecant, restitutaque eorum acie capita comburuntur; cinere cum melle utuntur ad claritatem et dolores ac lippitudines et ictus.

lacertas quoque pluribus modis ad oculorum remedia adsumunt. alii viridem includunt novo fictili et lapillos, qui vocantur cinaedia, quae et inguinum tumoribus adalligari solent, novem signis signant et singulos detrahunt per dies; nono emittunt lacertam, lapillos servant ad oculorum dolores. alii terram substernunt lacertae viridi excaecatae et una in vitreo vase anulos includunt e ferro solido vel auro. cum recepisse visum lacertam apparuit per vitrum, emissa ea anulis contra lippitudinem utuntur, alii capitis cinere pro stibi ad scabritias. quidam viridem, collo longo, in sabulosis nascentem comburunt et incipientem epiphoram inungunt, item glaucomata. mustelae etiam oculis punctu erutis aiunt visum reverti, eademque quae in lacertis et anulis faciunt; serpentis oculum dextrum adalligatum contra epiphoras prodesse, si serpens viva dimittatur. lacrimantibus sine fine oculis cinis stelionum capitis cum stibi eximie medetur. aranei muscarii tela et praecipue spelunca ipsa inposita per frontem ad duo tempora in splenio aliquo ita, ut a puero inpube et capiatur et inponatur nec is triduo se ostendat ei, cui medebitur, neve alter nudis pedibus terram attingat his diebus, mirabiliter epiphoris mederi dicitur; albugines quoque tollere inunctione araneus candidus, longissimis ac tenuissimis pedibus, contritus in oleo vetere. is etiam, cuius crassissimum textum est in contignationibus fere, adalligatus panno epiphoras sanare traditur. scarabaei viridis natura contuentium visum exacuit; itaque gemmarum scalptores contuitu eorum adquiescunt.

aures purgat fel pecudis cum melle, canini lactis instillatio sedat dolorem, gravitatem adeps cum absinthio et oleo vetere, item adeps anserinus. quidam adiciunt sucum cepae, alii pari modo. utuntur et per se ovis formicarum, namque et huic animali est medicina, constatque ursos aegros hoc cibo sanari. anserum omniumque avium adeps praeparatur ... exemptisque venis omnibus patina nova fictili operta in sole subdita aqua ferventi liquatus saccatusque lineis saccis et in fictili novo repositus loco frigido; minus putrescit addito melle. murium cinis cum melle instillatus aut cum rosaceo decoctus aurium dolores sedat. si aliquod animal intraverit, praecipuum remedium est murium fel aceto dilutum; si aqua intraverit, adeps anserinus cum cepae suco. gliris detracta pelle intestinisque exemptis discoquitur melle in vase novo. medici malunt e nardo decoqui usque ad tertias atque ita adservari, dein, cum opus sit, strigili tepefacta infundere. constat deplorata aurium vitia eo remedio sanari aut si terreni vermes cum adipe anseris decocti infundantur; item ex arboribus rubri cum oleo triti exulceratis et ruptis auribus praeclare medentur. lacertae inveteratae, in os pendentium addito sale, contusas et ab ictu miseras aures sanant, efficacissime autem ferrugineas maculas habentes, lineis etiam per caudam distinctae. milipeda, ab aliis centipeda aut multipeda dicta, animal est e vermibus terrae, pilosum, multis pedibus arcuatim repens tactuque

contrahens se; oniscon graeci vocant, alii iulon. efficacem narrant ad aurium dolores in cortice punici mali decoctum et porri suco. addunt et rosaceum et in alteram aurem infundunt. illam autem, quae non arcuatur, sepa graeci vocant, alii scolopendram, minorem perniciosamque. cocleae, quae sunt in usu cibi, cum murra aut turis polline adpositae, item minutae, latae fracturis aurium inlinuntur cum melle. senectus serpentium fervente testa usta instillatur rosaceo admixta, contra omnia quidem vitia efficax, sed contra graveolentiam praecipue ac, si purulenta sint, ex aceto, melius cum felle caprino vel bubulo aut testudinis marinae - vetustior anno eadem membrana non prodest, nec imbre perfusa, ut aliqui putant - , aranei sanies cum rosaceo aut per se in lana vel cum croco, gryllus cum sua terra effossus et inlitus. magnam auctoritatem huic animali perhibet nigidius, maiorem magi, quoniam retro ambulet terramque terebret, stridat noctibus. venantur eum formica circumligata capillo in cavernam eius coniecta, efflato prius pulvere, ne sese condat; ita formicae complexu extrahitur. ventris gallinaceorum membrana, quae abici solet, inveterata et in vino trita auribus purulentis calida infunditur, gallinarum adeps. est quaedam pinguitudo blattae, si caput avellatur; hanc tritam una cum rosaceo auribus mire prodesse dicunt, sed lanam, qua incluserint, post paulum extrahendam; celerrime enim id pingue transire in animal fierique vermiculum. alii binas ternasve in oleo decoctas efficacissime auribus mederi scribunt et tritas in linteolo inponi contusis. hoc quoque animal inter pudenda est, sed propter admirationem naturae priscorumque curae totum in hoc loco explicandum. plura earum genera fecerunt: molles, quas in oleo decoctas verrucis efficaciter inlini experti sunt. alterum genus myloecon appellavere circa molas fere nascens; his capite detracto adtritas lepras sanasse musaeum pycten in exemplis reliquerunt. tertium genus et odoris taedio invisum, exacuta clune; cum pisselaeo sanare ulcera alias insanabilia, strumas, panos diebus xxi inpositas, percussa, contusa et cacoe+the, scabiem furunculosque detractis pedibus et pinnis. nos haec etiam audita fastidimus; at, hercules, diodorus et in morbo regio et orthopnoicis se dedisse tradit cum resina et melle. tantum potestatis habet ars ea pro medicamento dandi quidquid velit. humanissimi eorum cinerem crematarum servandum ad hos usus in cornea pyxide censuere aut tritas clysteribus infundendas orthopnoicis aut rheumaticis. infixae utique corpori inlitas extrahere constat. mel utilissimum auribus quoque est, in quo apes immortuae sint. parotidas comprimit columbinum stercus vel per se vel cum farina hordeacea aut avenacea, noctuae cerebrum vel iocur cum oleo infusum auriculae a parotide, multipeda cum resinae parte tertia inlita, grylli sive inliti sive adalligati.

ad reliqua morborum genera medicinam ex isdem animalibus aut eiusdem generis sequenti dicemus volumine.

LIBER XXX

magicas vanitates saepius quidem antecedente operis parte, ubicumque causae locusque poscebant, coarguimus detegemusque etiamnum. in paucis tamen digna res est, de qua plura dicantur, vel eo ipso quod fraudulentissima artium plurimum in toto terrarum orbe plurimisque saeculis valuit. auctoritatem ei maximam fuisse nemo miretur, quandoquidem sola artium tres alias imperiosissimas humanae mentis complexa in unam se redegit. natam primum e medicina nemo dubitabit ac specie salutari inrepsisse velut altiolem sanctioremque medicinam, ita blandissimis desideratissimisque promissis addidisse vires religionis, ad quas maxime etiam nunc caligat humanum genus, atque, ut hoc quoque successerit, miscuisse artes mathematicas, nullo non avido futura de sese sciendi atque ea e caelo verissime peti credente. ita possessis hominum sensibus triplici vinculo in tantum fastigii adolevit, ut hodieque etiam in magna parte gentium praevaleat et in oriente regum regibus imperet.

sine dubio illic orta in perside a zoroastre, ut inter auctores convenit. sed unus hic fuerit an postea et alius, non satis constat. eudoxus, qui inter sapientiae sectas clarissimam utilissimamque eam intellegi voluit, zoroastren hunc sex milibus annorum ante platonis mortem fuisse prodidit; sic et aristoteles. hermippus, qui de tota ea arte diligentissime scripsit et viciens c milia versuum a zoroastre condita indicibus quoque voluminum eius positis explanavit, praeceptorem, a quo institutum diceret, tradidit agonacen, ipsum vero quinque milibus annorum ante troianum bellum fuisse. mirum hoc in primis, durasse memoriam artemque tam longo aevo, non commentariis intercedentibus, praeterea nec claris nec continuis successionibus custoditam. quotus enim quisque hominum auditu saltem cognitos habet, qui soli nominantur, apusorum et zaratum medos babyloniosque marmarum et arabantiphocum aut assyrium tarmoendam, quorum nulla exstant monumenta maxime tamen mirum est, in bello troiano tantum de arte ea silentium fuisse homero tantumque operis ex eadem in ulixis erroribus, adeo ut vel totum opus non aliunde constet, siquidem protea et sirenum cantus apud eum non aliter intellegi volunt, circe utique et inferum evocatione hoc solum agi. nec postea quisquam dixit, quonam modo venisset telmesum, religiosissimam urbem, quando transisset ad thessalas matres, quarum cognomen diu optinuit in nostro orbe, aliena genti troianis utique temporibus chironis medicinis contentae et solo marte fulminanti. miror equidem achillis populis famam eius in tantum adhaesisse, ut menander quoque, litterarum subtilitati sine aemulo genitus, thessalam cognominaret famulam complexam ambages feminarum detrahentium lunam. orphea putarem e propinquo artem primum intulisse ad vicina usque superstitionis ac medicinae provectum, si non experts sedes eius tota thrace magices fuisset. primus, quod exstet, ut equidem invenio, commentatus est de ea osthanes xerxen regem persarum bello, quod is

graeciae intulit, comitatus ac velut semina artis portentosae sparsit obiter infecto, quacumque commeaverat, mundo. diligentiores paulo ante hunc ponunt zoroastren alium proconnensium. quod certum est, hic maxime osthanes ad rabiem, non aviditatem modo scientiae eius, graecorum populos egit. quamquam animadverto summam litterarum claritatem gloriamque ex ea scientia antiquitus et paene semper petitam. certe pythagoras, empedocles, democritus, plato ad hanc discendam navigavere exiliis verius quam peregrinationibus susceptis, hanc reversi praedicavere, hanc in arcanis habuere. democritus apollobechen coptiten et dardanum e phoenice inlustravit voluminibus dardani in sepulchrum eius petitis, suis vero ex disciplina eorum editis. quae recepta ab ullis hominum atque transisse per memoriam aequae ac nihil in vita mirandum est; in tantum fides istis fasque omne deest, adeo ut qui cetera in viro probant, haec opera eius esse infitientur. sed frustra. hunc enim maxime adfixisse animis eam dulcedinem constat. plenumque miraculi et hoc, pariter utrasque artes effloruisse, medicinam dico magicenque, eadem aetate illam hippocrate, hanc democrito inlustrantibus, circa peloponnensiacum graeciae bellum, quod gestum est a trecentesimo urbis nostrae anno. est et alia magices factio a mose et ianne et lotape ac iudaeis pendens, sed multis milibus annorum post zoroastren. tanto recentior est cypria. non levem et alexandri magni temporibus auctoritatem addidit professioni secundus osthanes comitatu eius exornatus, planeque, quod nemo dubitet, orbem terrarum peragravit.

extant certe et apud italas gentes vestigia eius in xii tabulis nostris aliisque argumentis, quae priore volumine exposui. delvii demum anno urbis cn. cornelio lentulo P. Licinio Crasso cos. senatusconsultum factum est, ne homo immolaretur, palamque fit, in tempus illud sacra prodigiosa celebrata. gallias utique possedit, et quidem ad nostram memoriam. namque tiberii caesaris principatus sustulit druidas eorum et hoc genus vatium medicorumque. sed quid ego haec commemorem in arte oceanum quoque transgressa et ad naturae inane pervecta britannia hodieque eam adtonita celebrat tantis caerimoniis, ut dedisse persis videri possit. adeo ista toto mundo consensere, quamquam discordi et sibi ignoto. nec satis aestimari potest, quantum romanis debeatur, qui sustulere monstra, in quibus hominem occidere religiosissimum erat, mandi vero etiam saluberrimum.

ut narravit osthanes, species eius plures sunt. namque ex aqua et sphaeris et ae+re et stellis et lucernis ac pelvibus securibusque et multis aliis modis divina promittit, praeterea umbrarum inferorumque colloquia. quae omnia aetate nostra princeps nero vana falsaque comperit. quippe non citharae tragicique cantus libido illi maior fuit, fortuna rerum humanarum summa gestiente in profundis animi vitiis, primumque imperare dis concupivit nec quicquam generosius voluit. nemo umquam ulli artium validius favit. ad hoc non opes ei defuere, non vires, non discentis ingenium, quae non alia patiente mundo! immensum, indubitatum exemplum est falsae artis, quam dereliquit nero; utinamque inferos potius et quoscumque de suspicionibus suis deos

consuluisse, quam lupanaribus atque prostitutis mandasset inquisitiones eas! nulla profecto sacra, barbari licet ferique ritus, non mitiora quam cogitationes eius fuissent. saevius sic nos replevit umbris. sunt quaedam magis perfugia, veluti lentiginem habentibus non obsequi numina aut cerni. an obstitit forte hoc in illo nihil membris defuit. nam dies eligere certos liberum erat, pecudes vero, quibus non nisi ater colos esset, facile; nam homines immolare etiam gratissimum. magus ad eum tiridates venerat armeniacum de se triumphum adferens et ideo provinciis gravis. navigare noluerat, quoniam expuere in maria aliisque mortalium necessitatibus violare naturam eam fas non putant. magos secum adduxerat, magicis etiam cenis eum initiaverat; non tamen, cum regnum ei daret, hanc ab eo artem accipere valuit. proinde ita persuasum sit, instabilem, inritam, inanem esse, habentem tamen quasdam veritatis umbras, sed in his veneficas artes pollere, non magicas. quaerat aliquis, quae sint mentiti veteres magi, cum adolescentibus nobis visus apion grammaticae artis prodiderit cynocephalian herbam, quae in aegypto vocaretur osiritis, divinam et contra omnia veneficia, sed si tota erueretur, statim eum, qui eruisset, mori, seque evocasse umbras ad percunctandum homerum, quam patria quibusque parentibus genitus esset, non tamen ausus profiteri, quid sibi respondisse diceret.

peculiare vanitatis sit argumentum, quod animalium cunctorum talpas maxime mirantur tot modis a rerum natura damnatas, caecitate perpetua, tenebris etiamnum aliis defossas sepultisque similes. nullis aequae credunt extis, nullum religionum capacius iudicant animal, ut, si quis cor eius recens palpitansque devoret, divinationes et rerum efficiendarum eventus promittant. dente talpae vivae exempto sanari dentium dolores adalligato adfirmant. cetera ex eo animali placita eorum suis reddemus locis. nec quicquam probabilius invenietur quam muris aranei morsibus adversari eas, quoniam et terra orbitis, ut diximus, depressa adversatur.

cetero dentium doloribus, ut iidem narrant, medetur canum, qui rabie perierunt, caput cinis crematorum sine carnibus instillatus ex oleo cyprio per aurem, cuius e parte doleant, caninus dens sinister maximus, circumscariphato qui doleat, aut draconis os e spina, item enhyridis; est autem serpens masculus et albus. huius maximo dente circumscariphant, aut in superiorum dolore duos superiores adalligant, e diverso inferiores. huius adipe perunguntur qui crocodilum captant. dentes scariphant et ossibus lacertae e fronte luna plena exemptis ita, ne terram attingant. colluunt dentibus caninis decoctis in vino ad dimidias partes. cinis eorum pueros tarde dentientes adiuvat cum melle. fit eodem modo et dentifricium. cavis dentibus cinis e murino fimo inditur vel iocur lacertarum aridum. anguinum cor, si mordeatur adalligeturve, efficax habetur. sunt inter eos qui murem bis in mense iubeant mandi doloresque ita cavere. vermes terreni decocti in oleo infusique auriculae, cuius a parte doleant, praestant levamentum. eorundem cinis exesis dentibus coniectus ex facili cadere eos cogit, integros dolentes inlitis iuvat; comburi autem oportet in testeo. prosunt et cum mori radice in

aceto scillite decocti ita, ut colluantur dentes. is quoque vermiculus, qui in herba veneris labro appellata invenitur, cavis dentium inditus mire prodest. nam urucae e brassicae foliis contactu cadunt, et e malva cimices infunduntur auribus cum rosaceo. harenulae, quae inveniuntur in cornibus coclearum, cavis dentium inditae statim liberant dolore. coclearum inanum cinis cum murra gingivis prodest, serpentis cum sale in olla exustae cinis cum rosaceo in contrariam aurem infusus, anguinae vernationis membrana cum oleo taedaeque resina calefacta et auri alterutri infusa - adiciunt aliqui tus et rosaceum - ; eadem cavis indita, ut sine molestia cadant, praestat. vanum arbitror esse circa canis ortum angues candidos membranam eam exuere, quoniam ante ortum in italia visum est multoque minus credibile in tepidis regionum tam sero exui. hanc autem vel inveteratam cum cera celerrime evellere tradunt. et dens anguium adalligatus dolores mitigat. sunt qui et araneum animal ipsum sinistra manu captum tritumque in rosaceo et in aurem infusum, cuius a parte doleat, prodesse arbitrentur. ossiculi gallinarum in pariete servati fistula salva tacto dente vel gingiva scariphata proiectoque ossiculo statim dolorem abire tradunt, item fimo corvi lana adalligato vel passerum cum oleo calefacto et proximae auriculae infuso. pruritus quidem intolerabilem facit, et ideo utilius est passeris pullorum sarmentis crematorum cinerem ex aceto infricare.

oris saporem commendari adfirmant, murino cinere cum melle si fricentur dentes; admiscent quidam marathi radices. pinna vulturis si scalpantur dentes, acidum halitum faciunt. hoc idem hystricis spina fecisse ad firmitatem pertinet. linguae ulcera et laborum hirundines in mulso decoctae sanant, adeps anseris aut gallinae rimas, oesypum cum galla, araneorum telae candidae et quae in trabibus parvae texuntur. si ferventia os intus exusserint, lacte canino statim sanabuntur.

maculas in facie oesypum cum melle corsico, quod asperissimum habetur, extenuat, item scobem cutis in facie cum rosaceo inpositum vellere - quidam et butyrum addunt - , si vero vitiligines sint, fel caninum prius acu conpunctas, liventia et suggillata pulmones arietum pecudumque in tenues consecti membranas calidi inpositi vel columbinum fimum. cutem in facie custodit adeps anseris vel gallinae. lichenas et murino fimo ex aceto inlinunt et cinere irenaei ex oleo; in hac curatione prius nitro ex aceto faciem foveri praecipiant. tollit ex facie vitia et coclearum, quae latae et minutae passim inveniuntur, cum melle cinis. omnium quidem coclearum cinis spissat, calfacit smectica vi et ideo causticis miscetur psorisque et lepris et lentigini inlinitur. invenio et formicas herculaneas appellari, quibus tritis adiecto sale exiguo talia vitia sanentur. buprestis animal est rarum in italia, simillimum scarabaeo longipedi; fallit inter herbas bovem maxime, unde et nomen invenit, devoratumque tacto felle ita inflamat, ut rumpat. haec cum hircino sebo inlita lichenas ex facie tollit septica vi, ut supra dictum est. vulturinus sanguis cum chamaeleontos albae, quam herbam esse diximus, radice et cedria tritus contextusque brassica lepras sanat, item pedes locustarum cum sebo hircino

triti, varos adeps gallinaceus cum cepa subactus. utilissimum et in facie mel, in quo apes sint inmortuae, praecipue tamen faciem purgat atque erugat cygni adeps. stigmata delentur columbino fimo ex aceto.

gravedinem invenio finiri, si quis nares mulinas osculetur. uva et faucium dolor mitigatur fimo agnorum, priusquam herbam gustaverint, in umbra arefacto, uva suco cocleae acu transfossae inlita, ut coclea ipsa in fumo suspendatur, hirundinum cinere cum melle; sic et tonsillis succurritur. tonsillas et fauces lactis ovilli gargarizatio adiuvat, multipeda trita, fimum columbinum cum passo gargarizatum, etiam cum fico arida ac nitro inpositum extra. asperitatem faucium et destillationes leniunt cocleae - coqui debent inoltae demptoque tantum terreno conteri et in passo dari potui; sunt qui astypalaeicas efficacissimas putent et minimas earum - , gryllus infricatus aut si quis manibus, quibus eum contriverit, tonsillas attingat.

anginis felle anserino cum elaterio et melle citissime succurritur, cerebro noctuae, cinere hirundinis ex aqua calida poto. huius medicinae auctor est ovidius poeta. sed efficaciores ad omnia, quae ex hirundinibus monstrantur, pulli silvestrium - figura nidorum eas deprehendit - , multo tamen efficacissimi ripariarum pulli; ita vocant in riparum cavis nidificantes. multi cuiuscumque hirundinis pullum edendum censeant, ut toto anno non metuatur id malum. strangulatos cum sanguine comburunt in vase et cinerem cum pane aut in potu dant. quidam et mustelae cinerem pari modo admiscunt; sic ad strumae remedia dant et comitialibus cotidie potui. in sale quoque servatae hirundines ad anginam drachma bibuntur, cui malo et nidus earum mederi dicitur potus. milipedam inlini anginis efficacissimum putant; alii xx tritas in aquae mulsae hemina dari per hirundinem, quoniam dentibus tactis nihil prosint. tradunt et murem cum verbenaca excoctum, si bibatur is liquor, remedio esse, et corrigiam caninam ter collo circumdatam, fimum columbinum vino et oleo permixtum. cervicis nervis, opisthotono ex milui nido surculus viticis adalligatus auxiliari dicitur, strumis exulceratis mustelae sanguis, ipsa decocta in vino; non tamen sectis admovetur. aiunt et in cibo sumptam idem efficere vel cinerem eius sarmentis combustae mixtum axungia. lacertus viridis adalligatur; oportet post dies xxx alium adalligatum. quidam cor eius in argenteo vasculo servant ad femineas strumas et viriles. cocleae cum testa sua tusae inlinuntur, maxime quae fructibus adhaerent, item cinis aspidum cum sebo taurino inponitur, anguinus adeps mixtus oleo, item anguium cinis ex oleo inlitus vel cum cera. edisse quoque eos medios abscisis utrimque extremis partibus adversus strumas prodest vel cinerem bibisse in novo fictili ita crematorum, efficacius multo inter duas orbitas occisorum. et gryllum inlinere cum sua terra effossum suadent, item fimum columbarum per sese vel cum farina hordeacia aut avenacia ex aceto, talpae cinerem ex melle inlinere. alii iocur eiusdem contritum inter manus inlinunt et triduo non abluunt. dextrum quoque pedum eius remedio esse strumis adfirmant. alii praecidunt caput et cum terra a talpis excitata tustum digerunt in pastillos pyxide stagna et utuntur ad omnia, quae intumescant, et quae apostemata vocant quaeque in

cervice sint; vesci suilla tunc vetant. tauri vocantur scarabaei terrestres ricino similes - nomen cornicula dedere - , alii pediculos terrae vocant; ab his quoque terram egestam inlinunt strumis et similibus vitiis et podagris, triduo non abluunt. prodest haec medicina in annum, omniaque his adscribunt, quae nos in gryllis rettulimus. quidam et a formicis terra egesta sic utuntur. alii vermes terrenos totidem, quot sint strumae, adalligant, pariterque cum iis arescunt. alii viperam circa canis ortum circumcidunt ut diximus, dein mediam comburunt, cinerem eum dant bibendum ter septenis diebus, quantum prenditur ternis digitis; sic strumis medentur, aliqui vero circumligantes lino, quo praeligata infra caput vipera pependerit, donec exanimaretur. et milipedis utuntur addita resinae terebinthinae parte quarta, quo medicamento omnia apostemata curari iubent.

umeri doloribus mustelae cinis cum cera medetur. - ne sint alae hirsutae, formicarum ova pueris infricata praestant, item mangonibus, ut lanugo sit pubescentium, sanguis e testiculis agnorum, cum castrantur. qui evulsis pilis inlitus et contra virus proficit.

praecordia vocamus uno nomine exta in homine, quorum in dolore cuiuscumque partis si catulus lactens admoveatur adprimaturque his partibus, transire in eum dicitur morbus, idque exinterato perfusoque vino deprehendi vitiato viscere illo, quod doluerit homini, sed obrui tales religio est. ii quoque, quos melitaeos vocamus, stomachi dolorem sedant adplicati saepius; transire morbos aegritudine eorum intellegitur, plerumque et morte. pulmonum quoque vitiis medentur, item mures, maxime africani, detracta cute in oleo et sale decocti atque in cibo sumpti. eadem res et purulentis vel cruentis excreationibus medetur, praecipue vero coclearum cibus stomacho. in aqua eas subfervefieri intacto corpore earum oportet, mox in pruna torreri nihilo addito atque ita e vino garoque sumi, praecipue africanas. nuper hoc conpertum plurimis prodesse; id quoque observant, ut numero inpari sumantur. virus tamen earum gravitatem halitus facit. prosunt et sanguinem excreantibus dempta testa tritae in aqua potu. laudatissimae autem sunt africanae - ex iis iolitanae - , astypalaeicae, item siculae modicae, quoniam magnitudo duras facit et sine suco, baliaricae, quas cavaticas vocant, quoniam in speluncis nascuntur, laudatae ex insulis et caprearum, nullae autem cibis gratae neque veteres neque recentes. fluviatiles et albae virus habent, nec silvestres stomacho utiles, alvum solvunt, item omnes minutae. contra marinae stomacho utiliores, efficacissimae tamen in dolore stomachi e laudatis traduntur quaecumque vivae cum aceto devoratae. praeterea sunt quae ἀκέραιοι vocantur, latae, multifariam nascentes, de quarum usu dicemus suis locis. gallinaceorum ventris membrana, si inveterata est, inspersa potioni destillationes pectoris et umidam tussim vel recens tosta lenit. cocleae crudae tritae cum aquae tepidae cyathis iii si sorbeantur, tussim sedant. destillationes sedat et canina cutis cuilibet digito circumdata. iure perdicum stomachus recreatur.

iocinerum doloribus medetur mustela silvestris in cibo sumpta vel iocinera

eius, item viverra porcelli modo inassata, suspiriosis multipeda, ut ter septenae in attico melle diluantur et per harundinem bibantur; omne enim vas nigrescit contactu. quidam torrent sextarium in patina, donec candidae fiant, tunc melle miscent alii centipedam vocant et ex aqua calida dari iubent in cibo. cocleae iis, quos linquit animus aut quorum alienatur mens aut quibus vertigines fiunt, ex passi cyathis iii singulae contritae cum sua testa et calefactae in potu datae diebus plurimum viiii; aliqui singulas primo die dedere, sequenti binas, tertio ternas, quarto ii, quinto i; sic et suspiria emendant et vomicas. esse animal locustae simile sine pennis, quod trixallis graece vocetur, latinum nomen non habeat, aliqui arbitrantur, nec pauci auctores, hoc esse quod grylli vocentur; ex his xx torreri iubent ac bibi e mulso contra orthopnoeas. sanguinem expuentibus cocleae, si qui inlotis protropum infundat vel marina aqua ita decoquat et in cibo sumat aut si tritae cum testis suis sumantur cum protropo; sic et tussi medentur. vomicas privatim sanat mel, in quo apes sint demortuae. sanguinem reicientibus pulmo vulturinus vitigineis lignis combustus, adiecto flore punici mali ex parte dimidia, item cotoneorum liliorumque isdem portionibus, potus mane atque vesperi e vino, si febres absint, si minus, ex aqua, in qua cotonea decocta sint.

pecudis lien recens magicis praeceptis super dolentem lienem extenditur dicente eo, qui medeatur, lieni se remedium facere. post hoc iubent in pariete dormitorii eius tectorio includi et obsignari anulo ter novies eademque dici. caninus si viventi eximatur et in cibo sumatur, liberat eo vitio. quidam recentem superinligant. alii duum dierum catuli ex aceto scillite dant ignoranti vel irenacei lienem, item coclearum cinerem cum semine lini et urticae addito melle, donec persanet. liberat et lacerta viridis viva in olla ante cubiculum dormitorium eius, cui medeatur, suspensa, ut egrediens revertensque attingat manu, cinis e capite bubonis cum unguento, mel, in quo apes sint mortuae, araneus et maxime qui lycos vocatur.

upupae cor lateris doloribus laudatur, coclearum cibus in tisana decoctarum; et per se inlinuntur. canis rabiosi calvariae cinis potioni inspergitur. - lumborum dolori stelio transmarinus capite ablato et intestinis decoctus in vino cum papaveris nigri denarii pondere dimidio eo suco bibitur. lacertae virides decisis pedibus et capite in cibo sumuntur, cocleae iii contritae cum testis suis atque in vino decoctae cum piperis granis xv. aquilae pedes evellunt in aversum a suffragine ita, ut dexter dextrae partis doloribus adalligetur, sinister laevae. multipeda quoque, quam oniscon appellavimus, medetur denarii pondere ex vini cyathis ii pota. vermum terrenum catillo ligneo ante fisso et ferro vincto inpositum aqua excepta perfundere et defodere, unde effoderis, magi iubent, mox aquam bibere catillo, mire id prodesse ischiadicis adfirmantes.

dysintericos recreant femina pecudum decocta cum lini semine ea aqua pota, caseus ovillus vetus, sebum ovium decoctum in vino austero. hoc et ileo medetur et tussi veteri, dysintericis stelio transmarinus ablatis intestinis et capite pedibusque ac cute decoctus aequae et in cibo sumptus, cocleae ii cum

ovo, utraque cum putamine contrita atque in vase novo addito sale et passis cyathis ii aut palmarum suco et aquae cyathis iii subfervefacta et in potu data. prosunt et combustae, ut cinis earum bibatur in vino, addito resinae momento. cocleae nudaе, de quibus diximus, in africa maxime inveniuntur, utilissimae dysintericis, quinae combustae cum denarii dimidii pondere acaciae; ex eo cinere dantur coclearia bina in vino myrtite aut quolibet austero cum pari modo caldae. quidam omnibus africanis ita utuntur, alii totidem africanas velatas infundunt potius et, si maior fluctio sit, addunt acaciam fabae magnitudine. senectus anguium dysinteriae et tenesmis in stagneo vase decoquitur cum rosaceo vel, si in alio, cum stagno inlinitur. ius ex gallinaceis isdem medetur, sed veteris gallinacei vehementius salsum ius alvum ciet. membrana gallinarum tosta et data in oleo ac sale coeliacorum dolores mulcet - abstineri autem frugibus ante et gallinam et hominem oporteat - , fimum columbinum tostum potumque. caro palumbis in aceto decocta dysintericis et coeliacis medetur, turdus inassatus cum myrti bacis dysintericis, item merulae, mel, in quo apes sint inmortuae, decoctum.

gravissimum vitium alvi ileos appellatur. huic resisti aiunt discerpti vespertilionis sanguine, etiam inlito ventre subveniri. sistit alvum coclea sicut diximus in suspiriosis temperata, item cinis earum, quae vivae crematae sint, potus ex vino austero, gallinaceorum iocur assum aut ventriculi membrana, quae abici solet, inveterata admixto papaveris suco - alii recentem torrent ex vino bibendam - , ius perdicum et per se ventriculus contritus ex vino nigro, item palumbis ferus ex posca decoctus, lien pecudis tostus et in vino tritus, fimum columbinum cum melle inlitum, ossifragi venter arefactus et potus, iis, qui cibos non conficiant, utilissimus, vel si manu tantum teneant capientes cibum. quidam adalligant ex hac causa, sed continuare non debent, maciem enim facit. sistit et anatum muscularum sanguis. inflationes discutit coclearum cibus, tormina lien ovium tostus atque e vino potus, palumbis ferus ex posca decoctus, adips otidis ex vino, cinis ibide sine pennis cremata potus. quod praeterea traditur in torminibus, mirum est, anate adposita ventri transire morbum anatemque emori. tormina et melle curantur, in quo sint apes inmortuae, decocto. coli vitium efficacissime sanatur ave galerita assa in cibo sumpta. quidam in vase novo cum plumis exuri iubent conterique in cinerem, bibi ex aqua coclearibus ternis per quadriduum, quidam cor eius adalligari femini; aliis recens tepensque adhuc devoratur. consularis asprenatum domus est, in qua alter e fratribus colo liberatus est ave hac in cibo sumpta et corde eius armilla aurea incluso, alter sacrificio quodam facto crudis laterculis ad formam camini atque, ut sacrum peractum est, obstructo sacello. unum est ossifrago intestinum mirabili natura omnia devorata conficienti; huius partem extremam adalligatam prodesse contra colum constat. - sunt occulti interaneorum morbi, de quibus mirum proditur. si catuli, priusquam videant, adplicentur triduo stomacho maxime ac pectori et ex ore aegri suctum lactis accipiant, transire vim morbi, postremo exanimari dissectisque palam fieri aegri causas; monent humari debere eos obrutos terra. magi quidem

vespertilionis sanguine contacto ventre in totum annum caveri tradunt aut in dolore, si quis aquam ter pedes eluens haurire sustineat.

murino fimo contra calculos inlinere ventrem prodest. irenacei carnem iucundam esse aiunt, si capite percusso uno ictu interficiatur, priusquam in se urinam reddat. haec caro ad hunc modum occisi stillicidium vesicae emendat, item suffitus ex eodem. quod si urinam in se reddiderit, eos, qui carnem comederint, stranguriae morbum contrahere traditur. iubent et vermes terrenos bibi ex vino aut passo ad comminuendos calculos vel cocleas decoctas ut in suspiriosis, easdem exemptas testis iii tritasque in vini cyatho bibi, sequenti die ii, tertio die i, ut stillicidium urinae emendent, testarum vero inanum cinerem ad calculos pellendos, item hydri iocur bibi vel scorpionum cinerem aut in pane sumi vel si quis ut locusta edit, lapillos, qui in gallinaceorum vesica aut in palumbium ventriculo inveniantur, conteri et potioni inspergi, item membranam e ventriculo gallinacei aridam vel, si recens sit, tostam, fimum quoque palumbinum in faba sumi contra calculos et alias difficultates vesicae, similiter plumarum cinerem palumbium ferorum ex aceto mulso et intestinorum ex his cinerem coclearibus iii, e nido hirundinum glaebam dilutam aqua calida, ossifragi ventrem arefactum, turturis fimum in mulso decoctum vel ipsius discoctae ius. turdos quoque edisse cum bacis myrti prodest urinae, cicadas tostas in patellis, milipedam oniscon bibisse et in vesicae doloribus decoctum agnorum pedum. alvum ciet gallinaceorum discoctorum ius et acria mollit, ciet et hirundinum fimum adiecto melle subditum.

sedis vitiis efficacissima sunt oesypum - quidam adiciunt pompholygem et rosaceum - , canini capitis cinis, senecta serpentis ex aceto, si rhagades sint, cinis fimi canini candidi cum rosaceo - aiunt inventum aesculapii esse eodemque et verrucas efficacissime tolli - , murini fimi cinis, adeps cygni, adeps bovae. procidentia ibi sucus coclearum punctis evocatus inlita repellit. adtritris medetur cinis muris silvatici cum melle, fel irenacei cum vesperilionis cerebro et canino lacte, adeps anserinus cum cerebro et alumine et oesypo, fimum columbinum cum melle, condylomatis privatim araneus dempto capite pedibusque infricatus, ne acria perurant, adeps anserinus cum cera punica, cerussa, rosaceo, adeps cygni. hic et haemorrhoidas sanare dicitur. ischiadicis cocleas crudas tritas cum vino ammideo et pipere potu prodesse dicunt, lacertam viridem in cibo ablatis pedibus, interaneis, capite; sic et stelionem adiectis huic papaveris nigri obolis iii; ruptis, convulsis fel ovium cum lacte mulierum. verendorum fornicationibus verrucisque medetur arietini pulmonis inassati sanies, ceteris vitiis vellerum eius vel sordidorum cinis ex aqua, sebum ex omento pecudis, praecipue a renibus, admixto pumicis cinere et sale, lana sucida ex aqua frigida, carnes pecudis combustae ex aqua, mulae ungularum cinis, dentis caballini contusi farina inspersa, testibus vero farina ex ossibus canini capitis sine carne tusis. si decidat testium alter, spumam coclearum inlitam in remedio esse tradunt. taetris ibi ulceribus et manantibus auxiliantur canini capitis recentes cineres, cocleae parvae, latae contritae ex

aceto, senectus anguim ex aceto vel cinis eius, mel, in quo apes sint immortuae, cum resina, cocleae nudaе, quas in africa gigni diximus, tritae cum turis polline et ovorum albo; xxx die resolvunt; aliqui pro ture bulbum admiscent. hydrocelicis stelionis mire prodesse tradunt capite, pedibus, interaneis adeptis relicum corpus inassatum - in cibo id saepius datur - , sicut ad urinae incontinentiam caninum adipem cum alumine schisto fabae magnitudine, cocleas africanas cum sua carne et testa crematas potio cinere, anserum iii linguas inassatas in cibo. huius rei auctor est anaxilaus. at panos aperit sebum pecudum cum sale tosto, murinum fimum admixto turis polline et sandaraca discutit, lacertae cinis et ipsa divisa inposita, item multipeda contrita admixta resina terebinthina ex parte tertia - quidam et sinopidem admiscent - , cocleae contusae per se, cinis inanum coclearum cerae mixtus. discussoriam vim habet fimum columbarum per sese vel cum farina hordeacea aut avenacia inlitum. cantharides mixtae calce panos scalpelli vice auferunt, inguinum tumorem cocleae minutae cum melle inlitae leniunt.

varices ne nascantur, lacertae sanguine pueris crura ieiunis a ieiuno inlinuntur. podagras lenit oesypum cum lacte mulieris et cerussa, fimum pecudum, quod liquidum reddunt, pulmones pecudum, fel arietis cum sebo, mures dissecti inpositi, sanguis mustelae cum plantagine inlitus et vivae combustae cinis, ex aceto ac rosaceo si pinna inlinatur vel si cera et rosaceum admisceatur, fel caninum ita, ne manu attingatur, sed pinna inlinatur, fimum gallinarum, vermium terrenorum cinis cum melle ita, ut tertio die solvantur. aliqui ex aqua inlinere malunt, alii ipsos acetabuli mensura cum mellis cyathis iii, pedibus ante rosaceo perunctis. cocleae latae potae tollere dicuntur pedum et articulorum dolores; bibuntur autem binae in vino tritae. eadem inlinuntur cum helxines herbae succo; quidam ex aceto intrivisse contenti sunt. sale, qui una cum vipera crematus sit in olla nova, saepius sumpto aiunt podagra liberari; utile esse et adipe viperino pedes perungui. et de miluo adfirmant, si inveterato tritoque quantum iii digiti capiant bibatur ex aqua aut si pedes sanguine eius perunguantur. inlinuntur et columbarum sanguine cum urtica vel pennis earum, cum primum nascentur, tritis cum urtica. quin et fimum earum articulorum doloribus inlinitur, item cinis mustelae aut coclearum, et cum amylo vel tragacantha. incussos articulos aranei telae commodissime curant. sunt qui cinere earum uti malint, sicut fimi columbini cinere cum polenta et vino albo. articulis luxatis praesentaneum est sebum pecudis cum cinere e capillo mulierum. pernionibus quoque inponitur sebum pecudum cum alumine, canini capitis cinis aut fimi murini. quod si pura sint, ulcera cera addita ad cicatricem perducunt soricum vel glirium crematorum favilla ex oleo, item muris silvatici cum melle, vermium quoque terrenorum cum oleo vetere et cocleae, quae nudaе inveniuntur. ulcera omnia pedum sanat cinis earum, quae vivae combustae sint, fimi gallinarum cinis exulcerationes, columbini fimi ex oleo. adtritum calciamentorum veteris soleae cinis, agninus pulmo et arietis sanant, dentis caballini contusi farina privatim subluviem, lacertae viridis sanguis subtritus et hominum et iumentorum pedes sublitus,

clavos pedum urina muli mulaeve cum luto suo inlita, fimum ovium, iocur lacertae viridis vel sanguis flocco inpositus, vermes terreni ex oleo, stelionis caput cum viticis foliis pari modo tritum ex oleo, fimum columbinum decoctum ex aceto, verrucarum omnia genera urina canis recens cum suo luto inlita, fimi canini cinis cum cera, fimum ovium, sanguis recens murinus inlitus vel ipse mus divolsus, irenacei fel, caput lacertae vel sanguis vel cinis totius, membrana senectutis anguium, fimum gallinae cum oleo ac nitro. cantharides cum uva taminia intritae exedunt, sed ita erosas aliis, quae ad persananda ulcera demonstravimus, curari oportet.

nunc praevertemur ad ea, quae totis corporibus metuenda sunt.

fel canis nigri masculi amuletum esse dicunt magi domus totius suffitae eo purificataeve contra omnia mala medicamenta, item sanguinem canis respersis parietibus genitaleque eius sub limine ianuae defossum. minus mirentur hoc qui sciunt, foedissimum animalium in quantum magnificent, ricinum, quoniam uni nullus sit exitus saginae nec finis alia quam morte, diutius in fame viventi: septenis ita diebus durare tradunt, at in satietate paucioribus dehiscere; hunc ex aure sinistra canis omnes dolores sedare adalligatum. et indicium in augurio vitalium habent, nam si aeger initio respondeat ei, qui intulerit, a pedibus stanti interrogantique de morbo, spem vitae certam esse, moriturum nihil respondere. adiciunt ut evellatur ex aure laeva canis, cui non sit alius quam niger colos. nigidius fugere toto die canes conspectum eius, qui e sue id animal evellerit, scriptum reliquit. rursus magi tradunt lymphatos sanguinis talpae adpersu resipiscere, eos vero, qui a nocturnis diis faunisque agitentur, draconis lingua et oculis et felle intestinisque in vino et oleo decoctis ac sub diu nocte refrigeratis perunctionibus matutinis vespertinisque liberari.

perfrictionibus remedio esse tradit nicander amphisbaenam serpentem mortuam adalligatam vel pellem tantum eius, quin immo arbori, quae caedatur, adalligata non algere caedentes, faciliusque succedere ita. quae sola serpentium frigori se committit, prima omnium procedens et ante cuculi cantum. aliud est cuculo miraculum: quo quis loco primum audiat alitem illam, si dexter pes circumscribatur ac vestigium id effodiatur, non gigni pulices, ubicumque spargatur.

paralysim caventibus pingua glirium decoctorum et soricum utilissima tradunt esse, milipedas ut in angina diximus potas; phthisim sentientibus lacertam viridem decoctam in vini sextariis iii ad cyathum unum, singulis coclearibus sumptis per dies, donec convalescant, coclearum cinerem potum in vino; comitialibus morbis oesypum cum murrae momento et vini cyathis ii dilutum magnitudine nucis abellanae, a balineo potum, testiculos arietinos inveteratos tritosque dimidio denarii pondere in aquae vel lactis asinini hemina. interdicitur vini potus quinque diebus ante et postea. magnifice laudatur et sanguis pecudum potus, item fel cum melle, praecipue agninum, catulus lactens sumptus absciso capite pedibusque ex vino et murra, lichen mulae potus in oxymelite cyathis iii, stelionis transmarini cinis potus in aceto,

tunicula stelonis, quam eodem modo ut anguis exuit, in potu. quidam et ipsum harundine exinteratum inveteratumque bibendum dederunt, alii in cibo ligneis veribus inassatum. operae pretium est scire, quo modo praeripiatur, cum exuerit, membrana hiberna alias devoranti eam, quoniam nullum animal fraudulentius invidere homini tradunt, inde stelonum nomine in maledictum translato. observant cubile eius aestatibus; est autem in loricis ostiorum fenestrarumque aut camaris sepulchrisve. ibi vere incipiente fissis harundinibus textas opponunt ceu nassas, quarum angustiis etiam gaudet, eo facilius exuens circumdatum torporem; sed relicto non potest remeare. nihil ei remedio in comitialibus morbis praefertur. prodest et cerebrum mustelae inveteratum potumque et iocur eius, testiculi quoque volvaeque aut ventriculus inveteratus cum coriandro, ut diximus, item cinis, silvestris vero tota in cibo sumpta. eadem omnia praedicantur ex viverra. lacerta viridis cum condimentis, quae fastidium abstergeant, ablatis pedibus ac capite, coclearum cinis addito semine lini et urticae cum melle inlitu sanant. magis placet draconis cauda in pelle dorcadis adalligata cervinis nervis vel lapilli e ventre hirundinum pullorum sinistro lacerto adnexi; dicuntur enim excluso pullo lapillum dare. quod si pullus is detur in cibo, quem primum pepererit, cum quis primum temptatus sit, liberatur eo malo; postea medetur hirundinum sanguis cum ture vel cor recens devoratum. quin et e nido earum lapillus inpositus recreare dicitur confestim, adalligatus in perpetuum tueri. praedicatur et iocur milui devoratum et senectus serpentium, iocur vulturis tritum cum suo sanguine ter septenis diebus potum, cor pulli vulturini adalligatum. sed et ipsum vulturem in cibo dari iubent et quidem satiatum humano cadavere. quidam pectus eius bibendum censent in cerrino calice, aut testes gallinaei ex aqua et lacte, antecedente v diebus abstinentia vini; ob id inveterant. fuere et qui muscas xxi rufas, et quidem a mortuo, in potu darent, infirmioribus pauciores.

morbo regio resistunt sordes aurium aut mammarum pecudis denarii pondere cum murrae momento et vini cyathis ii canini capitis cinis in mulso, multipeda in vini hemina, vermes terreni in aceto mulso cum murra, gallina, si sit luteis pedibus, prius aqua purificatis, dein collutis vino, quod bibatur, cerebrum perdicis aut aquilae in vini cyathis iii, cinis plumarum aut interaneorum palumbis in mulso ad coclearia iii, passerum cinis sarmentis crematorum coclearibus ii in aqua mulsa. avis icterus vocatur a colore; quae si spectetur, sanari id malum tradunt et avem mori. hanc puto latine vocari galgulum.

phreneticis prodesse videtur pulmo pecudum calidus circa caput alligatus. nam muris cerebrum dare potui ex aqua aut cinerem mustelae vel etiam inveteratas carnes irenaei quis possit furenti, etiamsi certa sit medicina bubonis quidem oculorum cinerem inter ea, quibus prodigiose vitam ludificantur, acceperim, praecipueque febrium medicina placitis eorum renuntiat. namque et in duodecim signa digessere eam sole transmeante iterumque luna, quod totum abdicandum paucis e pluribus edocebo, siquidem

crematis tritisque cum oleo perungui iubent aegros, cum geminos transeat sol, cristis et auribus et unguibus gallinaceorum; si luna, radiis barbisque eorum; si virginem alteruter, hordei granis; si sagittarium, vespertilionis alis; si leonem luna, tamaricis fronde, et adiciunt sativae; si aquarium, e buxo carbonibus tritis. ex istis confessa aut certe verisimilia ponemus, sicuti lethargum olfactoriis excitari et inter ea fortassis mustelae testiculis inveteratis aut iocinere usto. his quoque pulmonem pecudis calidum circa caput adalligari putant utile.

in quartanis medicina clinice propemodum nihil pollet. quam ob rem plura eorum remedia ponemus primumque ea, quae adalligari iubent: pulverem, in quo se accipiter volutaverit, lino rutilo in linteolo, canis nigri dentem longissimum. pseudosphecem vocant vespam, quae singularis volitat; hanc sinistra manu adprehensam subnectunt, alii vero quam quis eo anno viderit primam; viperae caput abscisum in linteolo vel cor viventi exemptum; muris rostellum auriculasque summas russeo panno ipsumque dimittunt; lacertae vivae dextrum oculum effossum, mox cum capite suo deciso in pellicula caprina scarabaeum, qui pilas volvit. propter hunc aegypti magna pars scarabaeos inter numina colit, curiosa apionis interpretatione, qua colligat solis operum similitudinem huic animali esse, ad excusandos gentis suae ritus. sed et alios adalligant magi: cui sunt cornicula reflexa, sinistra manu collectum; tertium, qui vocatur fullo, albis guttis, dissectum utrique lacerto adalligant, cetera sinistro: cor anguium sinistra manu exemptum viventibus, scorpionis caudae iiii articulos cum aculeo panno nigro ita, ut nec scorpionem dimissum nec eum, qui adalligaverit, videat aeger triduo, post tertium circuitum id condat. urucam in linteolo ter lino circumdant totidem nodis ad singulos dicente, quare faciat, qui medebitur, limacem in pellicula vel iiii limacum capita praecisa harundine, multipedam lana involutam, vermiculos, ex quibus tabani fiunt, antequam pennas germinent, alios e spinosis frutectis lanuginosos. quidam ex illis quaternos inclusos iuglandis nucis putamine adalligant. cocleas, quae nudaе inveniuntur, stelionem, cum incluserunt capsulis, subiciunt capiti et sub decessu febris emittunt. devorari autem iubent cor mergi marini sine ferro exemptum, inveteratumque conteri et in calida aqua bibi, hirundinum corda cum melle; alii fimum drachma una in lactis caprini vel ovilli vel passi cyathis iii ante accessiones; sunt qui totas censeant devorandas. aspidis cutem pondere sexta parte denarii cum piperis pari modo parthorum gentes in remedium quartanae bibunt. chrysippus philosophus tradidit phryganion adalligatum remedio esse quartanis. quod esset animal, neque ille descripsit nec nos invenimus qui novisset; demonstrandum tamen fuit a tam gravi auctore dictum, si cuius cura efficacior esset inquirendi. cornicis carnes esse et nidum inlinere in longis morbis utilissimum putant. - et in tertianis fiat potestas experiendi, quoniam miserias copia spei delectat, anne aranei, quem lycon vocant, tela cum ipso in spleniolo resinae ceraeque inposita utrisque temporibus et fronti prosit, aut ipse calamo adalligatus, qualiter et aliis febribus prodesse traditur, item lacerta viridis adalligata viva

in eo vase, quod capiat, quo genere et recidivas frequenter abigi adfirmant.

hydropicis oesypum ex vino addita murra modice potui datur, nucis abellanae magnitudine. aliqui addunt et anserinum adipem ex vino myrteo. sordes ab uberibus ovium eundem effectum habent, item carnes inveteratae irencei sumptae. vomitus quoque canum inlitis ventri aquam trahere promittitur.

igni sacro medetur oesypum cum pompholyge et rosaceo, ricini sanguis, vermes terreni ex aceto inliti, gryllus contritus in manibus, quo genere praestat, ut qui id fecerit, antequam incipiat vitium, toto ei anno non accidat - oportet autem eum ferro cum terra cavernae suae tolli - , anseris adeps, viperae caput aridum adservatum et combustum, dein ex aceto inpositum, senectus serpentium ex aqua inlita a balneo cum bitumine et sebo agnino.

carbunculus fimo columbino aboletur per se inlito vel cum lini semine ex aceto mulso, item apibus, quae in melle sint mortuae, inpositis polentaque inposita insuper. si in verendis sit, ceterisque ibi ulceribus occurrit ex melle oesypum cum plumbi squamis, item fimum pecudum incipientibus carbunculis. tubera et quaecumque molliri opus sit efficacissime anserino adipe curantur; idem praestat et gruum adeps.

furunculis mederi dicitur araneus, priusquam nominetur, inpositus et tertio die solutus, mus araneus pendens enecatus sic, ut terram ne postea attingat, ter circumlatus furunculo, totiens expuentibus medente et cui is medebitur, ex gallinaceo fimo, quod est rufum, maxime recens inlitis ex aceto, ventriculus ciconiae ex vino decoctus, muscae in pari numero infricatae digito medico, sordes ex pecudum auriculis, sebum ovium vetus cum cinere capilli mulierum, sebum arietis cum cinere pumicis et salis pari pondere.

ambustis canini capitis cinis medetur, item glirium cum oleo, fimum ovium cum cera, murium cinis, coclearum quoque sic, ut ne cicatrix quidem appareat, adips viperinus, fimi columbini cinis ex oleo inlitis; nervorum nodis capitis viperini cinis in oleo cyprino, terreni vermes cum melle inliti. dolores eorum ... adips, amphisbaena mortua adalligata, adips vulturinus cum ... , venter arefactus tritusque cum adipe suillo inveterato, cinis e capite bubonis in mulso potus cum lilii radice, si magis credimus. in contractione nervorum caro palumbina in cibis prodest et inveterata, irencei spasticis, item mustelae cinis, serpentium senectus in pelle taurina adalligata. spasmos fieri prohibet et opisthotonos milui iocur aridum iii obolis in aquae mulsae cyathis iii potum.

reduvias et quae in digitis nascuntur pterygia tollunt canini capitis cinis aut vulva decocta in oleo, superinlito butyro ovillo cum melle, item folliculus cuiuslibet animalium fellis; unguium scabritiam cantharides cum pice tertio die solutae aut locustae frictae cum sebo hircino, pecudum sebum. aliqui miscent viscum et porcillacum, alii aeris florem et viscum ita, ut tertio die solvant.

sanguinem sistit in naribus sebum ex omento pecudum inditum, item coagulum ex aqua, maxime agninum, subductum vel infusum, etiam si alia non prosint, adips anserinus cum butyro pari pondere pastillis ingestus,

coclearum terrena, sed et ipsae extractae testis; e naribus fluentem cocleae contritae fronti inlitae, aranei tela; gallinacei cerebellum vel sanguis profluvia ex cerebro, item columbinus ob id servatus concretusque. si vero ex vulnere inmodice fluat, fimi caballini cum putaminibus ovorum cremati cinis inpositus mire sistit.

ulceribus medetur oesypum cum hordei cinere et aerugine aequis partibus, ad carcinomata quoque ac serpentina valet. erodit et ulcerum margines, carnesque exscrecentes ad aequalitatem redigit; explet quoque et ad cicatricem perducit. magna vis et in cinere pecudum fimi ad carcinomata, addito nitro, aut in cinere ex ossibus feminum agnitorum, praecipue in iis ulceribus, quae cicatricem non trahant. magna et pulmonibus, praecipue arietum: carnes exscrecentes in ulceribus ad aequalitatem efficacissime reducunt; fimo quoque ipso ovium sub testo calefacto et subacto tumor vulnere sedatur, fistulae purgantur sananturque, item epinyctides. summa vero in canini capitis cinere: exscrecentia omnia spodii vice erodit ac persanat. et murino fimo eroduntur, item mustelae fimi cinere. duritias in alto ulcerum et carcinomata persequitur multipeda trita admixta resina terebinthina et sinopide. eadem utilissima sunt in iis ulceribus, quae vermibus periclitentur. quin et vermium ipsorum genera mirandos usus habent. cosses, qui in ligno nascuntur, sanant ulcera omnia, nomas vero combusti cum pari pondere anesi ex oleo inliti. vulnera recentia conglutinant terreni adeo, ut nervos quoque abscisos inlitis solidari intra septimum diem persuasio sit; itaque in melle servandos censent. cinis eorum margines ulcerum duriores absumit cum pice liquida vel symphyto et melle. quidam arefactis in sole ad vulnera ex aceto utuntur nec solvunt nisi biduo intermisso. eadem ratione et coclearum terrena prosunt, totaeque exemptae recentia vulnera tusae inpositae conglutinant et nomas sistunt. - (herpes quoque animal a graecis vocatur, quo praecipue sanantur quaecumque serpunt). - cocleae prosunt et cum testis suis tusae; cum murra quidem et ture etiam praecisos nervos sanare dicuntur. draconum quoque adeps siccatus in sole magnopere prodest, item gallinacei cerebrum recentibus plagis. sale viperino in cibo sumpto tradunt et ulcera tractabilia fieri ac celerius sanari. antonius quidem medicus, cum incidisset insanabilia ulcera, viperas edendas dabat miraue celeritate persanabat. trixallidum cinis margines ulcerum duros aufert cum melle, item fimi columbini cum arrhenico et melle, eademque erodentia sunt. bubonis cerebrum cum adipe anserino mire vulnera dicitur glutinare; quae vero vocantur cacoe+the, cinis feminum arietis cum lacte muliebri, diligenter prius elutis linteolis, ulula avis cocta in oleo, cui liquato miscetur butyrum ovillum et mel. ulcerum labra duriora apes in melle mortuae emolliunt, et elephantiasin sanguis et cinis mustelae. verberum vulnera atque vibices pellibus ovium recentibus inpositis obliterantur.

articulorum fracturis cinis feminum pecudis peculiariter medetur cum cera - efficacius idem medicamentum fit maxillis simul ustis cornuque cervino et cera mollita rosaceo - ; ossibus fractis caninum cerebrum linteolo inlito, superpositis lanis, quae subinde oleo subfundantur; fere xiiii diebus solidat,

nec tardius cinis silvestris muris cum melle aut vermium terrenorum, qui et ossa extrahit.

cicatrices ad colorem reducit pecudum pulmo, praecipue ex ariete, sebum ex nitro, lacertae viridis cinis, vernatio anguium ex vino decocta, fimum columbinum cum melle, item vitilignes albas ex vino, vitiliginem et cantharides cum rutae foliorum ii partibus. in sole, donec formicet cutis, tolerandae sunt, postea fovere oleoque perunguere necessarium iterumque inlinere, idque pluribus diebus facere, caventes exulcerationem altam. ad easdem vitilignes et muscas inlini iubent cum radice eupatoriae, gallinarum fimi candidum servatum in oleo vetere cornea pyxide, vespertilionis sanguinem, fel irenaei ex aqua. scabiem vero bubonis cerebrum cum aphronitro, sed ante omnia sanguis caninus sedat, pruritum cocleae minutae, latae contritae inlitae.

harundines et tela quaeque alia extrahenda sunt corpori evocat mus dissectus inpositus, praecipue vero lacerta dissecta et vel caput tantum eius contusum cum sale inpositum, cocleae ex iis, quae gregatim folia sectantur, contusae inpositae cum testis et eae, quae manduntur, exemptae testis, sed cum leporis coagulo efficacissime. ossa anguium eundem cum coagulo cuiuscumque quadripedis intra tertium diem adprobant effectum. laudantur et cantharides tritae cum farina hordei.

in muliebribus malis membranae e partu ovium proficiunt, sicut in capris rettulimus. fimum quoque pecudum eosdem usus habet. locustarum suffitu stranguriae maxime mulierum iuvantur. gallinaceorum testes si subinde a conceptu edat mulier, mares in utero fieri dicuntur. partus conceptos hystricum cinis potus continet, maturat caninum lacte potum, evocat membrana e secundis canum, si terram non attigerit, lumbis parturientium tactis. fimum murinum aqua pluvia dilutum mammas mulierum a partu tumentes reficit. cinis irenaeorum cum oleo perunctarum custodit partus contra abortus. facilius enituntur quae ... um anserinum cum aquae ii cyathis sorbuere aut ex utriculo mustelino per genitale effluentes aquas. - vermes terreni inliti, ne cervicis scapularumque nervi doleant, praestant. graves secundas pellunt in passo poti. iidem per se inpositi mammarum suppurationes concocunt et aperiunt extrahuntque et ad cicatricem perducunt. lac devocant poti cum mulso. inveniuntur et in gramine vermiculi, qui adalligati collo continent partum; detrahuntur autem sub partu, alias eniti non patiuntur; cavendum et ne in terra ponantur. conceptus quoque causa dantur in potu quini aut septeni. - cocleae in cibo sumptae adcelerant partum, item conceptum inpositae cum croco. eadem ex amylo et tragacantha inlitae profluvia sistunt. prosunt et purgationibus sumptae in cibo et vulvam aversam corrigunt cum medulla cervina ita, ut uni cocleae denarii pondus addatur et cypri. inflationes quoque vulvarum discutiunt exemptae testis tritae cum rosaceo. ad haec astypalaeicae maxime eliguntur. alio modo africanae binae tritae cum feni graeci quod iii digitis capiatur, addito melle coclearibus iiii, inlinuntur alvo prius irino suco perunctae. sunt et minutae loricaeque candidae

coctae passim oberrantes; hae arefactae sole in tegulis tusaeque in farinam miscentur lomento aequis partibus candoremque et levorem corpori adferunt. scabendi desideria tollunt minutae et latae cum polenta. - viperam mulier praegnans si transcenderit, abortum faciet, item amphibaenam, mortuam dumtaxat, nam vivam habentes in pyxide inpune transeunt; etiam si mortua sit atque adservata, partus faciles praestat. in mortua mirum, si sine adservata transcenderit grvida, innoxium fieri, si protinus transcendat adservatam. - anguis inveterati suffitu menstrua adiuvant. anguium senectus adalligata lumbis faciliores partus facit, protinus a puerperio removenda. dant et in vino bibendam cum ture; aliter sumpta abortum facit. baculum, quo angui rana excussa sit, parturientes adiuvat; trixallidum cinis inlitis cum melle purgationes, item araneus: qui filum deducit ex alto, capi debet manu cava tritusque admoveri, quod, si redeuntem prenderit, inhibebit idem purgationes. - lapis ae+tites in aquilae repertus nido custodit partus contra omnes abortuum insidias. penna vulturina subiecta pedibus adiuvat parturientes. ovum corvi cavendum gravidis constat, quoniam transgressis abortum per os faciat. fimum accipitris in mulso potum videtur fecundas facere. vulvarum duritias, collectiones adeps anserinus aut cygni emollit. mammas a partu custodit adeps anseris cum rosaceo et araneo. phryges et lycaones mammis puerperio vexatis invenerunt otidum adipem utilem esse. iis, quae vulva strangulentur, et blattas inlinunt. ovorum perdicis putaminum cinis cadmiae mixtus et cerae stantes mammas servat. putant et ter circumductas ovo perdicis aut ... non inclinari et, si sorbeantur, eadem fecunditatem facere, lactis quoque copiam, cum anserino adipe perunctis mammis dolores minuere, molas uteri rumpere, scabiem vulvarum sedare, si cum cimice trito inlinantur.

vespertilionum sanguis psilotri vim habet, sed alis puerorum inlitis non satis proficit, nisi aerugo vel cicutae semen postea inducatur; sic enim aut in totum tolluntur pili aut non excedunt lanuginem. idem et cerebro eorum profici putant; est autem duplex, rubens utique et candidum. aliqui sanguinem et iocur eiusdem admiscent. quidam in iii heminis olei discocunt viperam exemptis ossibus, psilotri vice utuntur, evolsis prius pilis, quos renasci nolunt. fel irenacei psilotrum est, utique mixtum vespertilionis cerebro et lacte caprino, item per se cinis. lacte canis primiparae, prius evolsis pilis vel nondum natis, perunctae partes alios non sufficiunt. idem evenire traditur sanguine ricini evulsi cani, item hirundinino sanguine vel felle, ovis formicarum. supercilia denigrari muscis tritis tradunt; si vero oculi nigri nascentium placeant, soricem praegnanti edendum; capilli ne canescant, vermium terrenorum cinere praestari admixto oleo.

infantibus, qui lacte concreto vexantur, praesidio est agninum coagulatum ex aqua potum, aut si coagulato lacte acciderit, discutitur coagulum ex aceto dato. ad dentitiones cerebrum pecoris utilissimum est. ossibus in canino fimo inventis adustio infantum, quae vocatur siriasis, adalligatis emendatur, ramex infantum lacertae viridis admotae dormientibus morsu. postea harundini inligant et suspendunt in fumo traduntque pariter cum expirante ea sanari

infantem. coclearum saliva inlita infantium oculis palpebras corrigit gignitque. ramicosis coclearum cinis cum ture ex ovi albo specillo inlitus per dies xxx medetur. inveniuntur in corniculis coclearum harenaceae duritiae; hae dentitionem facilem praestant adalligatae. coclearum inanium cinis cerae mixtus procidentium interaneorum partes extremas prohibet; oportet autem cineri misceri saniem punctis emissam ante. cerebrum viperae inligatum pellicula dentitiones adiuvat. idem valent et grandissimi dentes serpentium. fimum corvi lana adalligatum infantium tussi medetur. - vix est serio conplecti quaedam, non omittenda tamen, quia sunt prodita. ramici infantium lacerta mederi iubent. marem hanc prendi; intellegi eo, quod sub cauda unam cavernam habeat. id agendum, ut per aureum vel argenteum claustrum mordeat vitium; tum in calice novo inligatam in fumo poni. urina infantium cohibetur muribus elixis in cibo datis. scarabaeorum cornua grandia denticulata adalligata iis amuleti naturam obtinent. bovae capiti lapillum inesse tradunt, quem ab ea expui, si necem timeat; inopinantis praeciso capite exemptum adalligatumque mire prodesse dentitioni. item cerebrum eiusdem ad eundem usum adalligari iubent et limacis lapillum sive ossiculum; invenitur in dorso. magnifice iuvat et ovis cerebrum gingivis inlitum, sicut aures adeps anserinus cum ocimi suco inpositus. sunt vermiculi in spinosis herbis asperi, lanuginosi; hos adalligatos protinus mederi tradunt infantibus, si quid ex cibo haereat.

somnos adlicit oesypum cum murræ momento in vini cyathis ii dilutum vel cum adipe anserino et vino myrtite, avis cuculus leporina pelle adalligatus, ardiolae rostrum in pelle asinina fronti adalligatum. putant et per se rostrum effectus eiusdem esse vino collutum. e diverso somnum arcet vespertilionis caput aridum adalligatum.

in urina virili enecata lacerta venerem eius, qui fecerit, inhibet; nam inter amatoria esse magi dicunt. inhibent et cocleae, fimum columbinum cum oleo et vino potum. pulmonis vulturini dextrae partes venerem concitant viris adalligatae gruis pelle, item si lutea ex ovis quinis columbarum admixta adipis suilli denarii pondere ex melle sorbeantur, passeret in cibo vel ova eorum, gallinacei dexter testis arietina pelle adalligatus. ibium cinere cum adipe anseris et irino perunctis sic conceptos partus contineri, contra inhiberi venerem pugnatoris galli testiculis anserino adipe inlitis adalligatisque pelle arietina tradunt, item cuiuscumque galli, si cum sanguine gallinacei lecto subiciantur. cogunt concipere invitas saetae ex cauda mulae, si iunctis evellantur, inter se conligatae in coitu. qui in urinam canis suam egresserit, dicitur ad venerem pigrior fieri. mirum et de stelionis cinere, si verum est, linamento involutum in sinistra manu venerem stimulare, si transferatur in dextram, inhibere, item vespertilionis sanguinem collectum flocco subpositumque capiti mulierum libidinem movere aut anseris linguam in cibo vel potione sumptam.

phthiriasim et totius corporis pota membrana senectutis anguium triduo necat, serum exempto caseo potum cum exiguo sale. - caseos, si cerebrum

mustelae coagulo addatur, negant corrumpi vetustate aut a muribus attingi. eiusdem mustelae cinis si detur in offa gallinaceis et columbinis, tutos esse a mustelis. - iumentorum urinae tormina vespertilione adalligato finiuntur, verminatio ter circumlato mediis palumbe. mirum dictu, palumbis emissus moritur iumentumque liberatur confestim.

ebriosis ova noctuae per triduum data in vino taedium eius adducunt. ebrietatem arcet pecudum assus pulmo praesumptus. hirundinis rostri cinis cum murra tritus et vino, quod bibetur, inspersus securos praestabit a temulentia. invenit orus assyriorum rex.

praeter haec sunt notabilia animalium ad hoc volumen pertinentium: gromphenam, avem in sardinia narratam grui similem, ignotam iam etiam sardis existimo. in eadem provincia ophion, cervis tantum pilo similis nec alibi nascens. iidem auctores sirulugum nec quale esset animal nec ubi nasceretur tradiderunt. fuisse quidem non dubito, cum et medicinae ex eo sint demonstratae. m. cicero tradit animalia biuros vocari, qui vites in campania erodant.

reliqua mirabilia ex iis, quae diximus: non latrari a cane membranam e secundis canis habentem aut leporis fimum vel pilos tenentem. in culicum genere muliones ... non amplius quam uno die vivere, eosque, qui arborarii pici rostrum habeant et mella eximant, ab apibus non attingi; porcos sequi eum, a quo cerebrum corvi acceperint in offa. pulverem, in quo se mula volutaverit, corpori inspersum mitigare ardores amoris. sorices fugere, si unus castratus emittatur. anguina pelle et sale et farre, serpyllo contritis una deiectisque cum vino in fauces boum uva maturescente, toto anno eos valere, vel si hirundinum pulli terni ternis offis dentur. pulvere e vestigio anguium collecto sparso apes in alvos reverti. arietis dextro teste praeligato oves tantum gigni. non lassescere in ullo labore qui nervos ex alis et cruribus gruis habeant. mulas non calcitrare, cum vinum biberint. ungulas tantum mularum repertas, neque aliam ullam materiam, quae non perroderetur a veneno stygis aquae, cum id dandum alexandro magno antipater mitteret, memoria dignum est, magna aristotelis infamia excogitatum.

nunc ad aquatilia praevertemur.

LIBER XXXI

aquatilium secuntur in medicina beneficia, opifice natura ne in illis quidem cessante et per undas fluctusque ac reciprocos aestus amniumque rapidos cursus improbas exercente vires, nusquam potentia maiore, si verum fateri volumus, quippe hoc elementum ceteris omnibus imperat. terras devorant aquae, flammās necant, scandunt in sublime et caelum quoque sibi vindicant ac nubium obtentu vitalem spiritum strangulant, quae causa fulmina elidit, ipso secum discordante mundo. quid esse mirabilius potest aquis in caelo stantibus at illae, ceu parum sit in tantam pervenire altitudinem, rapiunt eo secum piscium examina, saepe etiam lapides, subeuntque portantes aliena pondera. eadem cadentes omnium terra enascentium causa fiunt, prorsus mirabili natura, si quis velit reputare, ut fruges gignantur, arbores fruticesque vivant, in caelum migrare aquas animamque etiam herbis vitalem inde deferre, iusta confessione, omnes terrae quoque vires aquarum esse beneficii. quapropter ante omnia ipsarum potentiae exempla ponemus. cunctas enim enumerare quis mortalium queat

emicant benigne passimque in plurimis terris alibi frigidae, alibi calidae, alibi iunctae, sicut in tarbellis aquitana gente et in pyrenaeis montibus tenui intervallo discernente, alibi tepidae, egelidae, atque auxilia morborum profitentes et e cunctis animalibus hominum tantum causa erumpentes augent numerum deorum nominibus variis urbesque condunt, sicut puteolos in campania, statellas in liguria, sextias in narbonensi provincia. nusquam tamen largius quam in baiano sinu nec pluribus auxiliandi generibus: aliae sulphuris vi, aliae aluminis, aliae salis, aliae nitri, aliae bituminis, nonnullae etiam acida salsave mixtura, vapore ipso aliquae prosunt, tantaque est vis, ut balneae calefaciant ac frigidam etiam in soliis fervere cogant. quae in baiano posidiana vocantur, nomine accepto a claudii caesaris liberto, obsonia quoque percocunt. vaporant et in mari ipso quae Licinii Crassi fuere, mediosque inter fluctus existit aliquid valetudini salutare.

iam generatim nervis prosunt pedibusve aut coxendicibus, aliae luxatis fractisve, inaniunt alvos, sanant vulnera, capiti, auribus privatim medentur, oculis vero ciceronianae. dignum memoratu, villa est ab averno lacu puteolos tendentibus inposita litori, celebrata porticu ac nemore, quam vocabat m. cicero academiam ab exemplo athenarum, ibi compositis voluminibus eiusdem nominis, in qua et monumenta sibi instauraverat, ceu vero non et in toto terrarum orbe fecisset. huius in parte prima exiguo post obitum ipsius antistio vetere possidente eruperunt fontes calidi perquam salubres oculis, celebrati carmine laureae tullii, qui fuit e libertis eius, ut protinus noscatur etiam ministeriorum haustus ex illa maiestate ingenii. ponam enim ipsum carmen, ut ubique et non ibi tantum legi queat: “quo tua, romanae vindex clarissime linguae,

silva loco melius surgere iussa viret atque academiae celebratam nomine

villam

nunc reparat cultu sub potiore vetus, hoc etiam apparent lymphae non ante repertae,

languida quae infuso lumina rore levant. nimirum locus ipse sui ciceronis honori

hoc dedit, hac fontes cum patefecit ope, ut, quoniam totum legitur sine fine per orbem,

sint plures oculis quae medeantur aquae.”

in eadem campaniae regione sinuessanae aquae sterilitatem feminarum et virorum insaniam abolere produntur, in aenaria insula calculosis mederi et quae vocatur acidula ab teano sidicino [iiii] p. - haec frigida - , item in stabiano quae dimidia vocatur et in venafrano ex fonte acidulo. idem contingit in velino lacu potantibus, item in syriae fonte iuxta taurum montem auctor est M. Varro et in phrygiae gallo flumine callimachus. sed ibi in potando necessarius modus, ne lymphatos agat, quod in aethiopia accidere iis, qui e fonte rubro biberint, ctesias scribit. iuxta romam albulae aquae vulneribus medentur, egelidae hae, sed cutiliae in sabinis gelidissimae suctu quodam corpora invadunt, ut prope morsus videri possit, aptissimae stomacho, nervis, universo corpori. thespiarum fons conceptus mulieribus repraesentat, item in arcadia flumen elatum, custodit autem linus fons in eadem arcadia abortusque fieri non patitur. e diverso in pyrrha flumen, quod aphrodisium vocatur, steriles facit. lacu alphio vitilignes tolli Varro auctor est titiumque praetura functum marmorei signi faciem habuisse propter id vitium. cydnus ciliciae amnis podagricis medetur, sicut apparet epistula cassi parmensis ad m. antonium. contra aquarum culpa in troezene omnium pedes vitia sentiunt. tungri civitas galliae fontem habet insignem plurimis bullis stillantem, ferruginei saporis, quod ipsum non nisi in fine potus intellegitur. purgat hic corpora, tertianas febres discutit, calculorum vitia. eadem aqua igne admoto turbida fit ac postremo rubescit. leucogaei fontes inter puteolos et neapolim oculis et vulneribus medentur. cicero in admirandis posuit reatinis tantum paludibus ungulas iumentorum indurari.

eudicus in hestiaeotide fontes duos tradit esse, ceronam, ex quo bibentes oves nigras fieri, nelea, ex quo albas, ex utroque varias, theophrastus thuriis crathim candorem facere, sybarim nigritiam bubus ac pecori, quin et homines sentire differentiam eam; nam qui e sybari bibant, nigriores esse durioresque et crispo capillo, qui e crathi candidos mollioresque ac porrecta coma. item in macedonia qui velint sibi candida nasci, ad haliacmonem ducere, qui nigra aut fusca, ad axium. idem omnia fusca nasci quibusdam in locis dicit et fruges quoque, sicut in messapis, at in lysis arcadiae quodam fonte mures terrestres vivere et conversari. erythris aleos amnis pilos gignit in corporibus.

in boeotia ad trophonium deum iuxta flumen hercynnum e duobus fontibus alter memoriam, alter oblivionem adfert, inde nominibus inventis. in cilicia apud oppidum cescum rivus fluit nuus, ex quo bibentium subtiliores sensus fieri M. Varro tradit, at in cea insula fontem esse, quo hebetes fiant, zamae in

africa, ex quo canorae voces. - vinum taedio venire iis, qui ex clitorio lacu biberint, ait eudoxus, set theopompus inebriari fontibus iis, quos diximus, mucianus andri e fonte liberi patris statis diebus septenis eius dei vinum fluere, si auferatur e conspectu templi, sapore in aquam transeunte, polyclitus lipari iuxta solos ciliciae ungui, theophrastus hoc idem in aethiopia eiusdem nominis fonte, lycos in indis oratis fontem esse, cuius aqua lucernae luceant; idem ecbatanis traditur. theopompus in scotusaeis lacum esse dicit, qui volneribus medeatur, iuba in trogodytis lacum insanum malefica vi appellatum ter die fieri amarum salsumque ac deinde dulcem totiensque et nocte, scatentem albis serpentibus vicenum cubitorum; idem in arabia fontem exilire tanta vi, ut nullum non pondus inpactum respuat; theophrastus marsyae fontem in phrygia ad celaenarum oppidum saxa egerere. non procul ab eo duo sunt fontes claeon et gelon ab effectu graecorum nominum dicti. cyzici fons cupidinis vocatur, ex quo potantes amorem deponere mucianus credit.

cranone est fons calidus citra summum fervorem, qui vino addito triduo calorem potionis custodit in vasis. sunt et mattiaci in germania fontes calidi trans rhenum, quorum haustus triduo fervet, circa margines vero pumicem faciunt aquae.

quod si quis fide carere ex his aliqua arbitratur, discat in nulla parte naturae maiora esse miracula, quamquam inter initia operis abunde multa rettulimus. ctesias tradit silan vocari stagnum in indis, in quo nihil innatet, omnia mergantur; caelius apud nos in averno etiam folia subsidere, Varro aves, quae advolaverint, emori. contra in africae lacu apuscidamo omnia fluitant, nihil mergitur, item in siciliae fonte phinthia, ut apion tradit, et in medorum lacu puteoque saturni. item fluvii fons limyrae transire solet in loca vicina portendens aliquid; mirum quoque quod cum piscibus transit. responsa ab his petunt incolae cibo, quem rapiunt adnuentes, si vero eventum negent, caudis abigunt. amnis alcas in bithynia bryazum adluit - hoc est et templo et deo nomen - , cuius gurgitem periuri negantur pati velut flammam urentem. et in cantabria fontes tamarici in auguriis habentur. tres sunt octonis pedibus distantes, in unum alveum coeunt vasto amne. singuli siccantur duodenis diebus, aliquando vicens, citra suspicionem ullam aquae, cum sit vicinus illis fons sine intermissione largus. dirum est non profluere eos aspicere volentibus, sicut proxime larcio licinio legato pro praetore post septem dies accidit. in iudaea rivus sabbatis omnibus siccatur.

e diverso miracula alia dira. ctesias in armenia fontem esse scribit, ex quo nigros pisces ilico mortem adferre in cibis. quod et circa danuvii exortum audiui, donec veniatur ad fontem alveo adpositum, ubi finitur id genus piscium, ideoque ibi caput amnis eius intellegit fama. hoc idem et in lydia in stagno nympharum tradunt. in arcadia ad pheneum aqua profluit e saxis styx appellata, quae ilico necat, ut diximus, sed esse pisces parvos in ea tradit theophrastus, letales et ipsos, quod non in alio genere mortiferorum fontium. necare aquas theopompus et in thracia apud cichros dicit, lycos in leontinis tertio die quam quis biberit, Varro ad soracten in fonte, cuius sit latitudo

quattuor pedum; sole oriente eum exundare ferventi similem; aves, quae degustaverint, iuxta mortuas iacere. namque et haec insidiosa condicio est, quod quaedam etiam blandiuntur aspectu, ut ad nonacrim arcadiae, omnino nulla deterrent qualitate. hanc putant nimio frigore esse noxiam, utpote cum profluens ipsa lapidescat. aliter circa thessalica tempe, quoniam virus omnibus terrori est, traduntque ae+na etiam ac ferrum erodi illa aqua. profluit, ut indicavimus, brevi spatio, mirumque, siliqua silvestris amplecti radicibus fontem eum dicitur, semper florens purpura. et quaedam sui generis herba in labris fontis viret. in macedonia non procul euripidis poetae sepulchro duo rivi confluunt, alter saluberrimi potus, alter mortiferi.

in perperenis fons est, quamcumque rigat, lapideam faciens terram, item calidae aquae in euboeae aedepso. nam quae adit rivus saxa in altitudinem crescunt. in eurymenis deiectae coronae in fontem lapideae fiunt. in colossis flumen est, quo lateres coniecti lapidei extrahuntur. in scyretico metallo arbores, quaecumque flumine adluuntur, saxeae fiunt cum ramis. destillantes quoque guttae lapide durescunt in antris, conchatis ideo, nam miezae in macedonia etiam pendentes in ipsis camaris, at in corycio cum cecidere, in quibusdam speluncis utroque modo columnasque faciunt, ut in phausia cherrhonesi adversae rhodo in antro magno, etiam discolori aspectu. et hactenus contenti simus exemplis.

quaeritur inter medicos, cuius generis aquae sint utilissimae. stagnantes pigrasque merito damnant, utiliores quae profluunt existimantes, cursu enim percussuque ipso extenuari atque proficere; eoque miror cisternarum ab aliquis maxime probari. sed hi rationem adferunt, quoniam levissima sit imbrum, ut quae subire potuerit ac pendere in ae+re. ideo et nives praeferunt nivibusque etiam glaciem, velut ad infinitum coacta subtilitate; leviora enim haec esse et glaciem multo levior aqua. horum sententiam refelli interest vitae. in primis enim levitas illa deprehendi aliter quam sensu vix potest, nullo paene momento ponderis aquis inter se distantibus. nec levitatis in pluvia aqua argumentum est subisse eam in caelum, cum etiam lapides subire appareat cadensque inficiatur halitu terrae, quo fit ut pluviae aquae sordium plurimum inesse sentiatur citissimeque ideo calefiat aqua pluvia. nivem quidem glaciemque subtilissimum elementi eius videri miror adposito grandinum argumento, e quibus pestilentissimum potum esse convenit. nec vero pauci inter ipsos e contrario ex gelu ac nivibus insaluberrimos potus praedicant, quoniam exactum sit inde quod tenuissimum fuerit. minui certe liquorem omnem congelatione deprehenditur et rore nimio scabiem fieri, pruina uredinem, cognatis et nivis causis. pluvias quidem aquas celerrime putrescere convenit minimeque durare in navigatione. epigenes autem aquam, quae septies putrefacta purgata sit, ait amplius non putrescere. nam cisternas etiam medici confitentur inutiles alvo duritia faucibusque, etiam limi non aliis inesse plus aut animalium, quae faciunt taedium. item confitendum habent nec statim amnium utilissimas esse, sicuti nec torrentium ullius, lacusque plurimos salubres. quaenam igitur et cuius generis aptissimae aliae alibi. parthorum

reges ex choaspe et eulaeo tantum bibunt; eae quamvis in longinqua comitantur illos. sed horum placere, non quia sint amnes, apparet, quoniam neque e tigris neque euphrate neque e multis aliis bibunt.

limus aquarum vitium est. si tamen idem amnis anguillis scateat, salubritatis indicium habetur, sicuti frigoris taenias in fonte gigni. ante omnia autem damnantur amarae et quae sorbentem statim implent, quod evenit troezenae. nam nitrosas atque salmacidas in desertis rubrum mare petentes addita polenta utiles intra duas horas faciunt ipsaque vescuntur polenta. damnantur in primis quae fonte caenum faciunt quaeque malum colorem bibentibus, refert et si vasa aerea inficiant aut si legumina tarde percocant, si liquatae leniter terram relinquunt decoctaeque crassis obducant vasa crustis. est etiamnum vitium non fetidae modo, verum omnino quicquam resipientis, iucundum sit illud licet gratumque et, ut saepe, ad viciniam lactis accedens. aquam salubrem aeri quam simillimam esse oportet. unus in toto orbe traditur fons aquae iucunde olentis in mesopotamia chabura; fabulae rationem adferunt, quoniam eo iuno perfusa sit. de cetero aquarum salubrium sapor odorve nullus esse debet.

quidam statera iudicant de salubritate, frustrante diligentia, quando perrarum est ut levior sit aliqua. certior subtilitas, inter pares meliorem esse quae calefiat refrigereturque celerius. quin et haustam vasis portatis, ne manu pendeant, depositisque in humum tepescere adfirmant. ex quonam ergo genere maxime probabilis continget puteis nimirum, ut in oppidis video constare, sed iis, quibus et exercitationis ratio crebro haustu continget et illa tenuitas colante terra. salubritati haec satis sunt; frigori et opacitas necessaria utque caelum videant. super omnia una observatio - eadem et ad perennitatem pertinet - , ut illa e vado exiliat vena, non e lateribus. nam ut tactu gelida sit, etiam arte contingit, si expressa in altum aut e sublimi deiecta verberatum corripit aeri. in natando quidem spiritum continentibus frigidior sentitur eadem. neronis principis inventum est decoquere aquam vitroque demissam in nives refrigerare; ita voluptas frigoris contingit sine vitiiis nivis. omnem utique decoctam utiliore esse convenit, item calefactam magis refrigerari, subtilissimo invento. vitiosae aquae remedium est, si decoquatur ad dimidias partes. aqua frigida ingesta sistitur sanguis. aestus in balineis arcetur, si quis ore teneat. quae sint haustu frigidissimae, non perinde et tactu esse, alternante hoc bono, multi familiari exemplo colligunt.

clarissima aquarum omnium in toto orbe frigoris salubritatisque palma praeconio urbis marcia est, inter reliqua deum munera urbi tributa. vocabatur haec quondam aufeia, fons autem ipse pitonia. oritur in ultimis montibus paelignorum, transit marsos et fucinum lacum, romam non dubie petens. mox in specus mersa in tiburtina se aperit, ita novem milibus passuum fornicibus structis perducta. primus eam in urbem ducere auspicatus est ancus marcius, unus e regibus, postea q. marcius rex in praetura, rursusque restituit m. agrippa. idem et virginem adduxit ab octavi lapidis diverticulo duo milia passuum praenestina via. iuxta est herculaneus rivus, quem refugiens virginis

nomen obtinuit. horum amnium comparatione differentia supra dicta deprehenditur, cum quantum virgo tactu praestat, tantum praestet marcia haustu, quamquam utriusque iam pridem urbi periit voluptas, ambitione avaritiaque in villas ac suburbana detorquentibus publicam salutem.

non ab re sit quaerendi aquas iunxisse rationem. reperiuntur in convallibus maxime et quodam convexitatis cardine aut montium radicibus. multi septentrionales ubique partes aquosas existimavere, qua in re varietatem naturae aperuisse conveniat. in hyrcanis montibus a meridiano latere non pluit; ideo silvigeri ab aquilonis tantum parte sunt. at olympus, ossa, parnasus, appenninus, alpes undique vestiuntur amnibusque perfunduntur, aliqui ab austro, sicut in creta albi montes. nihil ergo in his perpetuae observationis iudicabitur.

aquarum sunt notae iuncus et herba, de qua dictum est, multumque alicui loco pectore incubans rana. salix enim erratica et alnus aut vitex aut harundo aut heder a sponte proveniunt et contrivatione aquae pluviae in locum humiliorem e superioribus defluentis, augurio fallaci, certiore multo nebulosa exhalatione ante ortum solis longius intuentibus, quod quidam ex edito speculantur proni terram adtingente mento. est et peculiaris aestimatio peritis tantum nota, quam ferventissimo aestu secuntur dieique horis ardentissimis, qualis ex quoque loco percussus splendeat. nam si terra sitiente umidior sit ille, indubitata spes promittitur. sed tanta oculorum intentione opus est, ut indolescant. quod fugientes ad alia experimenta decurrunt. loco in altitudinem pedum quinque defosso ollisque e figlino opere crudis aut peruncta pelvi aerea lanae vellere cooperto lucernaque ardente concamarata frondibus, dein terra, si figlinum umidum ruptumve aut in aere sudor vel lucerna sine defectu olei restincta aut etiam vellus lanae madidum reperiatur, non dubie promittunt aquas. quidam et igni prius excocunt locum, tanto efficaciore vasorum argumento.

terra vero ipsa promittit candicantibus maculis aut tota glauci coloris. in nigra enim scaturigines non fere sunt perennes. figularis creta semper adimit spes, nec amplius puteum fodiunt coria terrae observantes, ut a nigra descendat ordo supra dictus. aqua semper dulcis in argillosa terra, frigidior in tofo. namque et hic probatur, dulces enim levissimasque facit et colando continet sordes. sabulum exiles limosasque promittit, glarea incertas venas, sed boni saporis, sabulum masculum et harena carbunculus certas stabilesque et salubres, rubra saxa optimas speique certissimae, radices montium saxosae et silex hoc amplius rigentes. oporteat autem fodientibus umidiores adsidue respondere glaebas faciliusque ferramenta descendere. depressis puteis sulphurata vel aluminosa occurrentia putearios necant. experimentum huius periculi est demissa ardens lucerna si extingatur; tunc secundum puteum lexta ac sinistra fodiuntur aestuaria, quae graviorem illum halitum recipiant. fit et sine his vitiis altitudine ipsa gravior ae+r, quem emendant adsiduo linteorum iactatu eventilando. cum ad aquam ventum est, sine harenato opus surgit, ne venae obstruantur.

quaedam aquae vere statim incipiente frigidiores sunt, quarum non in alto origo est - hibernis enim constant imbris - , quaedam a canis ortu, sicut in macedoniae pella utrumque. ante oppidum enim incipiente aestate frigida est palustris, dein maximo aestu in excelsioribus oppidi riget. hoc et in chio evenit simili ratione portus et oppidi. athenis enneacrunos nimbose aestate frigidior est quam puteus in iovis horto, at ille siccitatibus riget. maxime autem putei circa arcturum, non ipsa aestate, deficiunt omnesque quadriduo eo subsidunt, iam vero multi hieme tota, ut circa olynthum, vere primum aquis redeuntibus. in sicilia quidem circa messanam et mylas hieme in totum inarescunt fontes, aestate exundant amnemque faciunt. apolloniae in ponto fons iuxta mare aestate tantum superfluit et maxime circa canis ortum, parcius, si frigidior sit aestas. quaedam terrae imbris sicciores fiunt, velut in narniensi agro, quod admirandis suis inseruit m. cicero, siccitate lutum fieri prodens, imbre pulverem. - omnis aqua hieme dulcior est, aestate minus, autumno minime, minusque per siccitates. neque aequalis amnium plerumque gustus est magna alvei differentia. quippe tales sunt aquae, qualis terra, per quam fluunt, qualesve herbarum, quas lavant, suci. ergo iidem amnes parte aliqua reperiuntur insalubres. mutant saporem et influentes rivi, ut borysthenen, victique diluuntur. aliqui vero et imbre mutantur. ter accidit in bosporo, ut salsi deciderent necarentque frumenta, totiens et nili rigua pluviae amara fecere, magna pestilentia aegypti.

nascuntur fontes decisis plerumque silvis, quos arborum alimenta consumeabant, sicut in haemo obsidente gallos cassandro, cum valli gratia silvas cecidissent. plerumque vero damnosi torrentes contrivantur detracta collibus silva continere nimbos ac digerere consueta. et coli moverique terram callumque summae cutis solvi aquarum interest. proditur certe in creta expugnato oppido, quod vocabatur arcadia, cessasse fontes amnesque, qui in eo situ multi erant, rursus condito post sex annos emersisse, ut quaeque coepissent partes coli. terrae quoque motus profundunt sorbentque aquas, sicut circa pheneum arcadiae quinquies accidisse constat. sic et in coryco monte amnis erupit posteaque coeptus est coli. illa mutatio mira, cuius causa nulla evidens apparet, sicut in magnesia e calida facta frigida, salis non mutato sapore, et in caria, ubi neptuni templum est, amnis, qui fuerat ante dulcis, mutatus in salem est. et illa miraculi plena, arethusam syracusis fimum redolere per olympia, verique simile, quoniam alpheus in eam insulam sub maria permeet. rhodiorum fons in cherroneso nono anno purgamenta egerit. mutantur et colores aquarum, sicut babylone lacus aestate rubras habet diebus xi et borysthenes statis temporibus caeruleus fertur, quamquam omnium aquarum tenuissimus ideoque innatans hypani, in quo et illud mirabile, austris flantibus superiorem hypanim fieri. sed tenuitatis argumentum et aliud est, quod nullum halitum, non modo nebulam, emittat. qui volunt diligentes circa haec videri, dicunt aquas graviores post brumam fieri.

ceterum a fonte duci fictilibus tubis utilissimum est crassitudine binum digitorum, commissuris pyxidatis ita, ut superior intret, calce viva ex oleo

levigatis. libramentum aquae in centenos pedes sicilici minimum erit, si cuniculo veniet, in binos actus lumina esse debebunt. quam surgere in sublime opus fuerit, plumbo veniat. subit altitudinem exortus sui. si longiore tractu veniet, subeat crebro descendatque, ne libramenta pereant. fistulas denum pedum longitudinis esse legitimum est et, si quinariae erunt, sexagena pondo pendere, si octonariae, centena, si denariae, centena vicena ac deinde ad has portiones. denaria appellatur cuius lamnae latitudo, antequam curvetur, digitorum x est, dimidioque eius quinaria. in anfractu omni collis quinariam fieri, ubi dometur impetus, necessarium est, item castella, prout res exiget.

homerum calidorum fontium mentionem non fecisse demiror, cum alioqui lavari calida frequenter induceret, videlicet quia medicina tunc non erat haec, quae nunc aquarum perfugio utitur. est autem utilis sulphurata nervis, aluminata paralyticis aut simili modo solutis, bituminata aut nitrosa, qualis cutilia est, bibendo itaque purgationibus. plerique in gloria ducunt plurimis horis perpeti calorem earum, quod est inimicissimum, namque paulo diutius quam balineis uti oportet ac postea frigida dulci, nec sine oleo discedentes, quod vulgus alienum arbitratur, idcirco non alibi corporibus magis obnoxiiis, quippe et vastitate odoris capita replentur et frigore infestantur sudantia, reliqua corporum parte mersa. similis error quam plurimo potu gloriantium, vidique iam turgidos bibendo in tantum, ut anuli integerentur cute, cum reddi non posset hausta multitudo aquae. nec hoc ergo fieri convenit sine crebro salis gustu. utuntur et caeno fontium ipsorum utiliter, sed ita, si inlitum sole inarescat. nec vero omnes, quae sint calidae, medicatas esse credendum, sicut in segesta siciliae, larisa troade, magnesia, melo, lipara. nec decolor species aeris argentine, ut multi existimavere, medicaminum argumentum est, quando nihil eorum in patavinis fontibus, ne odoris quidem differentia aliquaprehendetur.

medendi modus idem et in marinis erit, quae calefiunt ad nervorum dolores, feruminanda a fracturis ossa, contusa, item corpora siccanda, qua de causa et frigidum mari utuntur. praeterea est alius usus multiplex, principalis vero navigandi phthisi adfectis, ut diximus, aut sanguine egesto, sicut proxime annaeum gallionem fecisse post consulatum meminimus. neque enim aegyptus propter se petitur, sed propter longinquitatem navigandi. quin et vomitiones ipsae instabili volutatione commotae plurimis morbis capitis, oculorum, pectoris medentur omnibusque, propter quae helleborum bibitur. aquam vero maris per sese efficaciorum discutiendis tumoribus putant medici, si illa decoquatur hordeacea farina, ad parotidas. emplastris etiam, maxime albis, et malagmatis miscent; prodest et infusa crebro ictu. bibitur quoque, quamvis non sine iniuria stomachi, ad purganda corpora bilemque atram aut sanguinem concretum reddendum alterutra parte. quidam et in quartanis dedere eam bibendam et in tenesmis articulariisque morbis adservatam in hoc ut vetustate virus deponentem, aliqui decoctam, omnes ex alto haustam nullaque dulcium mixtura corruptam. in quo usu praecedere vomitum volunt. tunc quoque acetum aut vinum et aquam miscent. qui puram dedere, raphanos

supermandi ex mulso aceto iubent, ut ad vomitiones revocent. clysteribus quoque marinam infundunt tepefactam. testium quidem tumores fovendo non aliud praeferunt, item pernionum vitio ante ulcera, simili modo pruritibus, psoris et lichenum curationi. lendes quoque et taetra capitis animalia hac curantur. et liventia reducit eadem ad colorem. in quibus curationibus post marinam aceto calido fovere plurimum prodest. quin et ad ictus venenatos salutaris intellegitur, ut phalangiorum et scorpionum, et ptyade aspidē respersis; calida autem in his adsumitur. suffitur eadem cum aceto capitis doloribus. tormina quoque et choleras calida infusa clysteribus sedant. difficilius perfrigescunt marina calefacta. mammas sororientes, praecordia maciemque corporis piscinae maris corrigunt, aurium gravitatem, capitis dolores cum aceto ferventium vapor. rubiginem ferro marinae celerrime exterunt, pecorum quoque scabiem sanant lanasque emolliunt.

nec ignoro haec mediterraneis supervacua videri posse. verum et hoc cura providit inventa ratione, qua sibi quisque aquam maris faceret. illud in ea ratione mirum, si plus quam sextarius salis in iiii sextarios aquae mergatur, vinci aquam salemque non liquari. cetero sextarius salis cum iiii aquae sextariis salsissimi maris vim et naturam implet. moderatissimum autem putant supra dictam aquae mensuram octonis cyathis salis temperari, quoniam ita et nervos excalefaciat et corpus non exasperet.

inveteratur et quod vocant thalassomeli aequis portionibus maris, mellis, imbris. ex alto et ad hunc usum advehunt fictilique vaso et picato condunt. prodest ad purgationes maxime sine stomachi vexatione et sapore grato et odore. - hydromeli quoque ex imbre puro cum melle temperabatur quondam, quod daretur adpetentibus vini aegris veluti innocentiore potu, damnatum iam multis annis, isdem vitiis quibus vinum nec isdem utilitatibus. - quia saepe navigantes defectu aquae dulcis laborant, haec quoque subsidia demonstrabimus. expansa circa navem vellera madescunt accepto halitu maris, quibus dulcis umor exprimitur, item demissae reticulis in mare concavae e cera pilae vel vasa inania opturata dulcem intra se colligunt umorem. nam in terra marina aqua argilla percolata dulcescit.

luxata corpora et hominum et quadrupedum natando in cuius libeat generis aqua facillime in artus redeunt. - est et in metu peregrinantium ut temptent valitudinem aquae ignotae. hoc cavent e balineis egressi statim frigidam suspectam hauriendo. - muscus, qui in aqua fuerit, podagris inlitis prodest, idem oleo admixto talorum dolori tumorique. spuma aquae adfrictu verrucas tollit, nec non harena litorum maris, praecipue tenuis et sole candens; in medicina est siccandis corporibus coopertis hydropicorum aut rheumatismos sentientium.

et hactenus de aquis, nunc de aquatilibus. ordiemur autem, ut in reliquis, a principalibus eorum, quae sunt salsa ac spongea.

sal omnis aut fit aut gignitur, utrumque pluribus modis, sed causa gemina, coacto umore vel siccato. siccatur in lacu tarentino aestivis solibus, totumque stagnum in salem abit, modicum alioqui, altitudine genua non excedens, item

in sicilia in lacu, qui cocanicus vocatur, et alio iuxta gelam. horum extremitates tantum inarescunt, sicut in phrygia, cappadocia, aspendi, ubi largius coquitur et usque ad medium. aliud etiam in eo mirabile, quod tantundem nocte subvenit, quantum die auferas. omnis e stagnis sal minutus atque non glaeba est. aliud genus ex aquis maris sponte gignitur spuma in extremis litoribus ac scopulis relictis. hic omnis rore densatur, et est acrior qui in scopulis invenitur. sunt etiamnum naturales differentiae tres. namque in bactris duo lacus vasti, alter ad scythas versus, alter ad arios, sale exaestuant, sicut ad citium in cypro et circa memphin extrahunt e lacu, dein sole siccant. sed et summa fluminum densantur in salem, amne reliquo veluti sub gelu fluente, ut apud caspias portas quae salis flumina appellantur, item circa mardos et armenios. praeterea et apud bactros amnes ochus et oxus ex adpositis montibus deferunt salis ramenta. sunt et in africa lacus, et quidem turbidi, salem ferentes. ferunt quidem et calidi fontes, sicut pagasaei. et hactenus habent se genera ex aquis sponte provenientia. sunt et montes nativi salis, ut in indis oromenus, in quo lapicidinarum modo caeditur renascens, maiusque regum vectigal ex eo est quam ex auro atque margaritis. effoditur et e terra, ut palam est umore densato, in cappadocia. ibi quidem caeditur specularium lapidum modo; pondus magnum glaebis, quas micas vulgus appellat. gerris arabiae oppido muros domosque massis salis faciunt aqua feruminantes. invenit et iuxta pelusium ptolemaeus rex, cum castra faceret. quo exemplo postea inter aegyptum et arabiam etiam squalentibus locis coeptus est inveniri detractis harenis, qualiter et per africae sitientia usque ad hammonis oraculum, is quidem crescens cum luna noctibus. nam et cyrenaici tractus nobilitantur hammoniaco et ipso, quia sub harenis inveniatur, appellato. similis est colore alumini, quod schiston vocant, longis glaebis neque perlucidis, ingratus sapore, sed medicinae utilis. probatur quam maxime perspicuus, rectis scissuris. insigne de eo proditur, quod levissimus intra specus suos in lucem universam prolatus vix credibili pondere ingravescat. causa evidens, cuniculorum spiritu madido sic adiuvante molientes, ut adjuvant aquae. adulteratur siculo, quem cocanicum appellavimus, nec non et cyprio mire simili. in hispania quoque citeriore egelestae caeditur glaebis paene translucentibus, cui iam pridem palma a plerisque medicis inter omnia salis genera perhibetur. omnis locus, in quo reperitur sal, sterilis est nihilque gignit. et in totum sponte nascens intra haec est.

facticii varia genera. vulgaris plurimusque in salinis mari adfuso non sine aquis dulcibus riguis, sed imbre maxime iuvante ac super omnia sole multo ... que, aliter non inarescens. africa circa uticam construit acervos salis ad collium speciem, qui ubi sole lunaque induruerit, nullo umore liquescunt vixque etiam ferro caeduntur. fit tamen et in creta sine riguis mare in salinas infundentibus et circa aegyptum ipso mari influente in solum, ut credo, nilo sucosum. fit et puteis in salinas ingestis. prima densatio babylone in bitumen liquidum cogitur oleo simile, quo et in lucernis utuntur. hoc detracto subest sal. et in cappadocia e puteis ac fonte aquam in salinas ingerunt. in chaonia

excoquant aquam e fonte refrigerandoque salem faciunt inertem nec candidum. galliae germaniaeque ardentibus lignis aquam salsam infundunt; hispaniae quadam sui parte e puteis hauriunt muriam appellantes. illi quidem et lignum referre arbitrantur. quercus optima, ut quae per se cinere sincero vim salis reddat, alibi corylus laudatur. ita infuso liquore salso arbor etiam in salem vertitur. quicumque ligno confit sal niger est. apud theophrastum invenio umbros harundinis et iunci cinerem decoquere aqua solitos, donec exiguum superesset umoris. quin et e muria salsamentorum recoquitur iterumque consumpto liquore ad naturam suam redit, vulgo e menis iucundissimus.

marinorum maxime laudatur cyprius a salamine, at e stagnis tarentinus ac phrygius, qui tattaesus vocatur. hi duo oculis utiles. e cappadocia qui in laterculis adfertur, cutis nitorem dicitur facere. magis tamen extendit is, quem citium appellavimus, itaque a partu ventrem eo cum melanthio inlinunt. salissimus sal qui siccissimus, suavissimus omnium tarentinus atque candidissimus, set de cetero fragilis qui maxime candidus. pluvia dulcescit omnis, suaviorem tamen rores faciunt, sed copiosum aquilonis flatus. austro non nascitur. flos salis non fit nisi aquilonibus. in igni nec crepitat nec exilit tragasaeus neque acanthius, ab oppido appellatus, nec ullius spuma aut ramentum tenuius. agrigentinus ignium patiens ex aqua exilit. sunt et colorum differentiae. rubet memphi, rufus est circa oxum, centuripis purpureus, circa gelam in eadem sicilia tanti splendoris, ut imaginem recipiat. in cappadocia crocinus effoditur, tralucidus et odoratissimus. ad medicinae usus antiqui tarentinum maxime laudabant, ab hoc quemcumque e marinis, ex eo genere spumeum praecipue, iumentorum vero et boum oculis tragasaeum et baeticum. ad opsonium et cibum utilior quisquis facile liquescit, item umidior, minorem enim amaritudinem habent, ut atticus et euboicus. servandis carnibus aptior acer et siccus, ut megaricus. conditur etiam odoribus additis et pulmentarii vicem implet, excitans aviditatem invitansque in omnibus cibis ita, ut sit peculiaris ex eo intellectus inter innumera condimenta, item in mandendo quaesitus garo. quin et pecudes armentaque et iumenta sale maxime sollicitantur ad pastus, multo tum largiore lacte multoque gratiore etiam in caseo dote. ergo, hercules, vita humanior sine sale non quit degere, adeoque necessarium elementum est, uti transierit intellectus ad voluptates animi quoque eximias. sales appellantur, omnisque vitae lepos et summa hilaritas laborumque requies non alio magis vocabulo constat. honoribus etiam militiaeque interponitur salariis inde dictis, magna apud antiquos et auctoritate, sicut apparet ex nomine salariae viae, quoniam illa salem in sabinos portari convenerat. ancus marcius rex salis modios [vi] in congiario dedit populis et salinas primus instituit. Varro etiam pulmentarii vice usos veteres auctor est, et salem cum pane esitasse eos proverbio apparet. maxime tamen in sacris intellegitur auctoritas, quando nulla conficiuntur sine mola salsa.

salinarum sinceritas summam fecit suam differentiam quadam favilla salis, quae levissima ex eo est et candidissima. appellatur et flos salis, in totum

diversa res umidiorisque naturae et crocei coloris aut rufi, veluti rubigo salis, odore quoque ingrato ceu gari dissentiens a sale, non modo a spuma. aegyptus invenit, videturque nilo deferri. et fontibus tamen quibusdam innatat. optimum ex eo quod olei quandam pinguitudinem reddit; est enim etiam in sale pinguitudo, quod miremur. adulteratur autem tinguiturque rubrica aut plerumque testa trita, qui fucus aqua deprehenditur diluente facticium colorem, cum verus ille non nisi oleo resolvatur et unguentarii propter colorem eo maxime utantur. canitia in vasis summa est, media vero pars umidior, ut diximus. floris natura aspera, excalfactoria, stomacho inutilis, sudorem ciet, alvum solvit in vino et aqua, acopis et zmecticis utilis. detrahit et ex palpebris pilos. ima faecis concutiuntur, ut croci color redeat.

praeter haec etiamnum appellatur in salinis salsugo, ab aliis salsilago, tota liquida, a marina aqua salsiore vi distans. - aliud etiamnum liquoris exquisiti genus, quod garum vocavere, intestinis piscium ceterisque, quae abicienda essent, sale maceratis, ut sit illa putrescentium sanies. hoc olim conficiebatur ex pisce, quem graeci garon vocabant, capite eius usto suffitu extrahi secundas monstrantes, nunc e scombros pisce laudatissimum in carthaginis spartariae cetariis - sociorum id appellatur - , singulis milibus nummum permutantibus congios fere binos. nec liquor ullus paene praeter unguenta maiore in pretio esse coepit, nobilitatis etiam gentibus. scombros et mauretania baeticaeque etiam carteia ex oceano intrantes capiunt, ad nihil aliud utiles. laudantur et clazomenae garo pompeique et leptis, sicut muria antipolis ac thurii, iam vero et delmatia. - vitium huius est allex atque imperfecta nec colata faex. coepit tamen et privatim ex inutili pisciculo minimoque confici. apuam nostri, aphyen graeci vocant, quoniam is pisciculus e pluvia nascatur. foroiulienses piscem, ex quo faciunt, lupum appellant. transiit deinde in luxuriam, creveruntque genera ad infinitum, sicuti garum ad colorem mulsi veteris adeoque suavitatem dilutum, ut bibi possit. aliud vero est castimoniarum superstitioni etiam sacrisque iudaeis dicatum, quod fit e piscibus squama carentibus. sic allex pervenit ad ostreas, echinos, urticas maris, mullorum iocinera, innumerisque generibus ad sapes gulae coepit sal tabescere.

haec obiter indicata sint desiderii vitae. et ipsa tamen non nullius usus in medendo. namque et allece scabies pecoris sanatur infusa per cutem incisam, et contra canis morsus draconisve marini prodest, in linteolis autem conceptis inponitur, et garo ambusta recentia sanantur, si quis infundat ac non nomet garum. contra canum quoque morsus prodest maximeque crocodili et ulceribus, quae serpunt, aut sordidis. oris quoque et aurium ulceribus aut doloribus mirifice prodest. muria quoque sive illa salsugo spissat, mordet, extenuat, siccatur, dysintericis utilis, etiam si nome intestina corripiat, ischiadicis, coeliacis veteribus infunditur. fotu quoque apud mediterraneos aquae marinae vicem pensat.

salis natura per se ignea est et inimica ignibus, fugiens eos, omnia erodens, corpora vero adstringens, siccans, adligans, defuncta etiam a putrescendi tabe vindicans, ut durent ea per saecula, in medendo vero mordens, adurens,

repurgans, extenuans, dissolvens, stomacho tantum inutilis, praeterquam ad excitandam aviditatem. adversus serpentium morsus cum origano, melle, hysopo, contra cerasten cum origano et cedria aut pice aut melle auxiliatur, contra scolopendras ex aceto potus, adversus scorpionum ictus cum quarta parte lini seminis et oleo vel aceto inlitus, adversus crabrones vero et vespas similiaque ex aceto, ad heterocranias capitisque ulcera et pusulas papulasve et incipientes verrucas cum sebo vitulino, item oculorum remediis et ad excrescentes ibi carnes totiusque corporis pterygia, sed in oculis peculiariter, ob id collyriis emplastrisque additus - ad haec maxime probatur tattaeus aut caunites - , ex ictu vero suffusis cruore oculis suggillatisque cum murra pari pondere ac melle aut cum hysopo ex aqua calida, utque foveantur salsugine - ad haec hispaniensis eligitur - , contraque suffusiones oculorum cum lacte in coticulis teritur, privatim suggillationibus in linteolo involutus crebroque ex aqua ferventi inpositus, ulceribus oris manantibus in linteolo concepto, gingivarum tumori infricatus et contra scabritiem linguae fractus comminutusque. aiunt dentes non erodi nec putrescere, si quis cotidie mane ieiunus salem contineat sub lingua, donec liquescat. lepras idem et furunculos et lichenas et psoras emendat cum passa uva exempto eius ligno et sebo bubulo atque origano ac fermento vel pane; maxime thebaicus ad haec et pruritus eligitur. tonsillis et uvis cum melle prodest quicumque, ad anginas hoc amplius cum oleo et aceto eodem tempore extra faucibus inlitus cum pice liquida. emollit et alvum vino mixto, innoxie et taeniarum genera pellit in vino potus, aestus balnearum convalescentes ut tolerare possint, linguae subditus praestat. nervorum dolores, maxime circa umeros et renes, in saccis aqua ferventi crebro candefactus levat, colum torminaque et coxarum dolores potus et in isdem saccis inpositus candens, podagras cum farina ex melle et oleo tritus, ibi maxime usurpanda observatione, quae totis corporibus nihil esse utilius sale et sole dixit. utique cornea videmus corpora piscatorum, sed hoc praecipuum iudicatur in podagris. tollit et clavos pedum, item perniones. ambustis ex oleo inponitur aut commanducatus pusulasque reprimit, ignibus vero sacris, ulceribus, quae serpant, ex aceto aut hysopo, carcinomatis cum uva taminia, phagedaenis ulcerum tostus cum farina hordei, superinposito linteolo madente vino. morbo regio laborantes, donec sudent ad ignem, contra pruritus, quos sentiunt, ex oleo et aceto infricatus iuvat, fatigatos ex oleo. multi et hydropicos sale curavere fervoresque febrium cum oleo perunxere et tussim veterem linctu eius discutere, clysteribus infudere ischiadicis, ulcerum excrescentibus vel putrescentibus inposuere, crocodilorum morsibus ex aceto in linteolis ita, ut battuerentur ante his ulcera. bibitur et contra opium ex aceto mulso, luxatis inponitur cum farina et melle, item extuberationibus. dentium dolori cum aceto fotus et inlitus cum resina prodest. ad omnia autem spuma salis iucundior utiliorque. sed quicumque sal acopis additur ad excalfactiones, item zmegmatis ad extendendam cutem levandamque. pecorum quoque scabiem et boum inlitus tollit datusque lingendus et oculis iumentorum inspuitur. haec de sale dicta sint.

non est differenda et nitri natura, non multum a sale distans et eo diligentius dicenda, quia palam est medicos, qui de eo scripserunt, ignorasse naturam nec quemquam theophrasto diligentius tradidisse.

exiguum fit apud medos canescentibus siccitate convallibus, quod vocant halmyraga, minus etiam in thracia iuxta philippos, sordidum terra, quod appellant agrium. nam quercu cremata numquam multum factitatum est et iam pridem in totum omissum. aquae vero nitrosae plurimis locis reperiuntur, sed sine viribus densandi. optimum copiosumque in clitis macedoniae, quod vocant chalestricum, candidum purumque, proximum sali. lacus est nitrosus exiliente e medio dulci fonticulo. ibi fit nitrum circa canis ortum novenis diebus totidemque cessat ac rursus innatat et deinde cessat. quo apparet soli naturam esse, quae gignat, quoniam compertum est nec soles proficere quicquam, cum cesset, nec imbres. mirum et illud, scatebra fonticuli semper emicante lacum neque augeri neque effluere. iis autem diebus, quibus gignitur, si fuere imbres, salsius nitrum faciunt, aquilones deterius, quia validius commovent limum.

et hoc quidem nascitur, in aegypto autem conficitur, multo abundantius, sed deterius, nam fuscum lapidosumque est. fit paene eodem modo quo sal, nisi quod salinis mare infundunt, nilum autumno nitrariis. hae accedente nilo rigantur, decedente madent suco nitri xl diebus continuis, non ut in macedonia statis. si etiam imbres adfuerunt, minus e flumine addunt, statimque ut densari coeptum est, rapitur, ne resolvatur in nitrariis. hic quoque olei natura intervenit, ad scabiem animalium utilis. ipsum autem conditum in acervis durat. mirum in lacu ascanio et quibusdam circa chalcida fontibus summas aquas dulces esse potarique, inferiores nitrosas. - in nitro optimum quod tenuissimum, et ideo spuma melior, ad aliqua tamen sordidum, tamquam ad inficiendas purpuras tincturasque omnes. magnus et vitro usus, qui dicitur suo loco. - nitrariae aegypti circa naucratim et memphin tantum solebant esse, circa memphin deteriores. nam et lapidescit ibi in acervis, multique sunt cumuli ea de causa saxei. faciunt ex his vasa nec non et frequenter liquatum cum sulphure coquentes. in carnibus quoque, quas inveterari volunt, illo nitro utuntur. sunt ibi nitrariae, in quibus et rufum exit a colore terrae.

spumam nitri, quae maxime laudatur, antiqui negabant fieri, nisi cum ros cecidisset praegnantibus nitrariis, sed nondum parientibus; itaque non fieri incitatis, etiamsi caderet. alii acervorum fermento gigni existimavere. proxima aetas medicorum aphronitrum tradidit in asia colligi in speluncis molibus destillans - specus eos colligas vocant - , dein siccari sole. optimum putatur lydium; probatio, ut sit minime ponderosum et maxime friabile, colore paene purpureo. hoc in pastillis adfertur, aegyptium in vasis picatis, ne liquescat; vasa quoque ea sole inarescentia perficiuntur.

nitri probatio, ut sit tenuissimum et quam maxime spongeosum fistulosumque. adulteratur in aegypto calce, deprehenditur gustu. sincerum enim statim resolvitur, adulteratum pungit calce et aspersum reddit odorem vehementer. uritur in testa opertum, ne exultet. alias igni non exilit nitrum,

nihilque gignit aut alit, cum in salinis herbae gignantur et in mari tot animalia, tantum algae. sed maiorem esse acrimoniam nitri apparet non hoc tantum argumento, sed et illo, quod nitrariae calciamenta protinus consumunt, alias salubres oculorumque claritati utiles. in nitrariis non lippiunt; ulcera allata eo celerrime sanantur, ibi facta tarde. ciet et sudores cum oleo perunctis corpusque emollit. in pane salis vice utuntur chalestraeo, ad raphanos aegyptio; teneriores eos facit, sed obsonia alba et deteriora, olera viridiora. in medicina autem calfacit, extenuat, mordet, spissat, siccatur, exulcerat, utile iis, quae evocanda sint aut discutienda et lenius mordenda atque extenuanda, sicut in papulis pusulisque. quidam in hoc usu accensum vino austero restingunt atque ita trito in balneis utuntur sine oleo. sudores nimios inhibet cum iride arida adiecto oleo viridi. extenuat et cicatrices oculorum et scabritias genarum cum fico inlitum aut decoctum in passo ad dimidias partes - item contra argema - , oculorum ungues decoctum in passo cum mali punici calyce; adiuvat claritatem visus cum melle inunctum. prodest dentium dolori, ex vino si cum pipere colluantur; item cum porro decoctum nigrescentes dentes, crematum dentifricio, ad colorem reducit. capitis animalia et lendes necat cum samia terra inlitum ex oleo. auribus purulentis vino liquatum infunditur, sordes eiusdem partis erodit ex aceto, sonitus et tinnitus discutit siccum additum. vitilignes albas cum creta cimolia aequo pondere ex aceto in sole inlitum emendat. furunculos admixtum resinae extrahit; cum uva alba passa nucleis eius simul tritis testium inflammationi occurrit, item eruptionibus pituitae in toto corpore cum axungia, contraque canis morsus addita et resina inlitis. cum aceto inlinitur sic et serpentium morsibus; phagedaenis et ulceribus, quae serpunt aut putrescunt, cum calce ex aceto. hydropicis cum fico tusum datur inliniturque. discutit et tormina, si decoctum bibatur pondere drachmae cum ruta vel aneto vel cumino. reficit lassitudines cum oleo et aceto perunctorum, et contra algores horroresque prodest manibus pedibusque confricatis cum oleo. comprimit et pruritus suffusorum felle, maxime cum aceto instillatum. succurrit et venenis fungorum ex posca potum aut, si buprestis hausta sit, ex aqua, vomitionesque evocat. iis, qui sanguinem tauri biberint, cum lasere datur. in facie quoque exulcerationes sanat cum melle et lacte bubulo. ambustis tostum, donec nigrescat, tritumque inlinitur. infunditur vesicae et renium dolori aut rigori corporum nervorumve doloribus. paralysi in lingua cum pane inponitur. suspiriosis in tisana sumitur. tussim veterem sanat flore mixto galbano, resinae terebinthinae pari pondere omnium ita, ut fabae magnitudo devoretur. coquitur dilutumque postea cum pice liquida sorbendum in angina datur.

flos eius cum oleo cypreo et articulorum doloribus in sole iucundus est. regium quoque morbum extenuat in potionem vini et inflationes discutit, sanguinis profluvium e naribus sistit ex ferventi aqua vapore naribus raptum. porriginem alumine permixto tollit, alarum virus ex aqua cottidiano fotu, ulcera ex pituita nata cera permixtum, quo genere nervis quoque prodest. coeliacis infunditur. perungui ante accessiones frigidas nitro et oleo multi

praecepere, sicut adversus lepras, lentigines; podagris in balneis uti. solia nitri prosunt atrophis, opisthotonis, tetanis. - sal nitrum sulphuri concoctum in lapidem vertitur.

spongearum genera diximus in naturis aquatilium marinorum. quidam ita distinguunt: alias ex his mares tenui fistula spissioresque, persorbentes, quae et tinguntur in deliciis, aliquando et purpura; alias feminas maioribus fistulis ac perpetuis; maribus alias duriores, quas appellant tragos, tenuissimis fistulis atque densissimis. candidae cura fiunt: e mollissimis recentes per aestatem tinctae salis spuma ad lunam et pruinas sternuntur inversae, hoc est qua parte adhaesere, ut candorem bibant. animal esse docuimus, etiam cruore inhaerente. aliqui narrant et auditu regi eas contrahique ad sonum, experientes abundantiam umoris, nec avelli petris posse, ideo abscidi ac saniem remittere, quin et ... eas, quae ab aquilone sint genitae, praeferunt ceteris, nec usquam diutius durare spiritum medici adfirmant. sic et prodesse corporibus, quia nostro suum misceant, et ideo magis recentes magisque umidas, sed minus in calida aqua minusque unctas aut unctis corporibus inpositas et spissas minus adhaerentes. mollissimum genus earum penicilli. oculorum tumores sedant ex mulso inpositi, iidem abstergendae lippitudini, utilissime ex aqua; tenuissimos esse mollissimosque oportet. inponuntur et spongeae ipsae epiphoris ex posca et ex aceto calido ad capitis dolores. de cetero recentes discutiunt, mitigant, molliunt, veteres non glutinant vulnera. usus earum ad abstergenda, fovenda, operienda a fotu, dum aliud inponatur. ulcera quoque umida et senilia inpositae siccant. fracturae et vulnera spongeis utilissime foveantur. sanguis rapitur in secando, ut curatio perspicui possit. et ipsae vulnerum inflammationibus inponuntur nunc siccae, nunc aceto adpersae nunc vino, nunc ex aqua frigida; ex aqua vero caelesti inpositae secta recentia non patiuntur intumescere. inponuntur et integris partibus, sed fluctione occulta laborantibus, quae discutienda sit, et iis, quae apostemata vocant, melle decocto perunctis, item articulis alias aceto salso madidae, alias e posca; si ferveat impetus, ex aqua, eadem callo e salsa, at contra scorpionum ictus ex aceto. in vulnerum curatione et sucidae lanae vicem implent ex eadem; differentia haec, quod lanae emolliunt, spongeae coercent rapiuntque vitia ulcerum. circumligantur et hydropicis siccae vel ex aqua tepida poscave, utcumque blandiri opus est operireve aut siccare cutem. inponuntur et iis morbis, quos vaporari oporteat, ferventi aqua perfusae expressaeque inter duas tabulas. sic et stomacho prosunt et in febris contra nimios ardores, sed splenicis e posca, ignibus sacris ex aceto efficaciores quam aliud; inponi oportet sic, ut sanas quoque partes spatiose operiant. sanguinis profluvium sistunt ex aceto aut frigida, livorem ab ictu recentem ex aqua salsa calida saepius mutata tollunt, testium tumorem doloremque ex posca. ad canum morsus utiliter concisae inponuntur ex aceto aut frigida aut melle, abunde subinde umectandae. africanae cinis cum porri sectivi suco sanguinem reicientibus haustus, aliis ex frigida, prodest. idem cinis vel cum oleo vel cum aceto fronti inlitus tertianas tollit. privatim africanae ex posca

tumorem discutit, omnium autem cinis cum pice crematarum sanguinem sistit vulnerum; aliqui raras tantum ad hoc cum pice urunt. et oculorum causa comburuntur in cruda olla figulini operis, plurimum proficiente eo cinere contra scabritias genarum excrescentesque carnes et quicquid opus sit ibi destringere, spissare, explere. utilius in eo usu lavare cinerem. praestant et strigilium vicem linteorumque adfectis corporibus. et contra solem apte protegunt capita. medici inscitia ad duo nomina eas rede gere, africanas, quarum firmitus sit robur, rhodiacasque ad fovendum molliores. nunc autem mollissimae circa muros antiphelli urbis reperiuntur. trogus auctor est circa lyciam penicillos mollissimos nasci in alto, unde ablatae sint spongeae, polybius super aegrum suspensos quietiores facere noctes.

nunc praevertemur ad marina animalia.

LIBER XXXII

ventum est ad summa naturae exemplorumque per rerum ordinem, et ipsum sua sponte occurrit inmensum potentiae occultae documentum, ut prorsus neque aliud ultra quaeri debeat nec par ac simile possit inveniri, ipsa se vincente natura, et quidem numerosis modis. quid enim violentius mari ventisve et turbinibus ac procellis quo maiore hominum ingenio in ulla sui parte adiuta est quam velis remisque addatur his et reciproci aestus inenarrabilis vis versumque totum mare in flumen. tamen omnia haec pariterque eodem inpellentia unus ac parvus admodum pisciculus, echenais appellatus, in se tenet. ruant venti licet, saeviant procellae: imperat furori viresque tantas compescit et cogit stare navigia, quod non vincula ulla, non ancorae pondere inrevocabili iactae. infrenat impetus et domat mundi rabiem nullo suo labore, non renitendo aut alio modo quam adhaerendo. hoc tantulo satis est, contra tot impetus ut vetet ire navigia. sed armatae classes inponunt sibi turrium propugnacula, ut in mari quoque pugnetur velut e muris. heu vanitas humana, cum rostra illa aere ferroque ad ictus armata semipedalis inhibere possit ac tenere devincta pisciculus! fertur actiaco marte tenuisse praetoriam navem antoni properantis circumire et exhortari suos, donec transiret in aliam, ideoque caesariana classis impetu maiore protinus venit. tenuit et nostra memoria gai principis ab astura antium renavigantis - ut res est, etiam auspicalis pisciculus, siquidem novissime tum in urbem reversus ille imperator suis telis confossus est - , nec longa fuit illius morae admiratio, statim causa intellecta, cum e tota classe quinquereimis sola non proficeret, exilientibus protinus qui quaererent circa navem. invenere adhaerentem gubernaculo ostenderuntque gaio indignanti hoc fuisse, quod se revocaret quadringentorumque remigum obsequio contra se intercederet. constabat peculiariter miratum, quomodo adhaerens tenuisset nec idem polleret in navigium receptus. qui tunc posteaque videre eum, limaci magnae similem esse dicunt. nos plurium opiniones posuimus in natura aquatilium, cum de eo diceremus, nec dubitamus idem valere omnia ea genera, cum celebri et consecrato etiam exemplo apud cnidiam venerem conchas quoque esse eiusdem potentiae credi necesse sit. e nostris quidam latine moram appellavere eum, mirumque, e graecis alii lubricos partus atque procidentes continere ad maturitatem adalligatum, ut diximus, prodiderunt, alii sale adservatum adalligatumque gravidis partus solvere, ob id alio nomine odinolyten appellari. quocumque modo ista se habent, quis ab hoc tenendi navigia exemplo de ulla potentia naturae vique et effectum in remediis sponte nascentium rerum dubitet

quid non et sine hoc exemplo per se satis esset ex eodem mari torpedo etiam procul et e longinquo, vel si hasta virgave attingatur, quamvis praevalidos lacertos torpescere, quamlibet ad cursum veloces alligari pedes quod si necesse habemus fateri hoc exemplo esse vim aliquam, quae odore

tantum et quadam aura corporis sui adficiat membra, quid non de remediorum omnium momentis sperandum est

non sunt minus mira quae de lepore marino traduntur. venenum est aliis in potu aut cibo datus, aliis etiam visu, siquidem gravidae, si omnino adspexerint feminam ex eo genere dumtaxat, statim nausiant et redundatione stomachi vitium fatentur ac deinde abortum faciunt. remedio est mas ob id induratus sale, ut in brachialibus habeant. eadem res in mari ne tactu quidem nocet. vescitur eo unum tantum animalium, ut non intereat, nullus piscis; tenerescit tantum et inertior viliorque fit. homines, quibus in tactus est, piscem olent; hoc primo argumento veneficium id deprehenditur. cetero moriuntur totidem in diebus, quot vixerit lepus, incertique temporis veneficium id esse auctor est licinius macer. in india adfirmant non capi viventem invicemque ibi hominem illi pro veneno esse ac vel digito omnino in mari tactum mori, esse autem multo ampliorem, sicuti reliqua animalia.

iuba in iis voluminibus, quae scripsit ad c. caesarem aug. f. de arabia, tradit mitulos ternas heminas capere, cetos sescentorum pedum longitudinis et trecentorum sexaginta latitudinis in flumen arabiae intrasse, pinguique eius mercatores negotiatos, et omnium piscium adipe camelos perungui in eo situ, ut asilos ab iis fugent odore.

mihi videntur mira et quae ovidius prodidit piscium ingenia in eo volumine, quod halieuticon inscribitur: scarum inclusum nassis non fronte erumpere nec infestis viminibus caput inserere, sed aversum caudae ictibus crebris laxare fores atque ita retrorsum repere, quem luctatum eius si forte alius scarus extrinsecus videat, adprehensa mordicus cauda adiuvaré nissus erumpentis; lupum rete circumdatum harenas arare cauda atque ita condi, dum transeat rete; murenam maculas adpetere ipsas consciam teretis ac lubrici tergi, tum multiplici flexu laxare, donec evadat; polypum hamos adpetere brachiisque complecti, non morsu, nec prius dimittere, quam escam circumroserit, aut harundine levatum extra aquam. scit et mugil esse in esca hamum insidiasque non ignorat, aviditas tamen tanta est, ut cauda verberando excutiat cibum. minus in providendo lupus sollertiae habet, sed magnum robur in paenitendo. nam is, ut haesit in hamo, tumultuoso discursu laxat volnera, donec excidant insidiae. murenae amplius devorant quam hamum, admovent dentibus lineas atque ita erodunt. anthias tradit idem infixio hamo invertere se, quoniam sit in dorso cultellata spina, eaque liniam praesequare.

licinius macer murenas feminini tantum sexus esse tradit et concipere e serpentibus, ut diximus - ob id sibilo a piscatoribus tamquam a serpentibus evocari et capi - et pinguescere, iactato fusti non interemi, easdem ferula protinus. animam in cauda habere certum est eaque icta celerrime exanimari, ad capitis ictum difficulter. novacula pisce qui attackti sunt, ferrum olent. durissimum esse piscium constat qui orbis vocetur; rotundus est, sine squamis totusque capite constat. - (lolligo quotiens cernatur extra aquam volitans, tempestates nuntiari). - trebius niger xiphian, id est gladium, rostro mucronato esse, ab hoc naves perfossas mergi; in oceano ad locum mauretaniae, qui

cottae vocetur, non procul lixo flumine idem lolligines evolare ex aqua tradit tanta multitudo, ut navigia demergant.

e manu vescuntur pisces in pluribus quidem caesaris villis, sed - quae veteres prodidere in stagnis, non piscinis, admirati - in heloro siciliae castello non procul syracusis, item in labrayndi iovis fonte anguillae et inaures additas gerunt, similiter in chio iuxta senum delubrum, in mesopotamiae quoque fonte chabura, de quo diximus, pisces. nam in lycia myris in fonte apollinis, quem curium appellant, ter fistula vocati veniunt ad augurium. diripere eos carnes abiectas laetum est consultantibus, caudis abigere dirum. hieropoli syriae in lacu veneris aedituorum vocibus parent, vocati veniunt exornati auro, adulantes scalpuntur, ora hiantia manibus inserendis praebent. in stabiano campaniae ad herculis petram melanuri in mari panem abiectum rapiunt, iidem ad nullum cibum, in quo hamus sit, accedunt.

nec illa in novissimis mira, amaros esse pisces ad pelen insulam et ad clazomenas, contra scopulum siciliae ac leptim africae et euboeam et durrachium, rursus ita salsos, ut possint salsamenta existumari, circa cephallaniam et ampelon, paron et deli petras, in portu eiusdem insulae dulces. quam differentiam pabulo constare non est dubium. apion piscium maxime mirum esse tradit porcum, quem lacedaemoni orthagoriscum vocent; grunnire eum, cum capiat. esse vero illam naturae accedentiam - quod magis miremur - etiam in locis quibusdam, adposito occurret exemplo, siquidem salsamenta omnium generum in italia beneventi refici constat.

pisces marinos in usu fuisse protinus a condita roma auctor est cassius hemina, cuius verba de ea re subiciam: “numa constituit ut pisces, qui squamosi non essent, ni polluerent, parsimonia commentus, ut convivia publica et privata cenaque ad pulvinaria facilius compararentur, ni qui ad polluctum emerent pretio minus parcerent eaque praemercentur.”

quantum apud nos indicis margaritis pretium est, de quis suo loco satis diximus, tantum apud indos curalio; namque ista persuasione gentium constant. gignitur et in rubro quidem mari, sed nigrius, item in persico - vocatur lace - , laudatissimum in gallico sinu circa stoechadas insulas et in siculo circa aeolias ac drepana. nascitur et apud gravisca et ante neapolim campaniae maximeque rubens, sed molle et ideo vilissimum erythris. forma est ei fruticis, colos viridis. bacae eius candidae sub aqua ac molles, exemptae confestim durantur et rubescunt qua corna sativa specie atque magnitudine. aiunt tactu protinus lapidescere, si vivat; itaque occupari evellique retibus aut acri ferramento praecidi, qua de causa curalium vocitatum interpretantur. probatissimum quam maxime rubens et quam ramosissimum nec scabiosum aut lapideum aut rursus inane et concavum. auctoritas bacarum eius non minus indorum viris quoque pretiosa est quam feminis nostris uniones indici. harispices eorum vatesque inprimis religiosum id gestamen amoliendis periculis arbitrantur. ita et decore et religione gaudent. prius quam hoc notesceret, galli gladios, scuta, galeas adornabant eo. nunc tanta paenuria est vendibili merce, ut perquam raro cernatur in suo orbe. surculi infantiae

adalligati tutelam habere creduntur contraque torminum ac vesicae et calculorum mala in pulverem igni redacti potique cum aqua auxiliantur, simili modo ex vino poti aut, si febris sit, ex aqua somnum adferunt - ignibus diu repugnat - , sed eodem medicamine saepius poto tradunt lienem quoque absumi. sanguinem reicientibus excreantibusve medetur cinis eorum; miscetur oculorum medicamentis, spissat enim ac refrigerat, ulcerum cava explet, cicatrices extenuat.

quod ad repugnantiam rerum attinet, quam graeci antipathian vocant, nihil est usquam venenatius quam in mari pastinaca, utpote cum radio eius arbores necari dixerimus. hanc tamen persequitur galeos, idem et alios quidem pisces, sed pastinacas praecipue, sicut in terra mustela serpentes - tanta est aviditas ipsius veneni - , percussis vero ab ea medentur et hic quidem, sed et mullus ac laser, spectabili naturae potentia, in iis quoque, quibus et in terris victus est, sicut fibris, quos castoras vocant et castorea testes eorum. amputari hos ab ipsis, cum capiantur, negat sextius diligentissimus medicinae, quin immo parvos esse substrictosque et adhaerentes spinae, nec adimi sine vita animalis posse; adulterari autem renibus eiusdem, qui sint grandes, cum veri testes parvi admodum reperiantur; praeterea ne vesicas quidem esse, cum sint geminae, quod nulli animalium; in iis folliculis inveniri liquorem et adservari sale; itaque inter probationes falsi esse folliculos geminos ex uno nexu dependentes, quod ipsum corrumpi fraude conicientium cummim cum sanguine aut hammoniacum, quoniam hammoniacy coloris esse debeant circumdati, liquore veluti mellis cerosi, odore graves, gustu amaro et acri, friabiles. efficacissimi e ponto galatiaque, mox africa. sternumenta olfactu movent. somnum conciliant cum rosaceo et peucedano peruncto capite et per se poti ex aqua, ob id phreneticis utiles; iidem lethargicos odoris suffitu excitant volvarumque exanimationes vel subditu, ac menses et secundas cient ii drachmis cum puleio ex aqua poti. medentur et vertigini, opisthotono, tremulis, spasticis, nervorum vitiis, ischiadicis, stomachicis, paralyticis, perunctis omnibus, vel triti ad crassitudinem mellis cum semine viticis ex aceto ac rosaceo. sic et contra comitiales sumpti, poti vero contra inflationes, tormina, venena. differentia tantum contra genera est mixturae, quippe adversus scorpiones ex vino bibuntur, adversus phalangia et araneos ex mulso ita, ut vomitione reddantur aut ut contineantur cum ruta, adversus chalcidas cum myrtite, adversus cerasten et presteras cum panace aut ruta ex vino, adversus ceteras serpentes cum vino. dari binas drachmas satis; eorum, quae adiciantur, singulas. auxiliantur privatim contra viscum ex aceto, adversus aconitum ex lacte aut aqua, adversus helleborum album ex aqua mulsa nitroque. medentur et dentibus infusi cum oleo triti in aurem, a cuius parte doleant, aurium dolori melius, si cum meconio. claritatem visus faciunt cum melle attico inunctis. cohibent singultus ex aceto. urina quoque fibri resistit venenis et ob id in antidota additur. adservatur autem optume in sua vesica, ut aliqui existumant.

geminus similiter victus in aquis terraque et testudinum effectusque par,

honore habendo vel propter excellens in usu pretium figuraeque proprietatem. sunt ergo testudinum genera terrestres, marinae, lutariae et quae in dulci aqua vivunt. has quidam e graecis emydas appellant.

terrestrium carnes suffitionibus propriae magicisque artibus refutandis et contra venena salutare produntur. plurimae in africa. hae ibi amputato capite pedibusque pro antidoto dari dicuntur et e iure in cibo sumptae strumas discutere, lienes tollere, item comitiales morbos. sanguis earum claritatem visus facit, discutit suffusiones oculorum. et contra serpentium omnium et araneorum ac similium et ranarum venena auxiliatur servato sanguine in farina pilulis factis et, cum opus sit, in vino datis. felle testudinum cum attico melle glaucomata inungi prodest. scorpionum plagae instillant. tegimenti cinis vino et oleo subactus pedum rimas ulceraque sanat. squamae e summa parte derasae et in potu datae venerem cohibent. eo magis hoc mirum, quoniam totius tegimenti farina accendere traditur libidinem. urinam aliter earum quam in vesica dissectarum inveniri posse non arbitror et inter ea esse hoc quoque, quae portentose magi demonstrant, adversus aspidum ictus singularem, efficacior tamen, ut aiunt, cimicibus admixtis. ova durata inlinuntur strumis et ulceribus frigore aut adustione factis. sorbentur in stomachi doloribus.

marinarum carnes admixtae ranarum carnibus contra salamandras praeclare auxiliantur, neque est testudine aliud salamandrae adversius. sanguine alopeciarum inanitas et porrigo omniaque capitis ulcera curantur; inarescere eum oportet lenteque ablui. instillatur et dolori aurium cum lacte mulierum. adversus morbos comitiales manditur cum polline frumenti, miscetur autem sanguinis heminis iii aceti hemina. datur et suspiriosis, sed tum hemina vini additur; his et cum hordeacea farina, aceto quoque admixto, ut sit quod devoretur fabae magnitudine; et haec singula et matutina et vespera dantur, dein post aliquot dies bina vespera. comitialibus instillatur ore diducto; iis, qui modice corripiantur spasmo, cum castoreo clystere infunditur. quod si dentes ter annis colluantur testudinum sanguine, immunes a dolore fiant. et anhelitus discutit quasque orthopnoeas vocant; ad has in polenta datur. fel testudinum claritatem oculorum facit, cicatrices extenuat, tonsillas sedat et anginas et omnia oris vitia, privatim nomas ibi, item testium. naribus inlitum comitiales erigit attollitque. idem cum vernatione anguium aceto admixto unice purulentis auribus prodest. quidam bubulum fel admiscet decoctarum carnum testudinis suco, addita aequae vernatione anguium; sed vino testudinem excocunt. oculorum utique vitia omnia fel inunctum cum melle emendat, suffusiones etiam marinae fel cum fluviatilil sanguine et lacte. capillus mulierum inficitur felle. contra salamandras vel sucum decoctae bibisse satis est.

tertium genus testudinum est in caeno et paludibus viventium. latitudo his et in dorso pectori similis nec convexo curvata calice, ingrata visu. ex hac quoque tamen aliqua contingunt auxilia. tres namque in succensa sarmenta coiectae dividitibus se tegumentis rapiuntur, tum evolsae carnes earum

cocuntur in congio aquae sale modice addito; ita decoctarum ad tertias partes sucus paralytim et articulares morbos sentientibus bibitur. detrahit idem fel pituitas sanguinemque vitiatum. sistitur ab eo remedio alvus aquae frigidae potu.

e quarto genere testudinum, quae sunt in omnibus, divolsarum pingua cum aizoo herba tinsa admixto unguento et semine lili, si ante accessiones perunguntur aegri praeter caput, mox convoluti calidam aquam bibant, quartanis liberare dicuntur. hanc testudinem xv luna capi oportere, ut plus pinguium reperiatur, verum aegrum xvi luna perungi. ex eodem genere testudinum sanguis instillatus cerebro capitis dolores sedat, item strumas. sunt qui testudinum sanguinem cultro aereo supinarum capitibus praecisis excipi novo fictili iubeant, ignem sacrum cuiuscumque generis sanguine inlini, item capitis ulcera manantia, verrucas. iidem promittunt testudinum omnium fimo panos discuti; et, quod incredibile dictu sit, aliqui tradunt tardius ire navigia testudinis pedem dextrum vehentia.

hinc deinde in morbos digeremus aquatilia, non quia ignoremus gratiorem esse universitatem animalium maiorisque miraculi, sed hoc utilius est vitae, contributa habere remedia, cum aliud alii prosit, aliud alibi facilius inveniatur.

venenatum mel diximus ubi nasceretur. auxilio est piscis aurata in cibo. vel si ex melle sincero fastidium cruditasve, quae fit gravissima, incidat, testudinem circumcisis pedibus, capite, cauda decoctam antidotum esse auctor est pelops, scincum Apelles. quid esset scincus diximus, saepius vero quantum veneficii in menstruis mulierum. contra ea omnia auxiliatur, ut diximus, mullus, item contra pastinacam et scorpiones terrestres marinosque et dracones, phalangia inlitis sumptusve in cibo, eiusdem recentis e capite cinis contra omnia venena, privatim contra fungos. mala medicamenta inferri negant posse aut certe nocere stella marina volpino sanguine inlita et adfixa limini superiori aut clavo aereo ianuae. draconis marini scorpionumque ictus carnibus earum inpositis, item araneorum morsus sanantur. in summa contra omnia venena vel potu vel ictu vel morsu noxia sucus earum e iure decoctarum efficacissimus habetur.

sunt et servatis piscibus medicinae, salsamentorumque cibus prodest a serpente percussis et contra bestiarum ictus mero subinde hausto ita, ut per satiem cibus vomitione reddatur, peculiariter a chalcide, ceraste aut quas sepas vocant aut elope, dipsade percussis. contra scorpionem largius sumi, sed non evomi, salsamenta prodest ita, ut sitis toleretur; et inponere plagis eadem convenit. contra crocodilorum quidem morsus non aliud praesentius habetur. privatim contra presteris morsum sarda prodest. inponuntur salsamenta et contra canis rabiosi; vel si non sint ferro ustae plagae corporaque clysteribus exinanita, hoc per se sufficit. et contra draconem marinum ex aceto inponuntur. idem et cybio effectus. draco quidem marinus ad spinae suae, qua ferit, venenum ipse inpositus vel cerebro poto prodest.

ranarum marinarum ex vino et aceto decoctarum sucus contra venena bibitur, et contra ranae rubetae venenum et contra salamandras vel e

fluviatilibus; si carnes edantur iusve decoctarum sorbeatur, prosunt et contra leporem marinum et contra serpentes supra dictos, contra scorpiones ex vino. democritus quidem tradit, si quis extrahat ranae viventi linguam, nulla alia corporis parte adhaerente, ipsaque dimissa in aquam inponat supra cordis palpitationem mulieri dormienti, quaecumque interrogaverit, vera responsuram. addunt etiamnum alia magi, quae si vera sint, multo utiliores vitae existuntur ranae quam leges; namque harundine transfixis a natura per os si surculus in menstruis defigatur a marito, adulterorum taedium fieri. carnibus earum vel in hamum additis praecipue purpuras adlici certum est. iocur ranae geminum esse dicunt abicique formicis oportere; eam partem, quam adpetant, contra venena omnia esse pro antidoto. sunt quae in vepribus tantum vivunt, ob id rubetarum nomine, ut diximus, quas graeci φρῦνους vocant, grandissimae cunctarum, geminis veluti cornibus, plenae veneficiorum. mira de iis certatim tradunt auctores: inlatis in populum silentium fieri; ossiculo, quod sit in dextro latere, in aquam ferventem deiecto refrigerari vas nec postea fervere nisi exempto, id inveniri abiecta rana formicis carnibusque erosis, singula in oleum addi; esse in sinistro latere quo deiecto fervere videatur, apocynon vocari, canum impetus eo cohiberi, amorem concitari et iurgia addito in potionem, venerem adalligato stimulari, rursus e dextro latere refrigerari ferventia; hoc et quartanas sanari adalligato in pellicula agnina recenti aliasque febris, amorem inhiberi. ex isdem his ranis lien contra venena, quae fiant ex ipsis, auxiliatur, iocur vero etiam efficacius.

est colubra in aqua vivens. huius adipem et fel habentes qui crocodilos venentur mire adiuvari dicunt, nihil contra belua audente, efficacius etiamnum, si herba potamogiton misceatur. - cancri fluviatiles triti potique ex aqua recentes seu cinere adservato contra venena omnia prosunt, privatim contra scorpionum ictus cum lacte asinino, si non sit, caprino aut quocumque; addi et vinum oportet. necant eos triti cum ocimo admoti. eadem vis contra venenatorum omnium morsus, privatim scytalen et angues et contra leporem marinum ac ranam rubetam. cinis eorum servatus prodest pavore potus periclitantibus ex canis rabiosi morsu. quidam adiciunt gentianam et dant in vino, et si iam pavor occupaverit, pastillos vino subactos devorandos ita praecipiunt. decem vero cancris cum ocimi manipulo adligatis omnes, qui ibi sint, scorpiones ad eum locum coituros magi dicunt, et cum ocimo ipsos cineremve eorum percussis inponunt. minus in omnibus his marini prosunt. thrasyllus auctor est nihil aeque adversari serpentibus quam cancos; sues percussas hoc pabulo sibi mederi; cum sol sit in cancro, serpentes torqueri. - ictibus scorpionum carnes et fluviatilium coclearum resistunt crudae vel coctae. quidam ob id salsas quoque adservant. inponunt et plagis ipsis. - coracini pisces nilo quidem peculiare sunt, sed nos haec omnibus terris demonstramus. carnes eorum adversus scorpiones valent inpositae. - inter venena piscium sunt porci marini spinae in dorso, cruciatu magno laesorum. remedio est limus ex reliquiis piscium eorum corporis.

canis rabidi morsibus potum expavescentibus faciem perungunt adipe vituli

marini, efficacius, si medulla hyaenae et oleum e lentisco et cera misceantur. murenae morsus ipsarum capitis cinere sanantur. et pastinaca contra suum ictum remedio est cinere suo ex aceto inlito vel alterius. cibi causa extrahi debet ex dorso eius quidquid croco simile est caputque totum; et hanc autem et omnia testacea modice colluunt cibis, quia saporis gratia perit. e lepore marino veneficium restingunt poti hippocampi. contra dorycnium echini maxime prosunt, et iis, qui sucum carpathi biberint, praecipue e iure sumpti. et cancri marini decocti ius contra dorycnium efficax habetur, peculiariter vero contra leporis marini venena.

et ostrea adversantur isdem, nec potest videri satis dictum esse de iis, cum palma mensarum diu iam tribuatur illis. gaudent dulcibus aquis et ubi plurimi influant amnes; ideo pelagia parva et rara sunt. gignuntur tamen et in petrosis carentibusque aquarum dulcium adventu, sicut circa grynum et myrinam. grandescunt sideris quidem ratione maxime, ut in natura aquatiliū diximus, sed privatim circa initia aestatis multo lacte praegnata atque ubi sol penetret in vada. haec videtur causa, quare minora in alto reperiantur; opacitas cohibet incrementum, et tristitia minus adpetunt cibos. variantur coloribus, rufa hispaniae, fusca illyrico, nigra et carne et testa cerceis, praecipua vero habentur in quacumque gente spissa nec saliva sua lubrica, crassitudine potius spectanda quam latitudine, neque in lutosi capta neque in harenosis, sed solido vado, spondylo brevi atque non carnoso, nec fibris laciniosa ac tota in alvo. addunt peritiores notam ambiente purpureo crine fibras, eoque argumento generosa interpretantur calliblephara ea appellantes. gaudent et peregrinatione transferrique in ignotas aquas. sic brundisina in averno compasta et suum retinere sucum et a lucrino adoptare creduntur.

haec sint dicta de corpore; dicemus et de nationibus, ne fraudentur gloria sua litora, sed dicemus aliena lingua quaeque peritissima huius censurae in nostro aevo fuit. sunt ergo muciani verba, quae subiciam: “cyzicena maiora lucrinis, dulciora brittannicis, suaviora medullis, acriora ephesis, pleniora iliciensibus, sicciora coryphantenis, teneriora histricis, candidiora cerceiensibus. sed his neque dulciora neque teneriora ulla esse compertum est.” in indico mari alexandri rerum auctores pedalia inveniri prodidere, nec non inter nos nepotis cuiusdam nomenclatura tridacna appellavit, tantae amplitudinis intellegi cupiens, ut ter mordenda essent.

dos eorum medica hoc in loco tota dicitur: stomachum unice reficiunt, fastidiis medentur, addiditque luxuria frigus obrutis nive, summa montium et maris ima miscens. emolliunt alvum leniter. eademque cocta cum mulso tenesmo, qui sine exulceratione sit, liberant. vesicarum ulcera quoque repurgant. cocta in conchis suis, uti clusa invenerint, mire destillationibus prosunt. testae ostreorum cinis uvam sedat et tonsillas admixto melle, eodem modo parotidas, panos mammarumque duritias, caput ulcera ex aqua cutemque mulierum extendit; inspergitur et ambustis. et dentifricio placet. pruritibus quoque et eruptionibus pituitae ex aceto medetur. crudae si tundantur, strumas sanant et perniones pedum.

purpurae quoque contra venena prosunt. et algam maris theriacen esse nicander tradit. plura eius genera, ut diximus, longo folio et rubente, latiore alia vel crispo. laudatissima quae in creta insula iuxta terram in petris nascitur, tinguendis etiam lanis, ita colorem alligans, ut elui postea non possit. e vino iubet eam dari.

alopecias replet hippocampi cinis nitro et adipe suillo mixtus aut sincerus ex aceto, praeparat autem saepiarum crustae farina medicamentis cutem; replet et muris marini cinis cum oleo, item echini cum carnibus suis cremati, fel scorpionis marini, ranarum quoque iii, si vivae in olla concrementur, cinis cum melle, melius cum pice liquida. capillum denigrant sanguisugae, quae in vino nigro diebus xxxx computuere. alii in aceti sextariis ii sanguisugarum sextarium in vase plumbeo putrescere iubent totidem diebus, mox inlini in sole. sornatius tantam vim hanc tradit, ut, nisi oleum ore contineant qui tinguunt, dentes quoque suco earum denigrari dicat. - capitis ulceribus muricum vel purpurarum testae cinis cum melle utiliter inlinitur, conchyliorum vel, si non uratur, farina ex aqua, doloribus castoreum cum peucedano et rosaceo.

omnium piscium fluviatilium marinorumque adipēs liquefacti sole admixto melle oculorum claritati plurimum conferunt, item castoreum cum melle. callionymi fel cicatrices sanat et carnes oculorum supervacuas consumit. nulli hoc piscium copiosius, ut existumavit menander quoque in comoediis. idem piscis et uranoscopus vocatur ab oculo, quem in capite habet. et coracini fel excitat visum, et marini scorpionis rufi cum oleo vetere aut melle attico incipientes suffusiones discutit; inungui ter oportet intermissis diebus. eadem ratio albugines oculorum tollit. mullorum cibo aciem oculorum hebetari tradunt. lepus marinus ipse quidem venenatus est, sed cinis eius in palpebris pilos inutiles evolsos cohibet. ad hunc usum utilissimi minimi, item pectunculi salsi triti cum cedria, ranae, quas diopetas et calamitas vocant; earum sanguis cum lacrima vitis evolso pilo palpebris inlinatur. tumorem oculorum ruboremque saepiae cortex cum lacte mulieris inlitus sedat et per se scabritias emendat; invertunt ita genas et medicamentum auferunt post paulum rosaceoque inungunt et pane inposito mitigant. eodem cortice et nyctalopes curantur, in farinam trito ex aceto inlito. extrahit et squamas eius cinis. cicatrices oculorum cum melle sanat, pterygia cum sale et cadmia singulis drachmis, emendat et albugines iumentorum. aiunt et ossiculo eius genas, si terantur, sanari. echini ex aceto epinyctidas tollunt. eundem comburi cum viperinis pellibus ranisque et cinerem aspergi potionibus iubent magi, claritatem visus promittentes. ichthyocolla appellatur piscis, cui glutinosum est corium. idem nomen glutino eius; hoc epinyctidas tollit. quidam ex ventre, non e corio, fieri dicunt ichthyocollam, ut glutinum taurinum. laudatur pontica, candida et carens venis squamisque et quae celerrime liquescit. madescere autem debet concisa in aqua aut aceto nocte ac die, mox tundi marinis lapidibus, ut facilius liquescat. utilem eam et capitis doloribus adfirmant et tetanis. ranae dexter oculus dextri, sinister laevi, suspensi e collo

nativi coloris panno lippitudines sanant; quod si per coitum lunae eruantur, albuginem quoque, adalligati similiter in putamine ovi. reliquae carnes inpositae suggillationem rapiunt. cancri etiam oculos adalligatos collo mederi lippitudini dicunt. est parva rana in harundinetis et herbis maxime vivens, muta ac sine voce, viridis, si forte hauriatur, ventres boum distendens. huius corporis umorem derasum specillis claritatem oculis inunctis narrant adferre. et ipsas carnes doloribus oculorum superponunt. ranas xv coiectas in fictile novum iuncis configunt quidam sucoque earum, qui ita effluxerit, admiscent vitis albae lacrimam atque ita palpebras emendant, inutilibus pilis exemptis acu instillantes hunc sucum in vestigia evolsorum. meges psilotrum palpebrarum faciebat in aceto enecans putrescentes et ad hoc utebatur multis variisque per aquisitiones autumnii nascentibus. idem praestare sanguisugarum cinis ex aceto inlitus putatur - comburi eas oportet in novo vaso - , idem thynni iocur siccatum pondere #1108 iiii cum oleo cedrino perunctis pilis viiii mensibus.

auribus utilissimum batiae piscis fel recens, sed et inveteratum nitro, item bacchi, quem quidam mizyenem vocant, item callionymi cum rosaceo infusum vel castoreum cum papaveris suco. vocant et in mari peduculos eosque tritos instillari ex aceto auribus iubent. et per se et conchylio infecta lana magnopere prodest; quidam aceto et nitro madefaciunt. sunt qui praecipue contra omnia aurium vitia laudent gari excellentis cyathum, mellis dimidio amplius, aceti cyathum in calice novo leni pruna decoquere subinde spuma pinnis detera et, postquam desierit spumare, tepidum infundere. si tumeant aures, coriandri suco prius mitigandas iidem praecipiunt. ranarum adips instillatus statim dolores tollit. cancrorum fluviatilium sucus cum farina hordeacea aurium vulneribus efficacissime prodest. parotides muricum testae cinere cum melle vel conchyliorum ex mulso curantur.

dentium dolores sedantur ossibus draconis marini scariphatis gingivis, cerebro caniculae in oleo decocto adservatoque, ut ex eo dentes semel anno colluantur. pastinacae quoque radio scariphari gingivas in dolore utilissimum. contritus is et cum helleboro albo inlitus dentes sine vexatione extrahit. salsamentorum etiam in fictili vase combustorum cinis addita farina marmoris inter remedia est. et cybia vetera eluta in novo vase, dein trita prosunt doloribus. aequae prodesse dicuntur omnium salsamentorum spinae combustae tritaeque et inlitae. decocuntur et ranae singulae in aceti heminis, ut dentes ita colluantur contineaturque in ore sucus. si fastidium obstaret, suspendebat pedibus posterioribus eas sallustius dionysius, ut ex ore virus deflueret in acetum fervens, idque e pluribus ranis; fortioribus stomachis ex iure mandendas dabat. maxillaresque ita sanari praecipue dentes putant, mobiles vero supra dicto aceto stabiliri. ad hoc quidam ranarum corpora binarum praecisis pedibus in vini hemina macerant et ita collui dentium labantes iubent. aliqui totas adalligant maxillis. alii denas in sextariis iii aceti decoxere ad tertias partes, ut mobiles dentium stabilirent. nec non xlvi ranarum corda in olei veteris sextario sub aereo testo discoxere, ut infunderent per aurem

dolentis maxillae. alii iocur ranae decoctum et tritum cum melle inposuere dentibus. omnia supra scripta ex marina efficaciora. si cariosi et faetidi sint, cetum in furno areferi per noctem praecipiunt, postea tantundem salis addi atque ita fricari. enhydris vocatur graecis colubra in aqua vivens. huius iiii dentibus superioribus in dolore superiorum gingivas scariphant, inferiorum inferioribus; aliqui canino tantum earum contenti sunt. utuntur et cancrorum cinere, nam muricum cinis dentifricium est.

lichenas et lepras tollit adipis vituli marini, menarum cinis cum mellis obolis ternis, iocur pastinacae in oleo coctum, hippocampi aut delphini cinis ex aqua inlitus. exulcerationem sequi debet curatio, quae perducit ad cicatricem. quidam delphini in fictili torrent, donec pinguitudo similis oleo fluat; hac perungunt. muricum vel conchyliorum testae cinis maculas in facie mulierum purgat cum melle inlitus cutemque erugat et extendit septenis diebus inlitus ita, ut octavo candido ovorum foveantur. muricum generis sunt quae vocant graeci coluthia, alii coryphia, turbinata aequae, sed minora, multo efficaciora, etiam oris halitum custodientia. ichthyocolla erugat cutem extenditque in aqua decocta horis iiii, dein contusa et subacta ad liquorem usque mellis. ita praeparata in vase novo conditur et in usu iiii drachmis eius binae sulphuris et anchusae totidem, viii spumae argenteae adduntur aspersaque aqua teruntur una. sic inlita facies post iiii horas abluitur. medetur et lentigini ceterisque vitiis ex ossibus saepiarum cinis. idem et carnes excrescentes tollit et umida ulcera. psoras tollit rana decocta in heminis v aquae marinae; excoqui debet, donec sit lentitudo mellis. - fit in mari alcyoneum appellatum, e nidis, ut aliqui existumant, alcyonum et ceycum, ut alii, sordibus spumarum crassescens, alii e limo vel quadam maris lanugine. quattuor eius genera: cinereum, spissum, odoris asperi, alterum molle, lenius odore et fere algae, tertium candidioris vermiculi, quartum pumicosius, spongeae putri simile. paene purpureum quod optimum; hoc et milesium vocatur. quo candidius autem, hoc minus probabile est. vis eorum ut exulcerent, purgent. usus tostis et sine oleo. mire lepras, lichenas, lentigines tollunt cum lupino et sulphuris ii obolis. alcyoneo utuntur et ad oculorum cicatrices. - andreas ad lepras cancri cinere cum oleo usus est, attalus thynni adipe recenti.

oris ulcera menarum muria et capitum cinis cum melle sanat. strumas pungi piscis eius, qui rana in mari appellatur, ossiculo e cauda ita, ut non volneret, prodest. faciendum id cotidie, donec percurentur. eadem vis est pastinacae radio et lepori marino inposito ita, ut celeriter removeatur, echini testis contusis et ex aceto inlitis, item scolopendrae marinae e melle, cancro fluviatili contrito vel combusto ex melle. mirifice prosunt et saepiae ossa cum axungia vetere contusa et inlita. sic et ad parotidas utuntur, et sauri piscis marini iocineribus, quin et testis cadi salsamentarii tuis cum axungia vetere, muricum cinere ex oleo ad parotidas strumasque. - rigor cervicis mollitur et marinis, qui pediculi vocantur, drachma pota, castoreo poto cum pipere ex mulso mixto, ranis decoctis ex oleo et sale, ut sorbeatur succus. sic et opisthotono medentur et tetano, spasticis vero pipere adiecto. - anginas

menarum salsarum e capitibus cinis ex melle inlitus abolet, ranarum decoctarum aceto sucus; hic et contra tonsillas prodest. cancri fluviatiles triti singuli in hemina aquae anginis medentur gargarizati, aut e vino et calida aqua poti. uvae medetur garum coclearibus subditum. vocem siluri recentes salsive in cibo sumpti adiuvant.

vomitiones nulli inveterati tritique in potione concitant. - suspiriosis castorea cum hammoniacy exigua portione ex aceto mulso ieiunis utilissima potu. eadem potio spasmos stomachi sedat ex aceto mulso calido. - tussim sanare dicuntur piscium modo e iure decoctae in patinis ranae. suspensae autem pedibus, cum destillaverit in patinas saliva earum, exinterari iubentur abiectisque interaneis condiri. est rana parva arborem scandens atque ex ea vociferans; in huius os si quis expuat ipsamque dimittat, tussi liberari narratur. praecipiant et cocleae crudeae carnem tritam bibere ex aqua calida in tussi cruenta.

iocineris doloribus ... scorpio marinus in vino necatus, ut inde bibatur, conchae longae carnes ex mulso potae cum aquae pari modo aut, si febres sint, ex aqua mulsa. - lateris dolores leniunt hippocampi tosti sumpti tetheaque similis ostreo in cibo sumpta, ischiadicorum muria siluri clystere infusa. dantur autem conchae ternis obolis dilutis in vini sextariis ii per dies xv.

alvum emollit silurus e iure et torpedo in cibo et olus marinum simile sativo - stomacho inimicum alvum facillime purgat, sed propter acrimoniam cum pingui carne coquitur - et omnium piscium ius. idem et urinas ciet, e vino maxime. optimum e scorpionibus et iulide et saxatilibus nec virus resipientibus nec pinguibus. coci debent cum aneto, apio, coriandro, porro, additis oleo, sale. purgant et cybia vetera privatimque cruditates; pituitas, bilem trahunt.

purgant et myaces, quorum natura tota in hoc loco dicitur. acervantur muricum modo vivuntque in algosis, gratissimi autumnis et ubi multa dulcis aqua miscetur mari, ob id in aegypto laudatissimi. procedente hieme amaritudinem trahunt coloremque rubrum. horum ius traditur alvum et vesicas exinanire, interanea destringere, omnia adaperire, renes purgare, sanguinem adipemque minuere. itaque utilissimi sunt hydropicis, mulierum purgationibus, morbo regio, articulario, inflationibus, item obesis, fellis pituitae quoque, pulmonis, iocineris, lienis vitiis, rheumatismis. fauces tantum vexant vocemque obtundunt. ulcera, quae serpant aut sint purganda, sanant, item carcinomata cremati ut murices; et morsus canum hominumque cum melle, lepras, lentigines. cinis eorum lotus emendat caligines, scabritias, albugines, gingivarum et dentium vitia, eruptiones pituitae; et contra dorycnium aut opocarpalum antidoti vicem optinent. degenerant in duas species: mitulos, qui salem virusque resipiunt, myiscas quae rotunditate differunt, minores aliquanto atque hirtae, tenuioribus testis, carne dulciores. mituli quoque ut murices cinere causticam vim habent et ad lepras, lentigines, maculas. lavantur quoque plumbi modo ad genarum crassitudines et oculorum albugines caliginesque atque in aliis partibus sordida ulcera capitisque

pusulas. carnes eorum ad canis morsus inponuntur.

at pelorides emolliunt alvum, item castorea in aqua mulsa drachmis binis. qui vehementius volunt uti, addunt cucumeris sativi radices siccae drachmam et aphronitri ii. tethea torminibus et inflationibus occurrunt. inveniuntur haec in foliis maris sugentia, fungorum verius generis quam piscium. eadem et tenesnum dissolvunt reniumque vitia. nascitur et in mari apsinthium, quod aliqui seriphum vocant, circa taposirim maxime aegypti, exilius terrestri. alvum solvit et noxiis animalibus intestina liberat - solvunt et saepiae - ; in cibo datur cum oleo et sale et farina coctum. menae salsae cum felle taurino inlitaе umbilico alvum solvunt. piscium ius in patina coctorum cum lactucis tenesnum discutit. cancri fluviatiles triti et ex aqua poti alvum sistunt, urinam cient in vino albo. adeptis brachiis calculos pellunt iii obolis cum murra et iride singulis earum drachmis, ileos et inflationes castorea cum dauci semine et petroselino quantum ternis digitis sumatur, ex mulsi calidi cyathis iiii, tormina vero cum aneto ex vino mixto. erythini in cibo sumpti sistunt alvum. dysentericis medentur ranae cum scilla decoctae ita, ut pastilli fiant, vel cor earum cum melle tritum, ut tradit niceratus, morbo regio salsamentum cum pipere ita, ut reliqua carne abstineatur.

lienī medetur solea piscis inpositus, item torpedo, item rhombus; vivus dein remittitur in mare. scorpio marinus necatus in vino vesicae vitia et calculos sanat, lapis, qui invenitur in scorpionis marini cauda, pondere oboli potus, enhydridis iecur, blendiorum cinis cum ruta. inveniuntur et in bacchi piscis capite ceu lapilli; hi poti ex aqua calculosis praeclare medentur. aiunt et urticam marinam in vino potam prodesse, item pulmonem marinum decoctum in aqua. ova saepiae urinam movent reniumque pituitas extrahunt. rupta, convolsa cancri fluviatiles triti in asinino maxime lacte sanant, echini vero cum spinis suis contusi et e vino poti calculos - modus singulis hemina; bibitur, donec prosit - et alias in cibus ad hoc proficiunt. purgatur vesica et pectinum cibo. ex iis mares alii δὲνᾱκᾱς vocant, alii αὐλοῦς, feminas ὄνυχας. urinam mares movent. dulciores feminae sunt et unicolores. saepiae quoque ova urinam movent et renes purgant.

enterocelicis lepus marinus inlinitur tritus cum melle. iecur aquaticae colubrae, item hydri tritum potumque calculosis prodest. ischiadicos liberant salsamenta e siluro infusa clysterio, evacuata prius alvo, sedis attritus cinis e capite mugilum et mullorum; comburuntur autem in fictili vase, inlini cum melle debent. item capitis menarum cinis et ad rhagadas et ad condylomata utilis, sicut pelamydum salsarum capitum cinis vel cybiorum cum melle. torpedo adposita procidentis interanei morbum ibi coerces. cancrorum fluviatilium cinis ex oleo et cera rimas in eadem parte emendat, idem et marini cancri pollent.

panos salsamenta coracinorum discutiunt, sciaenae interanea et squamae combustae, scorpio in vino decoctus ita, ut foveantur ex illo. at echinorum testae contusae et ex aqua inlitaе incipientibus panis resistunt, muricum vel purpurarum cinis utroque modo, sive discutere opus sit incipientes sive

concoctos emittere. quidam ita componunt medicamentum: cerae et turis drachmas xx, spumae argenti xxxx, cineris muricum x, olei veteris heminam. prosunt per se salsamenta cocta, canceri fluviatiles triti; ad verendorum pusulas cinis e capite menarum, item carnes decoctae et inpositae, similiter percae salsae e capite cinis melle addito, pelamydum capitis cinis aut squatinae cutis combustae. haec est qua diximus lignum poliri, quoniam et a mari fabriles usus exeunt. prosunt et zmarides inlitae, item muricum vel purpurarum testae cinis cum melle, efficacius crematarum cum carnibus suis. carbunculos verendorum privatim salsamenta cocta cum melle restingunt. testem, si descenderit, coclearum spuma inlini volunt.

urinae incontinentiam hippocampi tosti et in cibo saepius sumpti emendant, ophidion pisciculus congruo similis cum lili radice, pisciculi minuti ex ventre eius, qui devoraverit, exempti cremati ita, ut cinis eorum bibatur ex aqua. iubent et cocleas africanas cum sua carne comburi cineremque ex vino signino dari.

podagris articularisque morbis utile est oleum, in quo decocta sint ranarum intestina, et rubetae cinis cum adipe vetere. quidam et hordei cinerem adiciunt trium rerum aequo pondere. iubent et lepore marino recenti podagram fricari, fibrinis quoque pellibus calceari, maxime pontici fibri, item vituli marini, cuius et adips prodest isdem, nec non et bryon, de quo diximus, lactucae simile, rugosioribus foliis, sine caule. natura ei styptica, inpositumque lenit impetus podagrae. item alga, de qua et ipsa dictum est. observatur in ea, ne arida inponatur. - perniones emendat pulmo marinus, canceri marini cinis ex oleo, item fluviatiles triti ustique, cinere et ex oleo subacto, siluri adips. - in articulis morborum impetus sedant ranae subinde recentes inpositae; quidam dissectas iubent inponi. - corpus auget ius mitulorum et concharum.

comitiales, ut diximus, coagulum vituli marini bibunt cum lacte equino asinaeve aut cum punici suco, quidam ex aceto mulso. nec non aliqui per se pilulas devorant. castoreum in aceti mulsi cyathis iiii ieiunis datur, iis vero, qui saepius corripiantur, clystere infusum mirifice prodest. castorei drachmae ii esse debebunt, mellis et olei sextarius et aquae tantundem. ad praesens vero correptis olfactu subvenit cum aceto. datur et mustelae marinae iocur, item muris, vel testudinum sanguis.

febrium circuitus tollit iocur delphini gustatum ante accessiones. hippocampi necantur in rosaceo, ut perungantur aegri frigidis febribus, et ipsi adalligantur aegris. item ex asello pisce lapilli, qui plena luna inveniuntur in capite, alligantur in linteolo. phagri fluviatilis longissimus dens capillo adalligatus ita, ut v diebus eum, qui adalligaverit, non cernat aeger, ranae in trivio decoctae oleo abiectis carnibus perunctos liberant quartanis. sunt qui strangulatas in oleo ipsas clam adalligent oleoque eo perungunt. cor earum adalligatum frigora febrium minuit et oleum, in quo intestina decocta sint. maxime autem quartanis liberant ablatis unguibus ranae aequae adalligatae et rubeta, si iocur eius vel cor adalligetur in panno leucophaeo. canceri fluviatiles triti in oleo et aqua perunctis ante accessiones in febribus prosunt; aliqui et

piper addunt. alii decoctos ad quartas in vino e balineo egressis bibere suadent in quartanis, aliqui vero sinistrum oculum devorare. magi oculis eorum ante solis ortum adalligatis aegro ita, ut caecos dimittant in aquam, tertianas abigi promittunt. eosdem oculos cum carnibus luscinae in pelle cervina inligatos praestare vigiliam somno fugato tradunt. in lethargum vergentibus coagulo ballaenae aut vituli marini ad olfactum utuntur. alii sanguinem testudinis lethargicis inlinunt. tertianis mederi dicitur et spondylus percae adalligatus, quartanis cocleae fluviatiles in cibo recentes; quidam ob id adservant sale, ut dent tritas in potu.

strombi in aceto putrefacti lethargicos excitant odore. prosunt et cardiacis. cachectis, quorum corpus macie conficitur, tethea utilia sunt cum ruta ac melle. - hydropicis medetur adips delphini liquatus et cum vino potus. gravitati saporis occurritur tactis naribus unguento aut odoribus vel quoquo modo opturatis. strombi quoque carnes tritae et in mulsi iii heminis pari modo aquae aut, si febres sint, ex aqua mulsa datae proficiunt, item sucus cancrorum fluviatilium cum melle, rana quoque aquatica in vino vetere et farre decocta ac pro cibo sumpta ita, ut bibatur ex eodem vase, vel testudo decisis pedibus, capite, cauda et intestinis exemptis, reliqua carne ita condita, ut citra fastidium sumi possit. - cancri fluviatiles ex iure sumpti et phthisicis prodesse traduntur.

adusta sanantur cancri marini vel fluviatilis cinere ex oleo; ichthyocolla, ranarum cinere ea, quae ferventi aqua combusta sint; haec curatio etiam pilos restituit. item cancrorum fluviatilium cinere putant utendum cum cera et adipe ursino. prodest et fibrinarum pellium cinis. - ignes sacros restingunt ranarum viventium ventres inpositi, pedibus posterioribus pronas adalligari iubent, ut crebriore anhelitu prosint. utuntur et silurorum salsamenti capitum cinere ex aceto. - pruritus scabiemque non hominum modo, sed et quadripedum efficacissime sedat iecur pastinacae decoctum in oleo.

nervos vel praecisos purpurarum callum, quo se operiunt, tusum glutinat. tetanicos coagulum vituli adiuvat ex vino potum oboli pondere, item ichthyocolla, tremulos castoreum, si ex oleo perunguntur. mullos in cibo inutiles nervis invenio.

sanguinem fieri piscium cibo putant, sisti polypo tuso inlito, de quo et haec traduntur: muriam ipsum ex sese emittere et ideo non debere addi in coquendo, secari harundine, ferro enim infici vitiumque trahere natura dissidente. ad sanguinem sistendum et ranarum inlinunt cinerem vel sanguinem arefactum. quidam ex ea rana, quam graeci calamiten vocant, quoniam inter harundines fruticesque vivat, minima omnium et viridissima, sanguinem cineremve fieri iubent, aliqui et nascentium ranarum in aqua, quibus adhuc cauda est, in calice novo combustarum cinerem, si per nares fluat, inferciendum. diversus hirudinum, quas sanguisugas vocant, ad extrahendum sanguinem usus est. quippe eadem ratio earum, quae cucurbitarum medicinalium, ad corpora levanda sanguine, spiramenta laxanda iudicatur, sed vitium, quod admissae semel desiderium faciunt circa eadem tempora anni semper eiusdem medicinae. multi podagris quoque admittendas

censuere. decidunt satiatæ et pondere ipso sanguinis detractæ aut sale adpersæ; aliquando tamen relinquunt adfixa capita, quæ causa volnera insanabilia facit et multos interemit, sicut messalinum e consularibus patriciis, cum ad genu admisisset, in veneni virus remedio verso. maxime rufæ ita formidantur; ergo sugere orsas forficibus præcidunt, ac velut siphonibus defluit sanguis, paulatimque morientium capita se contrahunt, nec relinquuntur. natura earum adversatur cimicibus, suffitu necat eos. - fibrinarum pellium cum pice liquida combustarum cinis narium profluvia sistit suco porri mollitus.

extrahit corpori tela inhaerentia saepiarum testæ cinis, item purpurarum testæ ex aqua, salsamentorum carnes, cancri fluviatiles triti, siluri fluviatilis, qui et alibi quam in nilo nascitur, carnes inpositæ, recentis sive salsi. eiusdem cinis extrahit, adips et cinis spinæ eius vicem spodi præbet.

ulcera, quæ serpunt, et quæ in iis excrescunt capitis menarum cinis vel siluri coercet, carcinomata percarum capita salsarum, efficacius si cinere earum misceatur sal et cunila capitata oleoque subigantur. cancri marini cinis usti cum plumbo carcinomata compescit. ad hoc et fluviatilis sufficit cum melle lineaque lanugine; aliqui malunt alumen melque misceri cineri. phagedaenæ siluro inveterato et cum sandaraca trito, cacoe+the et nomæ et putrescentia cybio vetere sanantur; vermes innati ranarum felle tolluntur. fistulae aperiuntur siccanturque salsamenti cum linteolo inmissis, intraque alterum diem callum omnem auferunt et putrescentia ulcerum quæque serpent emplastri modo subacta et inlita. et allex purgat ulcera in linteolis conceptis, item echinorum testæ cinis. carbunculos coracinorum salsamenta inlita discutiunt, item mullorum salsamenti cinis - quidam capite tantum utuntur cum melle - vel coracinorum carnes. muricum cinis cum oleo tumores tollit, cicatrices fel scorpionis marini.

verruccas tollit glani iocur inlitum, capitis menarum cinis cum alio tritus - ad thymia crudis utuntur - , fel scorpionis marini rufi, zmarides tritæ inlitæ, allex defervefacta. unguium scabritiam cinis e capite menarum extenuat.

mulieribus lactis copiam facit glauciscus e iure sumptus et zmarides cum tisana sumptæ vel cum feniculo decoctæ. mammas ipsas muricum vel purpuræ testarum cinis cum melle efficaciter sanat, item cancri inliti fluviatiles vel marini. pilos in mamma muricum carnes inpositæ tollunt. squatinae inlitæ crescere mammas non patiuntur. delphini adipe linamenta inlita accensa excitant volva strangulata oppressas, item strombi in aceto putrefacti. percarum vel menarum capitis cinis sale admixto et cunila oleoque volvæ medetur, suffitione quoque secundas detrahit. item vituli marini adips instillatur igni naribus intermortuarum volvæ vitio, coagulo eiusdem in vellere inposito. pulmo marinus alligatus purgat egregie profluvia, echini viventes tusi et in vino dulci poti sistunt et cancri fluviatiles triti in vino potique. item siluri suffitu, præcipue africæ, faciliores partus facere dicuntur, cancri ex aqua poti profluvia sistere, ex hysopo purgare. et si partus strangulet, similiter poti auxiliantur. eosdem recentes vel aridos bibunt ad partus

continentes. hippocrates et ad purgationes mortuosque partus utitur illis, cum quinis lapathi radice rutaeque et fuligine trita et in mulso data potui. iidem in iure cocti cum lapatho et apio menstruas purgationes expediunt lactisque ubertatem faciunt, iidem in febris, quae sit cum capitis doloribus et oculorum palpitatione, mulieribus in vino austero dati prodesse dicuntur. castoreum ex mulso potum purgationibus prodest contraque volvam olfactum cum aceto et pice aut subditum pastillis. ad secundas etiam uti eodem prodest cum panace in iiii cyathis vini et a frigore laborantibus ternis obolis. sed si castoreum fibrumve supergrediatur gravida, abortum facere dicitur et periclitari partu, si superferatur. mirum est et quod de torpedine invenio, si capiatur, cum luna in libra sit, triduoque adservetur sub diu, faciles partus facere postea, quotiens inferatur. adiuvare et pastinacae radius adalligatus umbilico existumatur, si viventi ablatus sit, ipsa in mare dimissa. invenio apud quosdam ostraceum vocari quod aliqui onychen vocent; hoc suffitum volvae poenis mire resistere; odorem esse castorei, meliusque cum eo ustum proficere; vetera quoque ulcera et cacoe+the eiusdem cinere sanari. nam carbunculos et carcinomata in muliebri parte praesentissimo remedio sanari tradunt cancro femina cum salis flore contuso post plenam lunam et ex aqua inlito.

psilotrum est thynni sanguis, fel, iocur, sive recentia sive servata, iocur etiam tritum mixtoque cedrio plumbea pyxide adservatum. ita pueros mangonicavit salpe obstetrix. eadem vis pulmonis marini, leporis marini sanguine et felle vel si in oleo lepus hic necetur. ... canceri, scolopendrae marinae cinis cum oleo, urtica marina trita ex aceto scillite, torpedinis cerebrum cum alumine inlitum xvi luna. ranae parvae, quam in oculorum curatione descripsimus, sanies efficacissimum psilotrum est, si recens inlinatur, et ipsa arefacta ac tusa, mox decocta iii heminis ad tertias vel in oleo decocta aereis vasis. eadem mensura alii ex xv ranis conficiunt psilotrum, sicut in oculis diximus. sanguisugae quoque tostae in vase fictili et ex aceto inlitae eundem contra pilos habent effectum. hic suffitus urentium eas necat cimices. inuncto castoreo quoque cum melle pro psilotro usi pluribus diebus reperiuntur. in omni autem psilotro evellendi prius sunt pili.

infantium gingivis dentitionibusque plurimum confert delphini cum melle dentium cinis et si ipso dente gingivae tangantur. adalligatus idem pavores repentinos tollit. idem effectus et caniculae dentis. ulcera vero, quae in auribus aut ulla parte corporis fiant, cancerum fluvatilium sucus cum farina hordeacea sanat. et ad reliquos morbos triti in oleo perunctis prosunt. siriasim infantium spongea frigida cerebro umefacto rana inversa adalligata efficacissime sanat. aridam inveniri adfirmant.

mullus in vino necatus vel piscis rubellio vel anguillae ii, item uva marina in vino putrefacta iis, qui inde biberint, taedium vini adfert.

venerem inhibet echeneis, hippopotamii frontis e sinistra parte pellis in agnina adalligata, fel torpedinis vivae genitalibus inlitum. concitant coclearum fluvatilium carnes sale adservatae et in potu ex vino datae, erythini in cibo sumpti, iocur ranae diopetis vel calamitis in pellicula gruis adalligatum vel

dens crocodili maxillaris adnexus brachio vel hippocampus vel nervi rubetae dextro lacerto adalligati. amorem finit in pecoris recenti corio rubeta adalligata.

equorum scabiem ranae decoctae in aqua extenuant, donec inlini possint. aiunt ita curatos non repeti postea. - salpe negat canes latrare, quibus in offa rana viva data sit.

inter aquatilia dici debet et calamochnus, latine adarca appellata. nascitur circa harundines tenues e spuma aquae dulcis ac marinae, ubi se miscent. vim habet causticam, ideo acopis utilis et contra perfrictionum vitia. tollit et mulierum lentigines in facie. et calami simul dici debent: phragmitis radix recens tusa luxatis medetur et spinae doloribus ex aceto inlita, cyprii vero, qui et donax vocatur, cortex alopeciis medetur ustus et ulceribus veteratis, folia extrahendis quae infixae sint corpori et igni sacro. paniculae flos aures si intravit, exsurdant.

sepie atramento tanta vis est, ut in lucernam addito aethiopus videri ablato priore lumine anaxilaus tradat. - rubeta excocta aqua potui data suum morbum medetur vel cuiuscumque ranae cinis. - pulmone marino si confricetur lignum, ardere videtur adeo, ut baculum ita praeleceat. -

peractis aquatilibus dotibus non alienum videtur indicare per tot maria, tam vasta et tot milibus passuum terrae infusa extraque circumdata mensura, paene ipsius mundi quae intellegatur, animalia centum quadraginta quattuor omnino generum esse eaque nominatim complecti, quod in terrestribus volucribusque fieri non quit. neque enim omnis indiae aethiopiaeque aut scythiae desertorumve novimus feras aut volucres, cum hominum ipsorum multo plurimae sint differentiae, quas invenire potuimus. accedat his taprobane insulaeque aliae atque aliae oceani fabulose narratae. profecto conveniet non posse omnia genera in contemplationem universam vocari. at, hercules, in tanto mari oceanoque quae nascuntur certa sunt, notioraque, quod miremur, quae profundo natura mersit.

ut a beluis ordiamur, arbores, physeteres, ballaenae, pistrices, tritones, nereides, elephanti, homines qui marini vocantur, rotae, orcae, arietes, muscoli et alii piscium forma arietes, delphini celebresque homero vituli, luxuriae vero testudines et medicis fibri - quorum generis luras nusquam mari accepimus mergi, tantum marina dicentes - , iam caniculae, drinones, cornutae, gladii, serrae, communesque terrae, mari, amni hippopotami, crocodili, et amni tantum ac mari thynni, thynnides, siluri, coracini, percae.

peculiares autem maris acipenser, aurata, asellus, acharne, aphyae, alopex, anguilla, araneus, boca, batia, bacchus, batrachus, belonae, quos aculeatos vocamus, balanus, corvus, citharus, rhomborum generis pessimus, chalcis, cobio, callarias, asellorum generis, ni minor esset, coliae sive parianus sive sexitanus a patria baetica, lacertorum minimi, ab iis nostrates, cybium - ita vocatur concisa pelamys, quae post xl dies a ponto in maeotim revertitur - , cordyla - et haec pelamys pusilla; cum in pontum a maeotide exit, hoc nomen habet - , cantharus, callionymus sive uranoscopus, cinaedi, soli piscium lutei,

cnide, quam nos urticam vocamus, cancrorum genera, chemae striatae, chemae leves, chemae peloridum generis, varietate distantes et rotunditate, chemae glycymarides, quae sunt maiores quam pelorides, coluthia sive coryphia, concharum genera, inter quae et margaritiferae, cochloe, quorum generis pentadactyli, item helices (ab aliis actinophoroe dicuntur), quibus radii; ... cantant - extra haec sunt rotundae in oleario usu cocleae - , cucumis, cynops, cammarus, cynosdextra, draco - quidam aliud volunt esse dracunculum; est autem gerriculae amplae similis, aculeos in branchiis habet ad caudam spectantes; sic ut scorpio laedit, dum manu tollitur - erythrinus, echenais, echinus, elephantii locustarum generis nigri, pedibus quaternis bisulcis - praeterea brachia iis ii binis articulis singulisque forcipibus denticulatis - , fabri sive zaei, glauciscus, glanis, gonger, gerres, galeos, garos, hippos, hippuros, hirundo, halipleumon, hippocampus, hepar, ictinus, iulis, lacertorum genera, loligo volitans, locustae, lucerna, lelepris, lamirus, lepus, leones, quorum brachia cancris similia sunt - reliqua pars locustae - , mullus, merula inter saxatiles laudata, mugil, melanurus, mena, maeotes, murena, mys, mitulus, myiscus, murix, oculata, ophidion, ostreae, otia, orcynus - hic est pelamydum generis maximus neque ipse redit in maeotim, similis tritomi, vetustate melior - , orbis, orthogoriscus, phager, phycis saxatilium quaedam, pelamys - earum generis maxima apolectum vocatur, durius tritomo - , porcus, phthir, passer, pastinaca, polyporum genera, pectines - maximi et in his nigerrimi aestate laudatissimi, hi autem mytilenis, tyndaride, salonis, altini, chia in insula, alexandriae in aegypto - , pectunculi, purpurae, pegrices, pina, pinoteres, rhine, quem squatum vocamus, rhombus, scarus, principalis hodie, solea, sargus, squilla, sarda - ita vocatur pelamys longa ex oceano veniens - , scomber, salpa, sorus, scorpaena, scorpio, salax, sciaena, sciadeus, scolopendra, smyrus, sepia, strombus, solen sive aulos sive donax sive onyx sive dactylus, spondyli, smarides, stellae, spongeae, turdus, inter saxatiles nobilis, thynnis, thranis, quem alii xiphian vocant, thrissa, torpedo, tethea, tritumum pelamydum generis magni, ex quo terna cybia fiunt, veneria, uva, xiphias.

his adiciemus ab ovidio posita animalia, quae apud neminem alium reperiuntur, sed fortassis in ponto nascentia, ubi id volumen supremis suis temporibus inchoavit: bovem, cercyrum in scopulis viventem, orphum rubentemque erythrinum, iulum, pictas mormyras aureique coloris chrysophryn, praeterea percam, tragus et placentem cauda melanurum, epodas lati generis. praeter haec insignia piscium tradit: channem ex se ipsam concipere, glaucum aestate numquam apparere, pompilum, qui semper comitetur navium cursus, chromin, qui nidificet in aquis. helopem dicit esse "nostris incognitum undis," ex quo apparet falli eos, qui eundem acipenserem existimaverint. helopi palmam saporis inter pisces multi dedere.

sunt praeterea a nullo auctore nominati. sudis latine appellatur, graece sphyræna, rostro similis nomini, magnitudine inter amplissimos; rarus is et non degenerat. appellantur et pernae concharum generis, circa pontias insulas

frequentissimae. stant velut suillum crus e longo in harena defixae hiantesque, qua latitudo est, pedali non minus spatio cibum venantur; dentes circuitu marginum habent pectinatim spissatos; intus spondyli grandis caro est. et hyaenam piscem vidi in aenaria insula captum. - exeunt praeter haec et purgamenta aliqua relatu indigna et algis potius adnumeranda quam animalibus.

LIBER XXXIII

metalla nunc ipsaeque opes et rerum pretia dicentur, tellurem intus exquirente cura multiplici modo, quippe alibi divitiis foditur quaerente vita aurum, argentum, electrum, aes, alibi deliciis gemmas et parietum lignorumque pigmenta, alibi temeritati ferrum, auro etiam gratius inter bella caedesque. persequimur omnes eius fibras vivimusque super excavatam, mirantes dehiscere aliquando aut intremescere illam, ceu vero non hoc indignatione sacrae parentis exprimi possit. imus in viscera et in sede manium opes quaerimus, tamquam parum benigna fertilique qua calcatur. et inter haec minimum remediorum gratia scrutamur, quoto enim cuique fodiendi causa medicina est quamquam et hoc summa sui parte tribuit ut fruges, larga facilisque in omnibus, quaecumque prosunt. illa nos peremunt, illa nos ad inferos agunt, quae occultavit atque demersit, illa, quae non nascuntur repente, ut mens ad inane evolans reputet, quae deinde futura sit finis omnibus saeculis exhauriendi eam, quo usque penetratura avaritia. quam innocens, quam beata, immo vero etiam delicata esset vita, si nihil aliunde quam supra terras concupisceret, breviterque, nisi quod secum est!

eruitur aurum et chrysocola iuxta, ut pretiosior videatur, nomen ex auro custodiens. parum enim erat unam vitae invenisse pestem, nisi in pretio esset auri etiam sanies. quaerebat argentum avaritia; boni consuluit interim invenisse minium rubentisque terrae excogitavit usum. heu prodiga ingenia, quot modis auximus pretia rerum! accessit ars picturae, et aurum argentumque caelando carius fecimus. didicit homo naturam provocare. auxere et artem vitiorum inritamenta; in poculis libidines caelare iuvat ac per obscenitates bibere. abiecta deinde sunt haec ac sordere coepere, ut auri argentique nimium fuit. murrina ex eadem tellure et crystallina effodimus, quibus pretium faceret ipsa fragilitas. hoc argumentum opum, haec vera luxuriae gloria existimata est, habere quod posset statim perire totum. nec hoc fuit satis. turba gemmarum potamus et zmaragdis teximus calices, ac temulentiae causa tenere indiam iuvat. aurum iam accessio est, utinamque posset e vita in totum abdicari sacrum fame, ut celeberrimi auctores dixere proscissum conviciis ab optimis quibusque et ad perniciem vitae repertum, quanto feliciore aevo, cum res ipsae permutabantur inter sese, sicut et troianis temporibus factitatum homero credi convenit! ita enim, ut opinor, commercia victus gratia invecta. alios coriis boum, alios ferro captivisque res emptitasse tradit. quare, quamquam ipse iam mirator auri, pecore aestimationes rerum ita fecit, ut c boum arma aurea permutasse glaucum diceret cum diomedis armis viiii boum. ex qua consuetudine multa legum antiquarum pecore constat etiam romae.

pessimum vitae scelus fecit qui primus induit digitis, nec hoc quis fecerit traditur. nam de prometheo omnia fabulosa arbitror, quamquam illi quoque ferreum anulum dedit antiquitas vinculumque id, non gestamen, intellegi voluit. midae quidem anulum, quo circumacto habentem nemo cerneret, quis

non etiam fabulosiorem fateatur manus et prorsus sinistrae maximam auctoritatem conciliavere auro, non quidem romanae, quarum in more ferrei erant ut virtutis bellicae insigne. de regibus romanis non facile dixerim. nullum habet romuli in capitolio statua nec praeter numae serviique tullii alia ac ne Lucii quidem Bruti. hoc in tarquiniis maxime miror, quorum e graecia fuit origo, unde hic anulorum usus venit, quamquam etiam nunc lacedaemone ferreo utuntur. sed a prisco tarquinio omnium primo filium, cum in praetextae annis occidisset hostem, bulla aurea donatum constat, unde mos bullae duravit, ut eorum, qui equo meruissent, filii insigne id haberent, ceteri lorum; et ideo miror tarquiniis eius statuam sine anulo esse. quamquam et de nomine ipso ambigi video. graeci a digitis appellavere, apud nos prisci ungulum vocabant, postea et graeci et nostri symbolum. longo certe tempore ne senatum quidem romanum habuisse aureos manifestum est, siquidem iis tantum, qui legati ad exterarum gentes ituri essent, anuli publice dabantur, credo, quoniam ita exterorum honoratissimi intellegebantur. neque aliis uti mos fuit quam qui ex ea causa publice acceperant, volgoque sic triumphabant et, cum corona ex auro etrusca sustineretur a tergo, anulus tamen in digito ferreus erat aequae triumphantis et servi prae se coronam sustinentis. sic triumphavit de iugurtha c. marius aureumque non ante tertium consulatum sumpsisse traditur. ii quoque, qui ob legationem acceperant aureos, in publico tantum utebantur iis, intra domos vero ferreis, quo argumento etiam nunc sponsae muneris vice ferreus anulus mittitur, isque sine gemma. equidem nec iliaticis temporibus ullos fuisse anulos video. nusquam certe homerus dicit, cum et codicillos missitatos epistularum gratia indicet et conditas arcis vestes ac vasa aurea argenteaque et eas colligatas nodi, non anuli, nota. sortiri quoque contra provocationes duces non anulis tradit, fabricae etiam deum fibulas et alia muliebris cultus, sicut inaures, in primordio factitasse, sine mentione anulorum. et quisquis primus instituit, cunctanter id fecit: laevis manibus latentibusque induit, cum, si honos securus fuisset, dextra fuerit ostentandus. quodsi impedimentum potuit in eo aliquod intellegi, etiam serioris usus argumentum esset: maius in laeva fuisset, qua scutum capitur. est quidem apud eundem homerum virorum crinibus aurum inplexum; ideo nescio an prior usus feminis coeperit.

romae ne fuit quidem aurum nisi admodum exiguum longo tempore. certe cum a gallis capta urbe pax emeretur, non plus quam mille pondo effici potuere. nec ignoro mm pondo auri perisse pompeii iiii consulatu e capitolini iovis solio a camillo ibi condita, et ideo a plerisque existimari mm pondo collata. sed quod accessit, ex gallorum praeda fuit detractumque ab iis in parte captae urbis delubris - gallos cum auro pugnare solitos torquatus indicio est - ; apparet ergo gallorum templorumque tantundem nec amplius fuisse. quod quidem in augurio intellectum est, cum capitolinus duplum reddidisset. illud quoque obiter indicari convenit - etiam de anulis sermonem repetivimus - , aedituum custodiae eius comprehensum fracta in ore anuli gemma statim expirasse et indicium ita extinctum. ergo ut maxime mm tantum pondo, cum

capta est roma, anno cccclxiii fuere, cum iam capitum liberorum censa essent [clii] dlxxiii. in eadem post annos cccvii, quod ex capitolinae aedis incendio ceterisque omnibus delubris c. marius filius praeneste detulerat, [xiiii] pondo, quae sub eo titulo in triumpho transtulit Sulla et argenti [vi]. idem ex reliqua omni victoria pridie transtulerat auri pondo [xv], argenti p. [cxv].

frequentior autem usus anulorum non ante cn. flavium anni filiumprehenditur. hic namque publicatis diebus fastis, quos populus a paucis principum cotidie petebat, tantam gratiam plebei adeptus est - libertino patre alioqui genitus et ipse scriba appi caeci, cuius hortatu exceperat eos dies consultando adsidue sagaci ingenio promulgaratque - , ut aedilis curulis crearetur cum q. anicio praenestino, qui paucis ante annis hostis fuisset, praeteritis c. poetilio et domitio, quorum patres consules fuerant. additum flavio, ut simul et tribunus plebei esset, quo facto tanta indignatio exarsit, ut “anulos abiectos” in antiquissimis reperiatur annalibus. fallit plerosque quod tum et equestrem ordinem id fecisse arbitrantur; etenim adiectum hoc quoque “sed et phaleras positas” propterque nomen equitum adiectum est, anulosque depositos a nobilitate in annales relatum est, non a senatu universo. hoc actum p. sempronio l. sulphicio cos. flavius vovit aedem concordiae, si populo reconciliasset ordines, et, cum ad id pecunia publice non decerneretur, ex multatitia faeneratoribus condemnatis aediculam aeream fecit in graecostasi, quae tunc supra comitium erat, inciditque in tabella aerea factam eam aedem ccciiii annis post capitolinam dedicatam. id a. cccclxxxviii a condita urbe gestum est et primum anulorum vestigium extat; promiscui autem usus alterum secundo punico bello, neque enim aliter potuisset trimodia anulorum illa carthaginem ab Hannibale mitti. inter caepionem quoque et drusum ex anulo in auctione venali inimicitiae coepere, unde origo socialis belli et exitia rerum. ne tunc quidem omnes senatores habuere, utpote cum memoria avorum multi praetura quoque functi in ferreo consenuerint - sicut calpurnium et manilium, qui legatus c. marii fuerit iugurthino bello, fenestella tradit, et multi l. fufidium illum, ad quem Scaurus de vita sua scripsit — , in quintiorum vero familia aurum ne feminas quidem habere mos fuerit, nullosque omnino maior pars gentium hominumque, etiam qui sub imperio nostro degunt, hodieque habeat. non signat oriens aut aegyptus etiam nunc litteris contenta solis.

multis hoc modis, ut cetera omnia, luxuria variavit gemmas addendo exquisiti fulgoris censuque opimo digitos onerando, sicut dicemus in gemmarum volumine, mox et effigies varias caelando, ut alibi ars, alibi materia esset in pretio. alias dein gemmas violari nefas putavit ac, ne quis signandi causam in anulis esse intellexeret, solidas induit. quasdam vero neque ab ea parte, qua digito occultantur, auro clusit aurumque millis lapillorum vilius fecit. contra vero multi nullas admittunt gemmas auroque ipso signant. id claudii caesaris principatu repertum. nec non et servitia iam ferrum auro cingunt - alia per sese mero auro decorant - , cuius licentiae origo nomine ipso in samothrace id institutum declarat.

singulis primo digitis geri mos fuerat, qui sunt minimis proximi. sic in

numae et servi tullii statu is videmus. postea pollicis proximo induere, etiam in deorum simulacris, dein iuvat et minimo dare. galliae brittanniaeque medio dicuntur usae. hic nunc solus excipitur, ceteri omnes onerantur, atque etiam privatim articuli minoribus aliis. sunt qui uni tantum minimo congerant, alii vero et huic tantum unum, quo signantem signent. conditus ille, ut res rara et iniuria usus indigna, velut e sacrario promitur, ut et unum in minimo digito habuisse pretiosioris in recondito supellectilis ostentatio sit. iam alii pondera eorum ostentant. aliis plures quam unum gestare labor est, alii bratteas infercire levio re materia propter casum tutius gemmarum sollicitudini putant, alii sub gemmis venena cludunt, sicut demosthenes summus graeciae orator, anulosque mortis gratia habent. denique vel plurima opum scelera anulis fiunt. quae fuit illa vita priscorum, qualis innocentia, in qua nihil signabatur! nunc cibi quoque ac potus anulo vindicantur a rapina. hoc profecere mancipiorum legiones, in domo turba externa ac iam servorum quoque causa nomenclator adhibendus. aliter apud antiquos singuli marcipores luciporesve dominorum gentiles omnem victum in promiscuo habebant, nec ulla domi a domesticis custodia opus erat. nunc rapiendae comparantur epulae pariterque qui rapiant eas, et claves quoque ipsas signasse non est satis. gravatis somno aut morientibus anuli detrahuntur, maiorque vitae ratio circa hoc instrumentum esse coepit. incertum a quo tempore, videmur tamen posse in externis auctoritatem eius rei intellegere circa polycraten sami tyrannum, cui dilectus ille anulus in mare abiectus capto relatus est pisce, ipso circiter ccxxx urbis nostrae annum interfecto. celebratior quidem usus cum faenore coepisse debet. argumento est consuetudo volgi, ad sponsiones etiamnum anulo exiliente, tracta ab eo tempore, quo nondum erat arra velocior, ut plane adfirmare possimus nummos ante apud nos, mox anulos coepisse. de nummis paulo post dicetur.

anuli distinxere alterum ordinem a plebe, ut semel coeperant esse celebres, sicut tunica ab anulis senatum. quamquam et hoc sero, vulgoque purpura latiore tunicae usos invenimus etiam praecones, sicut patrem l. aelii stilonis praeconini ob id cognominati. sed anuli plane tertium ordinem mediumque plebei et patribus inseruere, ac quod antea militares equi nomen dederant, hoc nunc pecuniae indices tribuunt. nec pridem id factum. Divo Augusto decurias ordinante maior pars iudicum in ferreo anulo fuit iique non equites, sed iudices vocabantur. equitum nomen subsistebat in turmis equorum publicorum. iudicum quoque non nisi quattuor decuriae fuere primo, vixque singula milia in decuriis inventa sunt, nondum provinciis ad hoc munus admissis, servatumque in hodiernum est, ne quis e novis civibus in iis iudicaret. decuriae quoque ipsae pluribus discretas nominibus fuere, tribunorum aeris et selectorum et iudicum. praeter hos etiamnum nongenti vocabantur ex omnibus electi ad custodiendas suffragiorum cistas in comitiis. et divisus hic quoque ordo erat superba usurpatione nominum, cum alius se nongentum, alius selectum, alius tribunum appellaret.

tiberii demum principatu nono anno in unitatem venit equester ordo,

anulorumque auctoritati forma constituta est c. asinio pollione c. antistio vetere cos. anno urbis conditae dcclxxv, quod miremur, futtili paene de causa, cum c. sulpicius galba, iuvenalem famam apud principem popinarum poenis aucupatus, questus esset in senatu, volgo institores eius culpaē defendi anulis. hac de causa constitutum, ne cui ius esset nisi qui ingenuus ipse, patre, avo paterno hs [cccc] census fuisset et lege iulia theatri in quattuordecim ordinibus sedisset. postea gregatim insigne id adpeti coeptum. propter haec discrimina c. princeps decuriam quintam adiecit, tantumque enatum est fastus, ut, quae sub Divo Augusto impleri non potuerant, decuriae non capiant eum ordinem, passimque ad ornamenta ea etiam servitute liberati transilient, quod antea numquam erat factum, quoniam ferro anulo et equites iudicesque intellegebantur. adeoque id promiscuum esse coepit, ut apud claudium caesarem in censura eius unus ex equitibus flavius proculus cccc ex ea causa reos postularet. ita dum separatur ordo ab ingenuis, communicatus est cum serviitiis. iudicum autem appellatione separare eum ordinem primi omnium instituere gracchi discordi popularitate in contumeliam senatus, mox debellata auctoritas nominis vario seditionum eventu circa publicanos substitit et aliquamdiu tertiae sortis viri publicani fuere. m. cicero demum stabilivit equestre nomen in consulatu suo catilinianis rebus, ex eo ordine profectum se celebrans eiusque vires peculiari popularitate quaerens. ab illo tempore plane hoc tertium corpus in re p. factum est, coepitque adici senatui populoque romano et equester ordo. qua de causa et nunc post populum scribitur, quia novissime coeptus est adici.

equitum quidem etiam nomen ipsum saepe variatum est, in iis quoque, qui id ab equitatu trahebant. celeres sub romulo regibusque sunt appellati, deinde flexuntes, postea trossuli, cum oppidum in tuscis citra volsinios p. [viii] sine ullo peditum adiumento cepissent eius vocabuli, idque duravit ultra c. gracchum. iunius certe, qui ab amicitia eius gracchanus appellatus est, scriptum reliquit his verbis: “quod ad equestrem ordinem attinet, antea trossulos vocabant, nunc equites vocant ideo, quia non intellegunt trossulos nomen quid valeat, multosque pudet eo nomine appellari.” et causam, quae supra indicata est, exponit invitosque etiamnum tamen trossulos vocari.

sunt adhuc aliquae non omittendae in auro differentiae. auxilia quippe et externos torquibus aureis donavere, at cives non nisi argenteis, praeterque armillas civibus dedere, quas non dabant externis.

iidem, quo magis miremur, coronas ex auro dedere et civibus. quis primus donatus sit ea, non inveni equidem; quis primus donaverit, a l. pisone traditur: a. postumius dictator apud lacum regillum castris latinorum expugnatis eum, cuius maxime opera capta essent. hanc coronam ex praeda is dedit ii l., item l. lentulus consul servio cornelio merendae samnitum oppido capto, sed hic quinque librarum; trium piso frugi filium ex privata pecunia donavit eamque coronam testamento ei praelegavit.

deorum honoris causa in sacris nihil aliud excogitatum est quam ut auratis cornibus hostiae, maiores dumtaxat, immolarentur. sed in militia quoque in

tantum adolevit haec luxuria, ut M. Bruti e philippicis campis epistulae reperiantur frementis fibulas tribunicias ex auro geri. ita, hercules idem enim tu, Brute, mulierum pedibus aurum gestatum tacuisti. et nos sceleris arguimus illum, qui primus auro dignitatem per anulos fecit! habeant in lacertis iam quidem et viri, quod ex dardanis venit - itaque et dardanium vocabatur; viriolae celtice dicuntur, viriae celtiberice - ; habeant feminae in armillis digitisque totis, collo, auribus, spiris; discurrant catenae circa latera et in secreto margaritarum sacculi e collo dominarum auro pendeant, ut in somno quoque unionum conscientia adsit: etiamne pedibus induetur atque inter stolam plebemque hunc medium feminarum equestrem ordinem faciet honestius viri paedagogiis id damus, balineasque dives puerorum forma convertit. iam vero et harpocraten statuasque aegyptiorum numinum in digitis viri quoque portare incipiunt. fuit et alia claudii principatu differentia insolens iis, quibus admissiones liberae ius dedissent imaginem principis ex auro in anulo gerendi, magna criminum occasione, quae omnia salutaris exortus vespasiani imperatoris abolevit aequaliter publicando principem. de anulis aureis usuque eorum hactenus sit dictum.

proximum scelus fuit eius, qui primus ex auro denarium signavit, quod et ipsum latet auctore incerto. populus romanus ne argento quidem signato ante pyrrhum regem devictum usus est. libralis - unde etiam nunc libella dicitur et dupondius - adpendebatur assis; quare aeris gravis poena dicta, et adhuc expensa in rationibus dicuntur, item impendia et dependere, quin et militum stipendia, hoc est stipis pondera, dispensatores, libripendes, qua consuetudine in iis emptionibus, quae mancipi sunt, etiam nunc libra interponitur. servius rex primus signavit aes. antea rudi usos romae timaeus tradit. signatum est nota pecudum, unde et pecunia appellata. maximus census [cxx] assium fuit illo rege, et ideo haec prima classis. - argentum signatum anno urbis cccclxxxv, q. ogulnio c. fabio cos., quinque annis ante primum punicum bellum. et placuit denarium pro x libris aeris valere, quinarium pro v, sestertium pro dupondio ac semisse. librare autem pondus aeris inminutum est bello punico primo, cum impensis res p. non sufficeret, constitutumque ut asses sextantario pondere ferirentur. ita quinque partes lucri factae, dissolutumque aes alienum. nota aeris eius fuit ex altera parte ianus geminus, ex altera rostrum navis, in triente vero et quadrante rates. quadrans antea teruncius vocatus a tribus unciiis. postea Hannibale urgente q. fabio maximo dictatore asses unciales facti, placuitque denarium xvi assibus permutari, quinarium octonis, sestertium quaternis. ita res p. dimidium lucrata est, in militari tamen stipendio semper denarius pro x assibus datus est. notae argenti fuere bigae atque quadrigae; inde bigati quadrigatique dicti. mox lege papiria semunciarum asses facti. livius drusus in tribunatu plebei octavam partem aeris argento miscuit. is, qui nunc victoriatum appellatur, lege clodia percussus est; antea enim hic nummus ex illyrico advectus mercis loco habebatur. est autem signatus victoria, et inde nomen. - aureus nummus post annos li percussus est quam argenteus ita, ut scripulum valeret sestertios vices, quod efficit in

libram ratione sestertii, qui tunc erat, [v]dclx. postea placuit #1108 xxxx signari ex auri libris, paulatimque principes inminuere pondus, et novissime nero ad xxxv.

sed a nummo prima origo avaritiae faenore excogitato quaestuosaque segnitia, nec paulatim: exarsit rabie quadam non iam avaritia, sed fames auri, utpote cum septumuleius, c. gracchi familiaris, auro rependendum caput eius abscisum ad opimum tulerit plumboque in os addito parricidio suo rem p. etiam circumscripserit; nec iam quiritium aliquis, sed universo nomine romano infami rex mithridates aquilio duci capto aurum in os infudit. haec parit habendi cupido! pudet intuentem nomina ista, quae subinde nova graeco sermone excogitantur insperso argenteis vasis auro et incluso, quibus deliciis pluris veneunt inaurata quam aurea, cum sciamus interdixisse castris suis spartacum, ne quis aurum haberet aut argentum. tanto plus fuit animi fugitivis nostris! messalla orator prodidit antonium triumvirum aureis usum vasis in omnibus obscenis desideriis, pudendo crimine etiam cleopatrae. summa apud externos licentiae fuerat philippum regem poculo aureo pulvinis subdito dormire solitum, hagnonem teium, alexandri magni praefectum, aureis clavis suffigere crepidas: antonius solus contumelia naturae vilitatem auro fecit. o dignum proscriptione, sed spartaci!

equidem miror populum romanum victis gentibus in tributo semper argentum imperasse, non aurum, sicut carthagini cum Hannibale victae octingenta milia, [xvi] pondo annua in quinquaginta annos, nihil auri. nec potest videri paenuria mundi id evenisse. iam midas et croesus infinitum possederant, iam Cyrus devicta asia pondo [xxiii] invenerat praeter vasa aurumque factum et in eo solium, platanum, vitem. qua victoria argenti [d] talentorum reportavit et craterem semiramidis, cuius pondus xv talentorum colligebat. talentum aegyptium pondo lxxx patere M. Varro tradit. iam regnaverat in colchis saulaces aeetae subolis, qui terram virginem nactus plurimum auri argentique eruisse dicitur in suanorum gente, et alioqui velleribus aureis incluto regno. et illius aureae camarae, argenteae trabes et columnae atque parastaticae narrantur victae sesostri, aegypti regi tam superbo, ut prodatur annis quibusque sorte reges singulos e subiectis iungere ad currum solitus atque ita triumphare!

et nos fecimus quae posteris fabulosa arbitrentur. caesar, qui postea dictator fuit, primus in aedilitate munere patris funebri omni apparatu harenae argenteo usus est, ferasque etiam argenteis vasis incessivere tum primum noxii, quod iam etiam in municipiis aemulantur. c. antonius ludos scaena argentea fecit, item l. murena; gaius princeps in circo pegma duxit, in quo fuere argenti pondo [cxxxiii]. claudius successor eius, cum de brittannia triumpharet, inter coronas aureas [vii] pondo habere quam contulisset hispania citerior, [viii] quam gallia comata, titulis indicavit. huius deinde successor nero pompeii theatrum operuit auro in unum diem, quo tiridati armeniae regi ostenderet. et quota pars ea fuit aureae domus ambientis urbem!

auri in aerario populi r. fuere sex. iulio l. aurelio cos., septem annis ante

bellum punicum tertium, pondo [xvii] ccccx, argenti [xxii] lxx, et in numerato [30lxi]30 [xxxv] cccc, sexto iulio l. marcio cos., hoc est belli socialis initio, auri ... [30xvi]30 [xx] dcccxxxi. c. caesar primo introitu urbis civili bello suo ex aerario protulit laterum aureorum [xv], argenteorum [xxx], et in numerato [30ccc]30. nec fuit aliis temporibus res p. locupletior. intulit et aemilius paulus perseo rege victo e macedonica praeda [30mmm]30, a quo tempore populus romanus tributum pendere desiit.

laquearia, quae nunc et in privatis domibus auro teguntur, post carthaginem eversam primo in capitolio inaurata sunt censura l. mummi. inde transiere in camaras quoque et parietes, qui iam et ipsi tamquam vasa inaurantur, cum varie sua aetas de catulo existimaverit, quod tegulas aereas capitolii inaurasset.

primos inventores auri, sicut metallorum fere omnium, septimo volumine diximus. praecipuam gratiam huic materiae fuisse arbitror non colore, qui clarior in argento est magisque diei similis, ideo militaribus signis familiarior, quoniam longius fulget, manifesto errore eorum, qui colorem siderum placuisse in auro arbitrantur, cum in gemma aliisque rebus non sit praecipuus. nec pondere aut facilitate materiae praelatum est ceteris metallis, cum cedat per utrumque plumbo, sed quia rerum uni nihil igne deperit, tuto etiam in incendiis rogisque. quin immo quo saepius arsit, proficit ad bonitatem, aurique experimentum ignis est, ut simili colore rubeat ignescatque et ipsum; obrussam vocant. primum autem bonitatis argumentum quam difficillime accendi. praeterea mirum, prunae violentissimi ligni indomitum palea citissime ardescere atque, ut purgetur, cum plumbo coqui. altera causa pretii maior, quod minimum usus deterit, cum argento, aere, plumbo lineae praeducantur manusque sordescant decidua materia. nec aliud laxius dilatatur aut numerosius dividitur, utpote cuius unciae in septingenas quinquagenas pluresque bratteas quaternum utroque digitorum spargantur. crassissimae ex iis praenestinae vocantur, etiamnum retinente nomen fortunae inaurato fidelissime ibi simulacro. proxima brattea quaestoria appellatur. hispania striges vocat auri parvas massas. super omnia solum in massa aut ramento capitur. cum cetera in metallis reperta igni perficiantur, hoc statim aurum est consummatamque materiam suam protinus habet, cum ita invenitur. haec enim inventio eius naturalis est; alia, quam dicemus, coacta. super cetera non robigo ulla, non aerugo, non aliud ex ipso, quod consumat bonitatem minuatur pondus. iam contra salis et aceti sucos, domitores rerum, constantia superat omnia, superque netur ac textitur lanae modo vel sine lana. tunica aurea triumphasse tarquinius priscum verrius docet; nos vidimus agrippinam claudi principis, edente eo navalis proelii spectaculum, adsidentem et indutam paludamento aureo textili sine alia materia. attalicis vero iam pridem intexitur, invento regum asiae.

marmoris et iis, quae candefieri non possunt, ovi candido inlinitur, ligno glutini ratione composita; leucophorum vocant. quid sit hoc aut quemadmodum fiat, suo loco docebimus. aes inaurari argento vivo aut certe hydrargyro legitimum erat, de quo dicemus illorum naturam reddentes.

excogitata fraus est, namque aes cruciatur in primis accensumque restringitur sale, aceto, alumine, postea exharenatur, an satis recoctum sit, splendore deprehendente, iterumque exhalatur igni, ut possit edomitum mixtis pumice, alumine, argento vivo inductas accipere bratteas. alumen et in purgando vim habet qualem esse diximus plumbo.

aurum invenitur in nostro orbe, ut omittamus indicum a formicis aut apud scythas grypis erutum, tribus modis: fluminum ramentis, ut in tago hispaniae, pado italiae, hebro thraciae, pactolo asiae, gange indiae, nec ullum absolutius aurum est, ut cursu ipso attrituque perpolitum. alio modo puteorum scrobibus effoditur aut in ruina montium quaeritur; utraque ratio dicatur.

aurum qui quaerunt, ante omnia segutilum tollunt; ita vocatur indicium. alveus hic est harenae, quae lavatur, atque ex eo, quod resedit, coniectura capitur. invenitur aliquando in summa tellure protinus rara felicitate, ut nuper in delmatia principatu neronis singulis diebus etiam quinquagenas libras fundens. cum ita inventum est in summo caespite, talutium vocant, si et aurosa tellus subest. cetero montes hispaniarum, aridi sterilesque et in quibus nihil aliud gignatur, huic bono fertiles esse coguntur.

quod puteis foditur, canalicium vocant, alii canaliense, marmoris glareae inhaerens, non illo modo, quo in oriente sappiro atque thebaico aliisque in gemmis scintillat, sed micras amplexum marmoris. vagantur hi venarum canales per latera puteorum et huc illuc, inde nomine invento, tellusque ligneis columnis suspenditur. quod effossum est, tunditur, lavatur, uritur, molitur. farinam a pila scudem vocant; argentum, quod exit a fornace, sudorem. quae e camino iactatur spurcitia in omni metallo scoria appellatur. haec in auro tunditur iterumque coquitur. catini fiunt ex tasconio; hoc est terra alba similis argillae, neque enim alia flatum ignemque et ardentem materiam tolerat.

tertia ratio opera vicerit gigantum. cuniculis per magna spatia actis cavantur montes lucernarum ad lumina; eadem mensura vigiliarum est, multisque mensibus non cernitur dies. arrugas id genus vocant. siduntque rimae subito et opprimunt operatos, ut iam minus temerarium videatur e profundo maris petere margaritas atque purpuras. tanto nocentiores fecimus terras! relinquuntur itaque fornices crebri montibus sustinendis. occurrant in utroque genere silices; hos igne et aceto rumpunt, saepius vero, quoniam id cuniculos vapore et fumo strangulat, caedunt fractariis cl libras ferri habentibus egeruntque umeris noctibus ac diebus per tenebras proximis tradentes; lucem novissimi cernunt. si longior videtur silex, latus sequitur fossor ambitque. et tamen in silice facilius existimatur opera; est namque terra ex quodam argillae genere glareae mixta - gangadium vocant - prope inexpugnabilis. cuneis eam ferreis adgrediuntur et isdem malleis nihilque durius putant, nisi quod inter omnia auri fames durissima est. peracto opere cervices fornicum ab ultimo caedunt. dat signum ruina, eamque solus intellegit in cacumine eius montis vigil. hic voce, nutu evocari iubet operas pariterque ipse devolat. mons fractus cadit ab sese longe fragore qui concipi

humana mente non possit, aequae et flatu incredibili. spectant victores ruinam naturae. nec tamen adhuc aurum est nec scire esse, cum foderent, tantaque ad pericula et impendia satis causae fuit sperare quod cuperent. alius par labor ac vel maioris impendii: flumina ad lavandam hanc ruinam iugis montium obiter duxere a centesimo plerumque lapide; corrugos vocant, a conrivatione credo. mille et hic labores: praeceps esse libramentum oportet, ut ruat verius quam fluat; itaque altissimis partibus ducitur. convalles et intervalla substructis canalibus iunguntur. alibi rupes inviae caeduntur sedemque trabibus cavatis praebere coguntur. qui caedit, funibus pendet, ut procul intuenti species ne ferarum quidem, sed alitum fiat. pendentes maiore ex parte librant et lineas itineri praeducunt, quaque insistentis vestigiis hominis locus non est, amnes trahuntur ab homine. vitium lavandi est, si fluens amnis lutum inportet; id genus terrae urium vocant. ergo per silices calculosve ducunt et urium evitant. ad capita deiectus in superciliis montium piscinae cavantur ducenos pedes in quasque partes et in altitudinem denos. emissaria in iis quina pedum quadratorum ternum fere relinquuntur, ut repleto stagno excussis opturamentis erumpat torrens tanta vi, ut saxa provolvat. alius etiamnum in plano labor. fossae, per quas profluat, cavantur - agogas vocant - ; hae sternuntur gradatim ulice. frutex est roris marini similis, asper aurumque retinens. latera cluduntur tabulis, ac per praecepta suspenduntur canales. ita profluens terra in mare labitur ruptusque mons diluitur, ac longe terras in mare his de causis iam promovit hispania. in priore genere quae exhauriuntur immenso labore, ne occupent puteos, in hoc rigantur. aurum arrugia quaesitum non coquitur, sed statim suum est. inveniuntur ita massae, nec non in puteis, et denas excedentes libras; palagas, alii palacurnas, iidem quod minutum est balucem vocant. ulex siccatur, uritur, et cinis eius lavatur substrato caespite herboso, ut sidat aurum. vicena milia pondo ad hunc modum annis singulis asturiam atque callaeciam et lusitaniam praestare quidam prodiderunt, ita ut plurimum asturia gignat. neque in alia terrarum parte tot saeculis perseverat haec fertilitas. italiae parci vetere interdicto patrum diximus; alioqui nulla fecundior metallorum quoque erat tellus. extat lex censoria victumularum aurifodinae in vercellensi agro, qua cavebatur, ne plus quinque milia hominum in opere publicani haberent.

aurum faciendi est etiamnum una ratio ex auripigmento, quod in syria foditur pictoribus in summa tellure, auri colore, sed fragile lapidum specularium modo. invitaveratque spes gaium principem avidissimum auri; quam ob rem iussit excoqui magnum pondus et plane fecit aurum excellens, sed ita parvi ponderis, ut detrimentum sentiret propter avaritiam expertus, quamquam auripigmenti librae #1108 iiii permutarentur. nec postea temptatum ab ullo est.

omni auro inest argentum vario pondere, aliubi decuma parte, aliubi octava. in uno tantum callaeciae metallo, quod vocant albucrarensis, tricensima sexta portio invenitur; ideo ceteris praestat. ubicumque quinta argenti portio est, electrum vocatur. scobes hae reperiuntur in canaliensi. fit et cura electrum argento addito. quod si quintam portionem excessit, incudibus

non resistit. vetusta et electro auctoritas homero teste, qui menelai regiam auro, electro, argento, ebore fulgere tradit. minervae templum habet lindos insulae rhodiorum, in quo helena sacravit calicem ex electro; adicit historia, mammae suae mensura. electri natura est ad lucernarum lumina clarius argento splendere. quod est nativum, et venena deprehendit. namque discurrunt in calicibus arcus caelestibus similes cum igneo stridore et gemina ratione praedicunt.

aurea statua prima omnium nulla inanitate et antequam ex aere aliqua modo fieret, quam vocant holosphyraton, in templo anaetidis posita dicitur quo situ terrarum nomen hoc signavimus, numine gentibus illis sacratissimo. direpta ea est antonii parthicis rebus, scitumque narratur veteranorum unius bononiae hospitali Divi Augusti cena, cum interrogatus esset, sciretne eum, qui primus violasset id numen, oculis membrisque captum exspirasse; respondit enim cum maxime Augustum e crure eius cenare seque illum esse totumque sibi censum ex ea rapina. hominum primus et auream statuam et solidam lxx circiter olympiade gorgias leontinus delphis in templo posuit sibi. tantus erat docendae artis oratoriae quaestus.

aurum pluribus modis pollet in remediis volneratisque et infantibus adplicatur, ut minus noceant quae inferantur veneficia. est et ipsi superlato vis malefica, gallinarum quoque et pecuvariorum feturis. remedium ablueri inlatum et spargere eos, quibus mederi velis. torretur et cum salis gemino pondere, triplici misyis ac rursus cum ii salis portionibus et una lapidis, quem schiston vocant. ita virus trahit rebus una crematis in fictili vase, ipsum purum et incorruptum. reliquus cinis servatus in fictili olla ex aqua inlitus lichenas in facie - lomento eo convenit ablui - , fistulas etiam sanat et quae vocantur haemorrhoides. quodsi tritus pumex adiciatur, putria ulcera et taetri odoris emendat, ex melle vero decoctum cum melanthio inlitum umbilico leniter solvit alvum. auro verrucas curari M. Varro auctor est.

chrysocolla umor est in puteis, quos diximus, per venam auri defluens crassescente limo rigoribus hibernis usque in duritiam pumicis. laudatiorem eandem in aerariis metallis et proximam in argentariis fieri conpertum est. invenitur et in plumbariis, vilior etiam auraria. in omnibus autem his metallis fit et cura multum infra naturalem illam inmissis in venam aquis leniter hieme tota usque in iunium mensem, dein siccatis iunio et iulio, ut plane intellegatur nihil aliud chrysocolla quam vena putris. nativa duritia maxime distat; uvam vocant. et tamen illa quoque herba, quam lutum appellant, tinguitur. natura est, quae lino lanaeve, ad sucum bibendum. tunditur in pila, dein tenui cribro cernitur, postea molitur ac deinde tenuius cribratur. quidquid non transmeat, repetitur in pila, dein molitur. pulvis semper in catinos digeritur et ex aceto maceratur, ut omnis duritia solvatur, ac rursus tunditur, dein lavatur, in conchis siccatur, tum tinguitur alumine schisto et herba supra dicta pingiturque, antequam pingat. refert quam bibula docilisque sit. nam nisi rapuit colorem, adduntur et scytanum atque turbistum; ita vocant medicamenta sorbere cogentia.

cum tinxere pictores, orobitin vocant eiusque duo genera faciunt: elutam, quae servatur in lomentum, et liquidam globulis sudore resolutis. haec utraque genera in cypro fiunt. laudatissima autem est in armenia, secunda in macedonia, largissima in hispania; summa commendationis, ut colorem in herba segetis laete virentis quam simillime reddat. visumque iam est neronis principis spectaculis harenam circi chrysocolla sterni, cum ipse concolori panno aurigaturus esset. indocta opificum turba tribus eam generibus distinguit: asperam, quae taxatur in libras #1108 vii, mediam quae #1108 v, attritam, quam et herbaceam vocant, #1108 iii. sublinunt autem harenosam, priusquam inducant, atramento et paraetonio. haec sunt tenacia eius, colore blanda. paraetonium, quoniam est natura pinguisimum et propter levorem tenacissimum, atramento aspergitur, ne paraetonii candor pallorem chrysocollae adferat. luteam putant a luto herba dictam, quam ipsam caeruleo subtritam pro chrysocolla inducunt, vilissimo genere atque fallacissimo.

usus chrysocollae et in medicina est ad purganda vulnera cum cera atque oleo. eadem per se arida siccatur et contrahitur. datur et in angina orthopnoeae lingenda cum melle. concitat vomitiones, miscetur et collyriis ad cicatrices oculorum ac viridibus emplastris ad dolores mitigandos, cicatrices trahendas. hanc chrysocollam medici acesim appellant, quae non est orobitis. chrysocollam et aurifices sibi vindicant adglutinando auro, et inde omnes appellatas similiter virentes dicunt. temperatur autem cypria aerugine et pueri in pubis urina addito nitro teriturque cyprio aere in cypriis mortariis; santernam vocant nostri. ita feruminatur aurum, quod argentosum vocant. signum est, si addita santerna nitescit. e diverso aerosum contrahit se hebetaturque et difficulter feruminatur. ad id glutinum fit auro et septima argenti parte ad supra dicta additis unaque tritis.

contexique par est reliqua circa hoc, ut universa naturae contingat admiratio. auro glutinum est tale, argilla ferro, cadmea aeris massis, alumen lamnis, resina plumbo et marmori, at plumbum nigrum albo iungitur ipsumque album sibi oleo, item stagnum aeramentis, stagno argentum. - pineis optime lignis aes ferrumque funditur, sed et aegyptio papyro, paleis aurum. - calx aqua accenditur et thracius lapis, idem oleo restinguitur, ignis autem aceto maxime et visco et ovo. - terra minime flagrat, carboni vis maior exusto iterumque flagranti.

ab his argenti metalla dicantur, quae sequens insania est. non nisi in puteis reperitur nullaque spe sui nascitur, nullis, ut in auro, lucentibus scintillis. terra est alias rubra, alias cineracea. excoqui non potest, nisi cum plumbo nigro aut cum vena plumbi - galenam vocant - , quae iuxta argenti venas plerumque reperitur. et eodem opere ignium discedit pars in plumbum, argentum autem innatat superne, ut oleum aquis. reperitur in omnibus paene provinciis, sed in hispania pulcherrimum, id quoque in sterili solo atque etiam montibus, et ubicumque una inventa vena est, non procul invenitur alia. hoc quidem et in omni fere materia, unde metalla graeci videntur dixisse. mirum, adhuc per hispanias ab Hannibale inchoatos durare puteos. sua nomina ab inventoribus

habent, ex quis baebelo appellatur hodie, qui ccc pondo Hannibali subministravit in dies, ad md passus iam cavato monte, per quod spatium aquitani stantes noctibus diebusque egerunt aquas lucernarum mensura amnemque faciunt. argenti vena in summo reperta crudaria appellatur. finis antiquis fodiendi solebat esse alumen inventum; ultra nihil quaerebatur. nuper inventa aeris vena infra alumen nullam finem spei fecit. odor ex argenti fodinis inimicus omnibus animalibus, sed maxime canibus. - aurum argentumque quo mollius, eo pulchrius. lineas ex argento nigras praeduci plerique mirantur.

est et lapis in iis venis, cuius vomica liquoris aeterni argentum vivum appellatur. venenum rerum omnium est perrumpitque vasa permanans tabe dira. omnia ei innatant praeter aurum; id unum ad se trahit. ideo et optime purgat, ceteras eius sordes expuens crebro iactatu fictilibus in vasis. ita vitiis eiectis ut et ipsum ab auro discedat, in pelles subactas effunditur, per quas sudoris vice defluens purum relinquit aurum. ergo et cum aera inaurentur, sublitum bratteis pertinacissime retinet, verum pallore detegit simplices aut praetenues bratteas. quapropter id furtum quaerentes ovi liquore candido usum eum adulteravere, mox et hydrargyro, de quo dicemus suo loco. et alias argentum vivum non largum inventu est.

in isdem argenti metallis invenitur, ut proprie dicatur, spumae lapis candidae nitentisque, non tamen tralucentis; stimi appellant, alii stibi, alii alabastrum, aliqui larbasim. duo eius genera, mas ac femina. magis probant feminam, horridior est mas scabriorque et minus ponderosus minusque radians et harenosior, femina contra nitet, friabilis fissurisque, non globis, dehiscens.

vis eius adstringere ac refrigerare, principalis autem circa oculos, namque ideo etiam plerique platyophthalmon id appellavere, quoniam in calliblepharis mulierum dilatet oculos, et fluctiones inhibet oculorum exulcerationesque farina eius ac turis cummi admixto. sistit et sanguinem e cerebro profluentem, efficacissime et contra recentia volnera et contra veteres canum morsus inspersa farina et contra ambusta igni cum adipe ac spuma argenti cerussaque et cera. uritur autem offis bubuli fimi circumlitum in clibanis, dein restinguitur mulierum lacte teriturque in mortariis admixta aqua pluvia; ac subinde turbidum transfunditur in aereum vas emundatum nitro. faex eius intellegitur plumbosissima, quae subsedit in mortario abiciturque. dein vas, in quod turbida transfusa sint, opertum linteo per noctem relinquitur et postero die quidquid innatet effunditur spongeave tollitur. quod ibi subsedit, flos intellegitur ac linteo interposito in sole siccatur, non ut perarescat, iterumque in mortario teritur et in pastillos dividitur. ante omnia autem urendi modus necessarius est, ne plumbum fiat. quidam non fimo utuntur coquentes, sed adipe. alii tritum in aqua triplici linteo saccant faecemque abiciunt idque, quod defluxit, transfundunt, quidquid subsidat colligentes. emplastris quoque et collyriis miscent.

scoriam in argento graeci vocant helcysma. vis eius adstringere et

refrigerare corpora, ac remedio est addita emplastris ut molybdaena, de qua dicemus in plumbo, cicatricibus maxime glutinandis, et contra tenesmos dysenteriasque infusa clysteribus cum myrteo oleo. addunt et in medicamenta, quae vocant liparas, ad excrescentia ulcerum aut ex attritu facta aut in capite manantia.

fit in isdem metallis et quae vocatur spuma argenti. genera eius tria: optima quam chrysitim vocant, sequens quam argyritim, tertia quam molybditim. et plerumque omnes hi colores in isdem tubulis inveniuntur. probatissima est attica, proxima hispaniensis. chrysitis ex vena ipsa fit, argyritis ex argento, molybditis e plumbi ipsius fusura - quae fit puteolis - et inde habet nomen. omnis autem fit excocta sua materia ex superiore catino defluens in inferiorem et ex eo sublata vericulis ferreis atque in ipsa flamma convoluta vericulo, ut sit modici ponderis. est autem, ut ex nomine intellegi potest, fervescentis et futurae materiae spuma. distat a scoria quo potest spuma a faece distare: alterum purgantis se materiae, alterum purgatae vitium est. quidam duo genera faciunt spumae, quae vocant scirerytida et peumenen, tertium molybdaenam in plumbo dicendam. spuma, ut sit utilis, iterum coquitur confractis tubulis ad magnitudinem anulorum. ita accensa folliis ad separandos carbones cineremque abluatur aceto aut vino simulque restinguitur. quodsi sit argyritis, ut candor ei detur, magnitudine fabae confracta in fictili coqui iubetur ex aqua addito in linteolis tritico et hordeo novis, donec ea purgentur. postea vi diebus terunt in mortariis, ter die abluentes aqua frigida et, cum dies desinat, calida, addito sale fossili in libram spumae obolo. novissimo die dein condunt in plumbeo vase. alii cum faba candida et tisana cocunt siccantque sole, alii in lana candida cum faba, donec lanam non denigret. tunc salem fossilem adiciunt subinde aqua mutata siccantque diebus xl calidissimis aestatis. nec non in ventre suillo in aqua coquunt exemptamque nitro fricant et ut supra terunt in mortariis cum sale. sunt qui non coquant, sed cum sale terant et adiecta aqua abluant. usus eius ad collyria et cuti mulierum cicatricum foeditates tollendas maculasque, abluendum capillum. vis autem siccare, mollire, refrigerare, temperate purgare, explere ulcera, tumores lenire; talibusque emplastris additur et liparis supra dictis. ignes etiam sacros tollit cum ruta myrtisque et aceto, item perniones cum myrtis et cera.

in argentiariis metallis invenitur minium quoque, et nunc inter pigmenta magnae auctoritatis et quondam apud romanos non solum maximae, sed etiam sacrae. enumerat auctores verrius, quibus credere necesse sit iovis ipsius simulacri faciem diebus festis minio inlini solitam triumphantiumque corpora; sic camillum triumphasse; hac religione etiamnum addi in unguenta cenae triumphalis et a censoribus in primis iovem miniandum locari. cuius rei causam equidem miror, quamquam et hodie id expeti constat aethiopum populis totosque eo tingui proceres, hunc ibi deorum simulacris colorem esse. quapropter diligentius persequemur omnia de eo.

theophrastus lxxxx annis ante praxibulum atheniensium magistratum - quod tempus exit in urbis nostrae cccxlviii annum - tradit inventum minium a

callia atheniense initio sperante aurum excoqui posse harenae rubenti in metallis argenti; hanc fuisse originem eius, reperiri autem iam tum in hispania, sed durum et harenosum, item apud colchos in rupe quadam inaccessa, ex qua iaculantes decuterent; id esse adulterum, optimum vero supra ephesum cilbianis agris harena cocci colorem habente, hanc teri, dein lavari farinam et quod subsidat iterum lavari; differentiam artis esse, quod alii minium faciant prima lotura, apud alios id esse dilutius, sequentis autem loturae optimum.

auctoritatem colori fuisse non miror. iam enim troianis temporibus rubrica in honore erat homero teste, qui naves ea commendat, alias circa pigmenta picturasque rarus. milton vocant graeci miniumque cinnabarim. unde natus error inscitia nominum. sic enim appellant illi saniem draconis elisi elephantorum morientium pondere permixto utriusque animalis sanguine, ut diximus, neque est alius colos, qui in pictura proprie sanguinem reddat. illa cinnabaris antidotis medicamentisque utilissima est. at, hercules, medici, quia cinnabarim vocant, utuntur hoc minio, quod venenum esse paulo mox docebimus.

cinnabari veteres quae etiam nunc vocant monochromata pingebant. pinxerunt et ephesio minio, quod derelictum est, quia curatio magni operis erat. praeterea utrumque nimis acre existimabatur. ideo transiere ad rubricam et sinopidem, de quibus suis locis dicam. cinnabaris adulteratur sanguine caprino aut sorvis tritis. pretium sinceræ nummi l.

iuba minium nasci et in carmania tradit, timagenes et in aethiopia, sed neutro ex loco invehitur ad nos nec fere aliunde quam ex hispania, celeberrimo sisaponensi regione in baetica miniario metallo vectigalibus populi romani, nullius rei diligentiore custodia. non licet ibi perficere id, excoctique romam adfertur vena signata, ad bina milia fere pondo annua, romae autem lavatur, in vendendo pretio statuta lege, ne modum excederet hs lxx in libras. sed adulteratur multis modis, unde praeda societati. namque est alterum genus omnibus fere argentariis itemque plumbariis metallis, quod fit exusto lapide venis permixto, non ex illo, cuius vomica argentum vivum appellavimus - is enim et ipse in argentum excoquitur - , sed ex aliis simul repertis. steriles etiam plumbi micae. deprehenduntur solo colore nec nisi in fornacibus rubescentes exustique tunduntur in farinam. hoc est secundarium minium perquam paucis notum, multum infra naturales illas harenas. hoc ergo adulteratur minium in officinis sociorum, et vilius syrico. quonam modo syricum fiat suo loco docebimus; sublini autem syrico minium compendi ratio demonstrat. et alio modo pingentium furto opportunum est, plenos subinde ablumentium penicillos. sidit autem in aqua constatque furantibus. sincero cocci nitor esse debet, secundarii autem splendor in parietibus sentit plumbaginem. quamquam hoc robigo quaedam metalli est. sisaponensibus autem miniariis sua vena harenae sine argento. excoquitur auri modo; probatur auro candente, fucatum enim nigrescit, sincerum retinet colorem. invenio et calce adulterari, ac simili ratione ferri candentis lamna, si non sit aurum, deprehendi. inlito

solis atque lunae contactus inimicus. remedium, ut pariete siccato cera punica cum oleo liquefacta candens saetis inducatur iterumque admotis gallae carbonibus inuratur ad sudorem usque, postea candelis subigatur ac deinde linteis puris, sicut et marmora nitescent. qui minium in officinis poliunt, faciem laxis vesicis inligant, ne in respirando perniciosam pulverem trahant et tamen super illas spectent. minium in voluminum quoque scriptura usurpatur clarioresque litteras vel in muro vel in marmore, etiam in sepulchris, facit.

ex secundo invenit vita et hydrargyrum in vicem argenti vivi, paulo ante dilatum. fit autem duobus modis: aereis mortariis pistillisque trito minio ex aceto aut patinis fictilibus inpositum ferrea concha, calice coopertum, argilla superinlita, dein sub patinis accenso foliis continuis igni atque ita calici sudore deterso, qui fit argenti colore et aquae liquore. idem guttis dividi facilis et lubrico umore confluere. quod cum venenum esse conveniat, omnia, quae de minio in medicinae usu traduntur, temeraria arbitror, praeterquam fortassis inlito capiti ventrivi sanguinem sisti, dum ne qua penetret in viscera ac vulnus attingat. aliter utendum non equidem censeam.

hydrargyro argentum inauratur solum nunc prope, cum et in aerea simili modo duci debeat. sed eadem fraus, quae in omni parte vitae ingeniosissima est, vilioris excogitavit materiam, ut docuimus.

auri argentique mentionem comitatur lapis, quem coticulam appellant, quondam non solitus inveniri nisi in flumine tmo, ut auctor est theophrastus, nunc vero passim. alii heraclium, alii lydium vocant. sunt autem modici, quaternas uncias longitudinis binasque latitudinis non excedentes. quod a sole fuit in iis, melius quam quod a terra. his coticulis periti cum e vena ut lima rapuerunt experimentum, protinus dicunt, quantum auri sit in ea, quantum argenti vel aeris, scripulari differentia, mirabili ratione non fallente.

argenti duae differentiae. vatillis ferreis candentibus ramento inposito, quod candidum permaneat, probatur. proxima bonitas rufo, nulla nigro. sed experimento quoque fraus intervenit. servatis in urina virorum vatillis inficitur ita ramentum obiter, dum uritur candoremque mentitur. est aliquod experimentum politi et in halitu hominis, si sudet protinus nubemque discutiat. lamnas duci in speciem vitri non nisi ex optimo posse creditum. fuerat id integrum, sed id quoque iam fraude corrumpitur.

est natura mira imagines reddendi, quod repercusso ae+re atque in oculos regesto fieri convenit. eadem vi sic in speculi usu polita crassitudine paulumque propulsa dilatatur in inensum magnitudo imaginum. tantum interest, repercussum illum excipiat an respuat. quin etiam pocula ita figurantur expulsi intus crebris ceu speculis, ut vel uno intuentis totidem populus imaginum fiat. excogitantur et monstrifica, ut in templo zmyrnae dicata. id evenit figura materiae. plurimum refert concava sint et poculi modo an parvae threicidae, media depressa an elata, transversa an obliqua, supina an infesta, qualitate excipientis figurae torquente venientes umbras; neque enim est aliud illa imago quam digesta claritate materiae accipientis umbra. atque ut omnia de speculis peragantur in hoc loco, optima aput maiores

fuerant brundisina, stagno et aere mixtis. praelata sunt argentea; primus fecit pasiteles magni pompeii aetate. nuper credi coeptum certiore imaginem reddi auro opposito aversis.

tinguit aegyptus argentum, ut in vasis anubim suum spectet, pingitque, non caelat, argentum. unde transiit materia et ad triumphales statuas; mirumque, crescit pretium fulgoris excaecati. id autem fit hoc modo: miscentur argento tertiae aeris cyprii tenuissimi, quod coronarium vocant, et sulphuris vivi quantum argenti; conflantur ita in fictili circumlito argilla; modus coquendi, donec se ipsa opercula aperiant. nigrescit et ovi indurati luteo, ut tamen aceto et creta deteratur.

miscuit denario triumvir antonius ferrum, miscent aera falsae monetae, alii et ponderi subtrahunt, cum sit iustum lxxxiii e libris signari. igitur ars facta denarios probare, tam iucunda plebei lege, ut mario gratidiano vicatim totas statuas dicaverit. mirumque, in hac artium sola vitia discuntur et falsi denarii spectatur exemplar pluribusque veris denariis adulterinus emitur.

non erat apud antiquos numerus ultra centum milia; itaque et hodie multiplicantur haec, ut decies centena aut saepius dicantur. faenus hoc fecit nummusque percussus, et sic quoque aes alienum etiam nunc appellatur. postea divites cognominati, dummodo notum sit eum, qui primus hoc cognomen acceperit, decoxisse creditoribus suis. ex eadem gente M. Crassus negabat locupletem esse nisi qui redditu annuo legionem tueri posset. in agris hs [30mm]30 possedit quiritorium post sullam divitissimus, nec fuit satis nisi totum parthorum usurpasset aurum; atque ut memoriam quidem opum occupaverit - iuvat enim insectari inexplabilem istam habendi cupidinem - : multos postea cognovimus servitute liberatos opulentiores, pariterque tres claudii principatu paulo ante callistum, pallantem, narcissum. atque ut hi omittantur, tamquam adhuc rerum potiantur, c. asinio gallo c. marcio censorino cos. a. d. vi kal. febr. c. caecilius c. l. isidorus testamento suo edixit, quamvis multa bello civili perdidisset, tamen relinquere servorum [iiii] cxvi, iuga boum [iii] dc, reliqui pecoris [cclvii], in numerato hs [30dc]30, funerari se iussit hs [30x]30. congerant excedentes numerum opes, quota tamen portio erunt ptolemaei, quem Varro tradit pompeio res gerente circa iudaeam octona milia equitum sua pecunia toleravisse, mille convivae totidem aureis potioris, mutantem ea vasa cum ferculis, saginasse! quota vero ille ipse - neque enim de regibus loquor - portio fuerit Pythis bithyni, qui platanum auream vitemque nobiles illas dario regi donavit, xerxis copias, hoc est [30vii]30 [lxxxviii] hominum, excepit epulo, stipendium quinque mensum frumentumque pollicitus, ut e quinque liberis in dilectu senectuti suae unus saltem concederetur! hunc quoque ipsum aliquis comparet croeso regi! quae, malum, amentia est id in vita cupere, quod aut et servis contigerit aut ne in regibus quidem invenerit finem!

populus r. stipem spargere coepit sp. postumio q. marcio cos.; tanta abundantia pecuniae erat, ut eam conferret l. scipioni, ex qua is ludos fecit. nam quod agrippae menenio sextantes aeris in funus contulit, honoris id

necessitatisque propter paupertatem agrippae, non largitionis esse duxerim.

vasa ex argento mire inconstantia humani ingenii variat nullum genus officinae diu probando. nunc furniana, nunc clodiana, nunc gratiana - etenim tabernas mensis adoptamus - , nunc anaglypta asperitatemque exciso circa liniarum picturas quaerimus, iam vero et mensas repositoriis inponimus ad sustinenda opsonia, interrاديمus alia, ut quam plurimum lima perdiderit. vasa coccinaria ex argento fieri calvus orator quiritat; at nos carrucas argento caelare invenimus, nostraque aetate poppaea coniunx neronis principis soleas delicatioribus iumentis suis ex auro quoque induere iussit.

triginta duo libras argenti africanus sequens heredi reliquit idemque, cum de poenis triumpharet, [iiii] ccclxx pondo transtulit. hoc argenti tota carthago habuit illa terrarum aemula, quot mensarum postea apparatu victa! numantia quidem deleta idem africanus in triumpho militibus #1108 vii dedit. o viros illo imperatore dignos, quibus hoc satis fuit! frater eius allobrogicus primus omnium pondo mille habuit, at drusus livius in tribunatu plebei x. nam propter quinque pondo notatum a censoribus triumphalem senem fabulosum iam videtur, item catum aelium, cum legati aetolorum in consulatu prandentem in fictilibus adissent, missa ab iis vasa argentea non accepisse neque aliud habuisse argenti ad supremum vitae diem quam duo pocula, quae l. paulus socer ei ob virtutem devicto perseo rege donavisset. invenimus legatos carthaginensium dixisse nullos hominum inter sese benignius vivere quam romanos. eodem enim argento apud omnes cenitavisse ipsos. at, hercules, pompeium paulinum, arelatensis equitis romani filium paternaque gente pellitum, [xii] pondo argenti habuisse apud exercitum ferocissimis gentibus oppositum scimus; lectos vero iam pridem mulierum totos operiri argento, quaedam et triclinia. quibus argentum addidisse primus traditur carvilius pollio eques romanus, non ut operiret aut deliaca specie faceret, sed punicana; eadem et aureos fecit, nec multo post argentei deliacos imitati sunt. quae omnia expiavit bellum civile sullanum.

paulo enim ante haec factae sunt lances e centenariis libris argenti, quas tunc super cl numero fuisse romae constat multosque ob eas proscriptos dolo concupiscentium. erubescant annales, qui bellum civile illud talibus vitiis inputavere; nostra aetas fortior fuit. claudii principatu servus eius drusilianus nomine rotundus, dispensator hispaniae citerioris, quingenariam lancem habuit, cui fabricandae officina prius exaedificata fuerat, et comites eius octo ad ccl libras, quaeso, ut quam multi eas conservi eius inferrent, aut quibus cenantibus cornelius nepos tradit ante sullae victoriam duo tantum triclinia romae fuisse argentea, repositoriis argentum addi sua memoria coeptum. fenestella, qui obiit novissimo tiberii caesaris principatu, ait et testudinea tum in usum venisse, ante se autem paulo lignea, rotunda, solida nec multo maiora quam mensas fuisse, se quidem puero quadrata et compacta aut acere operata aut citro coepisse, mox additum argentum in angulos lineasque per commissuras, tympana vero se iuvene appellata, tum a stateris et lances, quas antiqui magides vocaverant.

nec copia argenti tantum furit vita, sed valdius paene manipulorum, idque iam pridem, ut ignoscamus nobis. delphinos quinque milibus sestertium in libras emptos c. gracchus habuit, L. vero Crassus orator duos scyphos mentoris artificis manu caelatos *hs [c]*, confessus tamen est numquam iis uti propter verecundiam ausum. scimus eundem *hs [vi]* in singulas libras vasa empta habuisse. asia primum devicta luxuriam misit in italiam, siquidem l. scipio in triumpho transtulit argenti caelati pondo mille et cccc et vasorum aureorum pondo md anno conditae urbis dlxv. at eadem asia donata multo etiam gravius adflixit mores, inutiliorque victoria illa hereditas attalo rege mortuo fuit. tum enim haec emendi romae in auctionibus regiis verecundia exempta est urbis anno dcxxii, mediis lvii annis erudita civitate amare etiam, non solum admirari, opulentiam externam, inmenso et achaicae victoriae momento ad impellendos mores, quae et ipsa in hoc intervallo anno urbis dcviii parta signa et tabulas pictas invexit. ne quid deesset, pariter quoque luxuria nata est et carthago sublata, ita congruentibus fatiis, ut et liberet amplecti vitia et liceret. petiere et dignationem hinc aliqui veterum. c. marius post victoriam cimbricam cantharis potasse liberi patris exemplo traditur, ille arator arpinas et manipularis imperator.

argenti usum in statuas primum Divi Augusti temporum adulatione transisse falso existimatur. iam enim triumpho magni pompeii reperimus translata pharnacis, qui primus regnavit in ponto, argenteam statuam, item mithridatis eupatoris et currus aureos argenteosque. argentum succedit aliquando et auro luxu feminarum plebis compedes sibi facientium, quas induere aureas mos tritior vetet. vidimus et ipsi arellum fuscum motum equestri ordine ob insignem calumniam, cum celebritatem adsectarentur adolescentium scholae, argenteos anulos habentem. et quid haec attinet colligere, cum capuli militum ebore etiam fastidito caelantur argento, vaginae catellis, balnea lamnis crepitent, iam vero paedagogia in transitu virilitatis custodiantur argento, feminae laventur et nisi argentea solia fastidiant, eademque materia et cibus et probriis serviat videret haec fabricius et stratas argento mulierum balneas ita, ut vestigio locus non sit, cum viris lavantium! fabricius, qui bellicos imperatores plus quam pateram et salinum habere ex argento vetabat, videret hinc dona fortium fieri aut in haec frangi! heu mores, fabrici nos pudet!

mirum auro caelando neminem inclaruisset, argento multos. maxime tamen laudatus est mentor, de quo supra diximus. quattuor paria ab eo omnino facta sunt, ac iam nullum extare dicitur ephesiae dianae templi aut capitolini incendiis. Varro se et aereum signum eius habuisse scribit. proximi ab eo in admiratione acragas et boeothus et mys fuere. exstant omnium opera hodie in insula rhodiorum, boeothi apud lindiam minervam, acragantis in templo liberi patris in ipsa rhodo centauros bacchasque caelati scyphi, myos in eadem aede silenos et cupidines. acragantis et venatio in scyphis magnam famam habuit. post hos celebratus est calamis, et antipatro qui satyrum in phiala gravatum somno conlocavisse verius quam caelasse dictus est ... , stratonice mox

cyzicenus, Tauriscus. item ariston et eunicus mitylenaei laudantur et hecataeus et circa pompeii magni aetatem pasiteles, posidonius ephesius hedys, thracides, qui proelia armatosque caelavit, zopyrus, qui areopagitas et iudicium orestis in duobus scyphis ^{hs} [30xii]30 aestimatis. fuit et pytheas, cuius ii unciae #1108 [x] venierunt: ulixes et diomedes erant in phialae emblemate palladium subripientes. fecit idem et cocos magiriscia appellatos parvolis potoriis et e quibus ne exemplaria quidem liceret exprimere; tam opportuna iniuriae subtilitas erat. habuit et teucer crustarius famam, subitoque ars haec ita exolevit, ut sola iam vetustate censeatur usuque attritis caelaturis sic, ne figura discerni possit, auctoritas constet. - (argentum medicatis aquis inficitur atque adflatu salso, sicut in mediterraneis hispaniae.) -

in argenti et auri metallis nascuntur etiamnum pigmenta, sil et caeruleum. sil proprie limus est. optimum ex eo quod atticum vocatur, pretium in pondo libras #1108 ii; proximum marmorosum dimidio attici pretio. tertium genus est pressum, quod alii scyricum vocant, ex insula scyro, iam et ex achaia, quo utuntur ad picturae umbras, pretium in libras ^{hs} bini; dupondiis vero detractis quod lucidum vocant, e gallia veniens. hoc autem et attico ad lumina utuntur, ad abacos non nisi marmoroso, quoniam marmor in eo resistit amaritudini calcis. effoditur et ad xx ab urbe lapidem in montibus; postea uritur pressum appellantibus qui adulterant. sed esse falsum exustumque, amaritudine apparet et quoniam resolutum in pulverem est. sile pingere instituere primi polygnotus et micon, attico dumtaxat. secuta aetas hoc ad lumina usa est, ad umbras autem scyrico et lydio. lydium sardibus emebatur, quod nunc omittunt.

caeruleum harena est. huius genera tria fuere antiquitus: aegyptium maxime probatur; scythicum mox diluitur facile et, cum teritur, in quattuor colores mutatur, candidiorem nigrioremve et crassiorem tenuioremve; praefertur huic etiamnum cyprium. accessit his puteolanum et hispaniense, harena ibi confici coepta. tinguitur autem omne et in sua coquitur herba bibitque sucum. reliqua confectura eadem quae chrysocollae.

ex caeruleo fit quod vocatur lomentum, perficitur id lavando terendoque. hoc est caeruleo candidius. pretia eius #1108 x in libras, caerulei #1108 viii. usus in creta; calcis inpatiens. nuper accessit et vestorianum, ab auctore appellatum. fit ex aegyptii levissima parte; pretium eius in libras #1108 i. idem et puteolani usus, praeterque ad fenestras; cylon vocant. - non pridem adportari et indicum coeptum est, cuius pretium #1108 vii. ratio in pictura ad incisuras, hoc est umbras dividendas ab lumine. - est et vilissimum genus lomenti, quod tritum vocant, quinis assibus aestimatum.

caerulei sinceri experimentum in carbone ut flagret; fraus viola arida decocta in aqua sucoque per linteum expresso in cretam eretrium. vis in medicina ut purget ulcera; itaque et emplastris adiciunt, item causticis. teritur autem difficillime. - sil in medendo leniter mordet adstringitque et explet ulcera. uritur in fictilibus, ut prosit.

pretia rerum, quae usquam posuimus, non ignoramus alia aliis locis esse et omnibus paene mutari annis, prout navigatione constiterint aut ut quisque

mercatus sit aut aliquis praevalens manceps annonam flagellet, non obliti demetrium a tota seplasia neronis principatu accusatum apud consules; poni tamen necessarium fuit quae plerumque erant romae, ut exprimeretur auctoritas rerum.

LIBER XXXIV

proxime dicantur aeris metalla, cui et in usu proximum est pretium, immo vero ante argentum ac paene etiam ante aurum corinthio, stipis quoque auctoritas, ut diximus. hinc aera militum, tribuni aerarii et aerarium, obaerati, aere diruti. docuimus quamdiu populus romanus aere tantum signato usus esset: et alia re vetustas aequalem urbi auctoritatem eius declarat, a rege numa collegio tertio aerarium fabrum instituto.

vena quo dictum est modo foditur ignique perficitur. fit et e lapide aereo, quem vocant cadmean, celebri trans maria et quondam in campania, nunc et in bergomatium agro extrema parte italiae; ferunt nuper etiam in germania provincia repertum. fit et ex alio lapide, quem chalcitum appellant in cypro, ubi prima aeris inventio, mox vilitas praecipua reperto in aliis terris praestantiore maximeque aurichalco, quod praecipuam bonitatem admirationemque diu optinuit nec reperitur longo iam tempore effeta tellure. proximum bonitate fuit sallustianum in ceutronum alpino tractu, non longi et ipsum aevi, successitque ei livianum in gallia. utrumque a metallorum dominis appellatum, illud ab amico Divi Augusti, hoc a coniuge. velocis defectus livianum quoque; certe admodum exiguum invenitur. summa gloriae nunc in marianum conversa, quod et cordubense dicitur. hoc a liviano cadmean maxime sorbet et aurichalci bonitatem imitatur in sestertiis dupondiarisque, cyprio suo assibus contentis. et hactenus nobilitas in aere naturalis se habet.

reliqua genera cura constant, quae suis locis reddentur, summa claritate ante omnia indicata. quondam aes confusum auro argentoque miscebatur, et tamen ars pretiosior erat; nunc incertum est, peior haec sit an materia, mirumque, cum ad infinitum operum pretia creverint, auctoritas artis extincta est. quaestus enim causa, ut omnia, exerceri coepta est quae gloriae solebat - ideo etiam deorum adscripta operi, cum procures gentium claritatem et hac via quaererent - , adeoque exolevit fundendi aeris pretiosi ratio, ut iam diu ne fortuna quidem in ea re ius artis habeat.

ex illa autem antiqua gloria corinthium maxime laudatur. hoc casus miscuit corintho, cum caperetur, incensa, mireque circa id multorum adfectatio furit, quippe cum tradatur non alia de causa verrem, quem m. cicero damnaverat, proscriptum cum eo ab antonio, quoniam corinthiis cessurum se ei negavisset. ac mihi maior pars eorum simulare eam scientiam videtur ad segregandos sese a ceteris magis quam intellegere aliquid ibi subtilius; et hoc paucis docebo. corinthus capta est olympiadis clviii anno tertio, nostrae urbis dcviii, cum ante haec saecula fictores nobiles esse desissent, quorum isti omnia signa hodie corinthia appellant. quapropter ad coarguendos eos ponemus artificum aetates; nam urbis nostrae annos ex supra dicta comparatione olympiadum colligere facile erit. sunt ergo vasa tantum corinthia, quae isti elegantiores modo ad esculenta transferunt, modo in lucernas aut trulleos nullo munditiarum

dispectu. eius tria genera: candidum argento nitore quam proxime accedens, in quo illa mixtura praevaluit; alterum, in quo auri fulva natura; tertium, in quo aequalis omnium temperies fuit. praeter haec est cuius ratio non potest reddi, quamquam hominis manu est; at fortuna temperatur in simulacris signisque illud suo colore pretiosum ad iocineris imaginem vergens, quod ideo hepatizon appellant, procul a corinthio, longe tamen ante aegineticum atque deliacum, quae diu optinere principatum.

antiquissima aeris gloria deliaco fuit, mercatus in delo celebrante toto orbe, et ideo cura officinis. tricliniorum pedibus fulcrisque ibi prima aeris nobilitas, pervenit deinde et ad deum simulacra effigiemque hominum et aliorum animalium.

proxima laus aeginetico fuit, insula et ipsa eo, nec quod ibi gigneretur, sed officinarum temperatura, nobilitata. bos aereus inde captus in foro boario est romae. hoc erit exemplar aeginetici aeris, deliaci autem iuppiter in capitolio in iovis tonantis aede. illo aere Myron usus est, hoc polycletus, aequales atque condiscipuli; sic aemulatio et in materia fuit.

privatim aegina candelaborum superficiem dumtaxat elaboravit, sicut tarentum scapos. in iis ergo iuncta commendatio officinarum est. nec pudet tribunorum militarium salariis emere, cum ipsum nomen a candelarum lumine inpositum appareat. accessio candelabri talis fuit theonis iussu praeconis clesippus fullo gibber et praeterea et alio foedus aspectu, emente id gegania hs [I]. eadem ostentante in convivio empta ludibrii causa nudatus atque inpudentia libidinis receptus in torum, mox in testamentum, praedives numinum vice illud candelabrum coluit et hanc corinthiis fabulam adiecit, vindicatis tamen moribus nobili sepulchro, per quod aeterna supra terras geganiae dedecoris memoria duraret. sed cum esse nulla corinthia candelabra constet, nomen id praecipue in his celebratur, quoniam mummi victoria corinthus quidem diruit, sed e compluribus aethiae oppidis simul aera dispersit.

prisci limina etiam ac valvas in templis ex aere factitavere. invenio et a cn. octavio, qui de perseo rege navalem triumphum egit, factam porticum duplicem ad circum flaminium, quae corinthia sit appellata a capitulis aereis columnarum, vestae quoque aedem ipsam syracusana superficie tegi placuisse. syracusana sunt in pantheo capita columnarum a m. agrippa posita. quin etiam privata opulentia eo modo usurpata est. camillo inter crimina obiecit spurius carvilius quaestor, ostia quod aerata haberet in domo. nam triclinia aerata abacosque et monopodia cn. manlium asia devicta primum invexisse triumpho suo, quem duxit anno urbis dclxvii, l. piso auctor est, antias quidem heredes L. Crassi oratoris multa etiam triclinia aerata vendidisse. ex aere factitavere et cortinas tripodum, nomine et delphicas, quoniam donis maxime apollini delphico dicabantur. placuere et lychnuchi pensiles in delubris aut arborum mala ferentium modo lucentes, quale est in templo apollinis palatini quod alexander magnus thebarum expugnatione captum in cyme dicaverat eidem deo.

transiit deinde ars vulgo ubique ad effigies deorum. romae simulacrum ex aere factum cereri primum reperio ex peculio sp. cassi, quem regnum adfectantem pater ipsius interemerit. transiit et a diis ad hominum statuas atque imagines multis modis. bitumine antiqui tinguebant eas, quo magis mirum est placuisse auro integere. hoc nescio an romanum fuerit inventum; certe etiam nomen non habet vetustum. effigies hominum non solebant exprimi nisi aliqua inlustri causa perpetuitatem merentium, primo sacrorum certaminum victoria maximeque olympiae, ubi omnium, qui vicissent, statuas dicari mos erat, eorum vero, qui ter ibi superavissent, ex membris ipsorum similitudine expressa, quas iconicas vocant. athenienses nescio an primis omnium harmodio et aristogitoni tyrannicidis publice posuerint statuas. hoc actum est eodem anno, quo et romae reges pulsi. excepta deinde res est a toto orbe terrarum humanissima ambitione, et in omnium municipiorum foris statuae ornamentum esse coepere propagarique memoria hominum et honores legendi aevo basibus inscribi, ne in sepulcris tantum legerentur. mox forum et in domibus privatis factum atque in atriis: honos clientium instituit sic colere patronos.

togatae effigies antiquitus ita dicabantur. placuere et nudae tenentes hastam ab epheborum e gymnasiis exemplaribus; quas achilleas vocant. graeca res nihil velare, at contra romana ac militaris thoraces addere. caesar quidem dictator loricate sibi dicari in foro suo passus est. nam lupercorum habitu tam noviciae sunt quam quae nuper prodire paenulis indutae. mancinus eo habitu sibi statuit, quo deditus fuerat. notatum ab auctoribus et l. accium poetam in camenarum aede maxima forma statuam sibi posuisse, cum brevis admodum fuisset. equestres utique statuae romanam celebrationem habent, orto sine dubio a graecis exemplo. sed illi celetas tantum dicabant in sacris victores, postea vero et qui bigis vel quadrigis vicissent; unde et nostri currus nati in iis, qui triumphavissent. serum hoc, et in iis non nisi a Divo Augusto seiuges, sicut elephantis.

non vetus et bigarum celebratio in iis, qui praetura functi curru vecti essent per circum; antiquior columnarum, sicuti c. maenio, qui devicerat priscos latinos, quibus ex foedere tertias praedae populus romanus praestabat, eodemque in consulatu in suggestu rostra devictis antiatibus fixerat anno urbis ccccxvi, item c. duillio, qui primus navalem triumphum egit de poenis, quae est etiam nunc in foro, item l. minucio praefecto annonae extra portam trigeminam unciaria stipe conlata - nescio an primo honore tali a populo, antea enim a senatu erat - , praeclara res, ni frivolis coepisset initiis. namque et atti navi statua fuit ante curiam - basis eius conflagravit curia incensa p. clodii funere - ; fuit et hermodori ephesii in comitio, legum, quas decemviri scribebant, interpretis, publice dicata. alia causa, alia auctoritas m. horati coclitis statuae - quae durat hodieque - , cum hostes a ponte sublicio solus arcuisset. equidem et sibyllae iuxta rostra esse non miror, tres sint licet: una quam sextus pacuius taurus aed. pl. restituit; duae quas m. messalla. primas putarem has et atti navi, positas aetate tarquinii prisci, ni regum

antecedentium essent in capitolio, ex iis romuli et tatii sine tunica, sicut et camilli in rostris. et ante aedem castorum fuit q. marci tremuli equestris togata, qui samnites bis devicerat captaque anagnia populum stipendio liberaverat. inter antiquissimas sunt et tullii cloeli, l. rosci, sp. nauti, c. fulcini in rostris, a fidenatibus in legatione interfectorum. hoc a re p. tribui solebat iniuria caesis, sicut aliis et p. iunio, ti. coruncanio, qui ab teuta illyriorum regina interfecti erant. non omittendum videtur, quod annales adnotavere, tripedaneas iis statuas in foro statutas; haec videlicet mensura honorata tunc erat. non praeteribo et cn. octavium ob unum sc. verbum. hic regem antiochum daturum se responsum dicentem virga, quam tenebat forte, circumscripsit priusque, quam egrederetur circulo illo, responsum dare coegit. in qua legatione interfecto senatus statuam poni iussit “quam oculatissimo loco,” eaque est in rostris. invenitur statua decreta et taraciae gaiae sive fufetiae virgini vestali, “ut poneretur ubi vellet,” quod adiectum non minus honoris habet quam feminae esse decretam. meritum eius ipsis ponam annalium verbis: “quod campum tiberinum gratificata esset ea populo.” invenio et pythagorae et Alcibiadi in cornibus comitii positas, cum bello samniti apollo pythius iussisset fortissimo graiae gentis et alteri sapientissimo simulacra celebri loco dicari. eae stetere, donec Sulla dictator ibi curiam faceret. mirumque est, illos patres socrati cunctis ab eodem deo sapientia praelato pythagoran praetulisse aut tot aliis virtute Alcibiaden et quemquam utroque themistocli.

columnarum ratio erat attolli super ceteros mortales, quod et arcus significant novicio invento. primus tamen honos coepit a graecis, nullique arbitror plures statuas dicatas quam phalereo demetrio athenis, siquidem cccxl statuere, nondum anno hunc numerum dierum excedente, quas mox laceravere. statuerunt et romae in omnibus vicis tribus mario gratidiano, ut diximus, easdemque subvertere sullae introitu.

pedestres sine dubio romae fuere in auctoritate longo tempore; et equestrium tamen origo perquam vetus est, cum feminis etiam honore communicato cloeliae statua equestri, ceu parum esset toga eam cingi, cum lucretiae ac Bruto, qui expulerant reges, propter quos cloelia inter obsides fuerat, non decernerentur. hanc primam cum coclitis publice dicatam crediderim - atto enim ac sibyllae tarquinium, ac reges sibi ipsos posuisse verisimile est - , nisi cloeliae quoque piso traderet ab iis positam, qui una opsidibus fuissent, redditus a porsina in honorem eius. e diverso annius fetialis equestrem, quae fuerit contra iovis statoris aedem in vestibulo superbi domus, valeriae fuisse, publicolae consulis filiae, eamque solam refugisse tiberimque transnavisse ceteris opsidibus, qui porsinae mittebantur, interemptis tarquinii insidiis.

l. piso prodidit m. aemilio c. popilio iterum cos. a censoribus p. cornelio scipione m. popilio statuas circa forum eorum, qui magistratum gesserant, sublatis omnes praeter eas, quae populi aut senatus sententia statutae essent, eam vero, quam apud aedem telluris statuisset sibi sp. cassius, qui regnum

adfectaverat, etiam conflata a censoribus. nimirum in ea quoque re ambitionem providebant illi viri. exstant catonis in censura vociferationes mulieribus statuas romanis in provinciis poni; nec tamen potuit inhibere, quominus romae quoque ponerentur, sicuti corneliae gracchorum matri, quae fuit africani prioris filia. sedens huic posita soleisque sine ammento insignis in metelli publica porticu, quae statua nunc est in octaviae operibus. - publice autem ab exteris posita est romae c. aelio tr. pl. lege perlatam in sthenium stallium lucanum, qui thurinos bis infestaverat. ob id aelium thurini statua et corona aurea donarunt. iidem postea fabricium donavere statua liberati obsidione, passimque gentes in clientelas ita receptae, et adeo discrimen omne sublatum, ut Hannibalis etiam statuae tribus locis visantur in ea urbe, cuius intra muros solus hostium emisit hastam.

fuisse autem statuariam artem familiarem italiae quoque et vetustam, indicant hercules ab euandro sacratus, ut produnt, in foro boario, qui triumphalis vocatur atque per triumphos vestitur habitu triumphali, praeterea ianus geminus a numa rege dicatus, qui pacis bellicae argumento colitur digitis ita figuratis, ut cccxv dierum nota aut per significationem anni temporis et aevi esse deum indicent. signa quoque tuscanica per terras dispersa quin in eturia factitata sint, non est dubium. deorum tantum putarem ea fuisse, ni metrodorus scepheus, cui cognomen a romani nominis odio inditum est, propter m statuarum volsinios expugnatos obiceret. mirumque mihi videtur, cum statuarum origo tam vetus italiae sit, lignea potius aut fictilia deorum simulacra in delubris dicata usque ad devictam asiam, unde luxuria.

similitudines exprimendi quae prima fuerit origo, in ea, quam plasticen graeci vocant, dici convenientius erit; etenim prior quam statuaria fuit. sed haec ad infinitum effloruit, multorum voluminum opere, si quis plura persequi velit; omnia enim quis possit M. Scauri aedilitate signorum mmm in scaena tantum fuere temporario theatro. mummius achaia devicta replevit urbem, non relicturus filiae dotem; cur enim non cum excusatione ponatur multa et luculli invexere. rhodi etiamnum [iii] signorum esse mucianus ter cos. prodidit, nec pauciora athenis, olympiae, delphis superesse creduntur. quis ista mortalium persequi possit aut quis usus noscendi intellegatur insignia maxime et aliqua de causa notata voluptarium sit attigisse artificesque celebratos nominavisse, singulorum quoque inexplicabili multitudine, cum lysippus md opera fecisse prodatur, tantae omnia artis, ut claritatem possent dare vel singula: numerum apparuisse defuncto eo, cum thesaurum effregisset heres; solitum enim ex manipretio cuiusque signi denarios seponere aureos singulos.

evecta supra humanam fidem ars est successu, mox et audacia. in argumentum successus unum exemplum adferam, nec deorum hominumve similitudinis expressae. aetas nostra vidit in capitolio, priusquam id novissime conflagraret a vitellianis incensum, in cella iunonis canem ex aere volnus suum lambentem, cuius eximium miraculum et indiscreta veri similitudo non eo solum intellegitur, quod ibi dicata fuerat, verum et satisfactione; nam

quoniam summa nulla par videbatur, capite tutelarios cavere pro ea institutum publice fuit. audaciae innumera sunt exempla. moles quippe excogitatas videmus statuarum, quas colossaeas vocant, turribus pares. talis est in capitolio apollo, tralatus a m. lucullo ex apollonia ponti urbe, xxx cubitorum, d talentis factus; talis in campo martio iuppiter, a claudio caesare dicatus, qui devoratur pompeiani theatri vicinitate; talis et tarenti factus a lysippo, xl cubitorum. mirum in eo quod manu, ut ferunt, mobilis ea ratio libramenti est, ut nullis convellatur procellis. id quidem providisse et artifex dicitur modico intervallo, unde maxime flatum opus erat frangi, opposita columna. itaque magnitudinem propter difficultatemque moliendi non attigit eum fabius verrucosus, cum herculem, qui est in capitolio, inde transferret. ante omnes autem in admiratione fuit solis colossus rhodi, quem fecerat chares lindius, lysippi supra dicti discipulus. lxx cubitorum altitudinis fuit hoc simulacrum, post lxvi annum terrae motu prostratum, sed iacens quoque miraculo est. pauci pollicem eius amplectuntur, maiores sunt digiti quam pleraeque statuae. vasti specus hiant defractis membris; spectantur intus magnae molis saxa, quorum pondere stabiliverat eum constituens. duodecim annis tradunt effectum ccc talentis, quae contigerant ex apparatu regis demetrii relicto morae taedio obsessa rhodo. sunt alii centum numero in eadem urbe colossi minores hoc, sed ubicumque singuli fuissent, nobilitaturi locum, praeterque hos deorum quinque, quos fecit Bryaxis.

factitavit colossos et italia. videmus certe tuscanicum apollinem in bibliotheca templi Augusti quinquaginta pedum a pollice, dubium aere mirabiliorem an pulchritudine. fecit et sp. carvilius iovem, qui est in capitolio, victis samnitibus sacrata lege pugnantibus e pectoralibus eorum ocreisque et galeis. amplitudo tanta est, ut conspiciatur a latiori iove. e reliquiis limae suam statuam fecit, quae est ante pedes simulacri eius. habent in eodem capitolio admirationem et capita duo, quae p. lentulus cos. dicavit, alterum a charete supra dicto factum, alterum fecit ... dicus comparatione in tantum victus, ut artificum minime probabilis videatur. verum omnem amplitudinem statuarum eius generis vicit aetate nostra zenodorus mercurio facto in civitate galliae arvernensis per annos decem, hs [30cccc]30 manipretii, postquam satis artem ibi adprobaverat, romam accitus a nerone, ubi destinatum illius principis simulacro colossus fecit cxix pedum in longitudinem, qui dicatus soli venerationi est damnatis sceleribus illius principis. mirabamur in officina non modo ex argilla similitudinem insignem, verum et de parvis admodum surculis quod primum operis instaurati fuit. ea statua indicavit interisse fundendi aeris scientiam, cum et nero largiri aurum argentumque paratus esset et zenodorus scientia fingendi caelandique nulli veterum postponeretur. statuam arvernorum cum faceret provinciae dubio avito praesidente, duo pocula calamidis manu caelata, quae cassio salano avunculo eius, praeceptoris suo, germanicus caesar adamata donaverat, aemulatus est, ut vix ulla differentia esset artis. quanto maior zenodoro praestantia fuit, tanto magisprehenditur aeris oblitteratio.

signis, quae vocant corinthia, plerique in tantum capiuntur, ut secum circumferant, sicut hortensius orator sphingem verri reo ablatam, propter quam cicero illo iudicio in altercatione neganti ei, aenigmata se intellegere, respondit debere, quoniam sphingem domi haberet. circumtulit et nero princeps amazonem, de qua dicemus, et paulo ante c. cestius consularis signum, quod secum etiam in proelio habuit. alexandri quoque magni tabernaculum sustinere traduntur solitae statuae, ex quibus duae ante martis ultoris aedem dicatae sunt, totidem ante regiam.

minoribus simulacris signisque innumera prope artificum multitudo nobilitata est, ante omnes tamen Phidias atheniensis iove olympio facto ex ebore quidem et auro, sed et ex aere signa fecit. floruit autem olympiade lxxxiii, circiter ccc urbis nostrae annum, quo eodem tempore aemuli eius fuere Alcamenes, critias, nesiotes, hebias, et deinde olympiade lxxxvii hagelades, callon, gorgias lacon; rursus lxxxix polyclitus, phradmon, Myron, pythagoras, Scopas, perellus. ex iis polyclitus discipulos habuit argium, asopodorum, alexim, aristidem, phrynonem, dinonem, Athenodorum, demean clitorium, Myron lycium. lxxxv olympiade floruerunt naucydes, dinomenes, canachus, patroclus; cii polycles, Cephisodotus, leuchares, hypatodorus; ciii Praxiteles, euphranor; cvii aetion, therimachus. cxiii lysippus fuit, cum et alexander magnus, item lysistratus frater eius, sthennis, euphron, eucles, sostratus, ion, silanion - in hoc mirabile quod nullo doctore nobilis fuit; ipse discipulum habuit zeuxiaden; cxxi Eutychides, euthycrates, laippus, cephisodotus, timarchus, pyromachus. cessavit deinde ars ac rursus olympiade clvi revixit, cum fuere longe quidem infra praedictos, probati tamen, antaeus, callistratus, polycles athenaeus, callixenus, pythocles, pythias, timocles.

ita distinctis celeberrimorum aetatibus insignes raptim transcurram, reliqua multitudine passim dispersa. venere autem et in certamen laudatissimi, quamquam diversis aetatibus geniti, quoniam fecerant amazonas, quae cum in templo dianae ephesiae dicarentur, placuit eligi probatissimam ipsorum artificum, qui praesentes erant, iudicio, cum apparuit eam esse, quam omnes secundam a sua quisque iudicassent. haec est polycliti, proxima ab ea Phidiae, tertia cresilae, quarta cydonis, quinta phradmonis.

Phidias praeter iovem olympium, quem nemo aemulatur, fecit ex ebore aequae minervam athenis, quae est in parthenone stans, ex aere vero praeter amazonem supra dictam minervam tam eximiae pulchritudinis, ut formae cognomen acceperit. fecit et cliduchum et aliam minervam, quam romae paulus aemilius ad aedem fortunae huiusce diei dicavit, item duo signa, quae catulus in eadem aede, palliata et alterum colossicon nudum, primusque artem toreuticen aperuisse atque demonstrasse merito iudicatur.

polyclitus sicyonius, hageladae discipulus, diadumenum fecit molliter iuvenem, centum talentis nobilitatum, idem et doryphorum viriliter puerum. fecit et quem canona artifices vocant liniamenta artis ex eo petentes veluti a lege quadam, solusque hominum artem ipsam fecisse artis opere iudicatur. fecit et destringentem se et nudum telo incessentem duosque pueros item

nudos, talis ludentes, qui vocantur astragalizontes et sunt in titi imperatoris atrio - hoc opere nullum absolutius plerique iudicant - ; item mercurium, qui fuit lysimacheae, herculem, qui romae, hagera arma sumentem, artemona, qui periphoretos appellatus est. hic consummasse hanc scientiam iudicatur et toreuticen sic erudisse, ut Phidias aperuisse. proprium eius est, uno crure ut insisterent signa, excogitasse, quadrata tamen esse ea ait Varro et paene ad exemplum.

Myronem eleutheris natum, hageladae et ipsum discipulum, bucula maxime nobilitavit celebratis versibus laudata, quando alieno plerique ingenio magis quam suo commendantur. fecit et canem et discobolon et perseum et pristam et satyrum admirantem tibias et minervam, delphicos pentathlos, pancratiastas, herculem, qui est apud circum maximum in aede pompeii magni. fecisse et cicadae monumentum ac locustae carminibus suis erinna significat. fecit et apollinem, quem ab triumviro antonio sublatum restituit ephesiis Divus Augustus admonitus in quiete. primus hic multiplicasse veritatem videtur, numerosior in arte quam polyclitus et in symmetria diligentior, et ipse tamen corporum tenus curiosus animi sensus non expressisse, capillum quoque et pubem non emendatius fecisse, quam rudis antiquitas instituisset.

vicit eum pythagoras reginus ex italia pancratiaste delphis posito; eodem vicit et leontiscum. fecit et stadiodromon astylon, qui olympiae ostenditur, et libyn, puerum tenentem tabellam eodem loco et mala ferentem nudum, syracusis autem claudicantem, cuius ulceris dolorem sentire etiam spectantes videntur, item apollinem serpentemque eius sagittis configi, citharoedum, qui dicaeus appellatus est, quod, cum thebae ab alexandro caperentur, aurum a fugiente conditum sinu eius celatum esset. hic primus nervos et venas expressit capillumque diligentius. - fuit et alius pythagoras samius, initio pictor, cuius signa ad aedem fortunae huiusce diei septem nuda et senis unum laudata sunt. hic supra dicto facie quoque indiscreta similis fuisse traditur, regini autem discipulus et filius sororis fuisse sostratus.

lysippum sicyonium duris negat ullius fuisse discipulum, sed primo aerarium fabrum audendi rationem cepisse pictoris eupompi responso. eum enim interrogatum, quem sequeretur antecedentium, dixisse monstrata hominum multitudine, naturam ipsam imitandam esse, non artificem. plurima ex omnibus signa fecit, ut diximus, fecundissimae artis, inter quae destringentem se, quem m. agrippa ante thermas suas dicavit, mire gratum tiberio principi. non quivit temperare sibi in eo, quamquam imperiosus sui inter initia principatus, transtulitque in cubiculum alio signo substituto, cum quidem tanta pop. r. contumacia fuit, ut theatri clamoribus reponi apoxyomenon flagitaverit princepsque, quamquam adamatum, reposuerit. nobilitatur lysippos et temulenta tibicina et canibus ac venatione, in primis vero quadriga cum sole rhodiorum. fecit et alexandrum magnum multis operibus, a pueritia eius orsus, quam statuam inaurari iussit nero princeps delectatus admodum illa; dein, cum pretio perisset gratia artis, detractum est aurum, pretiosiorque talis existimabatur etiam cicatricibus operis atque

concisuris, in quibus aurum haeserat, remanentibus. idem fecit hephaestionem, alexandri magni amicum, quem quidam polyclito adscribunt, cum is centum prope annis ante fuerit; item alexandri venationem, quae delphis sacrata est, athenis satyrum, turmam alexandri, in qua amicorum eius imagines summa omnium similitudine expressit; hanc metellus macedonia subacta transtulit romam. fecit et quadrigas multorum generum. statuariae arti plurimum traditur contulisse capillum exprimendo, capita minora faciendo quam antiqui, corpora graciliora siccioraque, per quae proceritas signorum maior videretur. non habet latinum nomen symmetria, quam diligentissime custodiit nova intactaque ratione quadratas veterum staturas permutando, vulgoque dicebat ab illis factos quales essent homines, a se quales viderentur esse. propriae huius videntur esse argutiae operum custoditae in minimis quoque rebus.

filios et discipulos reliquit laudatos artifices laippum, boe+dan, sed ante omnes euthycraten. quamquam is constantiam potius imitatus patris quam elegantiam austero maluit genere quam iucundo placere. itaque optume expressit herculem delphis et alexandrum thespiis venatorem et proelium equestre, simulacrum ipsum trophoni ad oraculum, quadrigas complures, equum cum fiscinis, canes venantium. — huius porro discipulus fuit tiscrates, et ipse sicyonius, sed lysippi sectae propior, ut vix discernantur complura signa, ceu senex thebanus et demetrius rex, peucestes, alexandri magni servator, dignus tanta gloria.

artifices, qui compositis voluminibus condidere haec, miris laudibus celebrant telephanen phocaeum, ignotum alias, quoniam ... thessaliae habitaverit et ibi opera eius latuerint; alioqui suffragiis ipsorum aequatur polyclito, Myroni, pythagorae. laudant eius larisam et spintharum pentathlum et apollinem. alii non hanc ignobilitatis fuisse causam, sed quod se regum xerxis atque darei officinis dediderit, existimant.

Praxiteles quoque, qui marmore felicior, ideo et clarior fuit, fecit tamen et ex aere pulcherrima opera: proserpinae raptum, item catagusam et liberum patrem, ebrietatem nobilemque una satyrum, quem graeci periboe+ton cognominant, et signa, quae ante felicitatis aedem fuere, veneremque, quae ipsa aedis incendio cremata est claudii principatu, marmoreae illi suae per terras inclutae parem, item stephanusam, pseliumenen, oporan, harmodium et aristogitonem tyrannicidas, quos a xerxe persarum rege captos victa perside atheniensibus remisit magnus alexander. fecit et puberem apollinem subrepenti lacertae comminus sagitta insidiantem, quem sauroctonon vocant. spectantur et duo signa eius diversos adfectus exprimentia, flentis matronae et meretricis gaudentis. hanc putant phrynen fuisse deprehenduntque in ea amorem artificis et mercedem in vultu meretricis. habet simulacrum et benignitas eius; calamidis enim quadrigae aurigam suum inposuit, ne melior in equorum effigie defecisse in homine crederetur. ipse calamis et alias quadrigas bigasque fecit equis semper sine aemulo expressis; sed, ne videatur in hominum effigie inferior, alcumena nullius est nobilior.

Alcamenes, Phidiae discipulus, et marmorea fecit, sed aereum pentathlum, qui vocatur encrinomenos; at polycliti discipulus aristides quadrigas bigasque. amphicrates leaena laudatur. scortum haec, lyrae cantu familiaris harmodio et aristogitoni. consilia eorum de tyrannicidio usque in mortem excruciatam a tyrannis non prodidit; quam ob rem athenienses, et honorem habere ei volentes nec tamen scortum celebrasse, animal nominis eius fecere atque, ut intellexeretur causa honoris, in opere linguam addi ab artifice vetuerunt. Bryaxis aesculapium et seleucum fecit, boe+das adorantem, baton apollinem et iunonem, qui sunt romae in concordiae templo, cresilas volneratum deficientem, in quo possit intellegi quantum restet animae, et olympium periclen dignum cognomine, mirumque in hac arte est quod nobiles viros nobiliores fecit. cephisodorus minervam mirabilem in portu atheniensium et aram ad templum iovis servatoris in eodem portu, cui pauca comparantur, canachus apollinem nudum, qui philesius cognominatur, in didymaeo aeginetica aeris temperatura, cervumque una ita vestigiis suspendit, ut linum subter pedes trahatur alterno morsu calce digitisque retinentibus solum, ita vertebrato dente utrisque in partibus, ut a repulso per vices resiliat. idem et celetizontas pueros, chaereas alexandrum magnum et philippum patrem eius fecit, ctesilaus doryphoron et amazonem volneratam, demetrius lysimachen, quae sacerdos minervae fuit lxiiii annis, idem et minervam, quae myctica appellatur - dracones in gorgone eius ad ictus citharae tinnitu resonant - ; idem equitem simonem, qui primus de equitatu scripsit. daedalus, et ipse inter fectores laudatus, pueros duos destringentes se fecit, dinomenes protesilaum et pythodemum luctatorem. - euphranoris alexander paris est, in quo laudatur quod omnia simul intellegantur, iudex dearum, amator helenae et tamen achillis interfector. huius est minerva, romae quae dicitur catuliana, infra capitolium a q. lutatio dicata, et simulacrum boni eventus, dextra pateram, sinistra spicam ac papavera tenens, item latona puerpera apollinem et dianam infantes sustinens in aede concordiae. fecit et quadrigas bigasque et cliticon eximia forma et virtutem et graeciam, utrasque colossaeas, mulierem admirantem et adorantem, item alexandrum et philippum in quadrigis; Eutychides eurotam, in quo artem ipso amne liquidiores plurimi dixerunt. - hegiae minerva pyrrhusque rex laudatur et celetizontes pueri et castor ac pollux ante aedem iovis tonantis, hagesiae in pario colonia hercules, isidoti buthytes. lycius Myronis discipulus fuit, qui fecit dignum praeceptore puerum sufflantem languidos ignes et argonautas; Leochares aquilam sentientem, quid rapiat in ganymede et cui ferat, parcentemque unguibus etiam per vestem puero, autolycum pancratii victorem, propter quem xenophon symposium scripsit, iovemque illum tonantem in capitolio ante cuncta laudabilem, item apollinem diadematam, lyciscum mangonem, puerum subdolae ac fucatae vernilitatis, lycius et ipse puerum suffitorem. - menaechi vitulus genu premitur replicata cervice. ipse menaechus scripsit de sua arte. - naucydes mercurio et discobolo et immolante arietem censetur, naucerus luctatore anhelante, niceratus aesculapio et hygia, qui sunt in concordiae templo romae.

pyromachi quadriga ab Alcibiade regitur. polycles hermaphroditum nobilem fecit, pyrrhus hygiam et minervam, phanis, lysippi discipulus, epithyusan. - styppax cyprius uno celebratur signo, splachnopte; periclis olympii vernula hic fuit exta torrens ignemque oris pleni spiritu accendens. silanion apollodorum fudit, fictorem et ipsum, sed inter cunctos diligentissimum artis et iniquum sui iudicem, crebro perfecta signa frangentem, dum satiari cupiditate artis non quit, ideoque insanum cognominatum - hoc in eo expressit, nec hominem ex aere fecit, sed iracundiam - et achillem nobilem, item epistaten exercentem athletas; strongylion amazonem, quam ab excellentia crurum eucnemon appellant, ob id in comitatu neronis principis circumlatam. idem fecit puerum, quem amando Brutus philippiensis cognomine suo inlustravit. - theodorus, qui labyrinthum fecit sami, ipse se ex aere fudit. praeter similitudinis mirabilem famam magna suptilitate celebratur: dextra limam tenet, laeva tribus digitis quadrigulam tenuit, tralatam praeneste parvitatibus ut miraculum: pictam eam currumque et aurigam integeret alis simul facta musca. - xenocrates, tiscratis discipulus, ut alii, euthycratis, vicit utrosque copia signorum. et de sua arte composuit volumina.

plures artifices fecere attali et eumenis adversus gallos proelia, isigonus, pyromachus, stratonicus, antigonus, qui volumina condidit de sua arte. boe +thi, quamquam argento melioris, infans eximium anserem strangulat. atque ex omnibus, quae rettuli, clarissima quaeque in urbe iam sunt dicata a vespasiano principe in templo pacis aliisque eius operibus, violentia neronis in urbem convecta et in sellariis domus aureae disposita.

praeterea sunt aequalitate celebrati artifices, sed nullis operum suorum praecipui: ariston, qui et argentum caelare solitus est, callides, ctesias, cantharus sicyonius, diodorus, critiae discipulus, deliades, euphorion, eunicus et hecataeus, argenti caelatores, lesbocles, prodorus, pythodicus, polygnatus, idem pictor e nobilissimis, item e caelatoribus stratonicus, scymnus critiae discipulus.

nunc percensebo eos, qui eiusdem generis opera fecerunt, ut apollodorus, androbulus, Asclepiodorus, aleuas philosophos, apellas et adornantes se feminas, antignatus et perixyomenum tyrannidasque supra dictos, antimachus, Athenodorus feminas nobiles, aristodemus et luctatores bigasque cum auriga, philosophos, anus, seleucum regem. habet gratiam suam huius quoque doryphorus. Cephisodoti duo fuere: prioris est mercurius liberum patrem in infantia nutrens; fecit et contionantem manu elata - persona in incerto est - ; sequens philosophos fecit. colotes, qui cum Phidia iovem olympium fecerat, philosophos, item cleon et cenchramis et callicles et cepis, chalcosthenes et comoedos et athletas, daippus perixyomenon, daiphron et damocritus et daemon philosophos. - epigonus omnia fere praedicta imitatus praecessit in tubicine et matri interfectae infante miserabiliter blandiente. eubuli mulier admirans laudatur, ebulidis digitis computans. - micon athletic spectatur, menogenes quadrigis. - nec minus niceratus omnia, quae ceteri, adgressus repraesentavit Alcibiaden lampadumque accensu matrem eius

demaraten sacrificantem. - tiscratis bigae piston mulierem inposuit, idem fecit martem et mercurium, qui sunt in concordiae templo romae. perillum nemo laudet saeviozem phalaride tyranno, cui taurum fecit mugitus inclusi hominis pollicitus igni subdito et primus expertus cruciatum eum iustiore saevitia. huc a simulacris deorum hominumque devocaverat humanissimam artem. ideo tot conditores eius laboraverant, ut ex ea tormenta fierent! itaque una de causa servantur opera eius, ut quisquis illa videat, oderit manus. - sthennis cererem, iovem, minervam fecit, qui sunt romae in concordiae templo, idem flentes matronas et adorantes sacrificantesque. simon canem et sagittarium fecit, stratonicus caelator ille philosophos, copas uterque; athletas autem et armatos et venatores sacrificantesque baton, euechir, glaucides, heliodorus, hicanus, iophon, lyson, leon, menodorus, myagrus, polycrates, polyidus, pythocritus, protogenes, idem pictor e clarissimis, ut dicemus, patrocles, pollis, posidonius, qui et argentum caelavit nobiliter, natione ephesius, periclymenus, philon, symenus, \Timotheus, theomnestus, timarchides, timon, tisias, thrason.

ex omnibus autem maxime cognomine insignis est callimachus, semper calumniator sui nec finem habentis diligentiae, ob id catatexitechnus appellatus, memorabili exemplo adhibendi et curae modum. huius sunt saltantes lacaenae, emendatum opus, sed in quo gratiam omnem diligentia abstulerit. hunc quidem et pictorem fuisse tradunt. non aere captus nec arte, unam tantum zenonis statuam cypria expeditione non vendidit cato, sed quia philosophi erat, ut obiter hoc quoque noscatur tam insigne exemplum.

in mentione statuarum est et una non praetereunda, quamquam auctoris incerti, iuxta rostra, herculis tunicati, sola eo habitu romae, torva facie sentiensque suprema tunicae. in hac tres sunt tituli: "l. luculli imperatoris de manubiis," alter: "pupillum luculli filium ex s. c. dedicasse," tertius: "t. septimium sabinum aed. cur. ex privato in publicum restituisse." tot certaminum tantaeque dignationis simulacrum id fuit.

nunc praevertemur ad differentias aeris et mixturas. in cyprio coronarium et regulare est utrumque ductile coronarium tenuatur in lamnas, taurorumque felle tinctum speciem auri in coronis histrionum praebet, idemque in uncias additis auri scripulis senis praetenui pyropi brattea ignescit. regulare et in aliis fit metallis, itemque caldarium. differentia quod caldarium funditur tantum, malleis fragile, quibus regulare obsequitur ab aliis ductile appellatum, quale omne cyprium est. sed et in ceteris metallis cura distat a caldario; omne enim diligentius purgatis igni vitiis excoctisque regulare est. - in reliquis generibus palma campano perhibetur, utensilibus vasis probatissimo. pluribus fit hoc modis. namque capuae liquatur non carbonis ignibus, sed ligni, purgaturque roboreo cribro perfusum aqua frigida ac saepius simili modo coquitur, novissime additis plumbi argentarii hispaniensis denis libris in centenas aeris. ita lentescit coloremque iucundum trahit, qualem in aliis generibus aeris adfectant oleo ac sale. fit campano simile in multis partibus italiae provinciisque, sed octonas plumbi libras addunt et carbone recocunt propter inopiam ligni. quantum ea res differentiae adferat, in gallia maxime sentitur,

ubi inter lapides candefactos funditur; exurente enim coctura nigrum atque fragile conficitur. praeterea semel recoquunt, quod saepius fecisse bonitati plurimum confert. id quoque notasse non ab re est, aes omne frigore magno melius fundi. - sequens temperatura statuaria est eademque tabularis hoc modo: massa proflatur in primis, mox in proflatum additur tertia portio aeris collectanei, hoc est ex usu coempti. peculiare in eo condimentum attritu domiti et consuetudine nitoris veluti mansuefacti. miscentur et plumbi argentarii pondo duodena ac selibrae centenis proflati. - appellatur etiamnum et formalis temperatura aeris tenerrimi, quoniam nigri plumbi decima portio additur et argentarii vicesima, maximeque ita colorem bibit, quem graecanicum vocant. novissima est quae vocatur ollaria, vase nomen hoc dante, ternis aut quaternis libris plumbi argentarii in centenae aeris additis. - cyprio si addatur plumbum, colos purpurae fit in statuarum praetextis.

aera extensa robiginem celerius trahunt quam neglecta, nisi oleo perunguantur. servari ea optime in liquida pice tradunt. usus aeris ad perpetuitatem monimentorum iam pridem tralatus est tabulis aereis, in quibus publicae constitutiones inciduntur.

metalla aeris multis modis instruunt medicinam, utpote cum ulcera omnia ibi ocissime sanentur, maxime tamen prosunt cadmea. fit sine dubio haec et in argenti fornacibus, candidior ac minus ponderosa, sed nequaquam comparanda aerariae. plura autem genera sunt. namque ut ipse lapis, ex quo fit aes, cadmea vocatur, fusuris necessarius, medicinae inutilis, sic rursus in fornacibus existit alia, quae originis suae nomen recipit. fit autem egesta flammis atque flatu tenuissima parte materiae et camaris lateribusque fornacium pro quantitate levitatis adplicata. tenuissima est in ipso fornacium ore quam flammae eructarunt, appellata capnitis, exusta et nimia levitate similis favillae. interior optuma, camaris dependens et ab eo argumento botryitis nominata, ponderosior haec priore, levior secuturis - duo eius colores, deterior cinereus, pumicis melior - , friabilis oculorumque medicamentis utilissima. tertia est in lateribus fornacium, quae propter gravitatem ad camaras pervenire non potuit. haec dicitur placitis, et ipsa ab argumento, planitiae crusta verius quam pumex, intus varia, ad psoras utilior et cicatrices trahendas. fiunt ex ea duo alia genera: onychitis extra paene caerulea, intus onychis maculis similis, ostracitis tota nigra et e ceteris sordidissima, vulneribus maxime utilis. omnis autem cadmea, in cypri fornacibus optima, iterum a medicis coquitur carbone puro atque, ubi in cinerem rediit, extinguitur vino ammineo quae ad emplastra praeparatur, quae vero ad psoras, aceto. quidam in ollis fictilibus tusam urunt et lavant in mortariis, postea siccant. nymphodorus lapidem ipsum quam gravissimum spississimumque urit pruna et exustum chio vino restinguit tunditque, mox linteo cribrat atque in mortario terit, mox aqua pluvia macerat iterumque terit quod subsedit, donec cerussae simile fiat, nulla dentium offensa. eadem iollae ratio, sed quam purissimum eligit lapidem. cadmeae effectus siccare, persanare, sistere fluxiones, pterygia et sordes oculorum purgare, scabritiam

extenuare et quidquid in plumbi effectu dicemus.

et aes ipsum uritur ad omnia eadem, praeterque albugines oculorum et cicatrices, ulcera quoque oculorum cum lacte sanat; itaque aegyptii collyrii id modo terunt in coticulis. facit et vomitiones e melle sumptum. uritur autem cyprium in fictilibus crudis cum sulphuris pari pondere, vasorum circumlito spiramento, in caminis, donec vasa ipsa percoquantur. quidam et salem addunt, aliqui alumen pro sulphure, alii nihil, sed aceto tantum aspergunt. ustum teritur in mortario thebaico, aqua pluvia lavatur iterumque adiecta largiore teritur et, dum consadat, relinquitur, hoc saepius, donec ad speciem minii redeat. tunc siccatum in sole in aerea pyxide servatur.

et scoria aeris simili modo lavatur, minore effectum quam ipsum aes. sed et aeris flos medicinae utilis est. fit aere fuso et in alias fornaces tralato; ibi flatu crebriore excutiuntur veluti milii squamae, quas vocant florem; cadunt autem, cum panes aeris aqua refrigerantur, rubentque similiter squamae aeris, quam vocant lepida, et sic adulteratur flos, ut squama veneat pro eo. est autem squama aeris decussa vi clavis, in quos panes aerei feruminantur, in cypri maxime officinis. omnis differentia haec est, quod squama excutitur ictu isdem panibus, flos cadit sponte. squamae est alterum genus subtilius, ex summa scilicet lanugine decussum, quod vocant stomoma.

atque haec omnia medici - quod pace eorum dixisse liceat - ignorant. parent nominibus: in tantum a conficiendis medicaminibus absunt, quod esse proprium medicinae solebat. nunc quotiens incidere in libellos, componere ex iis volentes aliqua, hoc est inpendio miserorum experiri commentaria, credunt seplasiae omnia fraudibus corrumpenti. iam quidem facta emplastra et collyria mercantur, tabesque mercium aut fraus seplasiae sic excitetur!

et squama autem et flos uruntur in patinis fictilibus aut aereis, dein lavantur ut supra ad eosdem usus; squama et amplius narium carnosa vitia, item sedis, et gravitates aurium per fistulam in eas flatu impulsa et uvas oris farina admota tollit et tonsillas cum melle. fit ex candido aere squama longe cypria inefficacior. nec non urina pueri prius macerant clavos panesque quidam excussuri squamam, teruntque et aqua pluvia lavant. dant et hydropicis eam drachmis ii in mulsi hemina et inlinunt cum polline.

aeruginis quoque magnus usus est. pluribus fit ea modis. namque et lapidi, ex quo coquitur aes, deraditur, et aere candido perforato atque in cadis suspenso super acetum acre opturatumque operculo. multo probatior est, si hoc idem squamis fiat. quidam vasa ipsa candidi aeris fictilibus condunt in acetum raduntque decumo die. alii vinaceis contegunt totidemque post dies radunt, alii delimatam aeris scobem aceto spargunt versantque spathis saepius die, donec absumatur. eandem scobem alii terere in mortariis aereis ex aceto malunt. ocissime vero contingit coronariorum recisamentis in acetum id additis. adulterant marmore trito maxime rhodiam aeruginem, alii pumice aut cummi. praecipue autem fallit atramento sutorio adulterata; cetera enim dente deprehenduntur stridentia in frendendo. experimentum in vatillo ferreo, nam quae sincera est, suum colorem retinet, quae mixta atramento, rubescit.

deprehenditur et papyro galla prius macerato, nigrescit enim statim aerugine inlita. deprehenditur et visu maligne virens. sed sive sinceram sive adulteram aptissimum est elui siccataque in patina nova uri ac versari, donec favilla fiat; postea teritur ac reconditur. aliqui in crudis fictilibus urunt, donec figlinum percoquatur. nonnulli et tus masculum admiscent. lavatur autem aerugo sicut cadmea. vis eius collyriis oculorum aptissima et delacrimationibus mordendo proficiens, sed ablui necessarium penicillis calidis, donec rodere desinat. - hieracium vocatur collyrium, quod ea maxime constat. temperatur autem id hammoniacy unciis iiii, aeruginis cypriacae ii, atramenti sutorii, quod chalcanthum vocant, totidem, misyos una, croci vi. haec omnia trita aceto thasio colliguntur in pilulas, excellentis remedii contra initia glaucomatum et suffusionum, contra caligines aut scabritias et albugines et genarum vitia. cruda autem aerugo vulnerariis emplastris miscetur. oris etiam gingivarumque exulcerationes mirifice emendat et labrorum ulcera cum oleo. quod si et cera addatur, purgat et ad cicatricem perducit. aerugo et callum fistularum erodit vitiorumque circa sedem sive per se sive cum hammoniaco inlita vel collyrii modo in fistulas adacta. eadem cum resinae terebinthinae tertia parte subacta lepras tollit.

est et alterum genus aeruginis, quam vocant scoleca, in cyprio aere trito alumine et sale aut nitro pari pondere cum aceto albo quam acerrimo. non fit hoc nisi aestuosissimis diebus circa canis ortum. teritur autem, donec viride fiat contrahatque se vermiculorum specie, unde et nomen. quod vitiatum ut emendetur, ii partes quam fuere aceti miscentur urinae pueri inpubis. idem autem in medicamentis et santerna efficit, qua diximus aurum feruminari. usus utriusque qui aeruginis. scolex fit et per se derasus aerario lapidi, de quo nunc dicemus.

chalcitim vocant, ex quo et ipso aes coquitur. distat a cadmea, quod illa super terram ex subdialibus petris caeditur, haec ex obrutis, item quod chalcitis friat se statim, mollis natura, ut videatur lanugo concreta. est et alia distinctio, quod chalcitis tria genera continet, aeris et misyos et soreos, de quibus singulis dicemus suis locis. habet autem aeris venas oblongas. probatur mellei coloris, gracili venarum discursu, friabilis nec lapidosa. putant et recentem utiliorem esse, quoniam inveterata sori fiat. vis eius ad excrescentia in ulceribus, sanguinem sistere, gingivas, uvam, tonsillas farina compescere, volvae vitiis in vellere inponi. cum suco vero porri verendorum additur emplastris. maceratur autem in fictili ex aceto, circumlito fimo diebus xl, et colorem croci trahit. tum admixto cadmeae pari pondere medicamentum efficit psoricon dictum. quod si ii partes chalcitidis tertia cadmeae temperentur, acrius hoc idem fiat; etiamnum vehementius, si aceto quam vino temperetur; tosta vero efficacior fit ad eadem omnia.

sori aegyptium maxime laudatur, multum superato cyprio hispaniensique et africo, quamquam oculorum curationi quidam utilius putent cyprium; sed in quacumque natione optimum cui maximum virus olfactu, tritumque pinguiter nigrescens et spongiosum. stomacho res contraria in tantum, ut quibusdam

olfactum modo vomitiones moveat. et aegyptium quidem tale, alterius nationis contritum splendescit ut misy et est lapidosius. prodest autem et dentium dolori, si contineatur atque colluat, et ulceribus oris gravibus quaeque serpant. uritur carbonibus ut chalcitis.

misy aliqui tradiderunt fieri exusto lapide in scrobibus, flore eius luteo miscente se ligni pineae favillae. re vera autem e supra dicto fit lapide, concretum natura discretumque vi, optimum in cypriorum officinis, cuius notae sunt friati aureae scintillae et, cum teratur, harenosa natura sine terra, chalcitidi similis. hoc admiscent qui aurum purgant. utilitas eius infusi cum rosaceo auribus purulentis et in lana inpositi capitis ulceribus. extenuat et scabritias oculorum inveteratas, praecipue utile tonsillis contraque anginas et suppurata. ratio ut xvi drachmae in hemina aceti coquantur addito melle, donec lentescat. sic ad supra dicta utile est. quotiens opus sit molliri vim eius, mel adspergitur. erodit et callum fistularum ex aceto foveantur et collyriis additur, sistit et sanguinem ulceraque quae serpant quaeve putrescant, absumit et excrescentes carnes. peculiariter virilitatis vitiis utile et feminarum profluvium sistit.

graeci cognationem aeris nomine fecerunt et atramento sutorio; appellant enim chalcanthon. nec ullius aequae mira natura est. fit in hispaniae puteis stagnisve id genus aquae habentibus. decoquitur ea admixta dulci pari mensura et in piscinas ligneas funditur. immobilibus super has transtris dependent restes lapillis extentae, quibus adhaerescens limus vitreis acinis imaginem quandam uvae reddit. exemptum ita siccatur diebus xxx. color est caeruleus perquam spectabili nitore, vitrumque esse creditur; diluendo fit atramentum tinguendis coriis. fit et pluribus modis: genere terrae eo in scrobes cavato, quorum e lateribus destillantes hiberno gelu stirias stalagmian vocant, neque est purius aliud. sed ex eo, candidum colorem sentiente viola, lonchoton appellant. fit et in saxorum catinis pluvia aqua conrivato limo gelante; fit et salis modo flagrantissimo sole admissas dulces aquas cogente. ideo quidam duplici differentia fossile aut facticium appellant, hoc pallidius et quantum colore, tantum bonitate deterius. probant maxime cyprium in medicinae usu. sumitur ad pellenda ventris animalia drachmae pondere cum melle. purgat et caput dilutum ac naribus instillatum, item stomachum cum melle aut aqua mulsa sumptum. medetur et oculorum scabritiae dolorique et caligini et oris ulceribus. sistit et sanguinem narium, item haemorrhoidum. extrahit ossa fracta cum semine hyoscyami, suspendit epiphoras penicillo fronti inpositum, efficax et in emplastris ad purganda vulnere et excrescentia ulcerum. tollit et uvas, vel si decocto tangantur, cum lini quoque semine superponitur emplastris ad dolores tollendos. quod ex eo candicat, in uno usu praefertur violaceis, ut gravitati aurium per fistulas inspiretur. vulnere per se inlinitum sanat, sed tinguunt cicatrices. nuper inventum ursorum in harena et leonum ora spargere illo, tantaque est vis in adstringendo, ut non queant mordere.

etiamnum in aerariis reperiuntur quae vocant pompholygem et spodon.

differentia, quod pompholyx lotura separatur, spodos inlota est. aliqui quod sit candidum levissimumque pompholygem dixere et esse aeris ac cadmeae favillam, spodon nigriorem esse ponderosioremq̃ue, derasam parietibus fornacium, mixtis scintillis, aliquando et carbonibus. haec aceto accepto odorem aeris praestat et, si tangatur lingua, saporem horridum. convenit oculorum medicamentis, quibuscumque vitiis occurrens, et ad omnia quae spodos. hoc solum distat, quod huius elutior vis est. additur et in emplastra, quibus lenis refrigeratio quaeritur et siccatio. utilior ad omnia quae vino lota est.

spodos cypria optima. fit autem liquescentibus cadmea et aerario lapide. levissimum hoc est flaturae totius evolatque e fornacibus et tectis adhaerescit, a fuligine distans candore. quod minus candidum ex ea, immaturae fornacis argumentum est; hoc quidam pompholygem vocant. quod vero rubicundius ex iis invenitur, acriorem vim habet et exulcerat adeo, ut, cum lavatur, si attigit oculos, excaecet. est et mellei coloris spodos, in qua plurimum aeris intellegitur. sed quodcumque genus lavando fit utilius; purgatur ante pinna, dein crassiore lotura digitis scabritiae excernuntur. eximia vis est eius, quae vino lavatur. est aliqua et in genere vini differentia. leni enim lota collyriis oculorum minus utilis putatur, eademque efficacior ulceribus, quae manent, vel oris, quae madeant, et omnibus medicamentis, quae parentur contra gangraenas. fit et in argenti fornacibus spodos, quam vocant lauriotim. utilissima autem oculis adfirmatur quae fiat in aurariis, nec in alia parte magis est vitae ingenia mirari. quippe ne quaerenda essent metalla, vilissimis rebus utilitates easdem excogitavit.

antispodon vocant cinerem fici arboris vel caprifici vel myrti foliorum cum tenerrimis ramorum partibus vel oleastri vel oleae vel cotonei mali vel lentisci, item ex moris immaturis, id est candidis, in sole arefactis vel e buxi coma aut pseudocypiri aut rubi aut terebinthi vel oenanthes. taurini quoque glutinis aut linteorum cinerem similiter pollere inventum est. uruntur omnia ea crudo fictili in fornacibus, donec figlina percoquantur.

in aerariis officinis et smegma fit iam liquato aere ac percocto additis etiamnum carbonibus paulatimque accensis, ac repente vehementiore flatu expuitur aeris palea quaedam. solum, quo excipiat, stratum esse debet marilla.

ab ea discernitur quam in isdem officinis diphrygem vocant graeci ab eo, quod bis torreatur. cuius origo triplex. fieri enim traditur ex lapide pyrite cremato in caminis, donec excoquatur in rubricam. fit et in cypro ex luto cuiusdam specus arefacto prius, mox paulatim circumdatis sarmentis. tertio fit modo in fornacibus aeris faece subsidente. differentia est, quod aes ipsum in catinos defluit, scoria extra fornaces, flos supernatat, diphryges remanent. quidam tradunt in fornacibus globos lapidis, qui coquatur, feruminari, circa hunc aes fervere, ipsum vero non percoqui nisi tralatum in alias fornaces, et esse nodum quendam materiae; id, quod ex cocto supersit, diphryga vocari. ratio eius in medicina similis praedictis: siccare et excrescentia consumere ac

repurgare. probatur lingua, ut eam siccet tactu statim saporemque aeris reddat.

unum etiamnum aeris miraculum non omittemus. servilia familia inlustris in fastis trientem aereum pascit auro, argento, consumentem utrumque. origo atque natura eius incomperta mihi est. verba ipsa de ea re messallae senis ponam: “serviliorum familia habet trientem sacrum, cui summa cum cura magnificentiaque sacra quotannis faciunt. quem ferunt alias crevisse, alias decrevisse videri et ex eo aut honorem aut deminutionem familiae significare.”

proxime indicari debent metalla ferri. optumo pessimoque vitae instrumento est, siquidem hoc tellurem scindimus, arbores serimus, arbusta tondemus, vites squalore deciso annis omnibus cogimus iuvenescere, hoc exstruimus tecta, caedimus saxa, omnesque ad alios usus ferro utimur, sed eodem ad bella, caedes, latrocinia, non comminus solum, sed etiam missili volucrique, nunc tormentis excusso, nunc lacertis, nunc vero pinnato, quam sceleratissimam humani ingenii fraudem arbitror, siquidem, ut ocius mors perveniret ad hominem, alitem illam fecimus pinnaeque ferro dedimus. quam ob rem culpa eius non naturae fiat accepta. aliquot experimentis probatum est posse innocens esse ferrum. in foedere, quod expulsis regibus populo romano dedit porsina, nominatim comprehensum invenimus, ne ferro nisi in agri cultu uteretur. et tum stilo osseo scribere institutum vetustissimi auctores prodiderunt. magni pompeii in tertio consulatu extat edictum in tumultu necis clodianae prohibentis ullum telum esse in urbe. et ars antiqua ipsa non defuit honorem mitiorem habere ferro quoque. aristonidas artifex, cum exprimere vellet athamantis furem learcho filio praecipitato residentem paenitentia, aes ferrumque miscuit, ut robigine eius per nitorem aeris relucente exprimeretur verecundiae rubor. hoc signum exstat hodie rhodi. est in eadem urbe et ferreus hercules, quem fecit alcon laborum dei patientia inductus. videmus et romae scyphos e ferro dicatos in templo martis ultoris. obstitit eadem naturae benignitas exigentis ab ferro ipso poenas robigine eademque providentia nihil in rebus mortalius facientis quam quod esset infestissimum mortalitati.

ferri metalla ubique propemodum reperiuntur, quippe etiam insula italiae ilva gignente, minimaque difficultate agnoscuntur colore ipso terrae manifesto. ratio eadem excoquendis venis; in cappadocia tantum quaestio est, aquae an terrae fiat acceptum, quoniam perfusa ceraso fluvio terra neque aliter ferrum e fornacibus reddit. differentia ferri numerosa. prima in genere terrae caelive: aliae molle tantum plumboque vicinum subministrant, aliae fragile et aerosum rotarumque usibus et clavis maxime fugiendum, cui prior ratio convenit; aliud brevitate sola placet clavisque caligariis, aliud robiginem celerius sentit. stricturae vocantur hae omnes, quod non in aliis metallis, a stringenda acie vocabulo inposito. et fornacium magna differentia est, nucleusque quidam ferri excoquitur in iis ad indurandam aciem, alioque modo ad densandas incudes malleorumve rostra. summa autem differentia in aqua, cui subinde candens inmergitur. haec alibi atque alibi utilior nobilitavit loca gloria ferri, sicuti bilbilim in hispania et turiassonem, comum in italia, cum

ferraria metalla in iis locis non sint. ex omnibus autem generibus palma serico ferro est; seres hoc cum vestibus suis pellibusque mittunt; secunda parthico. neque alia genera ferri ex mera acie temperantur, ceteris enim admiscetur mollior complexus. in nostro orbe aliubi vena bonitatem hanc praestat, ut in noricis, aliubi factura, ut sulmone, aqua ubi diximus, quippe cum exacuendo oleariae cotes aquariaeque differant et oleo delicatior fiat acies. mirumque, cum excoquatur vena, aquae modo liquari ferrum, postea in spongeas frangi. tenuiora ferramenta oleo restingui mos est, ne aqua in fragilitatem durentur. a ferro sanguis humanus se ulciscitur, contactum namque eo celerius robiginem trahit.

de magnete lapide suo loco dicemus concordiaque, quam cum ferro habet. sola haec materia virus ab eo lapide accipit retinetque longo tempore, aliud adprehendens ferrum, ut anulorum catena spectetur interdum. quod volgus imperitum appellat ferrum vivum, vulneraque talia asperiora fiunt. hic lapis et in cantabria nascitur, non ut ille magnes verus caute continua, sed sparsa bulbatione - ita appellant - , nescio an vitro fundendo perinde utilis, nondum enim expertus est quisquam; ferrum utique inficit eadem vi. - magnete lapide architectus timochares alexandriae arsinoes templum concamarare incohaverat, ut in eo simulacrum e ferro pendere in ae+re videretur. intercessit ipsius mors et ptolemaei regis, qui id sorori suae iusserat fieri. - metallorum omnium vena ferri largissima est cantabriae. maritima parte, qua oceanus adluit, mons praealtus - incredibile dictu - totus ex ea materia est, ut in ambitu oceani diximus.

ferrum accensum igni, nisi duretur ictibus, corrumpitur. rubens non est habile tundendo neque antequam albescere incipiat. aceto aut alumine inlitum fit aeri simile. a robigine vindicatur cerussa et gypso et liquida pice. haec est ferro a graecis antipathia dicta. ferunt quidem et religione quadam id fieri et exstare ferream catenam apud euphraten amnem in urbe, quae zeugma appellatur, qua alexander magnus ibi iunxerit pontem, cuius anulos, qui refecti sint, robigine infestari, carentibus ea prioribus.

medicina e ferro est et alia quam secandi. namque et circumscribi circulo terve circumlato mucrone et adultis et infantibus prodest contra noxia medicamenta, et praefixisse in limine evulsos sepulchris clavos adversus nocturnas lymphationes, pungique leviter mucrone, quo percussus homo sit, contra dolores laterum pectorumque subitos, qui punctionem adferant. quaedam ustione sanantur, privatim vero canis rabidi morsus, quippe etiam praevalente morbo expavescentesque potum usta plaga ilico liberantur. calfit etiam ferro candente potus in multis vitiis, privatim vero dysentericis.

est et robigo ipsa in remediis, et sic proditur telephum sanasse achilles, sive id aerea sive ferrea cuspide fecit; ita certe pingitur ex ea decutiens gladio. sed robigo ferri deraditur umido ferro clavis veteribus. potentia eius ligare, siccare, sistere. emendat alopecias inlita. utuntur et ad scabritias genarum pusulasque totius corporis cum cera et myrteo oleo, ad ignes vero sacros ex aceto, item ad scabiem, paronychia digitorum et pterygia in linteolis. sistit et

feminarum profluvia inposita velleribus, plagis quoque recentibus vino diluta et cum murra subacta, condylomatis ex aceto. podagras quoque inlita lenit.

squama quoque ferri in usu est ex acie aut mucronibus, maxime simili, sed acriore vi quam robigo, quam ob rem et contra epiphoras oculorum adsumitur. sanguinem sistit, cum volnera ferro maxime fiant. sistit et feminarum profluvia. inponitur et contra lienium vitia, et haemorrhoidas compescit ulcerumque serpentia. et genis prodest farinae modo adspersa paullisper. praecipua tamen commendatio eius in hygremplastro ad purganda vulnera fistulasque et omnem callum erodendum et rasis ossibus carnes recreandas. componitur hoc modo: propolis oboli vi, cimoliae cretae drachmae vi, aeris tusi drachmae ii, squamae ferri totidem, cerae x, olei sextarius. his adicitur, cum sunt repurganda vulnera aut replenda, ceratum.

sequitur natura plumbi, cuius duo genera, nigrum atque candidum. pretiosissimum in hoc candidum, graecis appellatum cassiterum fabuloseque narratum in insulas atlantici maris peti vitilibusque navigiis et circumsutis corio advehi. nunc certum est in lusitania gigni et in gallaecia summa tellure, harenosa et coloris nigri. pondere tantum ea deprehenditur; interveniunt et minuti calculi, maxime torrentibus siccatis. lavant eas harenas metallici et, quod subsedit, cocunt in fornacibus. invenitur et in aurariis metallis, quae alutias vocant, aqua inmissa eluente calculos nigros paullum candore variatos, quibus eadem gravitas quae auro, et ideo in calathis, quibus aurum colligitur, cum eo remanent; postea caminis separantur conflatique in plumbum album resolvuntur. non fit in gallaecia nigrum, cum vicina cantabria nigro tantum abundet, nec ex albo argentum, cum fiat ex nigro. iungi inter se plumbum nigrum sine albo non potest nec hoc ei sine oleo ac ne album quidem secum sine nigro. album habuit auctoritatem et iliadis temporibus teste homero, cassiterum ab illo dictum. plumbi nigri origo duplex est; aut enim sua provenit vena nec quicquam aliud ex sese parit aut cum argento nascitur mixtisque venis conflatur. huius qui primus fuit in fornacibus liquor stagnum appellatur; qui secundus, argentum; quod remansit in fornacibus, galena, quae fit tertia portio additae venae; haec rursus conflata dat nigrum plumbum deductis partibus nonis ii.

stagnum inlitum aereis vasis saporem facit gratiorem ac compescit virus aeruginis, mirumque, pondus non auget. specula etiam ex eo laudatissima, ut diximus, brundisi temperabantur, donec argenteis uti coepere et ancillae. nunc adulteratur stagnum addita aeris candidi tertia portione in plumbum album. fit et alio modo mixtis albi plumbi nigrique libris; hoc nunc aliqui argentarium appellant. iidem et tertiarium vocant, in quo duae sunt nigri portiones et tertia albi. pretium eius in libras #1108 xx. hoc fistulae solidantur. improbiores ad tertiarium additis partibus aequis albi argentarium vocant et eo quae volunt incoquunt. pretium huius faciunt in p. #1108 lxx. albo per se sincero pretium sunt #1108 lxxx, nigro #1108 vii.

albi natura plus aridi habet, contraque nigri tota umida est. ideo album nulli rei sine mixtura utile est. neque argentum ex eo plumbatur, quoniam prius

liquescat argentum, confirmantque, si minus albo nigri, quam satis sit, misceatur, erodi ab eo argentum. album incoquitur aereis operibus galliarum invento ita, ut vix discerni possit ab argento, eaque incoctilia appellant. deinde et argentum incoquere simili modo coepere equorum maxime ornamentis iumentorumque ac iugorum in alesia oppido; reliqua gloria biturigum fuit. coepere deinde et esseda sua colisataque ac petorita exornare simili modo, quae iam luxuria ad aurea quoque, non modo argentea, staticula pervenit, quaeque in scyphis cerni prodigum erat, haec in vehiculis adteri cultus vocatur. plumbi albi experimentum in charta est, ut liquefactum pondere videatur, non calore, rupisse. india neque aes neque plumbum habet gemmisque ac margaritis suis haec permutat.

nigro plumbo ad fistulas lamnasque utimur, laboriosius in hispania eruto totasque per gallias, sed in britannia summo terrae corio adeo large, ut lex ultro dicatur, ne plus certo modo fiat. nigri generibus haec sunt nomina: iovetanum, caprariense, oleastrense, nec differentia ulla scoria modo excocta diligenter. mirum in his solis metallis, quod derelicta fertilius revivescunt. hoc videtur facere laxatis spiramentis ad satietatem infusus ae+r, aequae ut feminas quasdam fecundiores facere abortus. nuper id conpertum in baetica samariensi metallo, quod locari solitum #1108 [cc] annuis, postquam oblitteratum erat, #1108 [cclv] locatum est. simili modo antonianum in eadem provincia pari locatione pervenit ad hs [cccc] vectigalis. mirum et addita aqua non liquescere vasa e plumbo, eadem, si in aquam addantur calculus vel aereus quadrans, peruri.

in medicina per se plumbi usus cicatrices reprimere adalligatisque lumborum et renium parti lamnis frigidioris naturae inhibere inpetus veneris visaque in quiete veneria sponte naturae erumpentia usque in genus morbi. his lamnis calvus orator cohibuisse se traditur viresque corporis studiorum labori custodisse. nero, quoniam ita placuit diis, princeps, lamna pectori inposita sub ea cantica exclamans alendis vocibus demonstravit rationem. coquitur ad medicinae usus patinis fictilibus substrato sulphure minuto, lamnis inpositis tenuibus opertisque sulphure et ferro mixtis. cum coquatur, munienda in eo opere foramina spiritus convenit; alioqui plumbi fornacium halitus noxius sentitur. et pestilens est, canibus ocissime, omnium vero metallorum muscis et culicibus, quam ob rem non sunt ea taedia in metallis. quidam in coquendo scobem plumbi lima quaesitam sulphuri miscent, alii cerussam potius quam sulphur. fit et lotura plumbi usus in medicina. cum se ipso teritur in mortariis plumbeis addita aqua caelesti, donec crassescat; postea supernatans aqua tollitur spongeis; quod crassissimum fuit, siccatum dividitur in pastillos. quidam limatum plumbum sic terunt, quidam et plumbaginem admiscent, alii vero acetum, alii vinum, alii adipem, alii rosam. quidam in lapideo mortario et maxime thebaico plumbeum pistillum terere malunt, candidiusque ita fit medicamentum. id autem quod ustum est plumbum lavatur ut stibis et cadmea. potest adstringere, sistere, contrahere cicatrices; usu est eodem et in oculorum medicamentis, maxime contra procidentiam eorum et inanitates

ulcerum excrescentiae rimasque sedis aut haemorrhoidas et condylomata. ad haec maxime lotura plumbi facit, cinis autem usti ad serpentina ulcera aut sordida, eademque quae chartis ratio profectus. uritur autem in patinis per lamnas minutas cum sulphure, versatum rudibus ferreis aut ferulaceis, donec liquor mutetur in cinerem; dein refrigeratum teritur in farinam. alii elimatam scobem in fictili crudo cocunt in caminis, donec percoquatur figlinum. aliqui cerussam admiscunt pari mensura aut hordeum teruntque ut in crudo dictum est, et praeferunt sic plumbum spodio cyprio.

scoria quoque plumbi in usu est. optima quae maxime ad luteum colorem accedit, sine plumbi reliquiis aut sulphuris specie et terra carens. lavatur haec in mortariis minutim fracta, donec aqua luteum colorem trahat, et transfunditur in vas purum, idque saepius, usque dum subsidat quod utilissimum est. effectus habet eosdem quos plumbum, sed acriores. mirarique succurrit experientiam vitae, ne faece quidem rerum excrementorumque foeditate intemptata tot modis.

fit et spodium ex plumbo eodem modo quo ex cyprio aere; lavatur in linteis raris aqua caelesti separaturque terrenum transfusione; cribratum teritur. quidam pulverem eum pinnis digerere malunt ac terere in vino odorato.

est et molybdaena, quam alio loco galenam appellavimus, vena argenti plumbique communis. melior haec, quanto magis aurei coloris quantoque minus plumbosa, friabilis et modice gravis. cocta cum oleo iocineris colorem trahit. adhaerescit et auri argentique fornacibus; hanc metallicam vocant. laudatissima quae in zephyrio fiat; probantur minime terrenae minimeque lapidosae. coquuntur lavanturque scoriae modo. usus in lipara ad leniendam refrigeranda ulcera et emplastris, quae non inligantur, sed inlita ad cicatricem perducunt in teneris corporibus mollissimisque partibus. compositio eius e libris iii et cerae libra, olei iii heminis, quod in senili corpore cum fratribus additur. temperatur cum spuma argenti et scoria plumbi ad dysenteriam et tenesum fovenda calida.

psimithium quoque, hoc est cerussam, plumbariae dant officinae, laudatissimam in rhodo. fit autem ramentis plumbi tenuissimis super vas acetum asperrimi inpositis atque ita destillantibus. quod ex eo cecidit in ipsum acetum, arefactum molitur et cribratur iterumque aceto admixto in pastillos dividitur et in sole siccatur aestate. fit et alio modo, addito in urceos acetum plumbo opturatos per dies x derasoque ceu situ ac rursus reiecto, donec deficiat materia. quod derasum est, teritur et cribratur et coquitur in patinis misceturque rudiculis, donec rufescat et simile sandaracae fiat. dein lavatur dulci aqua, donec nubeculae omnes eluantur. siccatur postea similiter et in pastillos dividitur. vis eius eadem quae supra dictis, lenissima tantum ex omnibus, praeterque ad candorem feminarum. est autem letalis potu sicut spuma argenti. postea cerussa ipsa, si coquatur, rufescit.

sandaracae quoque propemodum dicta natura est. invenitur autem et in aurariis et in argentariis metallis, melior quo magis rufa quoque magis virus sulphuris redolens ac pura friabilisque. valet purgare, sistere, exalfacere,

erodere, summa eius dote septica. explet alopecias ex aceto inlita; additur oculorum medicamentis; fauces purgat cum melle sumpta vocemque limpidam et canoram facit; suspiriosis et tussientibus iucunde medetur cum resina terebinthina in cibo sumpta, suffita quoque cum cedro ipso nidore isdem medetur.

et arrhenicum ex eadem est materia. quod optimum, coloris etiam in auro excellentis; quod vero pallidius aut sandaracae simile est, deterius iudicatur. est et tertium genus, quo miscetur aureus color sandaracae. utraque haec squamosa, illud vero siccum purumque, gracili venarum discursu fissile. vis eadem quae supra, sed acrior. itaque et causticis additur et psilotris. tollit et pterygia digitorum carnesque narium et condylomata et quidquid excrescit. torretur, ut valdius prosit, in nova testa, donec mutet colorem.

LIBER XXXV

metallorum, quibus opes constant, adgnascentiumque iis natura indicata propemodum est, ita conexis rebus, ut immensa medicinae silva officinarumque tenebrae et morosa caelandi fingendique ac tinguendi subtilitas simul dicerentur. restant terrae ipsius genera lapidumque vel numerosiore serie, plurimis singula a graecis praecipue voluminibus tractata. nos in iis brevitatem sequemur utilem instituto, modo nihil necessarium aut naturale omittentes, primumque dicemus quae restant de pictura, arte quondam nobili - tunc cum expeteretur regibus populisque - et alios nobilitante, quos esset dignata posteris tradere, nunc vero in totum marmoribus pulsa, iam quidem et auro, nec tantum ut parietes toti operiantur, verum et interrasso marmore vermiculatisque ad effigies rerum et animalium crustis. non placent iam abaci nec spatia montes in cubiculo dilatantia: coepimus et lapide pingere. hoc claudii principatu inventum, neronis vero maculas, quae non essent in crustis, inserendo unitatem variare, ut ovatus esset numidicus, ut purpura distingueretur synnadicus, qualiter illos nasci optassent deliciae. montium haec subsidia deficientium, nec cessat luxuria id agere, ut quam plurimum incendiis perdat.

imaginum quidem pictura, qua maxime similes in aevum propagabantur figurae, in totum exolevit. aerei ponuntur clipei argentea facie, surdo figurarum discrimine; statuarum capita permutantur, volgatis iam pridem salibus etiam carminum. adeo materiam conspici malunt omnes quam se nosci. et inter haec pinacothecas veteribus tabulis consuunt alienasque effigies colunt, ipsi honorem non nisi in pretio ducentes, ut frangat heres furisque detrahat laqueo. itaque nullius effigie vivente imagines pecuniae, non suas, relincunt. iidem palaestras athletarum imaginibus et ceromata sua exornant, epicuri vultus per cubicula gestant ac circumferunt secum. natali eius sacrificant, feriasque omni mense vicesima luna custodiunt, quas icadas vocant, ii maxime, qui se ne viventes quidem nosci volunt. ita est profecto: artes desidia perdidit, et quoniam animorum imagines non sunt, negleguntur etiam corporum. aliter apud maiores in atriis haec erant, quae spectarentur; non signa externorum artificum nec aera aut marmora: expressi cera vultus singulis disponebantur armariis, ut essent imagines, quae comitarentur gentilicia funera, semperque defuncto aliquo totus aderat familiae eius qui umquam fuerat populus. stemmata vero lineis discurrebant ad imagines pictas. tabulina codicibus implebantur et monimentis rerum in magistratu gestarum. aliae foris et circa limina animorum ingentium imagines erant adfixis hostium spoliis, quae nec emptori refigere liceret, triumphabantque etiam dominis mutatis aeternae domus. erat haec stimulatio ingens, exprobrantibus tectis cotidie inbellem dominum intrare in alienum triumphum. exstat messalae oratoris indignatio, quae prohibuit inseri genti suae laevinorum alienam imaginem. similis causa messalae seni expressit volumina illa quae de familiis

condidit, cum scipionis pomponiani transisset atrium vidissetque adoptione testamentaria salvittones - hoc enim fuerat cognomen - africanorum dedecori inrepentes scipionum nomini. sed - pace messalarum dixisse liceat - etiam mentiri clarorum imagines erat aliquis virtutum amor multoque honestius quam mereri, ne quis suas expeteret.

non est praetereundum et novicium inventum, siquidem non ex auro argentove, at certe ex aere in bibliothecis dicantur illis, quorum immortales animae in locis iisdem locuntur, quin immo etiam quae non sunt finguntur, pariuntque desideria non traditos vultus, sicut in homero evenit. quo maius, ut equidem arbitror, nullum est felicitatis specimen quam semper omnes scire cupere, qualis fuerit aliquis. asini pollionis hoc romae inventum, qui primus bibliothecam dicando ingenia hominum rem publicam fecit. an priores coeperint alexandreae et pergami reges, qui bibliothecas magno certamine instituere, non facile dixerim. imaginum amorem flagrasse quondam testes sunt atticus ille ciceronis edito de iis volumine, M. Varro benignissimo invento insertis voluminum suorum fecunditati etiam septingentorum inlustrium aliquo modo imaginibus, non passus intercidere figuras aut vetustatem aevi contra homines valere, inventor muneris etiam dis invidiosi, quando immortalitatem non solum dedit, verum etiam in omnes terras misit, ut praesentes esse ubique ceu di possent. et hoc quidem alienis ille praestitit.

verum clupearum in sacro vel publico dicere privatim primus instituit, ut reperio, appius claudius qui consul cum p. servilio fuit anno urbis cclviii. posuit enim in bellonae aede maiores suos, placuitque in excelso spectari et titulos honorum legi, decora res, utique si liberum turba parvulis imaginibus ceu nidum aliquem subolis pariter ostendat, quales clupearum nemo non gaudens favensque aspicit. post eum m. aemilius collega in consulatu quinti lutatii non in basilica modo aemilia, verum et domi suae posuit, id quoque martio exemplo. scutis enim, qualibus apud troiam pugnatum est, continebantur imagines, unde et nomen habuere clupearum, non, ut perversa grammaticorum suptilitas voluit, a cluendo. origo plena virtutis, faciem reddi in scuto cuiusque, qui fuerit usus illo. poeni ex auro factitavere et clupearum et imagines secumque vexere. in castris certe captis talem hasdrubalis invenit marcius, scipionum in hispania ultor, isque clupeus supra fores capitolinae aedis usque ad incendium primum fuit. maiorum quidem nostrorum tanta securitas in ea re adnotatur, ut l. manlio, q. fulvio cos. anno urbis dlxxv m. aufidius tutelae capitolio redemptor docuerit patres argenteos esse clupearum, qui pro aereis per aliquot iam lustra adsignabantur.

de picturae initiis incerta nec instituti operis quaestio est. aegyptii sex milibus annorum aput ipsos inventam, priusquam in graeciam transiret, adfirmant, vana praedicatione, ut palam est; graeci autem alii sicyone, alii aput corinthios repertam, omnes umbra hominis lineis circumducta, itaque primam talem, secundam singulis coloribus et monochromaton dictam, postquam operosior inventa erat, duratque talis etiam nunc. inventam liniarem a philocle aegyptio vel cleanthe corinthio primi exercuere aridices corinthius et

telephanes sicyonius, sine ullo etiamnum hi colore, iam tamen spargentes linias intus. ideo et quos pinxere adscribere institutum. primus inlevit eas colore testae, ut ferunt, tritae ecphantus corinthius. hunc eodem nomine alium fuisse quam tradit cornelius nepos secutum in italiam damaratum, tarquinii prisci regis romani patrem, fugientem a corintho tyranni iniurias cypseli, mox docebimus.

iam enim absoluta erat pictura etiam in italia. exstant certe hodieque antiquiores urbe picturae ardeae in aedibus sacris, quibus equidem nullas aequae miror, tam longo aevo durantes in orbitate tecti veluti recentes. similiter lanivi, ubi atalante et helena comminus pictae sunt nudae ab eodem artifice, utraque excellentissima forma, sed altera ut virgo, ne ruinis quidem templi concussae. gaius princeps tollere eas conatus est libidine accensus, si tectorii natura permisisset. durant et caere antiquiores et ipsae, fatebiturque quisquis eas diligenter aestimaverit nullam artium celerius consummatam, cum iliadis temporibus non fuisse eam appareat.

apud romanos quoque honos mature huic arti contigit, siquidem cognomina ex ea pictorum traxerunt fabii clarissimae gentis, princepsque eius cognominis ipse aedem salutis pinxit anno urbis conditae ccccl, quae pictura duravit ad nostram memoriam aede ea claudi principatu exusta. proxime celebrata est in foro boario aede herculis pacui poetae pictura. enni sorore genitus hic fuit clarioremque artem eam romae fecit gloria scaenae. postea non est spectata honestis manibus, nisi forte quis turpilius equitem romanum e venetia nostrae aetatis velit referre, pulchris eius operibus hodieque veronae exstantibus. laeva is manu pinxit, quod de nullo ante memoratur. parvis gloriabatur tabellis extinctus nuper in longa senecta titedius labeo praetorius, etiam proconsulatu provinciae narbonensis functus, sed ea re inrisa etiam contumeliae erat. fuit et principum virorum non omittendum de pictura celebre consilium, cum q. pedius, nepos q. pedii consularis triumphalisque et a caesare dictatore coheredis Augusto dati, natura mutus esset. in eo messala orator, ex cuius familia pueri avia fuerat, picturam docendum censuit, idque etiam Divus Augustus comprobavit; puer magni profectus in ea arte obiit. dignatio autem praecipua romae increvit, ut existimo, a m'. valerio maximo messala, qui princeps tabulam picturam proelii, quo carthaginenses et hieronem in sicilia vicerat, proposuit in latere curiae hostiliae anno ab urbe condita cccxc. fecit hoc idem et l. scipio tabulamque victoriae suae asiaticae in capitolio posuit, idque aegre tulisse fratrem africanum tradunt, haut inmerito, quando filius eius illo proelio captus fuerat. non dissimilem offensionem et aemiliani subiit l. hostilius Mancinus, qui primus carthaginem inruperat, situm eius oppugnationesque depictas proponendo in foro et ipse adsistens populo spectanti singula enarrando, qua comitate proximis comitiis consulatum adeptus est. habuit et scaena ludis claudii pulchri magnam admirationem picturae, cum ad tegularum similitudinem corvi decepti imagine advolarent.

tabulis autem externis auctoritatem romae publice fecit primus omnium l. mummius, cui cognomen achaici victoria dedit. namque cum in praeda

vendenda rex attalus #1108 [30vi]30 emisset tabulam aristidis, liberum patrem, pretium miratus suspicatusque aliquid in ea virtutis, quod ipse nesciret, revocavit tabulam, attalo multum querente, et in cereris delubro posuit. quam primam arbitror picturam externam romae publicatam, deinde video et in foro positas volgo. hinc enim ille Crassi oratoris lepos agentis sub veteribus; cum testis compellatus instaret: “dic ergo, Crasse, qualem me noris talem,” inquit, ostendens in tabula inficetissime gallum exerentem linguam. in foro fuit et illa pastoris senis cum baculo, de qua teutonorum legatus respondit interrogatus, quantine eum aestimaret, donari sibi nolle talem vivum verumque. sed praecipuam auctoritatem publice tabulis fecit caesar dictator aiace et media ante veneris genetricis aedem dicatis, post eum m. agrippa, vir rusticitati propior quam deliciis. exstat certe eius oratio magnifica et maximo civium digna de tabulis omnibus signisque publicandis, quod fieri satius fuisset quam in villarum exilia pelli. verum eadem illa torvitas tabulas duas aiacis et veneris mercata est a cyzicenis hs [30xii]30. in thermarum quoque calidissima parte marmoribus incluserat parvas tabellas, paulo ante, cum reficerentur, sublatas. super omnes Divus Augustus in foro suo celeberrima in parte posuit tabulas duas, quae belli faciem pictam habent et triumphum, item castores ac victoriam. posuit et quas dicemus sub artificum mentione in templo caesaris patris. idem in curia quoque, quam in comitio consecrabat, duas tabulas inpressit parieti. nemean sedentem supra leonem, palmigeram ipsam, adstante cum baculo sene, cuius supra caput tabella bigae dependet, nicias scripsit se inussisse; tali enim usus est verbo. alterius tabulae admiratio est puberem filium seni patri similem esse aetatis salva differentia, supervolante aquila draconem complexa; philochares hoc suum opus esse testatus est, immensa, vel unam si tantum hanc tabulam aliquis aestimet, potentia artis, cum propter philocharen ignobilissimos alioqui glaucionem filiumque eius aristippum senatus populi romani tot saeculis spectet! posuit et tiberius caesar, minime comis imperator, in templo ipsius Augusti quas mox indicabimus. hactenus dictum sit de dignitate artis morientis.

quibus coloribus singulis primi pinxissent diximus, cum de iis pigmentis traderemus in metallis, quae monochromata a genere picturae vocantur. qui deinde et quae invenerint et quibus temporibus, dicemus in mentione artificum, quoniam indicare naturas colorum prior causa operis instituti est. tandem se ars ipsa distinxit et invenit lumen atque umbras, differentia colorum alterna vice sese excitante. postea deinde adiectus est splendor, alius hic quam lumen. quod inter haec et umbras esset, appellarunt tonon, commissuras vero colorum et transitus harmogen.

sunt autem colores austeri aut floridi. utrumque natura aut mixtura evenit. floridi sunt - quos dominus pingenti praestat - minium, armenium, cinnabaris, chrysocolla, indicum, purpurissum; ceteri austeri. ex omnibus alii nascuntur, alii fiunt. nascuntur sinopis, rubrica, paraetonium, melinum, eretria, auripigmentum; ceteri finguntur, primumque quos in metallis diximus, praeterea e vilioribus ochra, cerussa usta, sandaraca, sandyx, syricum,

atramentum.

sinopsis inventa primum in ponto est; inde nomen a sinope urbe. nascitur et in aegypto, baliaribus, africa, sed optima in lemno et in cappadocia, effossa e speluncis. pars, quae saxis adhaesit, excellit. glaebris suis colos, extra maculosus. hac usi sunt veteres ad splendorem. species sinopidis tres: rubra et minus rubens atque inter has media. pretium optimae #1108 ii, usus ad penicillum aut si lignum colorare libeat; eius, quae ex africa venit, octoni asses - cicerulum appellant - ; magis ceteris rubet, utilior abacis. idem pretium et eius, quae pressior vocatur, et est maxime fusca. usus ad bases abacorum, in medicina vero blandus ... emplastrisque et malagmatis, sive sicca compositione sive liquida facilis, contra ulcera in umore sita, velut oris, sedis. alvum sistit infusa, feminarum profluvia pota denarii pondere. eadem adusta siccatur scabritias oculorum, e vino maxime.

rubricae genus in ea voluere intellegi quidam secundae auctoritatis, palmam enim lemniae dabant. minio proxima haec est, multum antiquis celebrata cum insula, in qua nascitur. nec nisi signata venundabatur, unde et sphragidem appellavere. hac minium sublinunt adulterantque. in medicina praeclara res habetur. epiphoras enim oculorum mitigat ac dolores circumlita et aegilopia manare prohibet, sanguinem reicientibus ex aceto datur bibenda. bibitur et contra lienum reniumque vitia et purgationes feminarum, item et contra venena et serpentium ictus terrestrium marinorumque, omnibus ideo antidotis familiaris. - e reliquis rubricae generibus fabris utilissima aegyptia et africana, quoniam maxime sorbentur tectoriis. rubrica autem nascitur et in ferrariis metallis. ea et fit ochra exusta in ollis novis luto circumlitis. quo magis arsit in caminis, hoc melior. omnis autem rubrica siccatur ideoque ex emplastris conveniet igni etiam sacro.

sinopidis ponticae selibrae silis lucidi libris x et melini graecensis ii mixtis tritisque una per dies duodenos leucophorum fit. hoc est glutinum auri, cum inducitur ligno.

paraetonium loci nomen habet ex aegypto. spumam maris esse dicunt solidatam cum limo, et ideo conchae minutae inveniuntur in eo. fit et in creta insula atque cyrenis. adulteratur romae creta cimolia decocta conspissataque. pretium optimo in pondo vi #1108 l. e candidis coloribus pinguisimum et tectorii tenacissimum propter levorem.

melinum candidum et ipsum est, optimum in melo insula. in samo quod nascitur, eo non utuntur pictores propter nimiam pinguitudinem; accubantes effodiunt ibi inter saxa venam scrutantes. in medicina eundem usum habet quem eretria creta; praeterea linguam tactu siccatur, pilos detrahit smectica vi. pretium in libras sestertii singuli.

tertius e candidis colos est cerussa, cuius rationem in plumbi metallis diximus. fuit et terra per se in theodoti fundo inventa zmyrnae, qua veteres ad navium picturas utebantur. nunc omnis ex plumbo et aceto fit, ut diximus. usta casu reperta est in incendio piraei cerussa in urceis cremata. hac primum usus est nicias supra dictus. optima nunc asiatica habetur, quae et purpurea

appellatur. pretium eius in libras #1108 vi. fit et romae cremato sile marmoroso et restincto aceto. sine usta non fiunt umbrae.

eretria terrae suae habet nomen. hac nicomachus et parrhasius usi. refrigerat, emollit, explet volnera; si coquatur, ad siccanda praecipitur, utilis et capitis doloribus et ad deprehendenda pura; subesse enim ea intellegunt, si ex aqua inlita continuo arescat.

sandaracam et ochram iuba tradidit in insula rubri maris topazo nasci, sed inde non pervehuntur ad nos. sandaraca quomodo fieret diximus. fit et adulterina ex cerussa in fornace cocta. color esse debet flammeus. pretium in libras asses quini. haec si torreatur aequa parte rubrica admixta, sandycem facit, quamquam animadverto vergilium existimasse herbam id esse illo versu:

“sponte sua sandyx pascentis vestiat agnos.” pretium in libras dimidium eius quod sandaracae. nec sunt alii colores maioris ponderis.

inter facticios est et syricum, quo minium sublini diximus. fit autem sinopide et sandyce mixtis.

atramentum quoque inter facticios erit, quamquam est et terrae, geminae originis. aut enim salsuginis modo emanat, aut terra ipsa sulphurei coloris ad hoc probatur. inventi sunt pictores, qui carbonibus infestatis sepulchris effoderent. inportuna haec omnia ac novicia. fit enim e fuligine pluribus modis, resina vel pice exustis, propter quod etiam officinas aedificavere fumum eum non emittentes. laudatissimum eodem modo fit e taedis. adulteratur fornacium balnearumque fuligine quo ad volumina scribenda utuntur. sunt qui et vini faecem siccitam excoquant adfirmantque, si ex bono vino faex ea fuerit, indici speciem id atramentum praebere. polygnotus et micon, celeberrimi pictores, athenis e vinaceis fecere, tryginon appellantes. Apelles commentus est ex ebore combusto facere, quod elephantinum vocatur. adportatur et indicum ex india inexploratae adhuc inventionis mihi. fit etiam apud infectores ex flore nigro, qui adhaerescit aereis cortinis. fit et ligno e taedis combusto tritisque in mortario carbonibus. mira in hoc saepiarum natura, sed ex iis non fit. omne autem atramentum sole perficitur, librarium cumme, tectorium glutino admixto. quod aceto liquefactum est, aegre eluitur.

e reliquis coloribus, quos a dominis dari diximus propter magnitudinem pretii, ante omnes est purpurissum. creta argentaria cum purpuris pariter tingitur bibitque eum colorem celerius lanis. praecipuum est primum, fervente ahenis rudibus medicamentis inebriatum, proximum egesto eo addita creta in ius idem et, quotiens id factum est, elevatur bonitas pro numero dilutiore sanie. quare puteolanum potius laudetur quam tyrium aut gaetulicum vel laconicum, unde pretiosissimae purpurae; causa est quod hysgino maxime inficitur rubiaque, quae cogitur sorbere. vilissimum a canusio. pretium a singulis denariis in libras ad xxx. pingentes sandyce sublita, mox ex ovo inducentes purpurissum, fulgorem minii faciunt. si purpurae facere malunt, caeruleum sublinunt, mox purpurissum ex ovo inducunt.

ab hoc maxima auctoritas indico. ex india venit harundinum spumae

adhaerescens limo. cum cernatur, nigrum, at in diluendo mixturam purpureae caeruleique mirabilem reddit. alterum genus eius est in purpurariis officinis innatans cortinis, et est purpureae spuma. qui adulterant, vero indico tingunt stercora columbina aut cretam selinusiam vel anulariam vitro inficiunt. probatur carbone; reddit enim quod sincerum est flammam excellentis purpureae et, dum fumat, odorem maris. ob id quidam e scopulis id colligi putant. pretium indico #1108 xx in libras. in medicina indicum rigores et impetus sedat siccatque ulcera.

armenia mittit quod eius nomine appellatur. lapis est, hic quoque chrysocollae modo infectus, optimumque est quod maxime vicinum et communicato colore cum caeruleo. solebant librae eius trecentis nummis taxari. inventa per hispanias harena est similem curam recipiens; itaque ad denarios senos vilitas rediit. distat a caeruleo candore modico, qui teneriorem hunc efficit colorem. usus in medicina ad pilos tantum alendos habet maximeque in palpebris.

sunt etiamnum novicii duo colores e vilissimis: viride est quod appianum vocatur et chrysocollam mentitur, ceu parum multa dicta sint mendacia eius; fit e creta viridi, aestimatum sestertiis in libras. anulare quod vocant, candidum est, quo muliebres picturae inluminantur; fit et ipsum e creta admixtis vitreis gemmis e volgi anulis, inde et anulare dictum.

ex omnibus coloribus cretulam amant udoque inlini recusant purpurissum, indicum, caeruleum, melinum, auripigmentum, appianum, cerussa. cerae tinguntur isdem his coloribus ad eas picturas, quae inuruntur, alieno parietibus genere, sed classibus familiari, iam vero et onerariis navibus, quoniam et pericula expingimus, ne quis miretur et rogos pingi, iuvatque pugnatu ad mortem aut certe caedem speciose vehi.

qua contemplatione tot colorum tanta varietate subit antiquitatem mirari. quattuor coloribus solis immortalia illa opera fecere - ex albis melino, e silaciis attico, ex rubris sinopide pontica, ex nigris atramento — Apelles, aetion, melanthius, nicomachus, clarissimi pictores, cum tabulae eorum singulae oppidorum venirent opibus. nunc et purpuris in parietes migrantibus et india conferente fluminum suorum limum, draconum elephantorumque saniem nulla nobilis pictura est. omnia ergo meliora tunc fuere, cum minor copia. ita est, quoniam, ut supra diximus, rerum, non animi pretiis excubatur.

et nostrae aetatis insaniam in pictura non omittam. nero princeps iusserat colosseum se pingi cxx pedum linteo, incognitum ad hoc tempus. ea pictura, cum peracta esset in maianis hortis, accensa fulmine cum optima hortorum parte conflagravit. libertus eius, cum daret anti munus gladiatorium, publicas porticus occupavit pictura, ut constat, gladiatorum ministrorumque omnium veris imaginibus redditis. hic multis iam saeculis summus animus in pictura, pingi autem gladiatoria munera atque in publico exponi coepta a c. terentio lucano. is avo suo, a quo adoptatus fuerat, triginta paria in foro per triduum dedit tabulamque pictam in nemore dianae posuit.

nunc celebres in ea arte quam maxima brevitate percurram, neque enim

instituti operis est talis executio; itaque quosdam vel in transcurso et in aliorum mentione obiter nominasse satis erit, exceptis operum claritatibus quae et ipsa conveniet attingi, sive exstant sive intercidere.

non constat sibi in hac parte graecorum diligentia multas post olympiadas celebrando pictores quam statuarios ac toreutas, primumque olympiade lxxxx, cum et Phidian ipsum initio pictorem fuisse tradatur clipeumque athenis ab eo pictum, praeterea in confesso sit lxxx tertia fuisse fratrem eius Panaenum, qui clipeum intus pinxit elide minervae, quam fecerat colotes, discipulus Phidiae et ei in faciendo iove olympio adiutor. quid quod in confesso perinde est bularchi pictoris tabulam, in qua erat magnetum proelium, a candaule, rege lydiae heraclidarum novissimo, qui et myrsilus vocitatus est, repensam auro tanta iam dignatio picturae erat. circa romuli id aetatem acciderit necesse est, etenim duodevicensima olympiade interiit candaules aut, ut quidam tradunt, eodem anno quo romulus, nisi fallor, manifesta iam tunc claritate artis, adeo absolute. quod si recipi necesse est, simul apparet multo vetustiora principia eosque, qui monochromatis pinxerint, quorum aetas non traditur, aliquanto ante fuisse, hygiaenontem, dinian, charmadan et, qui primus in pictura marem a femina discreverit, eumarum atheniensem, figuras omnes imitari ausum, quique inventa eius excoluerit, cimonem cleonaeum. hic catagrapha invenit, hoc est obliquas imagines, et varie formare voltus, respicientes suspicientesve vel despicientes; articulis membra distinxit, venas protulit, praeterque in vestibus rugas et sinus invenit. panaenus quidem frater Phidiae etiam proelium atheniensium adversus persas apud marathona factum pinxit. adeo iam colorum usus increbruerat adeoque ars perfecta erat, ut in eo proelio iconicos duces pinxisse tradatur, atheniensium miltiadem, callimachum, cynaegirum, barbarorum datim, artaphernen. quin immo certamen etiam picturae florente eo institutum est corinthis ac delphis, primusque omnium certavit cum timagora chalcidense, superatus ab eo pythiis, quod et ipsius timagorae carmine vetusto apparet, chronicorum errore non dubio.

alii quoque post hos clari fuere ante lxxxx olympiadem, sicut polygnotus thasius, qui primus mulieres tralucida veste pinxit, capita earum mitris versicoloribus operuit plurimumque picturae primus contulit, siquidem instituit os adaperire, dentes ostendere, voltum ab antiquo rigore variare. huius est tabula in porticu pompeii, quae ante curiam eius fuerat, in qua dubitatur ascendentem cum cluqueo pinxerit an descendentem. hic delphis aedem pinxit, hic et athenis porticum, quae poecile vocatur, gratuito, cum partem eius micon mercede pingeret. vel maior huic auctoritas, siquidem amphictyones, quod est publicum graeciae concilium, hospitia ei gratuita decrevere. - fuit et alius micon, qui minoris cognomine distinguitur, cuius filia timarete et ipsa pinxit. -

lxxxx autem olympiade fuere aglaophon, cephisodorus, erillus, euenor, pater parrhasii et praeceptor maximi pictoris, de quo suis annis dicemus, omnes iam inlustres, non tamen in quibus haerere expositio debeat festinans ad lumina artis, in quibus primus refulsit apollodorus atheniensis lxxxxiii

olympiade. hic primus species exprimere instituit primusque gloriam penicillo iure contulit. eius est sacerdos adorans et aiax fulmine incensus, quae pergami spectatur hodie. neque ante eum tabula ullius ostenditur, quae teneat oculos.

ab hoc artis fores apertas zeuxis heracleotes intravit olympiadis lxxxxv anno quarto, audentemque iam aliquid penicillum - de hoc enim adhuc loquamur - ad magnam gloriam perduxit, a quibusdam falso in lxxxviii olympiade positus, cum fuisse necesse est demophilum himeraeum et nesea thasium, quoniam utrius eorum discipulus fuerit ambigitur. in eum apollodorus supra scriptus versum fecit, artem ipsis ablatam zeuxim ferre secum. opes quoque tantas adquisivit, ut in ostentatione earum olympiae aureis litteris in palliorum tesseris intextum nomen suum ostentaret. postea donare opera sua instituit, quod nullo pretio satis digno permutari posse diceret, sicuti alcmenam agragantinis, pana archelao. fecit et penelopen, in qua pinxisse mores videtur, et athletam adeoque in illo sibi placuit, ut versum subscriberet celebrem ex eo, invisurum aliquem facilius quam imitaturum. magnificus est et iuppiter eius in throno adstantibus diis et hercules infans dracones ii strangulans alcmena matre coram pavente et amphitryone. reprehenditur tamen ceu grandior in capitibus articulisque, alioqui tantus diligentia, ut agragantinis facturus tabulam, quam in templo iunonis laciniae publice dicarent, inspexerit virgines eorum nudas et quinque elegerit, ut quod in quaque laudatissimum esset pictura redderet. pinxit et monochromata ex albo. aequales eius et aemuli fuere timanthes, androcydes, eupompus, parrhasius. descendisse hic in certamen cum zeuxide traditur et, cum ille detulisset uvas pictas tanto successu, ut in scaenam aves advolarent, ipse detulisse linteum pictum ita veritate repraesentata, ut zeuxis alitum iudicio tumens flagitaret tandem remoto linteo ostendi picturam atque intellecto errore concederet palmam ingenuo pudore, quoniam ipse volucres fefellisset, parrhasius autem se artificem. fertur et postea zeuxis pinxisse puerum uvas ferentem, ad quas cum advolassent aves, eadem ingenuitate processit iratus operi et dixit: "uvas melius pinxi quam puerum, nam si et hoc consummassem, aves timere debuerant." fecit et figlina opera, quae sola in ambracia relictas sunt, cum inde musas fulvius nobilior romam transferret. zeuxidis manu romae helena est in philippi porticibus, et in concordiae delubro marsyas religatus.

parrhasius ephesi natus et ipse multa contulit. primus symmetrian picturae dedit, primus argutias voltus, elegantiam capilli, venustatem oris, confessione artificum in liniis extremis palmam adeptus. haec est picturae summa subtilitas. corpora enim pingere et media rerum est quidem magni operis, sed in quo multi gloriam tulerint; extrema corporum facere et desinentis picturae modum includere rarum in successu artis invenitur. ambire enim se ipsa debet extremitas et sic desinere, ut promittat alia et post se ostendatque etiam quae occultat. hanc ei gloriam concessere antigonus et xenocrates, qui de pictura scripsere, praedicantes quoque, non solum confitentes; et alias multa graphidis vestigia exstant in tabulis ac membranis eius, ex quibus proficere dicuntur

artifices. minor tamen videtur sibi comparatus in mediis corporibus exprimendis. pinxit demon atheniensium argumento quoque ingenioso. ostendebat namque varium: iracundum iniustum inconstantem, eundem exorabilem clementem misericordem; gloriosum ... , excelsum humilem, ferocem fugacemque et omnia pariter. idem pinxit et thesea, quae romae in capitolio fuit, et nauarchum thoracatum, et in una tabula, quae est rhodi, meleagrum, herculem, persea; haec ibi ter fulmine ambusta neque oblitterata hoc ipso miraculum auget. pinxit et archigallum, quam picturam amavit tiberius princeps atque, ut auctor est deculo, hs [30lx]30 aestimatam cubiculo suo inclusit. pinxit et thressam nutricem infantemque in manibus eius et philiscum et liberum patrem adstante virtute, et pueros duos, in quibus spectatur securitas aetatis et simplicitas, item sacerdotem adstante puero cum acerra et corona. sunt et duae picturae eius nobilissimae, hoplites in certamine ita decurrens, ut sudare videatur, alter arma deponens, ut anhelare sentiatur. laudantur et aeneas castorque ac pollux in eadem tabula, item telephus, achilles, agamemnon, ulixes. fecundus artifex, sed quo nemo insolentius usus sit gloria artis, namque et cognomina usurpavit habrodiaetum se appellando aliisque versibus principem artis et eam ab se consummatam, super omnia apollinis se radice ortum et herculem, qui est lindi, talem a se pictum, qualem saepe in quiete vidisset, et, cum magnis suffragiis superatus a timanthe esset sami in aiace armorumque iudicio, herois nomine se moleste ferre dicebat, quod iterum ab indigno victus esset. - (pinxit et minoribus tabellis libidines, eo genere petulantis ioci se reficiens). -

nam timanthi vel plurimum adfuit ingenii. eius enim est iphigenia oratorum laudibus celebrata, qua stante ad aras peritura cum maestos pinxisset omnes praecipueque patrum et tristitiae omnem imaginem consumpsisset, patris ipsius voltum velavit, quem digne non poterat ostendere. sunt et alia ingenii eius exempla, veluti cyclops dormiens in parvola tabella, cuius et sic magnitudinem exprimere cupiens pinxit iuxta satyros thyrso pollicem eius metientes. atque in unius huius operibus intellegitur plus semper quam pingitur et, cum sit ars summa, ingenium tamen ultra artem est. pinxit et heroa absolutissimi operis, artem ipsam complexus viros pingendi, quod opus nunc romae in templo pacis est.

euxinidas hac aetate docuit aristiden, praeclarum artificem, eupompus pamphilum, Apellis praeceptorem. est eupompi victor certamine gymnico palmam tenens. ipsius auctoritas tanta fuit, ut diviserit picturam: genera, quae ante eum duo fuere - helladicum et asiaticum appellabant - , propter hunc, qui erat sicyonius, diviso helladico tria facta sunt, ionicum, sicyonium, atticum. pamphili cognatio et proelium ad phliuntem ac victoria atheniensium, item ulixes in rate. ipse macedo natione, sed ... primus in pictura omnibus litteris eruditus, praecipue arithmetica et geometria, sine quibus negabat artem perfici posse, docuit neminem talento minoris - annuis #1108 d - , quam mercedem et Apelles et melanthius dedere ei. huius auctoritate effectum est sicyone primum, deinde in tota graecia, ut pueri ingenui omnia ante graphicen, hoc est

picturam in buxo, docerentur recipereturque ars ea in primum gradum liberalium. semper quidem honos ei fuit, ut ingenui eam exercerent, mox ut honesti, perpetuo interdicto ne servitia docerentur. ideo neque in hac neque in toreutice ullius, qui servierit, opera celebrantur.

clari et centesima septima olympiade exstitere aetion ac therimachus. aetionis sunt nobiles picturae liber pater, item tragoedia et comoedia, semiramis ex ancilla regnum apiscens, anus lampadas praeferens et nova nupta verecundia notabilis.

verum omnes prius genitos futurosque postea superavit Apelles cous olympiade centesima duodecima. picturae plura solus prope quam ceteri omnes contulit, voluminibus etiam editis, quae doctrinam eam continent. praecipua eius in arte venustas fuit, cum eadem aetate maximi pictores essent; quorum opera cum admiraretur, omnibus conlaudatis deesse illam suam venerem dicebat, quam graeci χάριτα vocant; cetera omnia contigisse, sed hac sola sibi neminem parem. et aliam gloriam usurpavit, cum protogenis opus inmensi laboris ac curae supra modum anxiae miraretur; dixit enim omnia sibi cum illo paria esse aut illi meliora, sed uno se praestare, quod manum de tabula sciret tollere, memorabili praecepto nocere saepe nimiam diligentiam. fuit autem non minoris simplicitatis quam artis. melanthio dispositione cedebat, Asclepiodoro de mensuris, hoc est quanto quid a quoque distare deberet.

scitum inter protogenen et eum quod accidit. ille rhodi vivebat, quo cum Apelles adnavigasset, avidus cognoscendi opera eius fama tantum sibi cogniti, continuo officinam petiit. aberat ipse, sed tabulam amplae magnitudinis in machina aptatam una custodiebat anus. haec foris esse protogenen respondit interrogavitque, a quo quaesitum diceret. “ab hoc,” inquit Apelles adreptoque penicillo lineam ex colore duxit summae tenuitatis per tabulam. et reverso protogeni quae gesta erant anus indicavit. ferunt artificem protinus contemplatum subtilitatem dixisse Apellen venisse, non cadere in alium tam absolutum opus; ipsumque alio colore tenuiorem lineam in ipsa illa duxisse abeuntemque praecepisse, si redisset ille, ostenderet adiceretque hunc esse quem quaereret. atque ita evenit. revertit enim Apelles et vinci erubescens tertio colore lineas secuit nullum relinquens amplius subtilitati locum. at protogenes victum se confessus in portum devolvavit hospitem quaerens, placuitque sic eam tabulam posteris tradi omnium quidem, sed artificum praecipuo miraculo. consumptam eam priore incendio caesaris domus in palatio audio, spectatam rhodi ante, spatiose nihil aliud continentem quam lineas visum effugientes, inter egregia multorum opera inani similem et eo ipso allicientem omnique opere nobiliorem.

Apelli fuit alioqui perpetua consuetudo numquam tam occupatum diem agendi, ut non lineam ducendo exerceret artem, quod ab eo in proverbium venit. idem perfecta opera proponebat in pergula transeuntibus atque, ipse post tabulam latens, vitia quae notarentur auscultabat, vulgum diligentiorum iudicem quam se praeferens; feruntque reprehensum a sutore, quod in crepidis

una pauciores intus fecisset ansas, eodem postero die superbo emendatione pristinae admonitionis cavillante circa crus, indignatum prospexisse denuntiantem, ne supra crepidam sutor iudicaret, quod et ipsum in proverbium abiit. fuit enim et comitas illi, propter quam gravior alexandro magno frequenter in officinam ventitanti - nam, ut diximus, ab alio se pingi vetuerat edicto - , sed in officina imperite multa disserenti silentium comiter suadebat, rideri eum dicens a pueris, qui colores tererent. tantum erat auctoritati iuris in regem alioqui iracundum. quamquam alexander honorem ei clarissimo perhibuit exemplo. namque cum dilectam sibi e pallacis suis praecipue, nomine pancaspen, nudam pingi ob admirationem formae ab Apelle iussisset eumque, dum paret, captum amore sensisset, dono dedit ei, magnus animo, maior imperio sui nec minor hoc facto quam victoria alia, quia ipse se vicit, nec torum tantum suum, sed etiam adfectum donavit artifice, ne dilectae quidem respectu motus, cum modo regis ea fuisset, modo pictoris esset. sunt qui venerem anadyomenen ab illo pictam exemplari putent. Apelles et in aemulis benignus protogeni dignationem primus rhodi constituit. sordebat suis, ut plerumque domestica, percontantique, quanti liceret opera effecta, parvum nescio quid dixerat, at ille quinquagenis talentis poposcit famamque dispersit, se emere, ut pro suis venderet. ea res concitavit rhodios ad intellegendum artificem, nec nisi augentibus pretium cessit.

imagines adeo similitudinis indiscretae pinxit, ut - incredibile dictu - apio grammaticus scriptum reliquerit, quendam ex facie hominum divinantem, quos metoposcopos vocant, ex iis dixisse aut futurae mortis annos aut praeteritae vitae. non fuerat ei gratia in comitatu alexandri cum ptolemaeo, quo regnante alexandriam vi tempestatis expulsus, subornato fraude aemulorum plano regio invitatus, ad cenam venit indignantique ptolemaeo et vocatores suos ostendenti, ut diceret, a quo eorum invitatus esset, arrepto carbone extincto e foculo imaginem in pariete delineavit, adgnoscente voltum plani rege inchoatum protinus. pinxit et antigoni regis imaginem altero lumine orbatu primus excogitata ratione vitia condendi; obliquam namque fecit, ut, quod deerat corpori, picturae deesse potius videretur, tantumque eam partem e facie ostendit, quam totam poterat ostendere. sunt inter opera eius et exspirantium imagines. quae autem nobilissima sint, non est facile dictu. venerem exeuntem e mari Divus Augustus dicavit in delubro patris caesaris, quae anadyomene vocatur, versibus graecis tantopere dum laudatur, aevs victa, sed inlustrata. cuius inferiorem partem corruptam qui reficeret non potuit reperiri, verum ipsa iniuria cessit in gloriam artificis. consenuit haec tabula carie, aliamque pro ea substituit nero in principatu suo dorothei manu. Apelles inchoaverat et aliam venerem coi, superaturus etiam illam suam priorem. invidit mors peracta parte, nec qui succederet operi ad praescripta liniamenta inventus est. pinxit et alexandrum magnum fulmen tenentem in templo ephesiae diana viginti talentis auri. digiti eminere videntur et fulmen extra tabulam esse - legentes meminerint omnia ea quattuor coloribus facta - ; manipretium eius tabulae in nummo aureo mensura accepit, non numero.

pinxit et megabyzi, sacerdotis dianaē ephesiae, pompam, clitum cum equo ad bellum festinantem, galeam poscenti armigerum porrigentem. alexandrum et philippum quotiens pinxerit, enumerare supervacuum est. mirantur eius habronem sami; menandrum, regem cariae, rhodi, item antaeum; alexandreae gorgosthenen tragoedum; romae castorem et pollucem cum victoria et alexandro magno, item belli imaginem restrictis ad terga manibus, alexandro in curru triumphante. quas utrasque tabulas Divus Augustus in fori sui celeberrimis partibus dicaverat simplicitate moderata; divus claudius pluris existimavit utrisque excisa alexandri facie Divi Augusti imagines addere. eiusdem arbitrantur manu esse et in dianaē templo herculem aversum, ut, quod est difficillimum, faciem eius ostendat verius pictura quam promittat. pinxit et heroa nudum eaque pictura naturam ipsam provocavit. est et equus eius, sive fuit, pictus in certamine, quo iudicium ad mutas quadrupes provocavit ab hominibus. namque ambitu praevalere aemulos sentiens singulorum picturas inductis equis ostendit: Apellis tantum equo adhinnivere, idque et postea semper evenit, ut experimentum artis illud ostentaretur. fecit et neoptolemum ex equo adversus persas, archelaum cum uxore et filia, antigonum thoracatum cum equo incedentem. peritiores artis praeferunt omnibus eius operibus eundem regem sedentem in equo et dianam sacrificantium virginum choro mixtam, quibus vicisse homeri versus videtur id ipsum describentis. pinxit et quae pingi non possunt, tonitrua, fulgetra fulguraque; bronten, astrapen et ceraunobolian appellant. - inventa eius et ceteris profuere in arte; unum imitari nemo potuit, quod absoluta opera atramento inlinebat ita tenui, ut id ipsum, cum repressum claritatis colorum omnium excitaret custodiretque a pulvere et sordibus, ad manum intuenti demum appareret, sed et luminum ratione magna, ne claritas colorum aciem offenderet veluti per lapidem specularem intuentibus et e longinquo eadem res nimis floridis coloribus austeritatem occulte daret.

aequalis eius fuit aristides thebanus. is omnium primus animum pinxit et sensus hominis expressit, quae vocant graeci ἦθη, item perturbationes, durior paulo in coloribus. huius opera ... oppido capto ad matris morientis ex vulnere mammam adrepens infans, intellegiturque sentire mater et timere, ne emortuo e lacte sanguinem lambat. quam tabulam alexander magnus transtulerat pellam in patriam suam. idem pinxit proelium cum persis, centum homines tabula ea complexus pactusque in singulos mnas denas a tyranno elatensium mnasone. pinxit et currentes quadrigas et supplicantem paene cum voce et venatores cum captura et leontion epicuri et anapauomenen propter fratris amorem, item liberum et ariadnen spectatos romae in aede cereris, tragoedum et puerum in apollinis, cuius tabulae gratia interiit pictoris inscitia, cui tergendam eam mandaverat m. iunius praetor sub die ludorum apollinarium. spectata est et in aede fidei in capitolio senis cum lyra puerum docentis. pinxit et aegrum sine fine laudatum tantumque arte valuit, ut attalus rex unam tabulam eius centum talentis emisse tradatur.

simul, ut dictum est, et protogenes floruit. patria ei caunus, gentis rhodiis

subiectae. summa paupertas initio artisque summa intentio et ideo minor fertilitas. quis eum docuerit, non putant constare; quidam et naves pinxisse usque ad quinquagesimum annum; argumentum esse, quod cum athenis celeberrimo loco minervae delubri propylon pingeret, ubi fecit nobilem paralum et hammoniada, quam quidam nausicaan vocant, adiecerit parvolas naves longas in iis, quae pictores parergia appellant, ut appareret, a quibus initiis ad arcem ostentationis opera sua pervenissent. palmam habet tabularum eius ialysus, qui est romae dicatus in templo pacis. cum pingeret eum, traditur madidis lupinis vixisse, quoniam sic simul et famem sustineret et sitim nec sensus nimia dulcedine obstrueret. huic picturae quater colorem induxit ceu tria subsidia iniuriae et vetustatis, ut decedente superiore inferior succederet. est in ea canis mire factus, ut quem pariter et casus pinxerit. non iudicabat se in eo exprimere spumam anhelantis, cum in reliqua parte omni, quod difficillimum erat, sibi ipse satisfecisset. displicebat autem ars ipsa: nec minui poterat et videbatur nimia ac longius a veritate discedere, spumae pingi, non ex ore nasci. anxio animi cruciatu, cum in pictura verum esse, non verisimile vellet, absterserat saepius mutaveratque penicillum, nullo modo sibi adprobans. postremo iratus arti, quod intellegeretur, spongeam inpegit invisio loco tabulae. et illa reposuit ablatis colores qualiter cura optaverat, fecitque in pictura fortuna naturam. hoc exemplo eius similis et nealcen successus spumae equi similiter spongea inpecta secutus dicitur, cum pingeret poppyzonta retinentem eum. ita protogenes monstravit et fortunam. propter hunc ialysum, ne cremaret tabulam, demetrius rex, cum ab ea parte sola posset rhodum capere, non incendit, parcentemque picturae fugit occasio victoriae. erat tunc protogenes in suburbano suo hortulo, hoc est demetrii castris, neque interpellatus proeliis incohata opera intermisit omnino nisi accitus a rege, interrogatusque, qua fiducia extra muros ageret, respondit scire se cum rhodiis illi bellum esse, non cum artibus. disposuit rex in tutelam eius stationes, gaudens quod manus servaret, quibus pepercerat, et, ne saepius avocaret, ultro ad eum venit hostis relictisque victoriae suae votis inter arma et murorum ictus spectavit artificem; sequiturque tabulam illius temporis haec fama, quod eam protogenes sub gladio pinxerit: satyrus hic est, quem anapauomenon vocant, ne quid desit temporis eius securitati, tenentem tibia. fecit et cydippen et tlepolemum, Philiscum, tragoediarum scriptorem, meditantem et athletam et antigonum regem, matrem aristotelis philosophi, qui ei suadebat, ut alexandri magni opera pingeret propter aeternitatem rerum - impetus animi et quaedam artis libido in haec potius eum tulere - ; novissime pinxit alexandrum ac pana. fecit et signa ex aere, ut diximus.

eadem aetate fuit Asclepiodorus, quem in symmetria mirabatur Apelles. huic mnaso tyrannus pro duodecim diis dedit in singulos mnas tricenas, idemque theomnesto in singulos heroas vicens.

his adnumerari debet et nicomachus, aristidis filius ac discipulus. pinxit raptum proserpinae, quae tabula fuit in capitolio in minervae delubro supra aediculam iuventatis, et in eodem capitolio, quam plancus imperator posuerat,

victoria quadrigam in sublime rapiens. ulixi primus addidit pilleum. pinxit et apollinem ac dianam, deumque matrem in leone sedentem, item nobiles bacchas obreptantibus satyris, scyllamque, quae nunc est romae in templo pacis. nec fuit alius in ea arte velocior. tradunt namque conduxisse pingendum ab aristrato, sicyoniorum tyranno, quod is faciebat telesti poetae monimentum praefinito die, intra quem perageretur, nec multo ante venisse, tyranno in poenam accenso, paucisque diebus absolvisse et celeritate et arte mira. - discipulos habuit aristonem fratrem et aristiden filium et philoxenum eretrium, cuius tabula nullis postferenda, cassandro regi picta, continuit alexandri proelium cum dario. idem pinxit et lasciviam, in qua tres sileni comissantur. hic celeritatem praeceptoris secutus breviores etiamnum quasdam picturae compendiaras invenit. - adnumeratur his et nicophanes, elegans ac concinnus ita, ut venustate ei pauci conparentur; cothurnus et gravitas artis multum a zeuxide et Apelle abest. (Apellis discipulus perseus, ad quem de hac arte scripsit, huius fuerat aetatis). aristidis thebani discipuli fuerunt et filii niceros et ariston, cuius est satyrus cum scypho coronatus, discipuli antorides et euphranor, de quo mox dicemus.

namque subtexi par est minoris picturae celebres in penicillo, e quibus fuit piraecus arte paucis postferendus: proposito nescio an distinxerit se, quoniam humilia quidem secutus humilitatis tamen summam adeptus est gloriam. tonstrinas sutrinisque pinxit et asellos et obsonia ac similia, ob haec cognominatus rhyparographos, in iis consummatae voluptatis, quippe eae pluris venire quam maximae multorum. e diverso “maeniana,” inquit Varro, “omnia operiebat serapionis tabula sub veteribus.” hic scaenas optime pinxit, sed hominem pingere non potuit. contra dionysius nihil aliud quam homines pinxit, ob id anthropographos cognominatus. parva et callicles fecit, item calates comicis tabellis, utraque antiphilus. namque et hesionam nobilem pinxit et alexandrum ac philippum cum minerva, qui sunt in schola in octaviae porticibus, et in philippi liberum patrem, alexandrum puerum, hippolytum tauro emissio expavescentem, in pompeia vero cadmum et europen. idem iocosis nomine gryllum deridiculi habitus pinxit, unde id genus picturae grylli vocantur. ipse in aegypto natus didicit a ctesidemo.

deceat non sileri et ardeatis templi pictorem, praesertim civitate donatum ibi et carmine, quod est in ipsa pictura his versibus:

“dignis digna. loco picturis condecoravit
reginae iunonis supremi coniugis templum
plautius marcus, cluet asia lata esse oriundus,
quem nunc et post semper ob artem hanc ar

dea laudat,” eaque sunt scripta antiquis litteris latinis, non fraudanda et studio Divi Augusti aetate, qui primus instituit amoenissimam parietum picturam, villas et porticus ac topiaria opera, lucos, nemora, colles, piscinas, euripos, amnes, litora, qualia quis optaret, varias ibi obambulantium species aut navigantium terraque villas adeuntium asellis aut vehiculis, iam piscantes, aucupantes aut venantes aut etiam vindemiantes. sunt in eius exemplaribus

nobiles palustri accessu villae, succollatis sponsione mulieribus labantes, trepidis quae feruntur, plurimae praeterea tales argutiae facetissimi salis. idem subdialibus maritimas urbes pingere instituit, blandissimo aspectu minimoque incendio. sed nulla gloria artificum est nisi qui tabulas pinxere. eo venerabilior antiquitatis prudentia apparet. non enim parietes excolebant dominis tantum nec domos uno in loco mansuras, quae ex incendiis rapi non possent. casa protogenes contentus erat in hortulo suo; nulla in Apellis tectoriis pictura erat. nondum libebat parietes totos tinguere; omnium eorum ars urbibus excubabat, pictorque res communis terrarum erat. - fuit et arellius romae celeber paulo ante Divum Augustum, ni flagitio insigni corrupisset artem, semper ei lenocinans feminae, cuius amore flagraret, et ob id deas pingens, sed dilectarum imagine. itaque in pictura eius scorta numerabantur. fuit et nuper gravis ac severus idemque floridis tumidus pictor famulus. huius erat minerva spectantem spectans, quacumque aspiceretur. paucis diei horis pingebat, id quoque cum gravitate, quod semper togatus, quamquam in machinis. carcer eius artis domus aurea fuit, et ideo non extant exempla alia magnopere. post eum fuere in auctoritate cornelius pinus et attius priscus, qui honoris et virtutis aedes imperatori Vespasiano Augusto restituenti pinxerunt, priscus antiquis similior. - non est omittenda in picturae mentione celebris circa lepidum fabula, siquidem in triumviratu quodam loco deductus a magistratibus in nemorosum hospitium minaciter cum iis postero die expostulavit somnum ademptum sibi volucrum concentu; at illi draconem in longissima membrana depictum circumdedere luco, eoque terrore aves tunc siluisse narratur et postea posse compesci.

ceris pingere ac picturam inurere quis primus excogitaverit, non constat. quidam aristidis inventum putant, postea consummatum a praxitele; sed aliquanto vetustiores encaustae picturae exstiterē, ut polygnoti et nicanoris, mnesilai pariorum. elasippus quoque aeginae picturae suae inscripsit ἑνέκαεν, quod profecto non fecisset nisi encaustica inventa. pamphilus quoque, Apellis praeceptor, non pinxisse solum encausta, sed etiam docuisse traditur pausian sicyonium, primum in hoc genere nobilem. bryetis filius hic fuit eiusdemque primo discipulus. pinxit et ipse penicillo parietes thespiis, cum reficerentur quondam a polygnoto picti, multumque comparatione superatus existimabatur, quoniam non suo genere certasset. idem et lacunaria primus pingere instituit, nec camaras ante eum taliter adornari mos fuit; parvas pingebat tabellas maximeque pueros. hoc aemuli interpretabantur facere eum, quoniam tarda picturae ratio esset illa. quam ob rem daturus ei celeritatis famam absolvit uno die tabellam, quae vocata est hemeresios, puero picto. amavit in iuventa glyceram municipem suam, inventricem coronarum, certandoque imitatione eius ad numerosissimam florum varietatem perduxit artem illam. postremo pinxit et ipsam sedentem cum corona, quae e nobilissimis tabula est, appellata stephanoplocos, ab aliis stephanopolis, quoniam glycera venditando coronas sustentaverat paupertatem. huius tabulae exemplar, quod apographon vocant, l. lucullus duobus talentis emit ...

dionysius athenis. pausias autem fecit et grandes tabulas, sicut spectatam in pompei porticu boum immolationem. eam primus invenit picturam, quam postea imitati sunt multi, aequavit nemo. ante omnia, cum longitudinem bovis ostendi vellet, adversum eum pinxit, non transversum, et abunde intellegitur amplitudo. dein, cum omnes, quae volunt eminentia videri, candicanti faciant colore, quae condunt, nigro, hic totum bovem atri coloris fecit umbraeque corpus ex ipsa dedit, magna prorsus arte in aequo extantia ostendente et in confracto solida omnia. sicyone et hic vitam egit, diuque illa fuit patria picturae. tabulas inde e publico omnes propter aes alienum civitatis addictas Scauri aedilitas romam transtulit.

post eum eminuit longe ante omnes euphranor isthmius olympiade ciii, idem qui inter fectores dictus est nobis. fecit et colossos et marmorea et typos scalpsit, docilis ac laboriosus ante omnes et in quocumque genere excellens ac sibi aequalis. hic primus videtur expressisse dignitates heroum et usurpasse symmetrian, sed fuit in universitate corporum exilior et capitibus articulisque grandior. volumina quoque composuit de symmetria et coloribus. opera eius sunt equestre proelium, xii dei, theseus, in quod dixit eundem apud parrhasium rosa pastum esse, suum vero carne. nobilis eius tabula ephesi est, ulixes simulata insania bovem cum equo iungens et palliati cogitantes, dux gladium condens.

eodem tempore fuere cydias, cuius tabulam argonautas hs [cxxxxiiii] hortensius orator mercatus est eique aedem fecit in tusculano suo, euphranoris autem discipulus antidotus. huius est clipeo dimicans athenis et luctator tubicenque inter pauca laudatus. ipse diligentior quam numerosior et in coloribus severus maxime inclaruit discipulo nicias atheniense, qui diligentissime mulieres pinxit. lumen et umbras custodiit atque ut eminenter e tabulis picturae maxime curavit. operum eius nemea advecta ex asia romam a silano, quam in curia diximus positam, item liber pater in aede concordiae, hyacinthus, quem Caesar Augustus delectatus eo secum deportavit alexandrea capta, et ob id tiberius caesar in templo eius dicavit hanc tabulam et danaen, ephesi vero est megabyzi, sacerdotis ephesiae dianae, sepulchrum, athenis necyomantea homeri. hanc vendere attalo regi noluit talentis lx potiusque patriae suae donavit abundans opibus. fecit et grandes picturas, in quibus sunt calypso et io et andromeda; alexander quoque in pompei porticibus praecellens et calypso sedens huic eidem adscribuntur. quadripedum prosperrime canes expressit. hic est nicias, de quo dicebat Praxiteles interrogatus, quae maxime opera sua probaret in marmoribus: “quibus nicias manum admovisset;” tantum circumlitioni eius tribuebat. non satis discernitur, alium eodem nomine an hunc eundem quidam faciant olympiade cxii.

nicias comparatur et aliquando praefertur athenion maronites, glaucionis corinthii discipulus, austerior colore et in austeritate iucundior, ut in ipsa pictura eruditio eluceat. pinxit in templo eleusine phylarchum et athenis frequentiam, quam vocavere syngenicon, item achillem virginis habitu occultatum ulixe dependente et in una tabula vi signa, quaque maxime

inclaruit, agasonem cum equo. quod nisi in iuventa obiisset, nemo compararetur.

est nomen et heraclidi macedoni. initio naves pinxit captoque perseo rege athenas commigravit. ubi eodem tempore erat metrodorus, pictor idemque philosophus, in utraque scientia magnae auctoritatis. itaque cum l. paulus devicto perseo petiisset ab atheniensibus, ut ii sibi quam probatissimum philosophum mitterent ad erudiendos liberos, item pictorem ad triumphum excolendum, athenienses metrodorum elegerunt, professi eundem in utroque desiderio praestantissimum, quod ita paulus quoque iudicavit.

timomachus byzantius caesaris dictatoris aetate aiacem et mediam pinxit, ab eo in veneris genetricis aede positas, lxxx talentis venundatas. talentum atticum #1108 [vi] taxat M. Varro. timomachi aequae laudantur orestes, iphigenia in tauris et lecythion, agilitatis exercitator, cognatio nobilium, palliati, quos dicturos pinxit, alterum stantem, alterum sedentem. praecipue tamen ars ei fuisse in gorgone visa est.

pausiae filius et discipulus aristolaus e severissimis pictoribus fuit, cuius sunt epaminondas, pericles, media, virtus, theseus, imago atticae plebis, boum immolatio. - sunt quibus et nicophanes, eiusdem pausiae discipulus, placeat diligentia, quam intellegant soli artifices, alias durus in coloribus et sile multus. nam socrates iure omnibus placet; tales sunt eius cum aesculapio filiae hygia, aegle, panacea, iaso et piger, qui appellatur ocnos, spartum torquens, quod asellus adrodit.

hactenus indicatis proceribus in utroque genere non silebuntur et primis proximi: aristocles, qui pinxit aedem apollinis delphis. antiphilus puero ignem conflante laudatur ac pulchra alias domo splendente ipsiusque pueri ore, item lanificio, in quo properant omnium mulierum pensa, ptolemaeo venante, sed nobilissimo satyro cum pelle pantherina, quem aposcopeuonta appellant, aristophon ancaeo vulnerato ab apro cum socia doloris astypalaea numerosaque tabula, in qua sunt priamus, helena, credulitas, ulixes, deiphobus, dolus. androbius pinxit scyllum ancoras praecedentem persicae classis, artemon danaen mirantibus eam praedonibus, reginam stratonicen, herculem et deianiram, nobilissimas autem, quae sunt in octaviae operibus, herculem ab oeta monte doridos exusta mortalitate consensu deorum in caelum euntem, laomedontis circa herculem et neptunum historiam; alcimachus dioxippum, qui pancratio olympiae citra pulveris iactum, quod vocant ἄkovρι, vicit; coenus stemmata. ctesilochus, Apellis discipulus, petulanti pictura innotuit, iove liberum parturiente depicto mitrato et muliebriter ingemescente inter obstetricia dearum, cleon cadmo, ctesidemus oechaliae expugnatione, laodamia, ctesicles reginae stratonices iniuria. nullo enim honore exceptus ab ea pinxit volutantem cum piscatore, quem reginam amare sermo erat, eamque tabulam in portu ephesi proposuit, ipse velis raptus. regina tolli vetuit, utriusque similitudine mire expressa. cratinus comoedos athenis in pompeo pinxit; Eutychides bigam: regit victoria. eudorus scaena spectatur - idem et ex aere signa fecit - , hippys neptuno et victoria. habron

amicam et concordiam pinxit et deorum simulacra, leontiscus aratum victorem cum tropaeo, psaltriam, leon sappho, nearchus venerem inter gratias et cupidines, herculem tristem insaniae paenitentia, nealces venerem, ingeniosus et sollers, ... ime siquidem, cum proelium navale persarum et aegyptiorum pinxisset, quod in nilo cuius est aqua maris similis factum volebat intellegi, argumento declaravit quod arte non poterat: asellum enim bibentem in litore pinxit et crocodilum insidiantem ei; oenias syngenicon, Philiscus officinam pictoris ignem conflante puero, phalerion scyllam, simonides agatharchum et mnemosynen, simus iuvenem requiescentem, officinam fullonis quinquatrus celebrantem, idemque nemesim egregiam, theorus se inungentem, idem ab oreste matrem et aegisthum interfici, bellumque iliacum pluribus tabulis, quod est romae in philippi porticibus, et cassandram, quae est in concordiae delubro, leontium epicuri cogitantem, demetrium regem, theon orestis insaniam, thamyram citharoedum, Tauriscus discobolum, clytaemestram, paniscon, polynicen regnum repetentem et capanea.

non omittetur inter hos insigne exemplum. namque erigonus, tritor colorum nealcae pictoris, in tantum ipse profecit, ut celebrem etiam discipulum reliquerit pasiam, fratrem aeginetae fictoris. illud vero perquam rarum ac memoria dignum est, suprema opera artificum imperfectasque tabulas, sicut irim aristidis, tyndaridas nicomachi, mediam timomachi et quam diximus venerem Apellis, in maiore admiratione esse quam perfecta, quippe in iis liniamenta reliqua ipsaeque cogitationes artificum spectantur, atque in lenocinio commendationis dolor est manus, cum id ageret, exstinctae.

sunt etiamnum non ignobiles quidem, in transcurso tamen dicendi aristocydes, anaxander, aristobulus syrus, Arcesilas, tisicratis filius, coroebus, nicomachi discipulus, charmantides euphranoris, dionysodorus colophonius, dicaeogenes, qui cum demetrio rege vixit, euthymides, heraclides macedo, milon soleus, pyromachi statuarii discipuli, mnasitheus sicyonius, mnasitimus, aristonidae filius et discipulus, nessus, habronis filius, polemon alexandrinus, theodorus samius et stadios, nicosthenis discipuli, xenon, neoclis discipulus, sicyonius.

pinxere et mulieres: timarete, miconis filia, dianam, quae in tabula ephesi est antiquissimae picturae; irene, cratini pictoris filia et discipula, puellam, quae est eleusine, calypso, senem et praestigiatorem theodorum, alcisthenen saltatorem; aristarete, nearchi filia et discipula, aesculapium. iaia cyzicena, perpetua virgo, M. Varronis iuventa romae et penicillo pinxit et cestro in ebore imagines mulierum maxime et neapoli anum in grandi tabula, suam quoque imaginem ad speculum. nec ullius velocior in pictura manus fuit, artis vero tantum, ut multum manipretiis antecederet celeberrimos eadem aetate imaginum pictores sopolim et dionysium, quorum tabulae pinacothecas inplent. pinxit et quaedam olympias, de qua hoc solum memoratur, discipulum eius fuisse autobulum.

encausto pingendi duo fuere antiquitus genera, cera et in ebore cestro, id est vericulo, donec classes pingi coepere. hoc tertium accessit resolutis igni

ceris penicillo utendi, quae pictura navibus nec sole nec sale ventisve corrumpitur.

pingunt et vestes in aegypto, inter pauca mirabili genere, candida vela, postquam attrivere, inlinentes non coloribus, sed colorem sorbentibus medicamentis. hoc cum fecere, non apparet in velis, sed in cortinam pigmenti ferventis mersa post momentum extrahuntur picta. mirumque, cum sit unus in cortina colos, ex illo alius atque alius fit in veste accipientis medicamenti qualitate mutatus, nec postea ablui potest. ita cortina, non dubie confusura colores, si pictos acciperet, digerit ex uno pingitque, dum coquit, et adustae eae vestes firmiores usibus fiunt quam si non urerentur. - de pictura satis superque. contexuisse his et plasticen conveniat eiusdem operae terrae.

ingere ex argilla similitudines butades sicyonius figulus primus invenit corinthe filiae opera, quae capta amore iuvenis, abeunte illo peregre, umbram ex facie eius ad lucernam in pariete lineis circumscripsit, quibus pater eius impressa argilla typum fecit et cum ceteris fictilibus induratum igni proposuit, eumque servatum in nymphaeo, donec mummius corinthum everterit, tradunt. sunt qui in samo primos omnium plasticen invenisse rhoecum et theodorum tradant multo ante bacchiadas corinthe pulsos, damaratum vero ex eadem urbe profugum, qui in eturia tarquinium regem populi romani genuit, comitatos fictores euchira, diopum, eugrammum; ab iis italiae traditam plasticen. butadis inventum est rubricam addere aut ex rubra cretaingere, primusque personas tegularum extremis imbricibus inposuit, quae inter initia prostypa vocavit; postea idem ectypa fecit. hinc et fastigia templorum orta. propter hunc plastae appellati.

hominis autem imaginem gypso e facie ipsa primus omnium expressit ceraque in eam formam gypsi infusa emendare instituit lysistratus sicyonius, frater lysippi, de quo diximus. hic et similitudines reddere instituit; ante eum quam pulcherrimas facere studebant. idem et de signis effigies exprimere invenit, crevitque res in tantum, ut nulla signa statuariae sine argilla fierent. quo apparet antiquiorem hanc fuisse scientiam quam fundendi aeris.

plastae laudatissimi fuere damophilus et gorgasus, iidem pictores, qui cereris aedem romae ad circum maximum utroque genere artis suae excoluerant, versibus inscriptis graece, quibus significarent ab dextra opera damophili esse, ab laeva gorgasi. ante hanc aedem tuscanica omnia in aedibus fuisse auctor est Varro, et ex hac, cum reficeretur, crustas parietum excisas tabulis marginatis inclusas esse, item signa ex fastigiis dispersa. fecit et chalcosthenes cruda opera athenis, qui locus ab officina eius ceramicos appellatur. M. Varro tradit sibi cognitum romae possim nomine, a quo facta poma et uvas nemo posset aspectu discernere a veris. idem magnificat Arcesilaum, l. luculli familiarem, cuius proplasmata pluris venire solita artificibus ipsis quam aliorum opera; ab hoc factam venerem genetricem in foro caesaris et, priusquam absolveretur, festinatione dedicandi positam; eidem a lucullo hs [30x]30 signum felicitatis locatum, cui mors utriusque inviderit; octavio equiti romano cratera facere volenti exemplar e gypso

factum talento. laudat et pasitelen, qui plasticen matrem caelaturae et statuariae sculpturaeque dixit et, cum esset in omnibus iis summus, nihil umquam fecit ante quam finxit. praeterea elaboratam hanc artem italiae et maxime etrusiae; vulcam veis accitum, cui locaret tarquinius priscus iovis effigiem in capitolio dicendam; fictilem eum fuisse et ideo miniari solitum; fictiles in fastigio templi eius quadrigas, de quibus saepe diximus; ab hoc eodem factum herculem, qui hodieque materiae nomen in urbe retinet. hae enim tum effigies deorum erant lautissimae, nec paenitet nos illorum, qui tales eos coluere; aurum enim et argentum ne diis quidem conficiebant. durant etiam nunc plerisque in locis talia simulacra; fastigia quidem templorum etiam in urbe crebra et municipiis, mira caelatura et arte suique firmitate, sanctiora auro, certe innocentiora.

in sacris quidem etiam inter has opes hodie non murrinis crystallinisve, sed fictilibus prolibatur simplicis, inenarrabili terrae benignitate, si quis singula aestimet, etiam ut omittantur in frugum, vini, pomorum, herbarum et fruticum, medicamentorum, metallorum generibus beneficia eius, quae adhuc diximus. neque adsiduitate satiant figlinarum opera, doliis ad vina excogitatis, ad aquas tubulis, ad balineas mammatis, ad tecta imbricibus, coctilibus laterculis fundamentisque aut quae rota fiunt, propter quae numa rex septimum collegium figulorum instituit. quin et defunctos sese multi fictilibus soliis condi maluere, sicut M. Varro, pythagorio modo in myrti et oleae atque populi nigrae foliis. maior pars hominum terrenis utitur vasis. samia etiam nunc in esculentis laudantur. retinent hanc nobilitatem et arretium in italia et calicum tantum surrentum, hasta, pollentia, in hispania saguntum, in asia pergamum. habent et trallis ibi opera sua et in italia mutina, quoniam et sic gentes nobilitantur et haec quoque per maria, terras ultro citro portantur, insignibus rotae officinis. erythris in templo hodieque ostenduntur amphorae duae propter tenuitatem consecratae discipuli magistrique certamine, uter tenuiorem humum duceret. cois ea laus maxima, hadrianis firmitas, nonnullis circa hoc severitatis quoque exemplis. q. coponium invenimus ambitus damnatum, quia vini amphoram dedisset dono ei, cui suffragi latio erat. atque ut e luxu quoque aliqua contingat auctoritas figlinis: “tripatinium,” inquit fenestella, “appellabatur summa cenarum lautitia; una erat murenarum, altera luporum, tertia mixti piscis,” inclinatis iam scilicet moribus, ut tamen eos praeferre graeciae etiam philosophis possimus, siquidem in aristotelis heredum auctione septuaginta patinas venisse traditur. nos cum unam aesopi tragoediarum histrionis in natura avium diceremus hs [c] stetisse, non dubito indignatos legentes. at, hercules, vitellius in principatu suo [30x]30 hs condidit patinam, cui faciendae fornax in campis exaedificata erat, quoniam eo pervenit luxuria, ut etiam fictilia pluris constent quam murrina. propter hanc mucianus altero consulatu suo in conquestione exprobravit patinarum paludes vitelli memoriae, non illa foediore, cuius veneno asprenati reo cassius severus accusator obiebat interisse convivas cxxx. nobilitantur his quoque oppida, ut regium et cumae. samia testa matris deum sacerdotes, qui galli vocantur,

virilitatem amputare nec aliter citra perniciem, m. caelio credamus, qui linguam sic amputandam obiecit gravi probro, tamquam et ipse iam tunc eidem vitellio malediceret. quid non excogitat vita fractis etiam testis utendo, sic ut firmitus durent, tunsis calce addita, quae vocant signina! quo genere etiam pavimenta excogitavit.

verum et ipsius terrae sunt alia commenta. quis enim satis miretur pessumam eius partem ideoque pulverem appellatam in puteolanis collibus opponi maris fluctibus, mersumque protinus fieri lapidem unum inexpugnabilem undis et fortiolem cotidie, utique si cumano misceatur caemento eadem est terrae natura et in cyzicena regione, sed ibi non pulvis, verum ipsa terra qua libeat magnitudine excisa et demersa in mare lapidea extrahitur. hoc idem circa cassandream produnt fieri, et in fonte cnidio dulci intra octo menses terram lapidescere. ab oropo quidem aulida usque quidquid attingitur mari terrae mutatur in saxa. non multum a pulvere puteolano distat e nilo harena tenuissima sui parte, non ad sustinenda maria fluctusque frangendos, sed ad debellanda corpora palaestrae studiis. inde certe patrobio, neronis principis liberto, advehebatur. quin et cratere et leonnato ac meleagro, alexandri magni ducibus, solitum hoc portari cum reliquis militaribus commerciis reperio, plura de hac parte non dicturus, non, hercules, magis quam de terrae usu in ceromatis, quibus exercendo iuventus nostra corporis vires perdit animorum. quid non in africa hispaniaque e terra parietes, quos appellant formaceos, quoniam in forma circumdatis ii utrimque tabulis inferciuntur verius quam struuntur, aevis durant, incorrupti imbribus, ventis, ignibus omnique caemento firmiores spectat etiam nunc speculas Hannibalis hispania terrenasque turre iugis montium inpositas. hinc et caespitum natura castrorum vallis accommodata contraque fluminum impetus aggeribus. inlini quidem crates parietum luto et lateribus crudis exstrui quis ignorat

lateres non sunt ex sabuloso neque harenoso multoque minus calculoso ducendi solo, sed e cretoso et albicante aut ex rubrica vel etiam e sabulo, masculo certe. finguntur optime vere, nam solstitio rimosi fiunt. aedificiis non nisi bimos probant, quia et intritam ipsam eorum, priusquam fingantur, macerari oportet. genera eorum fiunt tria: lydion, quo nos utimur, longum sesquipedem, latum pedem, alterum tetradoron, tertium pentadoron. graeci enim antiqui δῶρον palmum vocabant et ideo δῶρα munera, quia manu darentur; ergo a quattuor et quinque palmis, prout sunt, nominantur. eadem est et latitudo. minore privatis operibus, maiore in publicis utuntur in graecia. pitanae in asia et in ulteriore hispania civitatibus maxilua et callet fiunt lateres, qui siccati non merguntur in aqua. sunt enim e terra pumicosa, cum subigi potest, utilissima. graeci, praeterquam ubi e silice fieri poterat structura, latericios parietes praetulere. sunt enim aeterni, si ad perpendicularum fiant. ideo et publica opera et regias domos sic struxere: murum athenis, qui ad montem hymettum spectat, patris aedes iovis et herculis, quamvis lapideas columnas et epistylia circumdarent, domum trallibus regiam attali, item sardibus croesi, quam gerusian fecere, halicarnasi mausoli, quae etiam nunc

durant. lacedaemone quidem latericiis parietibus excisum opus tectorium propter excellentiam picturae ligneis formis inclusum romam deportavere in aedilitate ad comitium exornandum murena et Varro. cum opus per se mirum esset, tralatum tamen magis mirabantur. in italia quoque latericius murus arreti et mevaniae est. romae non fiunt talia aedificia, quia sesquipedalis paries non plus quam unam contignationem tolerat, cautumque est, ne communis crassior fiat, nec intergerivorum ratio patitur.

haec sint dicta de lateribus. in terrae autem reliquis generibus vel maxime mira natura est sulphuris, quo plurima domantur. nascitur in insulis aeoliis inter siciliam et italiam, quas ardere diximus, sed nobilissimum in melo insula. in italia quoque invenitur in neapolitano campanoque agro collibus, qui vocantur leucogaei. ibi e cuniculis effossum perficitur igni. genera iiii: vivum, quod graeci apyron vocant, nascitur solidum solum - cetera enim liquore constant et conficiuntur oleo incocta - ; vivum effoditur tralucetque et viret. solo ex omnibus generibus medici utuntur. alterum genus appellant glaebam, fullonum tantum officinis familiare. tertio quoque generi unus tantum est usus ad lanas suffiendas, quoniam candorem mollitiamque confert. egula vocatur hoc genus, quartum caute ad ellychnia maxime conficienda; cetero tantum vis est ut morbos comitiales deprehendat nidore inpositum igni. lusit et anaxilaus eo, addens in calicem vini prunaque subdita circumferens, exardescents repercussu pallorem dirum velut defunctorum effundente in conviviis. natura eius excalfacit, concoquit, sed et discutit collectiones corporum, ob hoc talibus emplastris malagmatisque miscetur. renibus quoque et lumbis in dolore cum adipe mire prodest inpositum. aufert et lichenas faciei cum terebinthi resina et lepras; harpax ita vocatur a celeritate praebendi, avelli enim subinde debet. prodest et suspiriosis linctu, purulenta quoque extussientibus et contra scorpionum ictus. vitiliginis vivum nitro mixtum atque ex aceto tritum et inlitum tollit, item lendes, et in palpebris aceto sandaracato admixtum. habet et in religionibus locum ad expiandas suffitu domos. sentitur vis eius et in aquis ferventibus, neque alia res facilius accenditur, quo apparet ignium vim magnam ei inesse. fulmina, fulgura quoque sulphuris odorem habent, ac lux ipsa eorum sulphurea est.

et bituminis vicina natura est. aliubi limus, aliubi terra est, limus e iudaeae lacu, ut diximus, emergens, terra in syria circa sidonem oppidum maritimum. spissantur haec utraque et in densitatem coeunt. est vero liquidum bitumen, sicut zacynthium et quod a babylone invehitur; ibi quidem et candidum gignitur. liquidum est et apolloniaticum, quae omnia graeci pissasphalton appellant ex argumento picis ac bituminis. gignitur et pingue oleique liquoris in sicilia agragantino fonte, inficiens rivum. incolae id harundinum paniculis colligunt, citissime sic adhaerescens, utunturque eo ad lucernarum lumina olei vice, item ad scabiem iumentorum. sunt qui et naphtham, de qua in secundo diximus volumine, bituminis generibus adscribant, verum eius ardens natura et ignium cognata procul ab omni usu abest. bituminis probatio ut quam maxime splendeat sitque ponderosum, graveolens, atrum modice, quoniam

adulteratur pice. vis quae sulphuri: sistit, discutit, contrahit, glutinat. serpentes accensum nidore fugat. ad suffusiones oculorum et albugines babilonium efficax traditur, item ad lepras, lichenas pruritusque corporum. inlinitur et podagris. omnia autem eius genera incommodos oculorum pilos replicant, dentium doloribus medentur simul nitro intrito. lenit tussim veterem et anhelitus cum vino potum; dysintericis etiam datur eodem modo sistitque alvum. cum aceto vero potum discutit concretum sanguinem ac detrahit. mitigat lumborum dolores, item articulorum, cum farina hordeacea inpositum emplastrum peculiare facit suo nomine. sanguinem sistit, volnera colligit, glutinat nervos. utuntur etiam ad quartanas bituminis drachma et hedyosmi pari pondere cum murræ obolo subacti. comitiales morbos ustum deprendit. volvarum strangulationes olfactu discutit cum vino et castoreo, procidentes suffitu reprimat, purgationes feminarum in vino potum elicit. in reliquo usu aeramentis inlinitur firmatque ea contra ignes. diximus et tinguere solitum aes eo statuque inlini. calcis quoque usum praebeat ita feruminatis babilonis muris. placet in ferrariis fabrorum officinis tinguendo ferro clavorum capitibus et multis aliis usibus.

nec minor est aut adeo dissimilis aluminis opera, quod intellegitur salsugo terrae. plura et eius genera. in cypro candidum et nigrius, exigua coloris differentia, cum sit usus magna, quoniam inficiendis claro colore lanis candidum liquidumque utilissimum est contraque fuscis aut obscuris nigrum. et aurum nigro purgatur. fit autem omne ex aqua limoque, hoc est terrae exudantis natura. contrivatum hieme aestivis solibus maturatur. quod fuit ex eo praecox, candidius fit. gignitur autem in hispania, aegypto, armenia, macedonia, ponto, africa, insulis sardinia, melo, lipara, strongyle. laudatissimum in aegypto, proximum in melo. huius quoque duae species, liquidum spissumque. liquidi probatio ut sit limpidum lacteumque, sine offensis fricandi, cum quodam igniculo caloris. hoc phorimon vocant. an sit adulteratum, deprehenditur suco punici mali; sincerum enim mixtura ... alterum genus est pallidi et scabri et quod inficiatur et galla, ideoque hoc vocant paraphoron. liquidi aluminis vis adstringere, indurare, rodere. melle admixto sanat oris ulcera, papulas pruritusque. haec curatio fit in balneis ii mellis partibus, tertia aluminis. virus alarum sudorisque sedat. sumitur pilulis contra lienis vitia pellendumque per urinam sanguinem. emendat et scabiem nitro ac melanthio admixtis.

concreti aluminis unum genus σχιστὸν appellant graeci, in capillamenta quaedam canescentia dehiscens, unde quidam trichitum potius appellavere. hoc fit e lapide, ex quo et aes - chalcitum vocant - , ut sudor quidam eius lapidis in spumam coagulatus. hoc genus aluminis minus siccatur minusque sistit umorem inutilem corporum, et auribus magnopere prodest infusum; vel inlitum et oris ulceribus dentibusque et si saliva cum eo contineatur. et oculorum medicamentis inseritur apte verendisque utriusque sexus. coquitur in catinis, donec liquari desinat. inertioris est alterum generis, quod strongylen vocant. duae et eius species, fungosum atque omni umore dilui facile, quod in

totum damnatur. melius pumicosum et foraminum fistulis spongeae simile rotundumque natura, candido propius, cum quadam pinguitudine, sine harenis, friabile, nec inficiens nigritia. hoc coquitur per se carbonibus puris, donec cinis fiat. - optimum ex omnibus quod melinum vocant ab insula, ut diximus. nulli vis maior neque adstringendi neque denigrandi neque indurandi, nullum spissius. oculorum scabritias extenuat, combustum utilius epiphoris inhibendis, sic et ad pruritus corporis. sanguinem quoque sistit intus potum, foris inlitum. evulsis pilis ex aceto inlinitur renascentesque mollit in languinem. summa omnium generum vis in adstringendo, unde nomen graecis. ob id oculorum vitiis aptissima sunt, sanguinis fluxiones inhibent cum adipe. putrescentia ulcerum compescit cum adipe - sic et infantium ulcera et hydropicorum eruptiones siccant - et aurium vitia cum suco punici mali et unguium scabritias cicatricumque duritias et pterygia ac pernioles, phagedaenas ulcerum ex aceto aut cum galla pari pondere cremata, lepras cum suco olerum, cum salis vero ii partibus vitia, quae serpunt, lentes et alia capillorum animalia aquae permixtum. sic et ambustis prodest et furfuribus corporum cum sero picis. infunditur et dysintericis uvamque in ore comprimit ac tonsillas. ad omnia, quae in ceteris generibus diximus, efficacius intellegatur ex melle advectum, nam ad reliquos usus vitae in coriis lanisque perficiendis quanti sit momenti, significatum est.

ab his per se ad medicinam pertinentia terrae genera tractabimus. samiae ii sunt, quae collyrium et quae aster appellantur. prioris laus ut recens sit ac levissima linguaeque glutinosa, altera glaebosior; candida utraque. uritur, lavatur. sunt qui praeferant priorem. prosunt sanguinem expuentibus; emplastrisque, quae siccandi causa componuntur, oculorum quoque medicamentis miscentur.

eretria totidem differentias habet, namque est alba et cinerea, quae praefertur in medicina. probatur mollitia et quod, si aere perducatur, violacium reddit colorem. vis et ratio eius in medendo dicta est inter pigmenta. - lavatur omnis terra - in hoc enim loco dicemus - perfusa aqua siccataque solibus, iterum ex aqua trita ac reposita, donec consadat et digerit possit in pastillos. coquitur in calicibus crebro concussis.

est in medicaminibus et chia terra candicans. effectus eius idem qui samiae; usus ad mulierum maxime cutem. idem et selinusiae. lactei coloris haec et aqua dilui celerrima; eadem lacte diluta tectoriorum albaria interpolantur. pnigitis eretrieae simillima est, grandioribus tantum glaebis glutinosaeque. effectus eius idem qui cimoliae, infirmior tantum. bitumini simillima est ampelitis. experimentum eius, si cerae modo accepto oleo liquescat et si nigricans colos maneat tostae. usus ad molliendum discutiendumque, et ad haec medicamentis additur, praecipue in calliblepharis et inficiendis capillis.

cretae plura genera. ex iis cimoliae duo ad medicos pertinentia, candidum et ad purpurissum inclinans. vis utrique ad discutiendos tumores, sistendas fluxiones aceto adsumpto. panos quoque et parotidas cohibet et lienem inlita pusulasque, si vero aphronitrum et cyprum adiciatur et acetum, pedum

tumores ita, ut in sole curatio haec fiat et post vi horas aqua salsa abluatur. testium tumoribus cypro et cera addita prodest. et refrigerandi quoque natura cretae est, sudoresque inmodicos sistit inlita atque ita papulas cohibet ex vino adsumpta in balineis. laudatur maxime thessalica. nascitur et in lycia circa bubonem.

est et alius cimoliae usus in vestibus. nam sarda, quae adfertur e sardinia, candidis tantum adsumitur, inutilis versicoloribus, et est vilissima omnium cimoliae generum, pretiosior umbrica et quam vocant saxum. proprietates saxi quod crescit in macerando; itaque pondere emitur, illa mensura. umbrica non nisi poliendis vestibus adsumitur. neque enim pigebit hanc quoque partem attingere, cum lex metilia extet fullonibus dicta, quam c. flaminus l. aemilius censores dedere ad populum ferendam. adeo omnia maioribus curae fuere. ergo ordo hic est: primum abluitur vestis sarda, dein sulphure sufficitur, mox desquamatur cimolia quae est coloris veri. fucatus enim apprehenditur nigrescitque et funditur sulphure, veros autem et pretiosos colores emollit cimolia et quodam nitore exhilarat contristatos sulphure. candidis vestibus saxum utilius a sulphure, inimicum coloribus. graecia pro cimolia tymphaico utitur gypso.

alia creta argentaria appellatur nitorem argento reddens, set vilissima qua circum praeducere ad victoriae notam pedesque venalium trans maria advectorum denotare instituerunt maiores; talemque publilium antiochium, mimicae scaenae conditorem, et astrologiae consobrinum eius manilium antiochum, item grammaticae staberium erotem eadem nave advectos videre proavi. sed quid hos referat aliquis, litterarum honore commendatos talem in catasta videre chrysogonum sullae, amphionem q. catuli, hectorem l. luculli, demetrium pompeii, augenque demetrii, quamquam et ipsa pompeii credita est, hipparchum m. antoni, menam et Menecraten sexti pompeii aliosque deinceps, quos enumerare iam non est, sanguine quiritium et proscriptionum licentia ditatos. hoc est insigne venaliciiis gregibus obprobriumque insolentis fortunae. quos et nos adeo potiri rerum vidimus, ut praetoria quoque ornamenta decerni a senatu iubente agrippina claudi caesaris videremus tantumque non cum laureatis fascibus remitti illo, unde cretatis pedibus advenissent.

praeterea sunt genera terrae proprietatis suae, de quibus iam diximus, sed et hoc loco reddenda natura: ex galata insula et circa clupeam africae scorpiones necat, baliaris et ebusitana serpentes.

LIBER XXXVI

lapidum natura restat, hoc est praecipua morum insania, etiam ut gemmae cum sucinis atque crystallinis murrinisque sileantur. omnia namque, quae usque ad hoc volumen tractavimus, hominum genita causa videri possunt: montes natura sibi fecerat ut quasdam compages telluris visceribus densandis, simul ad fluminum impetus domandos fluctusque frangendos ac minime quietas partes coercendas durissima sui materia. caedimus hos trahimusque nulla alia quam deliciarum causa, quos transcendisse quoque mirum fuit. in portento prope maiores habuere alpis ab Hannibale exsuperatas et postea a cimbris: nunc ipsae caeduntur in mille genera marmorum. promunturia aperiuntur mari, et rerum natura agitur in planum; evehimus ea, quae separandis gentibus pro terminis constituta erant, navesque marmorum causa fiunt, ac per fluctus, saevissimam rerum naturae partem, huc illuc portantur iuga, maiore etiamnum venia quam cum ad frigidos potus vas petitur in nubila caeloque proximae rupes cavantur, ut bibatur glacie. secum quisque cogitet, et quae pretia horum audiat, quas vehi trahique moles videat, et quam sine iis multorum sit beatior vita. ista facere, immo verius pati mortales quos ob usus quasve ad voluptates alias nisi ut inter maculas lapidum iaceant, ceu vero non tenebris noctium, dimidia parte vitae cuiusque, gaudia haec auferentibus!

ingens ista reputantem subit etiam antiquitatis rubor. exstant censoriae leges claudianae in cenis glires et alia dictu minora adponi vetantes: marmora invehi, maria huius rei causa transiri quae vetaret, lex nulla lata est. dicat fortassis aliquis: non enim invehebantur. id quidem falso. ccclx columnas M. Scauri aedilitate ad scaenam theatri temporari et vix mense uno futuri in usu viderunt portari silentio legum. sed publicis nimirum indulgentes voluptatibus. id ipsum cur aut qua magis via inrepunt vitia quam publica quo enim alio modo in privatos usus venere ebora, aurum, gemmae aut quid omnino diis reliquimus verum esto, indulserint publicis voluptatibus. etiamne tacuerunt, maximas earum atque adeo duodequadrageum pedum lucullei marmoris in atrio Scauri conlocari nec clam id occulteque factum est. satisdare sibi damni infecti coegit redemptor cloacarum, cum in palatium eae traherentur. non ergo in tam malo exemplo moribus caveri utilius fuerat tacuere tantas moles in privatam domum trahi praeter fictilia deorum fastigia! nec potest videri Scaurus rudi et huius mali improvidae civitati obrepisse quodam vitii rudimento. iam L. Crassum oratorem illum, qui primus peregrini marmoris columnas habuit in eodem palatio, hymettias tamen nec plures sex aut longiores duodenum pedum, M. Brutus in iurgiis ob id venerem palatinam appellaverat. nimirum ista omisere moribus victis, frustraue interdicta, quae vetuerant, cernentes nullas potius quam inritas esse leges maluerunt. haec atque quae secuntur meliores esse nos probabunt. quis enim hodie tantarum columnarum atrium habet sed priusquam de marmoribus dicamus, hominum in iis praeferenda iudicamus pretia. ante igitur artifices percensebimus.

marmore scalpendo primi omnium inclaruerunt Dipoenus et Scyllis, geniti in creta insula etiamnum medis imperantibus priusque, quam Cyrus in persis regnare inciperet. hoc est olympiade circiter quinquagensima. hi sicyonem se contulere, quae diu fuit officinarum omnium talium patria. deorum simulacra publice locaverant iis sicyonii, quae priusquam absolverentur, artifices iniuriam questi abiere in aetolos. protinus sicyonem fames invasit ac sterilitas maerorque dirus. remedium petentibus apollo pythius respondit: “si Dipoenus et Scyllis deorum simulacra perfecissent.” quod magnis mercedibus obsequiisque impetratum est. fuere autem simulacra ea apollinis, dianae, herculis, minervae, quod de caelo postea tactum est. — cum hi essent, iam fuerat in chio insula Melas sculptor, dein filius eius Micciades ac deinde nepos Archermus, cuius filii Bupalus et Athenis vel clarissimi in ea scientia fuere Hipponactis poetae aetate, quem certum est lx olympiade fuisse. quodsi quis horum familiam ad proavum usque retro agat, inveniat artis eius originem cum olympiadum initio coepisse. Hipponacti notabilis foeditas voltus erat; quam ob rem imaginem eius lascivia iocosam hi proposuere ridentium circulis, quod Hipponax indignatus destrinxit amaritudinem carminum in tantum, ut credatur aliquis ad laqueum eos compulisse. quod falsum est. complura enim in finitimis insulis simulacra postea fecere, sicut in delo, quibus subiecerunt carmen non vitibus tantum censi chion, sed et operibus Archermi filiorum. ostendunt et iasii dianam manibus eorum factam. in ipsa chio narrata est operis eorum dianae facies in sublimi posita, cuius voltum intrantes tristem, abeuntes exhilaratum putant. romae eorum signa sunt in palatina aede apollinis in fastigio et omnibus fere, quae fecit Divus Augustus. patris quoque eorum et deli fuere opera et in lesbo insula. Dipoeni quidem ambracia, argos, cleonae operibus refertae fuere.

omnes autem candido tantum marmore usi sunt e paro insula, quem lapidem coepere lychniten appellare, quoniam ad lucernas in cuniculis caederetur, ut auctor est Varro, multis postea candidioribus repertis, nuper vero etiam in lunensium lapicidinis. sed in pariorum mirabile proditur, glaeba lapidis unius cuneis dividendium soluta, imaginem silenii intus exitisse.

non omittendum hanc artem tanto vetustiore fuisse quam picturam aut statuariam, quarum utraque cum Phidia coepit octogensima tertia olympiade, post annos circiter cccxxii. et ipsum Phidian tradunt scalpsisse marmora, veneremque eius esse romae in octaviae operibus eximiae pulchritudinis. Alcamenen atheniensem, quod certum est, docuit in primis nobilem, cuius sunt opera athenis complura in aedibus sacris praeclarumque veneris extra muros, quae appellatur Ἀφροδίτη ἐν κήποις. huic summam manum ipse Phidias inposuisse dicitur. eiusdem discipulus fuit Agoracritus parius, et aetate gratus, itaque e suis operibus pleraque nomini eius donasse fertur. certavere autem inter se ambo discipuli venere facienda, vicitque Alcamenes non opere, sed civitatis suffragiis contra peregrinum suo faventis. quare Agoracritus ea lege signum suum vendidisse traditur, ne athenis esset, et appellasse nemesin. id positum est rhamnunte pago atticae, quod M. Varro

omnibus signis praetulit. est et in matris magnae delubro eadem civitate Agoracriti opus. Phidian clarissimum esse per omnes gentes, quae iovis olympii famam intellegunt, nemo dubitat, sed ut laudari merito sciant etiam qui opera eius non videre, proferemus argumenta parva et ingenii tantum. neque ad hoc iovis olympii pulchritudine utemur, non minervae athenis factae amplitudine, cum sit ea cubitorum xxvi — ebore haec et auro constat —, sed in scuto eius amazonum proelium caelavit intumescente ambitu, in parmae eiusdem concava parte deorum et gigantum dimicationes, in soleis vero lapitharum et centaurorum. adeo momenta omnia capacia artis illi fuere. in basi autem quod caelatum est, Πανδώρας γένεσιν appellant: dii sunt nascenti ... s xx numero. victoria praecipue mirabili, periti mirantur et serpentem ac sub ipsa cuspide aeream sphingem. haec sint obiter dicta de artifice numquam satis laudato, simul ut noscatur illam magnificentiam aequalem fuisse et in parvis.

Praxitelis aetatem inter statuarios diximus, qui marmoris gloria superavit etiam semet. opera eius sunt athenis in ceramico, sed ante omnia est non solum Praxitelis, verum in toto orbe terrarum venus, quam ut viderent, multi navigaverunt cnidum. duas fecerat simulque vendebat, alteram velata specie, quam ob id praetulerunt quorum condicio erat, coi, cum eodem pretio detulisset, severum id ac pudicum arbitantes; reiectam cnidii emerunt, inmensa differentia famae. voluit eam a cnidiis postea mercari rex Nicomedes, totum aes alienum, quod erat ingens, civitatis dissoluturum se promittens. omnia perpeti maluere, nec innerito; illo enim signo Praxiteles nobilitavit cnidum. aedicula eius tota aperitur, ut conspici possit undique effigies deae, favente ipsa, ut creditur, facta. nec minor ex quacumque parte admiratio est. ferunt amore captum quendam, cum delituisset noctu, simulacro cohaesisse, eiusque cupiditatis esse indicem maculam. sunt in cnido et alia signa marmorea inlustrum artificum, liber pater Bryaxidis et alter Scopae et minerva, nec maius aliud veneris praxiteliae specimen quam quod inter haec sola memoratur. eiusdem est et cupido, obiectus a cicerone verri “ille, propter quem thespiae visebantur,” nunc in octaviae scholis positus; eiusdem et alter nudus in pario colonia propontidis, par veneri cnidiae nobilitate et iniuria; adamavit enim Alcetas rhodius atque in eo quoque simile amoris vestigium reliquit. romae Praxitelis opera sunt flora, triptolemus, ceres in hortis servilianis, boni eventus et bonae fortunae simulacra in capitolio, item maenades et quas thyiadas vocant et caryatidas, et sileni in pollionis asini monumentis et apollo et neptunus. Praxitelis filius Cephisodotus et artis heres fuit. cuius laudatum est pergami symplegma nobile digitis corpori verius quam marmori inpressis. romae eius opera sunt latona in palatii delubro, venus in pollionis asini monumentis et intra octaviae porticus in iunonis aede aesculapius ac diana.

Scopae laus cum his certat. is fecit venerem et potho, qui samothrace sanctissimis caerimoniis coluntur, item apollinem palatinum, vestam sedentem laudatam in servilianis hortis duosque campteras circa eam, quorum

pares in asini monumentis sunt, ubi et canephoros eiusdem. sed in maxima dignatione delubro cn. domitii in circo flaminio neptunus ipse et thetis atque achilles, nereides supra delphinos et cete aut hippocampos sedentes, item tritones chorusque phorci et pistrices ac multa alia marina, omnia eiusdem manu, praeclarum opus, etiam si totius vitae fuisset. nunc vero praeter supra dicta quaeque nescimus mars etiamnum est sedens colossiaeus eiusdem manu in templo bruti callaeci apud circum eundem, praeterea venus in eodem loco nuda, praxitelliam illam antecedens et quemcumque alium locum nobilitatura.

romae quidem multitudo operum et iam obliteratio ac magis officiorum negotiorumque acervi omnes a contemplatione tamen abducunt, quoniam otiosorum et in magno loci silentio talis admiratio est. qua de causa ignoratur artifex eius quoque veneris, quam vespasianus imperator in operibus pacis suae dicavit antiquorum dignam fama. par haesitatio est in templo apollinis sosiani, niobae liberos morientes Scopas an Praxiteles fecerit; item ianus pater, in suo templo dicatus ab Augusto ex aegypto advectus, utrius manu sit, iam quidem et auro occultatus. similiter in curia octaviae quaeritur de cupidine fulmen tenente; id demum adfirmatur, Alcibiaden esse, principem forma in ea aetate. multa in eadem schola sine auctoribus placent: satyri quattuor, ex quibus unus liberum patrem palla velatum umeris praefert, alter liberam similiter, tertius ploratum infantis cohibet, quartus cratere alterius sitim sedat, duaeque aerae velificantes sua veste. nec minor quaestio est in saeptis, olympum et pana, chironem cum achille qui fecerint, praesertim cum capitali satisfactione fama iudicet dignos.

Scopas habuit aemulos eadem aetate Bryaxim et Timotheum et Leocharen, de quibus simul dicendum est, quoniam pariter caelavere mausoleum. sepulchrum hoc est ab uxore artemisia factum mausolo, cariae regulo, qui obiit olympiadis cvii anno secundo. opus id ut esset inter septem miracula, hi maxime fecere artifices. patet ab austro et septentrione sexagenos ternos pedes, brevius a frontibus, toto circumitu pedes ccccxviii, attollitur in altitudinem xxv cubitis, cingitur columnis xxxvi. pteron vocavere circumitum. ab oriente caelavit Scopas, a septentrione Bryaxis, a meridie Timotheus, ab occasu Leochares, priusque quam peragerent, regina obiit. non tamen recesserunt nisi absoluto, iam id gloriae ipsorum artisque monumentum iudicantes; hodieque certant manus. accessit et quintus artifex. namque supra pteron pyramis altitudinem inferiorem aequat, viginti quattuor gradibus in metae cacumen se contrahens; in summo est quadriga marmorea, quam fecit Pythis. haec adiecta cxxxx pedum altitudine totum opus includit. Timothei manu diana romae est in palatio apollinis delubro, cui signo caput reposuit avianius evander.

in magna admiratione est hercules Menestrati et hecate ephesi in templo dianae post aedem, in cuius contemplatione admonent aeditui parcere oculis; tanta marmoris radiatio est. (non postferuntur et charites in propylo atheniensium, quas socrates fecit, alius ille quam pictor, idem ut aliqui putant). nam Myronis illius, qui in aere laudatur, anus ebria est zmyrnae in

primis incluta.

pollio asinius, ut fuit acris vehementiae, sic quoque spectari monumenta sua voluit. in iis sunt centauri nymphas gerentes Arcesilae, thespiades Cleomenis, oceanus et iuppiter Heniochi, appiades Stephani, hermerotes taurisci, non caelatoris illius, sed tralliani, iuppiter hospitalis Papyli, Praxitelis discipuli, zethus et amphion ac dirce et taurus vinculumque ex eodem lapide, a rhodo advecta opera Apollonii et Taurisci. parentum hi certamen de se fecere, Menecraten videri professi, sed esse naturalem artemidorum. eodem loco liber pater Eutychidis laudatur, ad octaviae vero porticum apollo Philisci rhodii in delubro suo, item latona et diana et musae novem et alter apollo nudus. eum, qui citharam in eodem templo tenet, timarchides fecit, intra octaviae vero porticus aedem iunonis ipsam deam dionysius et polycles aliam, venerem eodem loco Philiscus, cetera signa Praxiteles. iidem polycles et dionysius, timarchidis filii, iovem, qui est in proxima aede, fecerunt, pana et olympum luctantes eodem loco heliodorus, quod est alterum in terris symplegma nobile, venerem lavantem sese daedalsas, stantem polycharmus. ex honore apparet, in magna auctoritate habitum lysiae opus, quod in palatio super arcum Divus Augustus honori octavi patris sui dicavit in aedicula columnis adornata, id est quadriga currusque et apollo ac diana ex uno lapide. in hortis servilianis reperio laudatos calamidis apollinem illius caelatoris, dercylidis pycetas, amphistrati callisthenen historiarum scriptorem. - nec deinde multo plurium fama est, quorundam claritati in operibus eximiis obstante numero artificum, quoniam nec unus occupat gloriam nec plures pariter nuncupari possunt, sicut in laocoonte, qui est in titi imperatoris domo, opus omnibus et picturae et statuariae artis praeferendum. ex uno lapide eum ac liberos draconumque mirabiles nexus de consilii sententia fecere summi artifices Hagesander et Polydorus et Athenodorus rhodii. similiter palatinas domos caesarum replevere probatissimis signis craterus cum pythodoro, polydeuces cum hermolao, pythodorus alius cum artemone, at singularis aphrodisius trallianus. agrippae pantheum decoravit diogenes atheniensis; in columnis templi eius caryatides probantur inter pauca operum, sicut in fastigio posita signa, sed propter altitudinem loci minus celebrata. inhonorus est nec in templo ullo hercules, ad quem poeni omnibus annis humana sacrificaverant victima, humi stans ante aditum porticus ad nationes. sitae fuere et thespiades ad aedem felicitatis, quarum unam amavit eques romanus iunius pisciculus, ut tradit Varro, admirator et pasitelis, qui et quinque volumina scripsit nobilium operum in toto orbe. natus hic in graeca italiae ora et civitate romana donatus cum iis oppidis, iovem fecit eboreum in metelli aede, qua campus petitur. accidit ei, cum in navalibus, ubi ferae africanae erant, per caveam intuens leonem caelaret, ut ex alia cavea panthera erumperet, non levi periculo diligentissimi artificis. fecisse opera complura dicitur; quae fecerit, nominatim non refertur. Arcesilaum quoque magnificat Varro, cuius se marmoream habuisse leaenam aligerosque ludentes cum ea cupidines, quorum alii religatam tenerent, alii cornu cogerent bibere, alii calciarent soccis, omnes ex

uno lapide. idem et a coponio quattuordecim nationes, quae sunt circa pompeium, factas auctor est. - inuenio et canachum laudatum inter statuarios fecisse marmorea. nec sauram atque batrachum obliterari conuenit, qui fecere templa octaviae porticibus inclusa, natione ipsi lacones. quidam et opibus praepotentes fuisse eos putant ac sua inpensa construxisse, inscriptionem sperantes, qua negata hoc tamen alio modo usurpasse. sunt certe etiam nunc in columnarum spiris insculptae nominum eorum argumento lacerta atque rana. in iouis aede ex iis pictura cultusque reliquus omnis femineis argumentis constat; erat enim facta iunoni, sed, cum inferrentur signa, permutasse geruli traduntur, et id religione custoditum, velut ipsis diis sedem ita partitis. ergo et in iunonis aede cultus est qui iouis esse debuit.

sunt et in parvulis marmoreis famam consecuti myrmecides, cuius quadrigam cum agitatore operuit alis musca, et callicrates, cuius formicarum pedes atque alia membra pervidere non est.

haec sint dicta de marmoris scalpторibus summaque claritate artificum, quo in tractatu subit mentem non fuisse tum auctoritatem maculoso marmori. fecere et e thasio, cycladum insularum aequo, et e lesbio; lividius hoc paulo. versicolores quidem maculas et in totum marmorum apparatus etiam menander, diligentissimus luxuriae interpres, primus et raro attigit. columnis demum utebantur in templis, nec lautitiae causa - nondum enim ista intellegebantur - , sed quia firmiores aliter statui non poterant. sic est inchoatum athenis templum iouis olympii, ex quo sulla capitolinis aedibus advexerat columnas. fuit tamen inter lapidem atque marmor differentia iam et apud homerum; dicit enim marmoreo saxo percussum, sed hactenus, regias quoque domus, cum lautissime, praeter aes, aurum, electrum, argentum ebore tantum adornans. primum, ut arbitror, versicolores istas maculas chiorum lapicidinae ostenderunt, cum exstruerent muros, faceto in id m. ciceronis sale - omnibus enim ostentabant ut magnificum - : “multo,” inquit, “magis mirarer, si tiburtino lapide fecissetis.” et, hercules, non fuisset picturis honos ullus, non modo tantus, aliqua marmorum auctoritate.

secandi in crustas nescio an cariae fuerit inventum. antiquissima, quod equidem inueniam, halicarnasi domus mausoli proconnesio marmore exculta est latericiis parietibus. is obiit olympiadis cvii anno secundo, urbis romae cdiii.

primum romae parietes crusta marmoris operuisse totos domus suae in caelio monte cornelius nepos tradit mamurram, formiis natum equitem romanum, praefectum fabrum c. caesaris in gallia, ne quid indignitati desit, tali auctore inventa re. hic namque est mamurra catulli veroniensis carminibus proscissus, quem, ut res est, domus ipsius clarius quam catullus dixit “habere quidquid habuisset comata gallia.” namque adicit idem nepos primum totis aedibus nullam nisi e marmore columnam habuisse et omnes solidas e carystio aut luniensi. m. lepidus q. catuli in consulatu conlega primus omnium limina ex numidico marmore in domo posuit magna reprehensione. is fuit consul anno urbis dclxxvi. hoc primum invecti numidici marmoris vestigium inuenio,

non in columnis tamen crustisve, ut supra carystii, sed in massa ac vilissimo liminum usu. post hunc lepidum quadriennio l. lucullus consul fuit, qui nomen, ut ex re apparet, luculleo marmori dedit, admodum delectatus illo, primusque romam invexit, atrum alioqui, cum cetera maculis aut coloribus commendentur. nascitur autem in melo insula, solumque paene hoc marmor ab amatore nomen accepit. inter hos primum, ut arbitror, marmoreos parietes habuit scaena M. Scauri, non facile dixerim secto an solidis glaebris polito, sicuti est hodie iovis tonantis aedis in capitolio. nondum enim secti marmoris vestigia invenio in italia.

sed quisquis primus invenit secare luxuriaque dividere, inportuni ingenii fuit. harena hoc fit et ferro videtur fieri, serra in praetenui linea premente harenas versandoque tractu ipso secante. aethiopica haec maxime probatur, nam id quoque accessit, ut ab aethiopia usque peteretur quod secaret marmora, immo vero etiam in indos, quo margaritas quoque peti severis moribus indignum erat. haec proxime laudatur; mollior tamen quae aethiopica. illa nulla scabritie secat, indica non aequè levat, sed combusta ea polientes marmora fricare iubentur. simile et naxiae vitium est et coptitidi, quae vocatur aegyptia. haec fuere antiqua genera marmoribus secandis. postea reperta est non minus probanda ex quodam hadriatici maris vado, aestu nudante, observatione non facili. iam quidem quacumque harena secare e fluviis omnibus fraus artificum ausa est, quod dispendium admodum pauci intellegunt. crassior enim harena laxioribus segmentis terit et plus erodit marmoris maiusque opus scabritia politurae relinquit; ita sectae attenuantur crustae. rursus thebaica polituris accommodatur et quae fit e poro lapide aut e pumice. - signis e marmore poliendis gemmisque etiam scalpendis atque limandis naxium diu placuit ante alia. ita vocantur cotes in cypro insula genitae. vicere postea ex armenia invectae.

marmorum genera et colores non attinet dicere in tanta notitia nec facile est enumerare in tanta multitudine. quoto cuique enim loco non suum marmor invenitur et tamen celeberrimi generis dicta sunt in ambitu terrarum cum gentibus suis. non omnia autem in lapicidinis gignuntur, sed multa et sub terra sparsa, pretiosissimi quidem generis, sicut lacedaemonium viride cunctisque hilarius, sicut et augusteum ac deinde tibereum, in aegypto Augusti ac tiberii primum principatu reperta. differentia eorum est ab ophite, cum sit illud serpentium maculis simile, unde et nomen accepit, quod haec maculas diverso modo colligunt, augusteum undatim crispum in vertices, tibereum sparsa, non convoluta, canitie. neque ex ophite columnae nisi parvae admodum inveniuntur. duo eius genera: molle candidi, nigricantis durum. dicuntur ambo capitis dolores sedare adalligati et serpentium ictus. quidam phreneticis ac lethargicis adalligari iubent candicantem. contra serpentes autem a quibusdam praecipue laudatur ex iis quem tephrian appellant a colore cineris. vocatur et memphites a loco, gemmantis naturae. huius usus conteri et iis, quae urenda sint aut secanda, ex aceto inlini; obstupescit ita corpus nec sentit cruciatum. rubet porphyrites in eadem aegypto; ex eodem candidis intervenientibus

punctis leptopsephos vocatur. quantislibet molibus caedendis sufficiunt lapicidinae. statuas ex eo claudio caesari procurator eius in urbem ex aegypto advexit vitrasius pollio, non admodum probata novitate; nemo certe postea imitatus est. invenit eadem aegyptus in aethiopia quem vocant basaniten, ferrei coloris atque duritiae, unde et nomen ei dedit. numquam hic maior repertus est quam in templo pacis ab imperatore Vespasiano Augusto dicatus argumento nili, sedecim liberis circa ludentibus, per quos totidem cubita summi incrementi augentis se amnis eius intelleguntur. non absimilis illi narratur in thebis delubro serapis, ut putant, memnonis statuae dicatus, quem cotidiano solis ortu contactum radiis crepare tradunt.

onychem in arabiae tantum montibus nec usquam aliubi nasci putavere nostri veteres, sudines in carmania. potoriis primum vasis inde factis, dein pedibus lectorum sellisque, nepos cornelius tradit magno fuisse miraculo, cum p. lentulus spinther amphoras ex eo chiorum magnitudine cadorum ostendisset, post quinquennium deinde xxxii pedum longitudinis columnas vidisse se. variatum in hoc lapide et postea est, namque pro miraculo insigni quattuor modicas in theatro suo cornelius balbus posuit; nos ampliores xxx vidimus in cenatione, quam callistus caesaris claudi libertorum, potentia notus, sibi exaedificaverat. hunc aliqui lapidem alabastriten vocant, quem cavant et ad vasa unguentaria, quoniam optume servare incorrupta dicatur. idem et ustus emplastris convenit. nascitur circa thebas aegyptias et damascum syriae. hic ceteris candidior, probatissimus vero in carmania, mox in india, iam quidem et in syria asiaque, vilissimus autem et sine ullo nitore in cappadocia. probantur quam maxime mellei coloris, in vertices maculosi atque non tralucidi. vitia in iis corneus colos aut candidus et quidquid simile vitro est.

paulum distare ab eo in unguentorum fide multi existimant lygdinos, in paro repertos amplitudine qua lances craterasque non excedant, antea ex arabia tantum advehi solitos, candoris eximii. magnus et duobus contrariae inter se naturae honos, corallitico in asia reperto mensurae non ultra bina cubita, candore proximo ebori et quadam similitudine. e diverso niger est alabandicus terrae suae nomine, quamquam et mileti nascens, ad purpuram tamen magis aspectu declinante. idem liquatur igni funditurque ad usum vitri. thebaicus lapis interstinctus aureis guttis invenitur in africae parte aegypto adscripta, coticulis ad terenda collyria quadam utilitate naturali conveniens, circa syenen vero thebaidis syenites, quem antea pyrrhopoecilon vocabant.

trabes ex eo fecere reges quodam certamine, obeliscos vocantes solis numini sacratos. radiorum eius argumentum in effigie est, et ita significatur nomine aegyptio. primus omnium id instituit mespheres, qui regnabat in solis urbe, somnio iussus; hoc ipsum inscriptum in eo, etenim scalpturae illae effigiesque quas videmus aegyptiae sunt litterae. postea et alii excidere reges. statuit eos in supra dicta urbe sesothes quattuor numero, quadragenum octonum cubitorum longitudine, rhamseis autem, quo regnante ilium captum est, cxxxx cubitorum. idem ... digressis inde, ubi fuit mnevidis regia, posuit

alium, longitudine quidem cxx cubitorum, sed prodigiosa crassitudine, undenis per latera cubitis. opus id fecisse dicuntur [cxx] hominum. ipse rex, cum surrecturus esset verereturque, ne machinae ponderi non sufficerent, quo maius periculum curae artificum denuntiaret, filium suum adalligavit cacumini, ut salus eius apud molientes prodesset et lapidi. hac admiratione operis effectum est, ut, cum oppidum id expugnaret cambyses rex ventumque esset incendiis ad crepidines obelisci, extinguere iuberet molis reverentia qui nullam habuerat urbis. sunt et alii duo, unus a zmarre positus, alter a phio sine notis, quadragenum octonum cubitorum. alexandriae statuit unum ptolemaeus philadelphus octoginta cubitorum. exciderat eum necthebis rex purum, maiusque opus in devehendo statuendove inventum est quam in excidendo. a satyro architecto aliqui devectum tradunt rate, callixenus a phoenice, fossa perducto usque ad iacentem obeliscum nilo, navesque duas in latitudinem patulas pedalibus ex eodem lapide ad rationem geminati per duplicem mensuram ponderis oneratas ita, ut subirent obeliscum pendentem extremitatibus suis in ripis utrimque; postea egestis laterculis adlevatas naves excepisse onus; statutum autem in sex talis e monte eodem, et artificem donatum talentis l. hic fuit in arsinoeo positus a rege supra dicto munus amoris, coniuge eademque sorore arsinoe. inde eum navalibus incommodum maximus quidam praefectus aegypti transtulit in forum, reciso cacumine, dum vult fastigium addere auratum, quod postea omisit. et alii duo sunt alexandreae ad portum in caesaris templo, quos excidit mesphres rex, quadragenum binum cubitorum.

super omnia accessit difficultas mari romam devehendi, spectatis admodum navibus. Divus Augustus eam, quae priorem advexerat, miraculi gratia puteolis perpetuis navalibus dicaverat; incendio consumpta ea est. divus claudius aliquot per annos adservatam, qua c. caesar inportaverat, omnibus quae umquam in mari visa sunt mirabiliorem, in ipsa turribus puteolis e pulvere exaedificatis, perductam ostiam portus gratia mersit. alia ex hoc cura navium, quae tiberi subvehant, quo experimento patuit non minus aquarum huic amni esse quam nilo. is autem obeliscus, quem Divus Augustus in circo magno statuit, excisus est a rege psemetnepserphreo, quo regnante pythagoras in aegypto fuit, lxxxv pedum et dodrantis praeter basim eiusdem lapidis; is vero, quem in campo martio, novem pedibus minor, a sesothide. inscripti ambo rerum naturae interpretationem aegyptiorum philosophia continent. - ei, qui est in campo, Divus Augustus addidit mirabilem usum ad deprendendas solis umbras dierumque ac noctium ita magnitudines, strato lapide ad longitudinem obelisci, cui par fieret umbra brumae confectae die sexta hora paulatimque per regulas, quae sunt ex aere inclusae, singulis diebus decresceret ac rursus augesceret, digna cognitu res, ingenio facundi novi mathematici. is apici auratam pilam addidit, cuius vertice umbra colligeretur in se ipsam, alias enormiter iaculante apice, ratione, ut ferunt, a capite hominis intellecta. haec observatio xxx iam fere annis non congruit, sive solis ipsius dissono cursu et caeli aliqua ratione mutato sive universa tellure a centro suo

aliquid emota (ut deprehendi et aliis in locis accipio) sive urbis tremoribus ibi tantum gnomone intorto sive inundationibus tiberis sedimento molis facto, quamquam ad altitudinem inpositi oneris in terram quoque dicuntur acta fundamenta. - tertius est romae in vaticano gai et neronis principum circo - ex omnibus unus omnino fractus est in molitione - , quem fecerat sesosidis filius nencoreus. eiusdem remanet et alius centum cubitorum, quem post caecitatem visu reddito ex oraculo soli sacrauit.

dicantur obiter et pyramides in eadem aegypto, regum pecuniae otiosa ac stulta ostentatio, quippe cum faciendi eas causa a plerisque tradatur, ne pecuniam successoribus aut aemulis insidiantibus praeberent aut ne plebs esset otiosa. multa circa hoc vanitas hominum illorum fuit. vestigia complurium incohatarum extant. una est in arsinoite nomo, duae in memphite, non procul labyrintho, de quo et ipso dicemus, totidem ubi fuit moeridis lacus, hoc est fossa grandis, sed aegyptiis inter mira ac memoranda narrata. harum cacumina cc cubita extra aquam eminere dicuntur. reliquae tres, quae orbem terrarum inplevere fama, sane conspicuae undique adnavigantibus, sitae sunt in parte africae monte saxeo sterilique inter memphim oppidum et quod appellari diximus delta, a nilo minus iiii milia passuum, a memphi [vii] d, vico adposito quem vocant busirin; in eo sunt adsueti scandere illas.

ante est sphinx vel magis narranda, de qua siluere, numen accolentium. harmain regem putant in ea conditum et volunt invectam videri; est autem saxo naturali elaborata. rubrica facies monstri colitur. capitis per frontem ambitus centum duos pedes colligit, longitudo pedum cxliii est, altitudo a ventre ad summam aspidem in capite, lxis.

pyramis amplissima ex arabicis lapicidinis constat. ccclx milia hominum annis xx eam construxisse produntur. tres vero factae annis lxxxviii, mensibus iiii. qui de iis scripserint - sunt herodotus, euhemerus, duris samius, aristagoras, dionysius, artemidorus, alexander polyhistor, butoridas, antisthenes, demetrius, demoteles, apion - , inter omnes eos non constat, a quibus factae sint, iustissimo casu oblitteratis tantae vanitatis auctoribus. aliqui ex iis prodiderunt in raphanos et alium ac cepas mdc talenta erogata. amplissima septem iugera optinet soli. quattuor angulorum paribus intervallis dcclxxxiii pedes singulorum laterum, altitudo a cacumine ad solum pedes dccxxv colligit, ambitus cacuminis pedes xviii. alterius intervalla singula per quattuor angulos pedes dcclviis comprehendunt. tertia minor quidem praedictis, sed multo spectatior, aethiopicis lapidibus adsurgit ccclxiii pedibus inter angulos. vestigia aedificationum nulla exstant, harena late pura circa, lentis similitudine, qualis in maiore parte africae. quaestionum summa est, quanam ratione in tantam altitudinem subiecta sint caementa. alii nitro ac sale adaggeratis cum crescente opere et peracto fluminis inrigatione dilutis; alii lateribus e luto factis exstructos pontes, peracto opere lateribus in privatas domos distributis, nilum enim non putant rigare potuisse multo humiliorem. in pyramide maxima est intus puteus lxxxvi cubitorum; flumen illo admissum arbitrantur. mensuram altitudinis earum omnemque similem deprehendere

invenit thales milesius umbram metiendo, qua hora par esse corpori solet. haec sunt pyramidum miracula, supremumque illud, ne quis regum opes miretur, minimam ex iis, sed laudatissimam, a rhodopide meretricula factam. aesopi fabellarum philosophi conserva quondam et contubernalis haec fuit, maiore miraculo, tantas opes meretricio esse conquistas.

magnificatur et alia turris a rege facta in insula pharo portum optinente alexandriae, quam constitisse dccc talentis tradunt, magno animo, ne quid omittamus, ptolemaei regis, quo in ea permiserit sostrati cnidii architecti structura ipsa nomen inscribi. usus eius nocturno navium cursu ignes ostendere ad praenuntianda vada portusque introitum, quales iam compluribus locis flagrant, sicut ostiae ac ravennae. periculum in continuatione ignium, ne sidus existimetur, quoniam e longinquo similis flammaram aspectus est. hic idem architectus primus omnium pensilem ambulationem cnidi fecisse traditur.

dicamus et labyrinthos, vel portentosissimum humani impendii opus, sed non, ut existimari potest, falsum. durat etiam nunc in aegypto in heracleopolite nomo qui primus factus est ante annos, ut tradunt, [iii] dc a petesuchi rege sive tithoe, quamquam herodotus totum opus xii regum esse dicit novissimique psammetichi. causas faciendi varie interpretantur, demoteles regiam moteridis fuisse, lyceas sepulchrum moeridis, plures soli sacrum id exstructum, quod maxime creditur. hinc utique sumpsisse daedalum exemplar eius labyrinthi, quem fecit in creta, non est dubium, sed centensimam tantum portionem eius imitatum, quae itinerum ambages occursusque ac recursus inexplicabiles continet, non - ut in pavimentis puerorumve ludicris campestribus videmus - brevi lacinia milia passuum plura ambulationis continentem, sed crebris foribus inditis ad fallendos occursus redeundumque in errores eosdem. secundus hic fuit ab aegypto labyrinthus, tertius in lemno, quartus in italia, omnes lapide polito fornicibus tecti, aegyptius, quod miror equidem, introitu lapidis e paro columnisque, reliqua e syenite molibus compositis, quas dissolvere ne saecula quidem possint, adiuvantibus heracleopolitis, quod opus invisum mire spectare.

positionem operis eius singulasque partes enarrare non est, cum sit in regiones divisum atque praefecturas, quas vocant nomos, xxi nominibus eorum totidem vastis domibus adtributis, praeterea templa omnium aegypti deorum contineat superque nemesi xl aediculis incluserit pyramides complures quadragenarum ulnarum senas radice ἀρούρας optinentes. fessi iam eundo perveniunt ad viarum illum inexplicabilem errorem, quin et cenacula clivis excelsa, porticusque descenduntur nonagenis gradibus; intus columnae porphyrite lapide, deorum simulacra, regum statuae, monstificae effigies. quarundam domuum talis est situs, ut adaperientibus fores tonitrum intus terribile existat, maiore autem in parte transitus est per tenebras. aliae rursus extra murum labyrinthi aedificiorum moles; pteron appellant. inde aliae perfossis cuniculis subterraneae domus. refecit unus omnino pauca ibi chaeremon, spado necthebis regis, d ante alexandrum magnum annis. id

quoque traditur, fulsisse trabibus spinae oleo incoctae, dum in fornices quadrati lapides adsurgerent.

et de cretico labyrintho satis dictum est. lemnus similis illi columnis tantum cl memorabilior fuit, quarum in officina turbines ita librati pependerunt, ut puero circumagente tornarentur. architecti fecere zmis et rhoecus et theodorus indigenae. exstantque adhuc reliquiae eius, cum cretici italicique nulla vestigia exstent. namque et italicum dici convenit, quem fecit sibi porsina, rex etrusiae, sepulchri causa, simul ut externorum regum vanitas quoque italica superetur. sed cum excedat omnia fabulositas, utemur ipsius M. Varronis in expositione ea verbis: "sepultus sub urbe clusio, in quo loco monumentum reliquit lapide quadrato quadratum, singula latera pedum tricenum, alta quinquagenum. in qua basi quadrata intus labyrinthum inextricabile, quo si quis introierit sine glomere lini, exitum invenire nequeat. supra id quadratum pyramides stant quinque, quattuor in angulis et in medio una, imae latae pedum quinquagenum, septuagenum, altae centum quinquagenum, ita fastigatae, ut in summo orbis aeneus et petasus unus omnibus sit inpositus, ex quo pendeant exapta catenis tintinabula, quae vento agitata longe sonitus referant, ut dodonae olim factum. supra quem orbem quattuor pyramides insuper singulae stant altae pedum centum. supra quas uno solo quinque pyramides." quarum altitudinem Varronem puduit adicere; fabulae etruscae tradunt eandem fuisse quam totius operis ad eas, vesana dementia, quaesisset gloriam inpendio nulli profuturo, praeterea fatigasse regni vires, ut tamen laus maior artificis esset.

legitur et pensilis hortus, immo vero totum oppidum aegyptiae thebae, exercitus armatos subter educere solitis regibus nullo oppidanorum sentiente; etiamnum hoc minus mirum quam quod flumine medium oppidum interfluente. quae si fuissent, non dubium est homerum dicturum fuisse, cum centum portas ibi praedicaret.

graeae magnificentiae vera admiratio exstat templum ephesiae dianae cxx annis factum a tota asia. in solo id palustri fecere, ne terrae motus sentiret aut hiatus timeret, rursus ne in lubrico atque instabili fundamenta tantae molis locarentur, calcatis ea substravere carbonibus, dein velleribus lanae. universo templo longitudo est ccccxxv pedum, latitudo ccxxv, columnae cxxvii a singulis regibus factae lx pedum altitudine, ex iis xxxvi caelatae, una a Scopa. operi praefuit chersiphron architectus. summa miraculi epistylia tantae molis attolli potuisse; id consecutus ille est aeronibus harenae plenis, molli clivo super capita columnarum exaggerato, paulatim exinaniens imos, ut sensim opus in loco sederet. difficillime hoc contigit in limine ipso, quod foribus inponebat; etenim ea maxima moles fuit nec sedit in cubili, anxio artifice mortis destinatione suprema. tradunt in ea cogitatione fessum nocturno tempore in quiete vidisse praesentem deam, cui templum fieret, hortantem, ut viveret: se composuisse lapidem. atque ita postera luce apparuit; pondere ipso correctus videbatur. cetera eius operis ornamenta plurimum librorum instar optinent, nihil ad specimen naturae pertinentia.

durat et cyzici delubrum, in quo millum aureum commissuris omnibus polito lapidis subiecit artifex, eboreum iovem dicaturus intus coronante eum marmoreo apolline. translucent ergo iuncturae tenuissimis capillamentis lenique adflatu simulacra refovent, et praeter ingenium artificis ipsa materia ingenii quamvis occulta in pretio operis intellegitur. - eodem in oppido est lapis fugitivus appellatus; argonautae eum pro ancora usi reliquerant ibi. hunc e prytaneo - ita vocatur locus - saepe profugum vinxere plumbo. - eadem in urbe iuxta portam, quae thracia vocatur, turres septem acceptas voces numeroso repercussu multiplicant. nomen huic miraculo echo est a graecis datum. et hoc quidem locorum natura evenit ac plerumque convallium; ibi casu accidit, olympiae autem arte, mirabili modo, in porticu, quam ob id heptaphonon appellant, quoniam septiens eadem vox redditur. cyzici et buleuterium vocant aedificium amplum, sine ferreo clavo ita disposita contignatione, ut eximantur trabes sine fulturis ac reponantur. quod item romae in ponte sublicio religiosum est, posteaquam coclites horatio defendente aegre revolsus est.

verum et ad urbis nostrae miracula transire conveniat dcccque annorum dociles scrutari vires et sic quoque terrarum orbem victum ostendere. quod accidisse totiens paene, quot referentur miracula, apparebit; universitate vero acervata et in quendam unum cumulum coiecta non alia magnitudo exurget quam si mundus alius quidam in uno loco narretur. nec ut circum maximum a caesare dictatore exstructum longitudine stadiorum trium, latitudine unius, sed cum aedificiis iugerum quaternum, ad sedem [ccl], inter magna opera dicamus: non inter magnifica basilicam pauli columnis e phrygibus mirabilem forumque Divi Augusti et templum pacis vespasiani imp. aug., pulcherrima operum, quae umquam vidit orbis non et tectum diribitori ab agrippa facti, cum theatrum ante texerit romae valerius ostiensis architectus ludis libonis pyramidas regum miramur, cum solum tantum foro exstruendo hs [30m]30 caesar dictator emerit et, si quem impensa moveat captis avaritia animis, hs [30cxlviii]30 domo empta clodius, quem milo occidit, habitaverit. quod equidem non secus ac regum insaniam miror; itaque et ipsum milonem hs [30dcc]30 aeris alieni debuisse inter prodigia animi humani duco. sed tum senes aggeris vastum spatium, substructiones capitolii mirabantur, praeterea cloacas, opus omnium dictu maximum, subfossis montibus atque, ut paullo ante retulimus, urbe pensili subterque navigata m. agrippae in aedilitate post consulatum. permeant convivati septem annes cursuque praecipiti torrentium modo rapere atque auferre omnia coacti, insuper imbrium mole concitati vada ac latera quatunt, aliquando tiberis retro infusus recipitur, pugnantque diversi aquarum impetus intus, et tamen obnixa firmitas resistit. trahuntur moles superne tantae non succumbentibus cavis operis, pulsant ruinae sponte praecipites aut inpactae incendiis, quatitur solum terrae motibus, durant tamen a tarquinio prisco annis dcc prope inexpugnabiles, non omittendo memorabili exemplo vel magis, quoniam celeberrimis rerum conditoribus omissum est. cum id opus tarquinius priscus plebis manibus faceret, essetque labor

incertum maior an longior, passim conscita nece quiritibus taedium fugientibus, novum, inexcogitatum ante posteaque remedium invenit ille rex, ut omnium ita defunctorum corpora figeret cruci spectanda civibus simul et feris volucrisque laceranda. quam ob rem pudor romani nominis proprius, qui saepe res perditas servavit in proeliis, tunc quoque subvenit, sed illo tempore vi post vitam erubescens, cum puderet vivos, tamquam puditurum esset extinctos. amplitudinem cavis eam fecisse proditur, ut vehem faeni large onustam transmitteret.

parva sunt cuncta, quae diximus, et omnia uni comparanda miraculo, antequam nova attingam. m. lepidus q. catulo cos., ut constat inter diligentissimos auctores, domus pulchrior non fuit romae quam lepidi ipsius, at, hercules, intra annos xxxv eadem centensimum locum non optinuit. computet in hac aestimatione qui volet marmorum molem, opera pictorum, impendia regalia et cum pulcherrima laudatissimaque certantes centum domus posteaque ab innumerabilibus aliis in hunc diem victas. profecto incendia puniunt luxum, nec tamen effici potest, ut mores aliquid ipso homine mortalius esse intellegant.

sed omnes eas duae domus vicerunt. bis vidimus urbem totam cingi domibus principum gai et neronis, huius quidem, ne quid deesset, aurea. nimirum sic habitaverant illi, qui hoc imperium fecere tantum, ad devincendas gentes triumphosque referendos ab aratro aut foco exeuntes, quorum agri quoque minorem modum optinuerunt quam sellaria istorum! subit vero cogitatio, quota portio harum fuerint areae illae, quas invictis imperatoribus decernebant publice ad exaedificandas domos; summusque illarum honos erat, sicut in p. valerio publicola, primo consule cum L. Bruto, post tot merita et fratre eius, qui bis in eodem magistratu sabinos devicerat, adici decreto, ut domus eorum fores extra aperirentur et ianua in publicum reiceretur. hoc erat clarissimum insigne inter triumphales quoque domos.

non patiar istos duos ne hac quidem gloria famae frui, docebimusque etiam insaniam eorum victam privatis opibus M. Scauri, cuius nescio an aedilitas maxime prostraverit mores maiusque sit sullae malum tanta privigni potentia quam proscriptio tot milium. in aedilitate hic sua fecit opus maximum omnium, quae umquam fuere humana manu facta, non temporaria mora, verum etiam aeternitatis destinatione. theatrum hoc fuit; scaena ei triplex in altitudinem ccclx columnarum in ea civitate, quae sex hymettias non tulerat sine probro civis amplissimi. ima pars scaenae e marmore fuit, media e vitro, inaudito etiam postea genere luxuriae, summa e tabulis inauratis; columnae, ut diximus, imae duodequadragenum pedum. signa aerea inter columnas, ut indicavimus, fuerunt [iii] numero; cavea ipsa cepit hominum [lxxx], cum pompeiani theatri totiens multiplicata urbe tantoque maiore populo sufficiat large [xxxx] sedere. relicus apparatus tantus attalica veste, tabulis pictis, cetero choragio fuit, ut, in tusculanam villam reportatis quae superfluebant cotidiani usus deliciis, incensa villa ab iratis servis concremaretur hs [30ccc]30.

aufert animum et a destinato itinere degredi cogit contemplatio tam prodigae mentis aliamque conectit maiorem insaniam e ligno. c. curio, qui bello civili in caesianis partibus obiit, funebri patris munere cum opibus apparatuque non posset superare Scaurum — unde enim illi vitricus Sulla et Metella mater proscriptionum sectrix unde M. Scaurus pater, totiens princeps civitatis et mariani sodalicii rapinarum provincialium sinus cum iam ne ipse quidem Scaurus sibi par esse posset, quando hoc certe incendi illius praemium habuit convectis ex orbe terrarum rebus, ut nemo postea par esset insaniae illi - ingenio ergo utendum suo curioni et aliquid excogitandum fuit. operae pretium est scire, quid invenerit, et gaudere moribus nostris ac verso modo nos vocare maiores. theatra iuxta duo fecit amplissima ligno, cardinum singulorum versatili suspensa libramento, in quibus utrisque antemeridiano ludorum spectaculo edito inter sese aversis, ne invicem obstreperent scaenae, repente circumactis - ut constat, post primos dies etiam sedentibus aliquis - , cornibus in se coeuntibus faciebat amphitheatrum gladiatorumque proelia edebat, ipsum magis auctoratum populum romanum circumferens. quid enim miretur quisque in hoc primum, inventorem an inventum, artificem an auctorem, ausum aliquem hoc excogitare an suscipere an iubere super omnia erit populi sedere ausi furor tam infida instabilique sede. en hic est ille terrarum victor et totius domitor orbis, qui gentes, regna diribet, iura exteris mittit, deorum quaedam immortalium generi humano portio, in machina pendens et ad periculum suum plaudens! quae vilitas animarum ista aut quae querella de cannis! quantum mali potuit accidere! hauriri urbes terrae hiatibus publicus mortalium dolor est: ecce populus romanus universus, veluti duobus navigiis inpositus, binis cardinibus sustinetur et se ipsum depugnantem spectat, periturus momento aliquo luxatis machinis! et per hoc quaeritur tribuniciis contionibus gratia, ut pensiles tribus quatiat, in rostris quid non ausurus apud eos, quibus hoc persuaserit! vere namque confitentibus populus romanus funebri munere ad tumulum patris eius depugnavit universus. variavit hanc suam magnificentiam fessis turbatisque cardinibus et amphitheatri forma custodita novissimo die diversis duabus per medium scaenis athletas edidit raptisque e contrario repente pulpitis eodem die victores e gladiatoribus suis produxit. nec fuit rex curio aut gentium imperator, non opibus insignis, ut qui nihil in censu habuerit praeter discordiam principum.

sed dicantur vera aestimatione invicta miracula. q. marcius rex, iussus a senatu aquarum appiae, anienis, tepulae ductus reficere, novam a nomine suo appellatam cuniculis per montes actis intra praeturae suae tempus adduxit; agrippa vero in aedilitate adiecta virgine aqua ceterisque conrivatis atque emendatis lacus dcc fecit, praeterea salientes d, castella cxxx, complura et cultu magnifica, operibus iis signa ccc aerea aut marmorea inposuit, columnas e marmore cccc, eaque omnia annuo spatio. adicit ipse aedilitatis suae commemoratione et ludos diebus undesexaginta factos et gratuita praebita balinea clxx, quae nunc romae ad infinitum auxere numerum. - vicit antecedentes aquarum ductus novissimum impendium operis incohata a c.

caesare et peracti a claudio, quippe a xxxx lapide ad eam excelsitatem, ut omnes urbis montes lavarentur, influxere curtius atque caeruleus fontes et anien novus, erogatis in id opus hs [30mmm]30 d. quod si quis diligentius aestumaverit abundantiam aquarum in publico, balineis, piscinis, euripis, domibus, hortis, suburbanis villis, spatia aquae venientis, exstructos arcus, montes perfosso, convalles aequatas, fatebitur nil magis mirandum fuisse in toto orbe terrarum. - eiusdem claudi inter maxime memoranda equidem duxerim, quamvis destitutum successoris odio, montem perfossum ad lacum fucinum emittendum inenarrabili profecto impendio et operarum multitudine per tot annos, cum aut conrivatio aquarum, qua terrenus mons erat, egereretur in verticem machinis aut silex caederetur quantaque intus in tenebris fierent, quae neque concipi animo nisi ab iis, qui videre, neque enarrari humano sermone possunt! nam portus ostiensis opus praetereo, item vias per montes excisas, mare tyrrhenum a lucrino molibus seclusum, tot pontes tantis impendiis factos. et inter plurima alia italiae ipsius miracula marmora in lapidinis crescere auctor est papirius fabianus, naturae rerum peritissimus, exemptores quoque adfirmant compleri sponte illa montium ulcera. quae si vera sunt, spes est numquam defutura luxuriae.

a marmoribus degredienti ad reliquorum lapidum insignes naturas quis dubitet in primis magnetem occurrere quid enim mirabilius aut qua in parte naturae maior improbitas dederat vocem saxi, ut diximus, respondentem homini, immo vero et obloquentem. quid lapidis rigore pigrius ecce sensus manusque tribuit illi. quid ferri duritia pugnacius pedes ei inpertivit et mores. trahitur namque magnete lapide, domitrixque illa rerum omnium materia ad inane nescio quid currit atque, ut propius venit, adsilit, tenetur amplexuque haeret. sideritim ob id alio nomine vocant, quidam heraclion. magnes appellatus est ab inventore, ut auctor est nicander - in ida, ut reperio, namque et passim inveniuntur, in hispania quoque - ; invenisse autem fertur clavis crepidarum, baculi cuspide haerentibus, cum armenta pasceret. quinque genera magnetis sotacus demonstrat: aethiopicum et a magnesia macedoniae contermina ab euboea iolcum petentibus dextra, tertium in hyetto boeotiae, quartum circa alexandriam troadem, quintum in magnesia asiae. differentia est prima, mas sit an femina, proxima in colore. nam qui in magnesia macedonica reperiuntur rufi nigrique sunt, boeoti vero rufi coloris plus habent quam nigri. is, qui in troade invenitur, niger est et feminei sexus ideoque sine viribus, deterrimus autem in magnesia asiae, candidus neque attrahens ferrum similisque pumici. conpertum tanto meliores esse, quanto sint magis caerulei. aethiopico palma datur pondusque argento rependitur. invenitur hic in aethiopiae zmiri; ita vocatur regio harenosa. ibi et haematites magnes sanguinei coloris sanguinemque reddens, si teratur, sed et crocum. in attrahendo ferro non eadem haematiti natura quae magneti. aethiopici argumentum est, quod magneta quoque alium ad se trahit. omnes autem hi oculorum medicamentis prosunt ad suam quisque portionem, maximeque epiphoras sistunt. sanant et adusta cremati tritique. alius rursus in eadem

aethiopia non procul magnes ferrum omne abigit respuitque. de utraque natura saepius diximus.

lapidem e syro insula fluctuari tradunt, eundem comminutum mergi.

in asso troadis sarcophagus lapis fissili vena scinditur. corpora defunctorum condita in eo absumi constat intra xl diem exceptis dentibus. mucianus specula quoque et strigiles et vestes et calciamenta inlata mortuis lapidea fieri auctor est. eiusdem generis et in lycia saxa sunt et in oriente, quae viventibus quoque adalligata erodunt corpora.

mitiores autem servandis corporibus nec absumendis chernites ebori simillimus, in quo darium conditum ferunt, parioque similis candore et duritia, minus tantum ponderosus, qui porus vocatur. theophrastus auctor est et tralucidi lapidis in aegypto, quem chio similem ait. fortassis tunc fuerit, quoniam et desinunt et novi reperiuntur.

assius gustatu salsus podagras lenit, pedibus in vas ex eo cavatum inditis. praeterea omnia crurum vitia in iis lapacidinis sanantur, cum in metallis omnibus crura vitientur. eiusdem lapidis flos appellatur, in farinam mollis ad quaedam perinde efficax. est autem similis pumici rufo. admixtus cerae cypriae mammarum vitia sanat, pici autem resinaeve strumas et panos discutit. prodest et phthisicis linctu. cum melle vetera ulcera ad cicatrices perducit, excrescentia erodit et a bestiarum morsu repugnantia curationi suppurata siccatur. fit cataplasma ex eo podagricis mixto fabae lomento.

idem theophrastus et mucianus esse aliquos lapides, qui pariant, credunt; theophrastus et ebur fossile e candido et nigro inveniri et ossa e terra nasci inveniri que lapides osseos.

palmati circa mundam in hispania, ubi caesar dictator pompeium vicit, reperiuntur idque quotiens fregeris. sunt et nigri, quorum auctoritas venit in marmora, sicut taenarius. Varro nigros ex africa firmiores esse tradit quam in italia, e diverso albos coranos duriores quam parios, idem luniensem silicem serra secari, tusculanum dissilire igni, sabinum fuscum addito oleo etiam lucere. idem molas versatiles volsinis inventas; aliquas et sponte motas invenimus in prodigiis. nusquam hic utilior quam in italia gignitur lapisque, non saxum, est. in quibusdam vero provinciis omnino non invenitur. sunt quidam in eo genere molliores, qui et cote levantur, ut procul intuentibus ophites videri possit, neque est alius firmior, quando et lapidis natura ligno similiter imbres solesque aut hiemes non patitur in aliis generibus atque aliis. sunt et qui lunam non tolerant et qui vetustate robiginem trahant coloremve candidum oleo mutant.

molarem quidam pyriten vocant, quoniam plurimus sit ignis illi, sed est alius spongiosior tantum et alius etiamnum pyrites similitudine aeris. in cypro eum reperiri volunt metallis, quae sint circa acamanta, unum argenteo colore, alterum aureo. cocuntur varie, ab aliis iterum tertiumque in melle, donec consumatur liquor, ab aliis pruna prius, dein in melle, ac postea lavantur ut aes. usus eorum in medicina excalfacere, siccare, discutere, extenuare et duritias in pus vertere. utuntur et crudis tuisque ad strumas atque furunculos.

pyritarum etiamnum unum genus aliqui faciunt plurimum ignis habentis. quos vivos appellamus, ponderosissimi sunt, hi exploratoribus castrorum maxime necessarii. qui clavo vel altero lapide percussi scintillam edunt, quae excepta sulphure aut fungis aridis vel foliis dicto celerius praeberet ignem.

ostracitae similitudinem testae habent. usus eorum pro pumice ad levandam cutem. poti sanguinem sistunt et inliti cum melle ulcera doloresque mammarum sanant. - amiantus alumini similis nihil igni deperdit. hic veneficiis resistit omnibus, privatim magorum. - geoden ex argumento appellant, quoniam complexus est terram, oculorum medicamentis utilissimum, item mammarum ac testium vitiis. - melitinus lapis sucum remittit dulcem melleumque. tunsus et cerae mixtus eruptionibus pituitae maculisque corporis medetur et faucium exulcerationi, epinyctidas tollit, volvarum dolores inpositus vellere. - gagates lapis nomen habet loci et amnis gegis lyciae. aiunt et in leucolla expelli mari atque intra xii stadia colligi. niger est, planus, pumicosus, levis, non multum a ligno differens, fragilis, odore, si teratur, gravis. fictilia ex eo inscripta non delentur; cum uritur, odorem sulphureum reddit; mirumque, accenditur aqua, oleo restinguitur. fugat serpentes ita recreatque volvae strangulationes. deprendit santicum morbum et virginitatem suffitus. idem ex vino decoctus dentibus medetur strumisque cerae permixtus. hoc dicuntur uti magi in ea, quam vocant axinomantiam, et peruri negant, si eventurum sit quod aliquis optet. - spongitae lapides inveniuntur in spongeis et sunt marini. quidam eos tecolithos vocant, quoniam vesicis medentur, calculos rumpunt in vino poti. - phrygius lapis gentis habet nomen; est autem glaeba pumicosa. uritur ante vino perfusus, flatus follibus, donec rufescat, ac rursus dulci vino extinguitur ternis vicibus, tinguendis vestibus tantum utilis.

schistos et haematites cognationem habent. haematites invenitur in metallis, ustus minii colorem imitatur, uritur ut phrygius, sed non restinguitur vino. adulteratum haematiten discernunt venae rubentes et friabilis natura. oculis cruore suffusis mire convenit. sistit profluvia mulierum potus. bibunt et qui sanguinem reiecerunt cum suco punici mali. et in vesicae vitiis efficax bibitur et in vino contra serpentium ictus. infirmiora omnia eadem in eo, quem schiston appellant. oculorum vitiis commodior croco similis, peculiaris explendis ulcerum lacunis in lacte muliebri, procidentesque oculos praeclare cohibet. haec est sententia eorum, qui nuperrime scripsere; sotacus e vetustissimis auctoribus quinque genera haematitarum tradit praeter magnetem. principatum dat ex iis aethiopico, oculorum medicamentis utilissimo et iis, quae panchresta appellat, item ambustis. alterum androdamanta dicit vocari, colore nigrum, pondere ac duritia insignem, et inde nomen traxisse praecipueque in africa repertum; trahere autem in se argentum, aes, ferrum. experimentum eius esse in cote ex lapide basanite - reddere enim sucum sanguineum - , et esse ad iocineris vitia praecipui remedii. tertium genus arabici facit, simili duritia, vix reddentis sucum ad cotem aquariam, aliquando croco similem. quarti generis hepatiten vocari, quamdiu crudus sit,

coctum vero militen, utilem ambustis, ad omnia utiliore rubrica; quinti generis schiston, haemorrhoidas reprimentem in potu. omnes autem haematitas tritos in oleo iii drachmarum pondere a ieiunis bibendos ad vitia sanguinis. idem schiston et alterius generis quam haematiten tradit, quem vocat anthraciten; nasci in africa nigrum, attritum aquariis cotibus reddere ab ea parte, quae fuerit ab radice, nigrum colorem, ab altera parte croci. ipsum utilem esse oculorum medicamentis.

ae+titae lapides ex argumento nominis magnam famam habent. reperiuntur in nidis aquilarum, sicut in decumo volumine diximus. aiunt binos inveniri, marem ac feminam, nec sine iis parere quas diximus aquilas, et ideo binos tantum; genera eorum quattuor: in africa nascentem pusillum ac mollem, intra se velut in alvo habentem argillam suavem, candidam. ipsum friabilem feminei sexus putant, marem autem, qui in arabia nascatur, durum, gallae similem aut subrutilem, in alvo habentem durum lapidem. tertius in cypro invenitur colore illis in africa nascentibus similis, amplior tamen atque dilatatus; ceteris enim globosa facies. habet in alvo harenam iucundam et lapillos, ipse tam mollis, ut etiam digitis frietur. quarti generis taphiusius appellatur, nascens iuxta leucada in taphiusa, qui locus est dextra navigantibus ex ithaca leucadem. invenitur in fluminibus candidus ac rotundus. huic est in alvo lapis, qui vocatur callimus, nec quicquam terreni. ae+titae gravidis adalligati mulieribus vel quadripedibus pelliculis sacrificatorum animalium continent partus, non nisi parturiant removendi; alioqui volvae excidunt. sed nisi parturientibus auferantur, omnino non pariant.

est et lapis samius in eadem insula, ubi terram laudavimus, poliendo auro utilis, in medicina oculorum ulceribus cum lacte quo supra dictum est modo et contra veteres lacrimationes. prodest et contra vitia stomachi potus, vertigines sedat mentesque commotas restituit. quidam et morbis comitialibus utiliter dari putant et ad urinae difficultates. et acopis miscetur. probatur gravitate, candore. volunt et partus contineri adalligato eo. - arabus lapis, ebori similis, dentifriciis adcommodatur crematus. privatim haemorrhoidas sanat cum lanugine linteorum aut super linteolis inpositis.

non praetermittenda est et pumicum natura. appellantur quidem ita erosa saxa in aedificiis, quae musaea vocant, dependentia ad imaginem specus arte reddendam, sed ii pumices, qui sunt in usu corporum levandorum feminis, iam quidem et viris, atque, ut ait catullus, libris, laudatissimi sunt in melo, nisyro et aeoliis insulis. probatio in candore minimoque pondere et ut quam maxime spongiosi aridique sint, teri faciles nec harenosi in fricando. vis eorum in medicina extenuare, siccare, trina ustione ita, uti torreantur carbone puro, totiens vino restinguantur albo. lavantur deinde ut cadmia et siccati conduntur quam minime uliginoso loco. usus farinae ex iis oculorum maxime medicamentis: ulcera purgant eorum leniter explentque, cicatrices emendant. - (quidam a tertia ustione refrigeratos potius quam restinctos terere malunt ex vino). - adduntur et in malagmata capitum verendorumque ulceribus utilissimi. fiunt ex iis et dentifricia. theophrastus auctor est potiores in

certamine bibendi praesumere farinam eam, sed, nisi universo potu inpleantur, periclitari, tantamque refrigerandi naturam esse, ut musta fervere desinant pumice addito.

auctoribus curae fuere lapides mortariorum quoque, nec medicinalium tantum aut ad pigmenta pertinentium. etesium lapidem in iis praetulere ceteris, mox thebaicum, quem pyrropocilon appellavimus - aliqui psaranum vocant - , tertium ex chalazio chrysiten, medicis autem ex basanite. hic enim lapis nihil ex sese remittit. ii lapides, qui sucum reddunt, oculorum medicamentis utiles existimantur; ideo aethiopici ad ea maxime probantur. taenarium lapidem et phoeniceum et haematiten iis medicamentis prodesse tradunt, quae ex croco componantur; ex alio taenario, qui niger est, et ex pario lapide non aequae medicis utilem, potioemque ex alabastrite aegyptio vel ex ophite albo. est enim hoc genus ophitis, ex quo vasa et cados etiam faciunt.

in siphno lapis est, qui cavatur tornaturque in vasa vel coquendis cibis utilia vel ad esculentorum usus, quod et in comensi italiae lapide viridi accidere scimus, sed in siphnio singulare quod excalfactus oleo nigrescit durescitque natura mollissimus. tanta qualitatum differentia est, nam mollitiae trans alpis praecipua sunt exempla. in belgica provincia candidum lapidem serra, qua lignum, faciliusque etiam secant tantum ad tegularum et imbricum vicem vel, si libeat, quae vocant pavonacea tegendi genera.

et hi quidem sectiles sunt, specularis vero, quoniam et hic lapidis nomen optinet, faciliore multo natura finditur in quamlibet tenues crustas. hispania hunc tantum citerior olim dabat, nec tota, sed intra [c] passuum circa segobrigam urbem, iam et cypros et cappadocia et sicilia et nuper inventum africa, postferendos tamen omnes hispaniae, cappadocia amplissimos magnitudine, sed obscuros. sunt et in bononiensi italiae parte breves, macula complexu silicis alligata, quorum tamen appareat natura similis. puteis in hispania effoditur e profunda altitudine, nec non et saxo inclusus sub terra invenitur extrahiturque aut exciditur, sed maiore ex parte fossili natura, absolutus in se caementi modo, numquam adhuc quinque pedum longitudine amplior. umorem hunc terrae quadam anima crystalli modo glaciari et in lapidem concreescere manifesto apparet, quod cum ferae decidere in puteos tales, medullae in ossibus earum post unam hiemem in eandem lapidis naturam figurantur. invenitur et niger aliquando, sed candido natura mira, cum sit mollitia nota, perpetiendi soles rigoresque, nec senescit, si modo iniuria absit, cum hoc etiam in caementis multorum generum accidat. invenere et alium usum in ramentis squamaque, circum maximum ludis circensibus sternendi ut sit in commendatione candor.

nerone principe in cappadocia repertus est lapis duritia marmoris, candidus atque tralucens etiam qua parte fulvae inciderant venae, ex argumento phengites appellatus. hoc construxerat aedem fortunae, quam seiani appellant, a servio rege sacratam, amplexus aurea domo; quare etiam foribus opertis interdum claritas ibi diurna erat alio quam specularium modo tamquam inclusa luce, non transmissa. - in arabia quoque esse lapidem vitri modo tralucidum,

quo utantur pro specularibus, iuba auctor est.

nunc ad operarios lapides transisse conveniat primumque cotes ferro acuendo. multa earum genera: creticae diu maximam laudem habuere, secundam laconicae et taygeto monte, oleo utraeque indigentes. inter aquarias naxiae laus maxima fuit, mox armeniacae, de quibus diximus. ex oleo et aqua ciliciae pollent, ex aqua arsinoiticae. repertae sunt et in italia aqua trahentes aciem acerrimae effectum, nec non et trans alpis, quas passernices vocant. quarta ratio est saliva hominis proficientium in tonstrinarum officinis. laminitanae ex hispania citeriore in eo genere praecipuae.

et reliqua multitudine lapidum tofus aedificiis inutilis est mortalitate, mollitia. quaedam tamen loca non alium habent, sicuti carthago in africa. exestur halitu maris, friatur vento, everberatur imbri. sed cura tuentur picando parietes, quoniam et tectorii calce eroditur, sciteque dictum est ad tecta eos pice, ad vina calce uti, quoniam sic musta condiunt. alia mollitia circa romam fidenati et albano. in umbria quoque et venetia albus lapis dentata serra secatur. hi tractabiles in opere laborem quoque tolerant, sub tecto dumtaxat; aspergine et gelu pruinisque rumpuntur in testas, nec contra auram maris robusti. tiburtini, ad reliqua fortes, vapore dissiliunt.

nigri silices optimi, quibusdam in locis et rubentes. nonnusquam vero et albi, sicut in tarquiniensi anicianis lapicidinibus circa lacum volsiniensem et in statoniensi, quibus ne ignis quidem noceat. iidem et in monumentis scalpti contra vetustatem quoque incorrupti permanent; ex iis formae fiunt, in quibus aera funduntur. est et viridis lapis vehementer igni resistens, sed nusquam copiosus et, ubi invenitur, lapis, non saxum, est. et reliquis pallidus in caemento raro utilis, globosus contra iniurias fortis, sed structurae infidelis, nisi multa suffrenatione devinctus. nec certior fluviatilis, semper veluti madens. remedium est in lapide dubio aestate eum eximere nec ante biennium inserere tecto, domitum tempestatibus. quae ex eo laesa fuerint, subterraneae structurae aptentur utilius; quae restiterint, tutum est vel caelo committere.

graeci et lapide duro aut silice aequato struunt veluti latericios parietes. cum ita fecerunt, isodomon vocant genus structurae; at cum inaequali crassitudine structa sunt coria, pseudisodomon. tertium est emplecton; tantummodo frontibus politis reliqua fortuita conlocant. alternas coagmentationes fieri, ut commissuras antecedentium medii lapides optineant, necessarium est, in medio quoque pariete, si res patiat; si minus, utique a lateribus. medios parietes farcire fractis caementis diatonicon vocant. reticulata structura, qua frequentissime romae struunt, rimis opportuna est. structuram ad normam et libellam fieri, ad perpendicularum respondere oportet. cisternas harenae purae asperae v partibus, calcis quam vehementissimae ii construi, fragmentis silicis non excedentibus libras; ita ferratis vectibus calcari solum parietesque similiter. utilius geminas esse, ut in priore vitia considant atque per colum in proximam transeat pura aqua.

calcem et vario lapide cato censorius inprobat; ex albo melior. quae ex duro, structurae utilior; quae ex fistuloso, tectoriis; ad utrumque damnatur ex

silice. utilior eadem effosso lapide quam ex ripis fluminum collecto, utilior e molari, quia est quaedam pinguior natura eius. mirum aliquid, postquam arserit, accendi aquis. - harenae tria genera: fossicia, cui quarta pars calcis addi debet, fluviatili aut marinae tertia. si et testae tusae tertia pars addatur, melior materia erit. ab appennino ad padum non invenitur fossicia, nec trans maria. - ruinarum urbis ea maxime causa, quod furto calcis sine ferumine suo caementa componuntur. intrita quoque ea quo vetustior, eo melior. in antiquorum aedium legibus invenitur, ne recentiore trima uteretur redemptor; ideo nullae tectoria eorum rimae foedavere. tectorium, nisi quod ter harenato et bis marmorato inductum est, numquam satis splendoris habet. uliginosa et ubi salsugo vitiet testaceo sublini utilius. in graecia tectoriis etiam harenatum, quo inducturi sunt, prius in mortario ligneis vectibus subigunt. experimentum marmorati est in subigendo, donec rutro non cohaereat; contra in albario opere, ut macerata calx ceu glutinum haereat; macerari non nisi ex glaeba oportet. elide aedis est minervae, in qua frater Phidiae Panaenus tectorium induxit lacte et croco subactum, ut ferunt; ideo, si teratur hodie in eo saliva pollice, odorem croci saporemque reddit.

columnae eadem densius positae crassiores videntur. genera earum quattuor: quae sextam partem altitudinis in crassitudine ima habent, doricae vocantur; quae nonam, ionicae; quae septimam, tuscanicae; corinthiis eadem ratio quae ionicis, set differentia, quoniam capitulis corinthiarum eadem est altitudo, quae colligitur crassitudine ima, ideoque graciliores videntur; ionicis enim capituli altitudo tertia pars est crassitudinis. antiqua ratio erat columnarum altitudinis tertia pars latitudinum delubri. in ephesiae dianae aede, quae prius fuit, primum columnis spirae subditae et capitula addita, placuitque altitudinis octava pars in crassitudine et ut spirae haberent crassitudinis dimidium septimaeque partes detraherentur summarum crassitudine. praeter haec sunt quae vocantur atticae columnae quaternis angulis, pari laterum intervallo.

calcis et in medicina magnus usus. eligitur recens nec aspersa aquis. urit, discutit, extrahit incipientesque serpentium ulcerum impetus coercescit; aceto et rosaceo mixta atque inlita, mox cera ac rosaceo temperata perducit ad cicatricem. luxatis quoque cum liquida resina aut adipe suillo ex melle medetur, eadem compositione et strumis.

maltha e calce fit recenti. glaeba vino restinguitur, mox tunditur cum adipe suillo et fico, duplici lenimento. quae res omnium tenacissima et duritiam lapidis antecedens. quod malthatur, oleo perfricatur ante.

cognata calci res gypsum est. plura eius genera. nam et e lapide coquitur, ut in syria ac thuriis, et e terra foditur, ut in cypro ac perrhaebia; e summa tellure et tymphaicum est. qui coquitur lapis non dissimilis alabastritae esse debet aut marmoroso. in syria durissimos ad id eligunt cocuntque cum fimo bubulo, ut celerius urantur. omnium autem optimum fieri compertum est e lapide speculari squamamve talem habente. gypso madido statim utendum est, quoniam celerrime coit; tamen rursus tundi se et in farinam resolvi patitur.

usus gypsi in albariis, sigillis aedificiorum et coronis gratissimus. exemplum inlustre est, c. proculeium, Augusti Caesaris familiaritate subnixum, in stomachi dolore gypso poto conscivisse sibi mortem.

pavimenta originem apud graecos habent elaborata arte picturae ratione, donec lithostrota expulere eam. celeberrimus fuit in hoc genere sosus, qui pergami stravit quem vocant asaroton oecon, quoniam purgamenta cenae in pavimentis quaeque everri solent velut relictia fecerat parvis e tessellis tinctisque in varios colores. mirabilis ibi columba bibens et aquam umbra capitis infuscans; apricantur aliae scabentes sese in canthari labro. - pavimenta credo primum facta quae nunc vocamus barbarica atque subtegulanea, in italia festucis pavita. hoc certe ex nomine ipso intellegi potest. romae scutulatum in iovis capitolini aede primum factum est post tertium bellum punicum initum, frequentata vero pavimenta ante cimbricum magna gratia animorum indicio est lucilianus ille versus:

“arte pavimenti atque emblemate vermiculato.”

subdialia graeci invenere talibus domos contegentes, genus facile tractu tepente, sed fallax ubicumque imbres gelant. necessarium binas per diversum coaxationes substerni et capita earum praefigi, ne torqueantur, et ruderi novo tertiam partem testae tusae addi, dein rudus, in quo ii quintae calcis misceantur, pedali crassitudine festucari, tunc nucleo crasso vi digitos induci, tessella grandi non minus alta ii digitos strui, fastigium vero servari in pedes denos sescunciae ac diligenter cote despumari. quernis axibus contabulari, quia torquentur, inutile putant, immo et felice aut palea substerni melius esse, quo minor vis calcis perveniat. necessarium et globosum lapidem subici. similiter fiunt spicata testacea. - non neglegendum est etiamnum unum genus graecanici: solo festucato inicitur rudus aut testaceum pavementum, dein spisse calcatis carbonibus inducitur ex sabulo et calce ac favilla mixtis materia crassitudine semipedali, ad regulam et libellam exigitur, et est forma terrena; si vero cote depolitum est, nigri pavimenti usum optinet.

lithostrota coeptavere iam sub sulla; parvolis certe crustis exstat hodieque quod in fortunae delubro praeneste fecit. pulsa deinde ex humo pavimenta in camaras transiere vitro. novicium et hoc inventum; agrippa certe in thermis, quas romae fecit, figlinum opus encausto pinxit in calidis, reliqua albario adornavit, non dubie vitreas factururus camaras, si prius inventum id fuisset aut a parietibus scaenae, ut diximus, Scauri pervenisset in camaras. quam ob rem et vitri natura indicanda est.

pars syriae, quae phoenice vocatur, finitima iudaeae intra montis carmeli radices paludem habet, quae vocatur candebia. ex ea creditur nasci belus amnis quinque milium passuum spatio in mare perfluens iuxta ptolemaidem coloniam. lentus hic cursu, insaluber potu, sed caerimoniis sacer, limosus, vado profundus, non nisi refuso mari harenas fatetur; fluctibus enim volutatae nitescent detritis sordibus. tunc et marino creduntur adstringi morsu, non prius utiles. quingentorum est passuum non amplius litoris spatium, idque tantum multa per saecula gignendo fuit vitro. fama est adpulsa nave mercatorum nitri,

cum sparsi per litus epulas pararent nec esset cortinis attollendis lapidum occasio, glaebas nitri e nave subdidisse, quibus accensis, permixta harena litoris, tralucentes novi liquoris fluxisse rivos, et hanc fuisse originem vitri. mox, ut est ingeniosa sollertia, non fuit contenta nitrum miscuisse; coeptus addi et magnes lapis, quoniam in se liquorem vitri quoque ut ferrum trahere creditur. simili modo et calculi splendentes multifariam coepti uri, dein conchae ac fossiles harenae. auctores sunt in india et crystallo fracta fieri et ob id nullum comparari indico. levibus autem aridisque lignis coquitur addito cypro ac nitro, maxime aegyptio. continuis fornacibus ut aes liquatur, massaeque fiunt colore pingui nigricantes. acies tanta est quacumque, ut citra sensum ullum ad ossa consecet quidquid adflaverit corporis. ex massis rursus funditur in officinis tinguiturque, et aliud flatu figuratur, aliud torno teritur, aliud argenti modo caelatur, sidone quondam his officinis nobili, siquidem etiam specula excogitaverat.

haec fuit antiqua ratio vitri. iam vero et in volturino amne italiae harena alba nascens sex milium passuum litore inter cumas atque liternum, qua mollissima est, pila molave teritur. dein miscetur iii partibus nitri pondere vel mensura ac liquata in alias fornaces transfunditur. ibi fit massa, quae vocatur hammonitrum, atque haec recoquitur et fit vitrum purum ac massa vitri candidi. iam vero et per gallias hispaniasque simili modo harena temperatur. ferunt tiberio principe excogitato vitri temperamento, ut flexile esset, totam officinam artificis eius abolitam, ne aeris, argenti, auri metallis pretia detraherentur, eaque fama crebrior diu quam certior fuit. sed quid refert, neronis principatu reperta vitri arte, quae modicos calices duos, quos appellabant petrotos, ^{hs} [vi] venderet

in genere vitri et obsiana numerantur ad similitudinem lapidis, quem in aethiopia invenit obsius, nigerrimi coloris, aliquando et tralucidi, crassiore visu atque in speculis parietum pro imagine umbras reddente. gemmas multi ex eo faciunt; vidimus et solidas imagines Divi Augusti capaci materia huius crassitudinis, dicavitque ipse pro miraculo in templo concordiae obsianos iiii elephantos. remisit et tiberius caesar heliopolitarum caerimoniis repertam in hereditate sei eius, qui praefuerat aegypto, obsianam imaginem menelai, ex qua apparet antiquior materiae origo, nunc vitri similitudine interpolata. xenocrates obsianum lapidem in india et in samnio italiae et ad oceanum in hispania tradit nasci. fit et tincturae genere obsianum ad escaria vasa et totum rubens vitrum atque non tralucens, haematinum appellatum. fit et album et murrina aut hyacinthos sappirosque imitatum et omnibus aliis coloribus, neque est alia nunc sequacior materia aut etiam picturae accommodatior. maximus tamen honos in candido tralucetibus, quam proxima crystalli similitudine. usus eorum ad potandum argenti metalla et auri pepulit. est autem caloris inpatiens, ni praecedat frigidus liquor, cum addita aqua vitreae pilae sole adverso in tantum candescant, ut vestes exurant. fragmenta teporata adglutinantur tantum, rursus tota fundi non queunt praeterquam abruptas sibimet in guttas, veluti cum calculi fiunt, quos quidam ab oculis appellant,

aliquos et pluribus modis versicolores. - vitrum sulphuri concoctum feruminatur in lapidem.

et peractis omnibus, quae constant ingenio arte naturam faciente, succurrit mirari nihil paene non igni perfici. accipit harenas, ex quibus aliubi vitrum, aliubi argentum, aliubi minium, aliubi plumbi genera, aliubi pigmenta, aliubi medicamenta fundit. igni lapides in aes solvuntur, igni ferrum gignitur ac domatur, igni aurum perficitur, igni cremato lapide caementa in tectis ligantur. alia saepius uri prodest, eademque materia aliud gignit primis ignibus, aliud secundis, aliud tertiis, quando ipse carbo vires habere incipit restinctus atque interisse creditus maioris fit virtutis. immensa, improba rerum naturae portio et in qua dubium sit, plura absumat an pariat.

est et ipsis ignibus medica vis. pestilentiae, quae obscuracione solis contrahitur, ignes si fiant, multifariam auxiliari certum est. empedocles et hippocrates id demonstravere diversis locis. “ad convolsa interiora viscera aut contusa,” M. Varro — ipsis enim verbis eius utar— “pyxis sit,” inquit, “focus. inde enim cinis lixivus potus medetur. licet videre gladiatores, cum deluserunt, hac iuvare potione.” quin et carbunculum, genus morbi, quo duos consulares nuper absumptos indicavimus, querneus carbo tritus cum melle sanat. adeo in rebus damnatis quoque ac iam nullis sunt aliqua commoda, ut carbone ecce atque cinere.

non praeteribo et unum foci exemplum romanis litteris clarum: tarquinio prisco regnante tradunt repente in foco eius comparuisse genitale e cinere masculi sexus eamque, quae insederat ibi, tanaquilis reginae ancillam ocrem captivam consurrexisse gravidam. ita servium tullium natum, qui regno successit. inde et in regia cubanti ei puero caput arsisse, creditumque laris familiaris filium. ob id compitalia ludos laribus primum instituisse.

LIBER XXXVII

ut nihil instituto operi desit, gemmae supersunt et in artum coacta rerum naturae maiestas, multis nulla parte mirabilior. tantum tribuunt varietati, coloribus, materiae, decori, violare etiam signis, quae causa gemmarum est, quasdam nefas ducentes, aliquas vero extra pretia ulla taxationemque humanarum opum arbitantes, ut plerisque ad summam absolutamque naturae rerum contemplationem satis sit una aliqua gemma. quae fuerit origo et a quibus initiis in tantum admiratio haec exarserit, diximus quadamtenus in mentione auri anulorumque. fabulae primordium a rupe caucasi tradunt, promethei vinculorum interpretatione fatali, primumque saxi eius fragmentum inclusum ferro ac digito circumdatum: hoc fuisse anulum et hoc gemmam.

his initiis coepit auctoritas in tantum amorem elata, ut polycrati samio, insularum ac litorum tyranno, felicitatis suae, quam nimiam fatebatur etiam ipse qui felix erat, satis piamenti in unius gemmae voluntario damno videretur, si cum fortunae volubilitate paria fecisset, planeque ab invidia eius abunde se redimi putaret, si hoc unum doluisset, adsiduo gaudio lassus. ergo proventus navigio in altum anulum mersit. at illum piscis, eximia magnitudine regi natus, escae vice raptum, ut faceret ostentum, in culina domino rursus fortunae insidiantis manu reddidit. sardonychem eam gemmam fuisse constat, ostenduntque romae, si credimus, in concordiae delubro cornu aureo augustae dono inclusam et novissimum prope locum praelatis multis optinentem.

post hunc anulum regis alterius in fama est gemma, pyrrhi illius, qui adversus romanos bellum gessit. namque habuisse dicitur achaten, in qua novem musae et apollo citharam tenens spectarentur, non arte, sed naturae sponte ita discurrentibus maculis, ut musis quoque singulis sua redderentur insignia. nec deinde alia, quae tradatur magnopere, gemmarum claritas exstat apud auctores, praeterquam ismenian choraulen multis fulgentibusque uti solitum, comitante fabula vanitatem eius: indicato in cypro sex aureis smaragdo, ubi erat scalpita amymone, iussisse numerari et, cum duo relati essent, “male, hercules, factum” dixisse, “multum enim detractum gemmae dignitati.” hic videtur instituisse, ut omnes musicae artis hac quoque ostentatione censerentur, veluti dionysodorus, aequalis eius et aemulus, ut sic quoque non par videretur qui tertius eodem tempore inter musicos fuit: nicomachus enim multas tantum habuisse gemmas traditur, sed nulla peritia electas. et forte quadam his exemplis initio voluminis oblatis adversus istos, qui sibi hac ostentatione adrogant, ut palam sit eos tibicinum gloria tumere:

polycratis gemma, quae demonstratur, intacta inlibataque est; ismeniae aetate multos post annos apparet scalpi etiam smaragdus solitos. confirmat hanc eandem opinionem edictum alexandri magni, quo vetuit in hac gemma ab alio se scalpi quam ab pyrgotele, non dubie clarissimo artis eius. post eum apollonides et cronius in gloria fuere quique Divi Augusti imaginem simillime expressit, qua postea principes signant, dioscurides. sulla dictator traditione

iugurthae semper signavit. est apud auctores et intercatiensem illum, cuius patrem scipio aemilianus ex provocatione interfecerat, pugnae effigie eius signasse, volgato stilonis praeconini sale, quidnam fuisse facturum, si scipio a patre eius interemptus fuisset. Divus Augustus inter initia sphinge signavit. duas in matris anulis eas indiscretas similitudinis invenerat. altera per bella civilia absente ipso signavere amici epistulas et edicta, quae ratio temporum nomine eius reddi postulabat, non inficeto lepore accipientium, aenigmata adferre eam sphingem. quippe etiam maecenatis rana per collationes pecuniarum in magno terrore erat. Augustus postea ad devitanda convicia sphingis alexandri magni imagine signavit.

gemmas plures primus omnium romae habuit - quod peregrino appellant nomine dactyliothecam — privignus sullae Scaurus, diuque nulla alia fuit, donec pompeius magnus eam, quae mithridatis regis fuerat, inter dona in capitolio dicaret, ut Varro alique aetatis eius auctores confirmant, multum praelata Scauri. hoc exemplo caesar dictator sex dactyliothecas in aede veneris genetricis consecravit, marcellus octavia genitus unam in aede palatini apollinis.

victoria primum ad margaritas gemmasque mores inclinavit, sicut l. scipionis et cn. manli ad caelatum argentum et vestes attalicas et triclinia aerata, sicut l. mummi ad corinthia et tabulas pictas. id uti planius noscatur, verba ex ipsis pompeii triumphorum actis subiciam. ergo tertio triumpho, quem de piratis, asia, ponto gentibusque et regibus in vii volumine operis huius indicatis m. pisone m. messala cos. pr. k. octobres natali suo egit, transtulit alveum cum tesserae lusorium e gemmis duabus latum pedes tres, longum pedes quattuor - ne quis effetas res dubitet nulla gemmarum magnitudine hodie prope ad hanc amplitudinem accedente, in eo fuit luna aurea pondo xxx - , lectos tricliniares tres, vasa ex auro et gemmis abacorum novem, signa aurea tria minervae, martis, apollinis, coronas ex margaritis xxxiii, montem aureum quadratum cum cervis et leonibus et pomis omnis generis circumdata vite aurea, musaeum ex margaritis, in cuius fastigio horologium. erat et imago cn. pompeii e margaritis, illo relicino honore grata, illius probi oris venerandique per cunctas gentes, ficta ex margaritis, ita severitate victa et veriore luxuriae triumpho! numquam profecto inter illos viros durasset cognomen magni, si prima victoria sic triumphasset! e margaritis, magne, tam prodiga re et feminis reperta, quas gerere te fas non sit, fieri tuos voltus sic te pretiosum videri non ergo illa tua similior est imago, quam pyrenaei iugis inposuisti grave profecto, foedum probum erat, ni verius saevum irae deorum ostentum id credi oporteret clareque intellegi posset iam tum illud caput orientis opibus sine reliquo corpore ostentatum. cetera triumphus eius quam virilia! hs [30mm]30 r. p. data, legatis et quaestoribus, qui oras maris defendissent, hs [30m]30, militibus singulis hs sena milia. tolerabiliorem tamen causam fecit c. principis, qui super cetera muliebria soccos induebat e margaritis, aut neronis principis, qui sceptrum et personas et cubilia viatoria unionibus construebat. quin immo etiam ius videmur

perdidisse corripiendi gemmata potoria et varia supellectilis genera, anulos translucentes. quae enim non luxuria innocentior existimari possit

eadem victoria primum in urbem myrrhina invexit, primusque pompeius capides et pocula ex eo triumpho capitolino iovi dicavit. quae protinus ad hominum usum transiere, abacis etiam escariisque vasis expetitis; et crescit in dies eius luxuria. myrrhino [lxx] hs empto, capaci plane ad sextarios tres calice, potavit ... anus consularis, ob amorem adroso margine eius, ut tamen iniuria illa pretium auget; neque est hodie myrrhini alterius praestantior indicatura. idem in reliquis generis eius quantum voraverit, licet aestimare ex multitudine, quae tanta fuit, ut auferente liberis eius nerone exposita occuparent theatrum peculiare trans tiberim in hortis, quod a populo impleri canente se, dum pompeiano proludit, etiam neroni satis erat. vidi tunc adnumerari unius scyphi fracti membra, quae in dolorem, credo, saeculi invidiamque fortunae tamquam alexandri magni corpus in conditorio servari, ut ostentarentur, placebat. t. petronius consularis moriturus invidia neronis, ut mensam eius exheredaret, trullam myrrhinam hs [ccc] emptam fregit; sed nero, ut par erat principem, vicit omnes hs [30x]30 capidem unam parando. memoranda res tanti imperatorem patremque patriae bibisse!

oriens myrrhina mittit. inveniuntur ibi pluribus locis nec insignibus, maxime parthici regni, praecipua tamen in carmania. umorem sub terra putant calore densari. amplitudine numquam parvos excedunt abacos, crassitudine raro quanta dicta sunt potoria. splendor est iis sine viribus nitorque verius quam splendor. sed in pretio varietas colorum subinde circumagentibus se maculis in purpuram candoremque et tertium ex utroque, ignescente veluti per transitum coloris purpura aut rubescente lacteo. sunt qui maxime in iis laudent extremitates et quosdam colorum percussus, quales in caelesti arcu spectantur. iam aliis maculae pingues placent - tralucere quicquam aut pallere vitium est - itemque sales verrucaeque non eminentes, sed, ut in corpore etiam, plerumque sessiles. aliqua et in odore commendatio est.

contraria huic causa crystallum facit, gelu vehementiore concreto. non aliubi certe reperitur quam ubi maxime hibernae nives rigent, glaciemque esse certum est, unde nomen graeci dedere. oriens et hanc mittit, quoniam indiciae nulla praefertur. nascitur et in asia, vilissima circa alabanda et orthosiam finitimisque, item in cypro, sed laudata in europa alpium iugis. iuba auctor est et in quadam insula rubri maris ante arabiam sita nasci, quae necron vocetur, et in ea, quae iuxta gemmam topazum ferat, cubitalemque effossam a pythagora ptolemaei praefecto; cornelius bocchus et in lusitania perquam mirandi ponderis in ammaeensis iugis, depressis ad libramentum aquae puteis. hoc mirum, quod xenocrates ephesius tradit, aratro in asia et cypro excitari; non enim reperiri in terreno nec nisi inter cautes creditum fuerat. similis veri est, quod idem xenocrates tradit, et torrentibus saepe deportari. sudines negat nisi ad meridiem spectantibus locis nasci. quod certum est, non reperitur in aquosis, quamquam in regione praegelida, vel si ad vada usque glaciuntur amnes. e caelesti umore puraque nive id fieri necesse est; ideo

caloris inpatiens nisi in frigido potu abdicatur. quare nascatur sexangulis lateribus, non facile ratio iniri potest, eo magis quod neque in mucronibus eadem species est et ita absolutus laterum levor est, ut nulla id arte possit aequari.

magnitudo amplissima adhuc visa nobis erat quam in capitolio livia Augusti dicaverat, librarum circiter cl. xenocrates idem auctor est vas amphorale visum, et aliqui ex india sextariorum quattuor. - (nos liquido adfirmare possumus in cautibus alpium nasci adeo inviis plerumque, ut fune pendentes eam extrahant.) - peritis signa et indicia nota sunt. infestantur plurimis vitiis, scabro ferumine, maculosa nube, occulta aliquando vomica, praeduro fragilique centro, item sale appellato. est et rufa aliquis robigo, aliis capillamentum rimae simile. hoc artifices caelatura occultant. quae vero sine vitio sint, pura esse malunt, acenteta appellantes, nec spumei coloris, sed limpidae aquae. postrema auctoritas in pondere est. invenio apud medicos, quae sint urenda corporum, non aliter utilius uri putari quam crystallina pila adversis opposita solis radiis. alius et in his furor, his centum quinquaginta milibus trullam unam non ante multos annos mercata matre familias nec divite. nero amissarum rerum nuntio accepto duos calices crystallinos in suprema ira fregit inlisos. haec fuit ultio saeculum suum punientis, ne quis alius iis biberet. fragmenta sarciri nullo modo queunt. mire his ad similitudinem accessere vitrea, sed prodigii modo, ut suum pretium auxerint, crystalli non deminuerint.

proximum locum in deliciis, feminarum tamen adhuc tantum, sucina optinent, eandemque omnia haec quam gemmae auctoritatem; sane priora illa aliquis de causis, crystallina frigido potu, myrrhina utroque; in sucinis causam ne deliciae quidem adhuc excogitare potuerunt.

occasio est vanitatis graecorum detegendae: legentes modo aequo perpetiantur animo, cum hoc quoque intersit vitae scire, non quidquid illi prodidere mirandum. phae+thontis fulmine icti sorores luctu mutatas in arbores populos lacrimis electrum omnibus annis fundere iuxta eridanum amnem, quem padum vocavimus, electrum appellatum, quoniam sol vocitatus sit elector, plurimi poe+tae dixere primique, ut arbitror, aeschylus, philoxenus, euripides, nicander, satyrus. quod esse falsum italiae testimonio patet. diligentiores eorum electridas insulas in mari hadriatico esse dixerunt, ad quas delaberetur pado. qua appellatione nullas umquam ibi fuisse certum est, nec vero ullas ita positas esse, in quas quidquam cursu padi devehi posset. nam quod aeschylus in hiberia hoc est in hispania eridanum esse dixit eundemque appellari rhodanum, euripides rursus et Apollonius in hadriatico litore confluere rhodanum et padum, faciliorem veniam facit ignorati sucini tanta ignorantia orbis. modestiores, sed aequae falsum, prodidere in extremis hadriatici sinus inviis rupibus arbores stare, quae canis ortu hanc effunderent cummim. theophrastus effodi in liguria dixit, chares vero phae+thontem in aethiopia Ἀμμωνος νῆσῳ obisse, ibi et delubrum eius esse atque oraculum electrumque gigni. philemon fossile esse et in scythia erui duobus locis,

candidum atque cerei coloris quod vocaretur electrum, in alio fulvum quod appellaretur sualiternicum. demonstratus lyncurium vocat et fieri ex urina lyncum bestiarum, e maribus fulvum et igneum, e feminis languidiis atque candidum; alios id dicere langurium et esse in italia bestias langueros. zenothemis langas vocat easdem et circa padum iis vitam adsignat, sudines arborem, quae gignat in liguria, vocari lynca. in eadem sententia et metrodorus fuit. sotacus credidit in britannia petris effluere, quas electridas vocavit, pytheas guionibus, germaniae genti, accoli aestuarium oceani metuonidis nomine spatio stadiorum sex milium; ab hoc diei navigatione abesse insulam abalum; illo per ver fluctibus advehi et esse concreti maris purgamentum; incolas pro ligno ad ignem uti eo proximisque teutonibus vendere. huic et timaeus credidit, sed insulam basiliam vocavit. philemon negavit flammam ab electro reddi. nicias solis radiorum sucum intellegi voluit hoc; circa occasum vehementiores in terram actos pinguem sudorem in ea relinquere, oceani deinde aestibus in germanorum litora eici. in aegypto nasci simili modo - vocari sacal - , item in india gratiusque et ipso ture esse indis; in syria quoque feminas verticillos inde facere et vocare harpaga, quia folia paleasque et vestium fimbrias rapiat. theochrestus oceano id exaestuante ad pyrenaei promunturia adpelli, quod et xenocrates credidit, qui de his nuperrime scripsit vivitque adhuc. asarubas tradit iuxta atlanticum mare esse lacum cephisida, quem mauri vocent electrum. hunc sole excalfactum e limo reddere electrum fluitans. mnaseas africae locum sicyonem appellat et crathin amnem in oceanum effluentem e lacu, in quo aves, quas meleagridas et penelopas vocat, vivere; ibi nasci ratione eadem qua supra dictum est. theomenes syrtim iuxta magnam hortum hesperidon esse et stagnum electrum, ibi arbores populos, quarum e cacuminibus in stagnum cadat; colligi autem ab virginibus hesperidum. ctesias in indis flumen esse hypobarum, quo vocabulo significetur omnia bona eum ferre; fluere a septentrione in exortivum oceanum iuxta montem silvestrem arboribus electrum ferentibus. arbores eas psithachoras vocari, qua appellatione significetur praedulcis suavitas. mithridates in carmaniae litoribus insulam esse, quam vocari seritam, cedri genere silvosam, inde defluere in petras. xenocrates non sucinum tantum in italia, sed et thium vocari, a scythiis vero sacrium, quoniam et ibi nascatur; alios putare in numidia ex limo gigni. super omnes est sophocles poeta tragicus, quod equidem miror, cum tanta gravitas ei cothurni sit, praeterea vitae fama alias principi loco genito athenis et rebus gestis et exercitu ducto. hic ultra indiam fieri dixit e lacrimis meleagridum avium meleagrum deflentium. quod credidisse eum aut sperasse aliis persuaderi posse quis non miretur quamve pueritiam tam inperitam posse reperiri, quae avium ploratus annuos credat lacrimasve tam grandes avesve, quae a graecia, ubi meleager periit, ploratum adierint indos quid ergo non multa aeque fabulosa produnt poetae sed hoc in ea re, quae cotidie invehatur atque abundet ac mendacium coarguat, serio quemquam dixisse summa hominum contemptio est et intoleranda mendaciorum inpunitas.

certum est gigni in insulis septentrionalis oceani et ab germanis appellari glaesum, itaque et ab nostris ob id unam insularum glaesariam appellatam, germanico caesare res ibi gerente classibus, austeraviam a barbaris dictam. nascitur autem defluente medulla pinei generis arboribus, ut cummis in cerasis, resina in pinis erumpit umoris abundantia. densatur rigore vel tempore ac mari, cum ipsum intumescens aestus rapuit ex insulis, certa in litora expellitur, ita volubile, ut pendere videatur atque non sidere in vado. arboris sucum esse etiam prisci nostri credidere, ob id sucinum appellant. pinei autem generis arboris esse indicio est pineus in adtritu odor et quod accensum taedae modo ac nidore flagrat. adfertur a germanis in pannoniam maxime provinciam, et inde veneti primum, quos enetos graeci vocaverunt, famam rei fecere proximique pannoniae et agentes circa mare hadriaticum. pado vero adnexa fabula est evidente causa, hodieque transpadanorum agrestibus feminis monilium vice sucina gestantibus, maxime decoris gratia, sed et medicinae; creditur quippe tonsillis resistere et faucium vitiis, varie genere aquarum iuxta alpis infestante guttura hominum. dc m p. fere a carnunto pannoniae abesse litus id germaniae, ex quo invehitur, percognitum nuper, vivitque eques r. ad id comparandum missus ab iuliano curante gladiatorium munus neronis principis. qui et commercia ea et litora peragravit, tanta copia invecta, ut retia coercendis feris podium protegentia sucinis nodarentur, harena vero et libitina totusque unius diei apparatus in variatione pompae singulorum dierum esset e sucino. maximum pondus is glaebae attulit xiii librarum. nasci et in india certum est. archelaus, qui regnavit in cappadocia, illinc pineo cortice inhaerente tradit advehi rude polirique adipe suis lactentis incoctum. liquidum id primo destillare argumento sunt quaedam intus traluentia, ut formicae culicesque et lacertae, quae adhaesisse musteo non est dubium et inclusa durescente eodem remansisse.

genera eius plura sunt. ex iis candida odoris praestantissimi, sed nec his nec cerinis pretium. fulvis maior auctoritas. ex iis etiamnum amplius traluentibus, praeterquam si nimio ardore flagrent; imaginem igneam in iis esse, non ignem, placet. summa laus falernis a vini colore dictis, molli fulgore perspicuis in quibus et decocti mellis lenitas placeat. verum hoc quoque notum fieri oportet, quocumque modo libeat, ea tingui, haedorum sebo et anchusae radice, quippe iam et conchylio inficiuntur. ceterum attritu digitorum accepta caloris anima trahunt in se paleas et folia arida et philyras, ut magnes lapis ferrum. ramenta quoque eius oleo addito flagrant dilucidius diutiusque quam lini medulla. taxatio in deliciis tanta, ut hominis quamvis parva effigies vivorum hominum vigentiumque pretia exsuperet, prorsus ut castigatio una non sit satis. in corinthiis aes placet argento auroque mixtum, in caelatis ars et ingenia; myrrhinorum et crystallinorum diximus gratiam; uniones capite circumferuntur, gemmae digitis; in omnibus denique aliis vitiis aut ostentatio aut usus placet: in sucinis sola deliciarum conscientia. domitius nero in ceteris vitae suae portentis capillos quoque poppaeae coniugis suae in hoc nomen adoptaverat quodam etiam carmine sucinos appellando, quoniam

nullis vitiis desunt pretiosa nomina; ex eo tertius quidam hic colos coepit expeti matronis.

usus tamen aliquis sucinorum invenitur in medicina, sed non ob hoc feminis placent. infantibus adalligari amuleti ratione prodest. callistratus prodesse etiam cuicumque aetati contra lymphationes tradit et urinae difficultatibus potum adalligatumque. hic et differentiam novam fecit appellando chryselectrum quod sit coloris aurei et matutino gratissimi aspectus, rapacissimum ignium, si iuxta fuerint, celerrime ardescens. hoc collo adalligatum mederi febribus et morbis, tritum vero cum melle ac rosaceo aurium vitiis et, si cum melle attico teratur, oculorum quoque obscuritati, stomachi etiam vitiis vel per se farina eius sumpta vel cum mastiche pota ex aqua. - sucina et gemmis, quae sunt tralucidae, adulterandis magnum habent locum, maxime amethystis, cum tamen omni, ut diximus, colore tinguntur.

de lyncurio proxime dici cogit auctorum pertinacia, quippe, etiamsi non electrum id, tamen gemmam esse contendunt, fieri autem ex urina quidem lyncis, sed et genere terrae, protinus eo animali urinam operiente, quoniam invidet homini, ibique lapidescere. esse autem, qualem in sucinis, colorem igneum, scalpique nec folia tantum aut stramenta ad se rapere, sed aeris etiam ac ferri lamnas, quod diocli cuidam theophrastus quoque credit. ego falsum id totum arbitror nec visam in aevo nostro gemmam ullam ea appellatione. falsum et quod de medicina simul proditur, calculos vesicae poto eo elidi et morbo regio succurri, si ex vino bibatur aut spectetur etiam.

nunc gemmarum confessa genera dicemus ab laudatissimis orsi, nec vero id solum agemus, sed etiam maiore utilitate vitae coarguemus magorum infandam vanitatem, quando vel plurima illi prodidere de gemmis ab medicinae blandissima specie ad prodigia transgressi.

maximum in rebus humanis, non solum inter gemmas, pretium habet adamas, diu non nisi regibus et iis admodum paucis cognitus. ita appellabatur auri nodus in metallis repertus perquam raro comes auri nec nisi in auro nasci videbatur. veteres eum in aethiopum metallis tantum inveniri existimavere inter delubrum mercuri et insulam meroen, dixeruntque non ampliorem cucumis semine aut colore dissimilem inveniri. nunc primum genera eius sex noscuntur: indici non in auro nascentis et quadam crystalli cognatione, siquidem et colore tralucido non differt et laterum sexangulo levore, turbinati in mucronem e duabus contrariis partibus, quo magis miremur, ut si duo turbines latissimis partibus iungantur, magnitudine vero etiam abellani nuclei. similis est huic arabius, minor tantum, similiter et nascens. ceteris pallor argenti et in auro non nisi excellentissimo natalis. incudibus hi deprehenduntur ita respuentes ictus, ut ferrum utrimque dissultet, incudes ipsae etiam exiliant. quippe duritia est inenarrabilis, simulque ignium victrix natura et numquam incalescens, unde et nomen interpretatione graeca indomita vis accepit. unum ex iis vocant cenchron, milii magnitudine, alterum macedonium, in philippico auro repertum; hic est cucumis semini par. post hos cyprius vocatur in cypro repertus, vergens ad aereum colorem, sed medica

vi, de qua dicemus, efficacissimus. post hunc siderites ferrei splendoris, pondere ante ceteros, sed natura dissimilis. namque et ictibus frangi et alio adamante perforari potest, quod et cyprio evenit, breviterque ut degeneres nominis tantum auctoritatem habent.

nunc quod totis voluminibus his docere conati sumus de discordia rerum concordiaque, quam antipathian graeci vocavere ac sympathian, non aliter clarius intellegi potest, siquidem illa invicta vis, duarum violentissimarum naturae rerum ferri igniumque contemptrix, hircino rumpitur sanguine, neque aliter quam recenti calidoque macerata et sic quoque multis ictibus, tunc etiam praeterquam eximias incudes malleosque ferreos frangens. cuius hoc invento quove casu repertum aut quae fuit coniectura experiendi rem inmensi pretii in foedissimo animalium numinum profecto talis inventio est et hoc munus omne, nec quaerenda ratio in ulla parte naturae, sed voluntas! cum feliciter contigit rumpere, in tam parvas friatur crustas, ut cerni vix possint. expetuntur hae scalptoribus ferroque includuntur, nullam non duritiam ex facili cavantes. adamas dissidet cum magnete in tantum, ut iuxta positus ferrum non patiatur abstrahi aut, si admotus magnes adprehenderit, rapiat atque auferat. adamas et venena vincit atque irrita facit et lymphationes abigit metusque vanos expellit a mente. ob id quidam eum ananciten vocavere. - metrodorus scepsius in eadem germania basilia insula nasci, in qua et sucinum, solus, quod equidem legerim, dicit et praefert arabicis. quod esse falsum quis dubitet

proximum apud nos indicis arabicisque margaritis pretium est, de quibus in nono diximus volumine inter res marinas.

tertia auctoritas smaragdis perhibetur pluribus de causis, quippe nullius coloris aspectus iucundior est. nam herbas quoque silentes frondesque avide spectamus, smaragdos vero tanto libentius, quoniam nihil omnino viridius comparatum illis viret. praeterea soli gemmarum contuitu inplent oculos nec satiant. quin et ab intentione alia aspectu smaragdi recreatur acies, scalpentibusque gemmas non alia gratior oculorum refectio est: ita viridi lenitate lassitudinem mulcent. praeterea longinquo amplificantur visu inficientes circa se reperiuntur aëra, non sole mutati, non umbra, non lucernis, semperque sensim radiantes et visum admittentes ad crassitudinem sui facilitate tralucida, quod etiam in aquis nos iuvat. iidem plerumque concavi, ut visum conligant. quam ob rem decreto hominum iis parcutur scalpi vetitis. quamquam scythicorum aegyptiorumque duritia tanta est, ut non queant vulnerari. quorum vero corpus extentum est, eadem qua speculatio supini rerum imagines reddunt. nero princeps gladiatorum pugnas spectabat in smaragdo.

genera eorum duodecim: nobilissimi scythici, ab ea gente, in qua reperiuntur, appellati. nullis maior austeritas nec minus vitii; quantum smaragdi a gemmis distant, tantum scythicus a ceteris smaragdis. proximam laudem habent, sicut et sedem, bactriani. in commissuris saxorum colligere eos dicuntur etesiis flantibus; tunc enim tellure deoperta internitent, quia iis ventis harenae maxime moventur. sed hos minores multo scythicis esse

tradunt. tertium locum aegyptii habent. eruuntur circa copton, oppidum thebaidis, collibus excavatis.

reliqua genera in metallis aerariis inveniuntur, quapropter principatum ex iis optinent cyprii. dos eorum est in colore liquido nec diluto, verum ex umido pingui quaque perspicitur imitante tralucidum maris, pariterque ut traluceat et niteat hoc est ut colorem expellat, aciem recipiat. ferunt in ea insula tumulo reguli hermiaie iuxta cetarias marmoreo leoni fuisse inditos oculos e smaragdis ita radiantibus etiam in gurgitem, ut territi thynni refugerent, diu mirantibus novitatem piscatoribus, donec mutavere oculis gemmas. - sed et vitia demonstrari convenit in tam prodigis pretiis. sunt quidem omnium eadem, quaedam tamen nationum peculiaria, sicut in homine. ergo cyprii, varie glauci magisque ac minus in eodem smaragdo aliis partibus, tenorem illum scythicae austeritatis non semper custodiunt. ad hoc quibusdam intercurrit umbra, surdusque fit colos, qui inprobatur etiam dilutior. hinc genera distinguntur, ut sint aliqui obscuri, quos vocant caecos, alii densi nec e liquido tralucidi, quidam varii, quidam nubecula obducti. aliud est haec quam umbra, de qua diximus. nubecula albicantis est vitium, cum viridis non pertransit aspectus, sed aut intus occurrit aut excipit in fine visum candor. haec coloris sunt vitia, item corporis capillamentum, sal, plumbago, quae communia fere sunt.

ab his aethiopici laudantur ab copto dierum itinere, ut auctor est iuba, xxv, acriter virides, sed non facile puri aut concolores. democritus in hoc genere ponit thermiaeos et persicos, illos intumescences pinguius, persicos vero non tralucidos, sed iucundi tenoris visum implere, quem non admittant, felium pantherarumque oculis similes, namque et illos radiare nec perspicere, eosdem in sole hebetari, in umbra refulgere et longius quam ceteros nitere. omnium horum etiamnum vitium, quod fellis colorem aut acris olei habent, dilucidi quidem ac liquidi, sed non virides. haec vitia in atticis maxime sentiuntur in argentariis metallis repertorum. in loco, qui thoricos vocatur, semper minus pingues, sed ex longinquo speciosiores. frequens est in his et plumbago, hoc est ut in sole plumbei videantur. illud peculiare, quod quidam ex his senescunt, paulatim viriditate evanida, et sole quoque laeduntur. post hos medici plurimum habent varietatis, interdum aliquid et e sappiro. hi sunt fluctuosi ac rerum imagines complexi, papaverum verbi gratia aut avium catulorumque vel pinnarum. quidam tamen virides nasci videntur, quoniam oleo meliores fiunt, neque est aliorum amplitudo maior. calchedonii - nescio an in totum - exoleverunt, postquam metalla aeris ibi defecerunt, et semper tamen vilissimi fuere minimique, iidem fragiles et coloris incerti et virentium in caudis pavonum columbarumque e collo plumis similiter ad inclinationem magis aut minus lucidi, venosi iidem squamosique. erat et peculiare in iis vitium sarcion appellatum, hoc est quaedam gemmae caro. mons est iuxta calchedonem, in quo legebantur, smaragdites vocatus. iuba auctor est smaragdum, quam chloran vocent, in arabia aedificiorum ornamentis includi et lapidem, quem alabastriten aegyptii vocent, complures vero e proximis et in taygeto monte erui medicis similes et alios in sicilia.

inseritur smaragdis et quae vocatur tanos e persis veniens gemma, ingrata viridis atque intus sordida, itidem chalcosmaragdus e cypro, turbida aereis venis. theophrastus tradit in aegyptiorum commentariis reperiri regi eorum a rege babylonio muneri missum smaragdum quattuor cubitorum longitudine ac trium latitudine, et fuisse apud eos in iovis delubro obeliscum e quattuor smaragdis quadraginta cubitorum longitudine, latitudine vero in parte quattuor, in parte duorum, se autem scribente esse in tyro herculis templo stelen amplam e smaragdo, nisi potius pseudosmaragdus sit, nam et hoc genus reperiri, et in cypro inventum ex dimidia parte smaragdum, ex dimidia iaspidem, nondum umore in totum transfigurato. apion cognominatus plistonices paulo ante scriptum reliquit esse etiam nunc in labyrintho aegypti colosseum serapim e smaragdo novem cubitorum.

eandem multis naturam aut certe similem habere berulli videntur. india eos gignit, raro alibi repertos. poliuntur omnes sexangula figura artificum ingeniis, quoniam hebes unitate surda color percussu angulorum excitetur. aliter politi non habent fulgorem. probatissimi ex iis sunt qui viriditatem maris puri imitantur, proximi qui vocantur chrysoberulli, paulo pallidiores, sed in aureum colorem exeunte fulgore. vicinum huic genus est, sed pallidius et a quibusdam proprii generis existimatum vocatumque chrysoprasum. quarto loco numerantur hyacinthizantes, quinto quos ae+roidis vocant, postea cerini ac deinde oleagini, hoc est colore olei, postremi crystallo similes. hi fere capillamenta habent sordescque, alioqui evanidi, quae sunt omnia vitia. indi mire gaudent longitudine eorum solosque gemmarum esse praedicant, qui carere auro malint; ob id perforatos elephantorum saetis subligant. convenit non oportere perforari quorum sit absoluta bonitas, umbilicis tantum ex auro capita comprehendentibus. ideo cylindros ex iis malunt facere quam gemmas, quoniam est summa commendatio in longitudine. quidam et angulosos statim putant nasci et perforatos gratiores fieri medulla candoris exempta additoque auri percussu aut omnino castrata perspicuitati crassitudine. vitia praeter iam dicta eadem fere, quae in smaragdis, et pterygia. in nostro orbe aliquando circa pontum inveniri putantur. indi et alias quidem gemmas crystallum tingendo adulterare invenerunt, sed praecipue berullos.

minimum iidemque plurimum ab iis differunt opali, smaragdis tantum cedentes. india sola et horum mater est. qui ut pretiosissimarum gloria compositi gemmarum maxime inenarrabilem difficultatem adferunt. est in his carbunculi tenuior ignis, est amethysti fulgens purpura, est smaragdi virens mare, cuncta pariter incredibili mixtura lucentia. alii summam fulgoris armenio colori pigmentorum aequari credunt, alii sulphuris ardentis flammae aut ignis oleo accensi. magnitudo abellanam nucem aequat, insignis etiam apud nos historia, siquidem exstat hodieque huius generis gemma, propter quam ab antonio proscriptus est nonius senator, filius strumae noni eius, quem catullus poeta in sella curuli visum indigne tulit, avusque servili noniani, quem consulem vidimus. ille proscriptus fugiens hunc e fortunis omnibus anulum abstulit secum. certum est sestertio vicies tum aestimatum, sed mira

antoni feritas atque luxuria propter gemmam proscribentis, nec minus noni contumacia proscriptionem suam amantis, cum etiam ferae abrosa parte corporis, propter quam periclitari se sciant, et relicta redimere se credantur.

vitia opalis sunt, si color in florem herbae, quae vocatur heliotropium, exeat aut in crystallum aut grandinem, si sal interveniat aut scabritia aut puncta oculis occurrentia. nullos magis fraus indiscreta similitudine vitro adulterat. experimentum in sole tantum: falsis enim contra radios libratibus digito ac pollice unus atque idem tralucet color in se consumptus; veri fulgor subinde variatur et modo ex hoc plus, modo ex illo spargit, fulgorque lucis in digitis funditur. hanc gemmam propter eximiam gratiam plerique appellavere paederota. qui privatum genus eius faciunt, sangenon ab indis vocari tradunt. nasci dicitur in aegypto et in arabia, et vilissima in ponto, item in galatia ac thaso et cypro. qui praecellit ex his, opali quidem gratiam habet, sed mollius nitet, raro non scaber. summa illi coloris ex ae+re et purpura constat, viriditas smaragdi deest. melior ille, cuius fulgor vini colore fuscatur, quam qui diluitur aquae.

hactenus de principatu convenit mulierum maxime senatusconsulto. minus certa sunt de quibus et viri iudicant; singulorum enim libido pretia singulis facit praecipueque aemulatio, velut cum claudius caesar smaragdus induebat vel sardoniches. primus autem romanorum sardoniche usus est africanus prior, ut tradit demonstratus, et inde romanis gemmae huius auctoritas. quam ob rem et proximum ei dabimus locum.

sardoniches olim, sicut ex ipso nomine apparet, intellegebantur candore in sarda, hoc est veluti carne ungui hominis inposita, et utroque tralucido. talesque esse indicas tradunt ismenias, demonstratus, zenothemis, sotacus, hi quidem duo reliquas omnes, quae non traluceant, caecas appellantes. quae nunc abstulere nomen, nullo sardarum vestigio indicarum, arabicae sunt, coeperuntque pluribus hae gemmae coloribus intellegi, radice nigra aut caeruleum imitante et ungue minium, redimitum candido pingui, nec sine quadam spe purpurae candore in minium transeunte. has indis non habitas in honore zenothemis scribit, tantae alias magnitudinis, ut inde capulos factitarent - etenim constat ibi torrentibus detegi - , placuisse in nostro orbe initio, quoniam solae prope gemmarum scalptae ceram non auferrent. persuasimus deinde indis, ut ipsi quoque iis gauderent. utitur perforatis vulgus in collo; et hoc nunc est indicarum argumentum. arabicae excellunt candore, circulo praelucido atque non gracili neque in recessu gemmae aut in deiectu renidente, sed in ipsis umbonibus nitente, praeterea substrato nigerrimi coloris. hoc in indicis caeruleum aut corneum invenitur. item circuli albi quaedam in iis caelestis arcus anhelatio est, superficies vero locustarum maris, crustis rubentibus. nam melleae aut faeculentae - hoc enim nomen est vitio - inprobantur, aut si zona alba fundat se, non colligat, simili modo si ex alio colore admittat in se aliquid enormiter. nihil in sua sede interpellari alieno placet. sunt et armeniae, cetera probandae, sed pallida zona.

exponenda est et onychis ipsius natura propter nominis societatem. hoc

aliubi lapidis, hic gemmae vocabulum est. sudines dicit in gemma esse candorem unguis humani similitudine, item chrysolithi colorem et sardae et iaspidis, zenothemis indicam onychem plures habere varietates, igneam, nigram, corneam, cingentibus candidis venis oculi modo, intervenientibus quarundam et obliquis venis. sotacus et arabicam tradit onychem distare, quod indica igniculos habeat albis cingentibus zonis singulis pluribusve aliter quam in sardonyche indica; illic enim momentum esse, hic circulum; arabicas onychas nigras inveniri candidis zonis; satyrus carnosas esse indicas, parte carbunculi, parte chrysolithi et amethysti, totumque id genus abdicat; veram autem onychem plurimas variasque cum lacteis habere venas, omnium in transitu colore inenarrabili et in unum redeunte concentum suavitate grata.

nec sarda differenda est, huic gemmae dividua ex eodem et ipsa nomine, obiterque omnium ardentium gemmarum indicanda natura.

principatum habent carbunculi a similitudine ignium appellati, cum ipsi non sentiant ignes, a quibusdam ob hoc acaustoe appellati. horum genera indici et garamantici, quos et carchedonios vocavere propter opulentiam carthaginis magnae. adiciunt aethiopicos et alabandicos in orthosia cariae nascentes, sed qui perficiantur alabandis. praeterea in omni genere masculi appellantur acriores et feminae languidius refulgentes. in masculis quoque observant liquidiores aut flammae nigrioris et quosdam ex alto lucidos ac magis ceteris in sole flagrant, optimos vero amethystizontas, hoc est quorum extremus igniculus in amethysti violam exeat, proximos illis, quos vocant syrfitas, pinnato fulgore radiantes. inveniri autem ubi maxime sit solis repercussus. satyrus indicos non esse claros dicit ac plerumque sordidos ac semper fulgoris retorridi, aethiopicos pingues lucemque non fundentes convulso igne flagrare. callistratus fulgorem carbunculi debere candidum esse, ut positus extremo visu nubilante sit, si attollatur, exardescere fulgore - ob id plerique hunc carbunculum candidum vocavere, eum, qui languidius lucet, lignyzontem - ; carchedonios multo minores esse, indicos etiam sextarii unius mensura cavari. archelaus carchedonios nigrioris aspectus esse, sed igni vel sole et inclinatione acrius quam ceteros excitari; eosdem obumbrante tecto purpureos videri, sub caelo flammeos, contra radios solis scintillare, ceras signantibus his liquescere, quamvis in opaco. multi indicos carchedoniis candidiores esse et e diverso inclinatione hebetari scripsere, etiamnum in carchedoniis maribus stellam intus ardere, feminas fulgorem universum fundere extra se, alabandicos nigriores ceteris esse scabrosque. et circa miletum nascuntur in terra coloris eiusdem, ignem minime sentientes. theophrastus auctor est et in orchomeno arcadiae inveniri et in chio, illos nigriores, e quibus et specula fieri; esse et troezenios varios intervenientibus maculis albis, item corinthios, sed pallidiores e candido; a massilia quoque inportari. bocchus et in olisiponensi erui scripsit, magno labore ob argillam soli adusti. - nec est aliud difficilius quam discernere haec genera; tanta est in iis occasio artis, subditis per quae tralucere cogantur. aiunt hebetiores, in aceto maceratos xiiii diebus, nitescere totidem mensibus durante fulgore.

adulterantur vitro simillime, sed cote deprehenduntur, sicut aliae gemmae; fictis enim mollior materia fragilisque est. centrosas cote deprehendunt et pondere, quod minus est in vitreis, aliquando et pusulis argenti modo relucentibus.

est et anthracitis appellata, in thesprotia fossilis, carbonibus similis. falsum arbitror quod et in liguria nasci prodiderunt, nisi forte tunc nascebantur. esse in iis et praecinctas candida vena tradunt. harum igneus color ut superiorum, sed peculiare quod tactu velut intermortuae extinguuntur, contra aquis perfusae exardescunt.

cognata est et sandastros, proxima natura eius, quam aliqui garamanticam vocant. nascitur in indis loco eiusdem nominis. gignitur et in arabia ad meridiem versa. commendatio summa quod veluti in tralucido ignis optentus stellantibus fulget intus aureis guttis, semper in corpore, numquam in cute. accedit et religio narrata siderum cognatione, quoniam fere pliadum hyadumque dispositione ac numero stellantur, ob id chaldaeis in caerimoniis habitae. et hic mares austeritas distinguat et quidam vigor adposita tinguens; indicae quidem etiam hebetare visus dicuntur. blandior feminis flamma, allucens magis quam accendens. sunt qui praeferant arabicas indicis fumidaeque chrysolitho similes illas dicant. ismenias negat poliri sandastros propter teneritatem, et ob id magno venire. sunt qui has sandrisitas vocent. inter omnes constat, quantum numero stellarum accedat, tantum et pretio accedere. - adfert aliquando errorem similitudo nominis sandaresi. nicander sandaserion vocat, alii sandareson, quidam vero hanc sandastrum, illam sandaresum, in india nascentem illam quoque et loci nomen custodientem, mali colore aut olei viridis, omnibus inprobatam.

ex eodem genere ardentium est lychnis appellata a lucernarum adsensu, tum praecipuae gratiae. nascitur circa orthosiam totaque caria ac vicinis locis, sed probatissima in indis. quidam remissiorem carbunculum esse dixerunt, secundam bonitate quae similis esset iovis appellatis floribus. et alias invenio differentias: unam quae purpuram radiet, alteram quae coccum; has sole excalfactas aut attritu digitorum paleas et chartarum fila ad se rapere. - hoc idem et carchedonia facere dicitur, quamquam multo vilior praedictis. nascitur apud nasamonas in montibus, ut incolae putant, imbre divino. inveniuntur ad repercussum lunae maxime plenae, carthaginem quondam deportabantur. archelaus et in aegypto circa thebas nasci tradit fragiles, venosas, morienti carboni similes. potoria ex hac et ex lychnide factitata invenio, omnia autem haec genera contumaciter scalpturae resistunt partemque in signo cerae tenent.

e diverso ad haec sarda utilissima, quae nomen cum sardonyche communicavit. ipsa vulgaris et primum sardibus reperta est; laudatissimae circa babylona. cum lapicidinae quaedam aperiantur, haerentes in saxo cordis modo reperiuntur. hoc metallum apud persas defecisse tradunt, sed inveniuntur compluribus aliis locis, ut in paro et asso; in india trium generum: rubrae et quas pionias vocant ab pinguitudine; tertium genus est quod argenteis bratteis sublinunt. indicae perlucent, crassiores sunt arabicae.

inveniuntur et circa leucada epiri et in aegypto quae brattea aurea sublinuntur. et in his autem mares excitatius fulgent, feminae pigriores et crassius nitent. nec fuit alia gemma apud antiquos usu frequentior - hac certe apud menandrum et philemonem fabulae superbiunt - , nec ullae tralucentium tardius subfusae umore hebetantur, oleoque magis quam alio liquore. damnantur ex iis melleae ac validius testaceae.

egregia etiam nunc sua topazo gloria est, e virenti genere et, cum primum reperta est, praelatae omnibus. accidit in arabiae insula, quae cytis vocabatur, in quam devenerant trogodytae praedones fame et tempestate fessi, ut, cum herbas radicesque foderent, eruerent topazon. haec archelai sententia est. iuba topazum insulam in rubro mari a continenti stadiis ccc abesse dicit; nebulosam et ideo quaesitam saepius navigantibus nomen ex ea causa accepisse, topazin enim trogodytarum lingua significationem habere quaerendi. ex hac primum inportatam berenicae reginae, quae fuit mater sequentis ptolemaei, ab philone praefecto; regi mire placuisse et inde factam statuam arsinoae ptolemaei uxori quattuor cubitorum, sacratam in delubro, quod arsinoeum cognominabatur. recentissimi auctores et circa thebaidis alabastrum oppidum nasci dicunt et duo genera eius faciunt, prasoides atque chrysopteron, simile chrysopraso. tota enim similitudo ad porri sucum derigitur. est autem amplissima gemmarum. eadem sola nobilium limam sentit, ceterae naxio et cotibus poliuntur. haec et usu atteritur.

comitatur eam similitudine propior quam auctoritate callaina, e viridi pallens. nascitur post aversa indiae apud incolas caucasi montis, hyrcanos, sacas, dahas, amplitudine conspicua, sed fistulosa ac sordium plena, sincerior praestantiorque multo in carmania, utrobique autem in rupibus inviis et gelidis, oculi figura extuberans leviterque adhaerescens nec ut adnata petris, sed ut adposita. quam ob rem scandere ad eas pigritia pedum equestres populos taedet, simul et periculum terret; ergo fundis e longinquo incessunt et cum toto musco excutiunt. hoc vectigal, hoc gestamen in cervice, digitis gratissimum norunt, hinc census, haec gloria a pueritia deiectum numerum praedicantium; in quo varia fortuna quidam ictu primo cepere praeclaras, multi ad senectam nullas. et venatus quidem callainis talis est. sectura inde formantur, alias faciles. optimis color smaragdi, ut tamen appareat alienum esse quod placeat. inclusae decorantur auro, aurumque nullae magis decent. quae sunt earum pulchriores, oleo, unguento, etiam mero colorem deperdunt, viliores constantius repraesentant, neque est imitabilior alia mendacio vitri. sunt qui in arabia inveniri eas dicant in nidis avium, quas melancoryphos vocant.

viridantium et alia plura sunt genera. vilioris turbae prasius, cuius alterum genus sanguineis punctis abhorret, tertium virgulis tribus distinctum candidis. praefertur his chrysoprasos porri sucum et ipsa referens, sed haec paulum declinantem a topazo in aurum. huic et amplitudo ea est, ut cymbia etiam ex ea fiant, cylindri quidem et creberrime. - india et has generat et nilion, fulgore ab ea distantem brevi et, cum intueare, fallaci. sudines dicit et in sibero atticae

flumine nasci. est autem color fumidae topazi aut aliquando melleae. iuba in aethiopia gigni tradit in litoribus amnis, quem nilum vocamus, et inde nomen trahere. - non tralucet molochitis; spissius viret ab colore malvae nomine accepto, reddendis laudata signis et infantum custodia quodamque innato contra pericula medicamine. - viret et saepe tralucet iaspis, etiam victa multis antiquitatis gloriam retinens. plurimae ferunt eam gentes, smaragdo similem indi, cypros duram glaucoque pingui, persae ae+ri similem, quae ob id vocatur ae+rizusa; talis et caspia est. caerulea est circa thermodontem amnem, in phrygia purpurea et in cappadocia ex purpura caerulea, tristis atque non refulgens. amisos indicae similem mittit, calchedon turbidam. sed minus refert nationes quam bonitates distinguere. optima quae purpurae aliquid habet, secunda quae rosae, tertia quae smaragdi. singulis graeci nomina ex argumento dedere. quarta apud eos vocatur boria, caelo autumnali matutino similis; haec erit illa, quae ae+rizusa dicitur. similis est et sardae, imitata et violas. non minus multae species reliquae sunt, sed omnes in vitium caeruleae, ut crystallo similis aut myxis, item terebinthizusa. quam ob rem praestantiores funda cluduntur, ut sint patentes ab utraque parte nec praeter margines quicquam auro amplectente. vitium in iis est et brevis nitor nec longe splendescens et sal et quae ceteris omnia. et vitro adulterantur, quod manifestum fit, cum extra fulgorem spargunt atque non in se continent. reliquas sphragidas vocant, publico gemmarum nomine his tantum dato quoniam optime signent. totus vero oriens pro amuleto gestare eas traditur. ea, quae ex iis smaragdo similis est, saepe transversa linea alba media praecingitur et monogrammos vocatur; quae pluribus, polygrammos. libet obiter vanitatem magicam hic quoque coarguere, quoniam hanc utilem esse contionantibus prodiderunt. - est et onychi iuncta quae iasponyx vocatur, et nubem complexa et nives imitata et stellata rutilis punctis. est et sali megarico similis et velut fumo infecta, quae capnias vocatur. magnitudine xvi unciarum vidimus formatam inde effigiem neronis thoracatam.

reddetur et per se cyanos, accommodato paulo ante et iaspidi nomine a colore caeruleo. optima scythica, dein cypria, postremo aegyptia. adulteratur maxime tinctura, idque in gloria est regum aegypti; adscribitur et qui primus tinxit. dividitur autem et haec in mares feminasque. inest ei aliquando et aureus pulvis, non qualis sappiris; in his enim aurum punctis conlucet. - caeruleae et sappiri, rarumque ut cum purpura. optimae apud medos, nusquam tamen perlucidae. praeterea inutiles sculpturis intervenientibus crystallinis centris. quae sunt ex iis cyanei coloris, mares existimantur.

alius ex hoc ordo purpureis dabitur aut quae ab iis descendunt. principatum amethysti tenent indicae, sed in arabiae quoque parte, quae finitima syriae petra vocatur, et in armenia minore et aegypto et galatia reperiuntur, sordidissimae autem vilissimaeque in thaso et cypro. causam nominis adferunt quod usque ad vini colorem accedens, priusquam eum degustet, in violam desinat fulgor, alii quia sit quiddam in purpura illa non ex toto igneum, sed in vini colorem deficiens. perlucet autem omnes violaceo decore, sculpturis

faciles. indica absolutum phoenices purpurae colorem habet. ad hanc tingentium officinae dirigunt vota. fundit autem aspectu leniter blandum neque in oculos, ut carbunculi, vibrantem. alterum earum genus descendit ad hyacinthos; hunc colorem indi socon vocant, talemque gemmam socondion. dilutior ex eodem sapenos vocatur, eademque pharanitis in contermino arabiae, gentis nomine. quartum genus colorem vini habet. quintum ad vicina crystalli descendit albicante purpurae defectu. hoc minime probatur, quando praezellens debeat esse in suspectu velut ex carbunculo refulgens quidam leniter in purpura roseus nitor. tales aliqui malunt paederotas vocare, alii anterotas, multi veneris genam. magorum vanitas ebrietati eas resistere promittit et inde appellatas, praeterea, si lunae nomen ac solis inscribatur in iis atque ita suspendantur e collo cum pilis cynocephali et plumis hirundinis, resistere veneficiis, iam vero quoquo modo adesse reges adituris, grandinem quoque avertere ac locustas precatione addita, quam demonstrant. nec non in smaragdis quoque similia promissere, si aquilae scalperentur aut scarabaei, quae quidem scripsisse eos non sine contemptu et inrisu generis humani arbitror.

multum ab hac distat hyacinthos, ab vicino tamen colore descendens. differentia haec est, quod ille emicans in amethysto fulgor violaceus diluitur hyacintho primoque aspectu gratus evanescit, antequam satiet, adeoque non inplet oculos, ut paene non attingat, marcescens celerius nominis sui flore. - hyacinthos aethiopia mittit et chrysolithos aureo fulgore tralucentes. praeferuntur his indicae et, si variae non sint, tibarenae. deterrimae autem arabicae, quoniam turbidae sunt et variae, fulgoris interpellati nubilo macularum, etiam quae limpidae contingere, veluti scobe refertae. optimae sunt quae in collatione aurum albicare quadam argenti facie cogunt. hae funda includuntur perspicuae, ceteris subicitur aurichalcum, tametsi exiere iam de gemmarum usu. - appellantur aliquae et chryselectroae, in colorem electri declinantes, matutino tamen tantum aspectu. ponticas deprehendit levitas. quaedam durae sunt ac rufae, quaedam molles, sordidae. bocchus auctor est et in hispania repertas et quo in loco crystallum dixit ad libramentum aquae puteis defossis erui, chrysolithon xii pondo a se visam. - fiunt et leucochrysi interveniente candida vena. sunt et in hoc genere capniae. sunt et vitreis similes, velut croco fulgentes; vitro adulterantur, ut visu discerni non possint; tactus deprendit, tepidior in vitreis. in eodem genere sunt melichrysi veluti per aurum sincero melle tralucente. has india fert, quamquam in duritia fragiles, non ingratas. eadem et xuthon parit, plebeiam sibi gemmam.

candidarum dux est paederos, quamquam quaeri potest, in quo colore numerari debeat totiens iactati per alienas pulchritudines nominis, adeo ut decoris praerogativa in vocabulo facta sit. sed tamen et suum genus expectatione tanta dignum. coeunt quippe in tralucidam crystallum viridis suo modo ae+r simulque purpurae et quidam vini aurei nitor semper extremus in visu, sed purpura coronatus. madere videtur et singulis his et pariter omnibus, nec gemmarum esse ulla liquidior potest iucunda suavitate oculis. haec

laudatissima est in indis, apud quos sangenen vocatur, proxima in aegypto, ubi syenites, tertia in arabia, verum scabra, tum pontica, quae mollius radiat, thasia, et ipsa mollior, et galatica et thracia et cypria. vitia earum languor aut alienis turbari coloribus et quae ceterarum.

proxima candicantium est asteria. principatum habet proprietate naturae, quod inclusam lucem pupilla quadam continet. hanc transfundit cum inclinatione velut intus ambulantem alio atque alio loco reddens. eadem contraria soli regerit candicantes radios in modum stellae, unde nomen invenit. difficiles in india natae ad caelandum. praeferuntur carmanicae.

similiter candida est quae vocatur astrion, crystallo propinqua, in india nascens et in patalenes litoribus. huic intus a centro stella lucet fulgore pleno lunae. quidam causam nominis reddunt quod astris opposita fulgorem rapiat et regerat. optimam in carmania gigni dicunt nullamque minus obnoxiam vitio; cerauniam etiam vocari quae sit deterior; pessimam vero lanternarum lumini similem. celebrant et astrioten, mirasque laudes eius in magicis artibus zoroastren cecinisse produunt. - astolon sudines dicit oculis piscium similem esse, radiare fulgore candido ut solem.

est inter candidas et quae ceraunia vocatur, fulgorem siderum rapiens, ipsa crystallina, splendoris caerulei, in carmania nascens. zenothemis fatetur albam esse, sed habere intus stellam coruscantem; fieri et hebetes ceraunias, quas in nitro et aceto maceratas per aliquot dies concipere stellam eam, quae post totidem menses relanguagescat. sotacus et alia duo genera fecit cerauniae, nigrae rubentisque similes eas esse securibus. ex his quae nigrae sint ac rotundae, sacras esse; urbes per illas expugnari et classes; baetulos vocari; quae vero longae sint, ceraunias. faciunt et aliam raram admodum, magorum studiis expetitam, quoniam non aliubi inveniatur quam in loco fulmine icto.

proximum cerauniae nomen apud eos habet quae vocatur iris. effoditur in quadam insula rubri maris, quae distat a berenice urbe [lx] p., cetera sui parte crystallus. itaque quidam eam radicem crystalli esse dixerunt. ex argumento vocatur iris, nam sub tecto percussa sole species et colores arcus caelestis in proximos parietes eiacularur, subinde mutans magnaque varietate admirationem sui augens. sexangulam esse ut crystallum constat, sed aliqui scabris lateribus et angulis inaequalibus dicunt, in sole aperto radios in se candentes discutere, aliquo vero ante se proiecto nitore adiacentia inlustrare. colores autem non nisi ex opaco, ut diximus, reddunt, nec ut ipsae habeant, sed ut repercussu parietum elidant; optima quae maximos arcus facit simillimosque caelestibus. est et alia iritis, cetera similis, sed praedura. hanc orus crematam tusamque ad ichneumonum morsus remedio esse scripsit, nasci autem in perside. - similis aspectu est, sed non eiusdem effectus, quae vocatur leros, alba nigraque macula in traversum distinguuntibus crystallum.

expositis per genera colorum principalibus gemmis reliquas per litterarum ordinem explicabimus.

achates in magna fuit auctoritate, nunc in nulla est, reperta primum in sicilia iuxta flumen eiusdem nominis, postea plurimis in terris, excellens

amplitudine, numerosa varietatibus, quae mutant cognomina eius. vocatur enim iaspachates, cerachates, smaragdachates, haemachates, leucachates, dendrachates, quae velut arbusculis insignis est, antachates, quae, cum uritur, murram redolet, corallachates guttis aureis sappiri modo sparsa, qualis copiosissima in creta. quae et sacra appellatur. quidam putant contra araneorum et scorpionum ictus eam prodesse. quod in siculis utique crediderim, quoniam primo eius provinciae adflatu scorpionum pestis extinguitur. et in india inventae contra eadem pollent, magnis et aliis miraculis: reddunt enim fluminum species, nemorum, iumentorum etiam. essedariis staticula, equorum ornamenta inde medicisque coticulas faciunt, nam spectasse etiam prodest oculis. sitim quoque sedant in os additae. phrygiae viridia non habent. thebis aegyptiis repertae carent rubentibus venis et albis, hae quoque contra scorpiones validae. eadem auctoritas et cyprii. sunt qui maxime probent vitream perspicuitatem in his. reperiuntur et in trachinia circa oetam et in parnaso et in lesbo et in messene similes limitum floribus et in rhodo. aliae apud magos differentiae sunt in iis: quae leoninis pellibus similes reperiuntur, potentiam habere contra scorpiones dicunt. in persis vero suffitu earum tempestates averti et presteras, flumina sisti - argumentum esse, si in ferventes cortinas additae refrigerent - , sed, ut prosint, leoninis iubis adalligandas, nam hyaenae addita abominantur discordiam domibus. eam vero, quae unius coloris sit, invictam athleticis esse, argumento, quod in ollam plenam olei coiecta cum pigmentis, intra duas horas suffervefacta, unum colorem ex omnibus faciat minii.

acopos nitro colore similis est, pumicosa, guttis aureis stellata. cum hac oleum suffervefactum perunctis lassitudinem, si credimus, solvit. - alabastritis nascitur in alabastro aegypti et in syriae damasco candore interstincto variis coloribus. haec cremata cum fossili sale et trita gravitates oris et dentium extenuare dicitur. - alectorias vocant in ventriculis gallinaceorum inventas crystallina specie, magnitudine fabae, quibus milonem crotoniensem usum in certaminibus invictum fuisse videri volunt. - androdamas argenti nitorem habet ut adamas, quadratis semper tessellis similis. magi putant nomen inpositum ab eo, quod impetus hominum et iracundias domet. argyrodamas eadem sit an alia, auctores non explicant. - antipathes nigra non tralucet. experimentum eius ut coquatur in lacte; facit enim id murrae simile. inmensum quiddam in hac fortassis aliquis expectet, in tot exemplis uni possessione huius nominis data. contra effascinationes auxiliari eam magi volunt. - arabica ebori simillima est, et hoc videretur, nisi abnueret duritia. hanc putant contra dolores nervorum prodesse habentibus. - aromatitis et ipsa in arabia invenitur, sed et in aegypto circa philas, ubique lapidosa et murrae coloris et odoris, ob hoc reginis frequentata. - asbestos in arcadiae montibus nascitur coloris ferrei. - aspisatim democritus in arabia nasci tradit, ignei coloris, et oportere cum cameli fimo splenicis adalligari, inveniri utique in nido arabicarum alitum; et aliam eodem nomine ibi in leucopetra nasci, argentei coloris, radiantem; cum ... contra lymphatum habentibus. - atizoen in

india et persidis acidane monte nasci, argenteo nitore fulgentem, magnitudine trium digitorum, ad lenticulae figuram, odoris iucundi, necessariam magis regem constituentibus. - augitis non alia videtur multis esse quam callaina.

lapis amphidanes alio nomine chrysocolla appellatur, nascens in indiae parte, ubi formicae eruunt aurum, in quo et invenitur auro similis, quadrata figura. adfirmatur natura eius quae magnetis esse, nisi quod augere quoque aurum traditur. - aphrodisiaca ex candido rufa est. - apsyctos septenis diebus calorem tenet excalefacta igni, nigra ac ponderosa, distinguentibus eam venis rubentibus. putant prodesse contra frigora. - aegyptillam iacchus intellegit per album sardae nigraque venis transeuntibus, volgus autem nigra radice, caerulea facie. nomen a loco.

balanitae duo genera sunt, subviridis et corinthii aeris similitudine, illa a copto, haec ab trogodytica veniens, medias secante flammea vena. - batrachitas quoque coptos mittit, unam ranae similem colore, alteram et venis, tertiam rubetis e nigro. - baptes, mollis alioqui, odore excellit. - beli oculus albicans pupillam cingit nigram e medio aureo colore fulgentem et propter speciem sacratissimo assyriorum deo dicatam. belum autem aliam, quam sic vocant, in arbelis nasci democritus tradit nucis iuglandis magnitudine, vitrea specie. - baroptenus sive baripe, nigra sanguineis et albis nodis, adalligata proicitur veluti portentosa. - botryitis alia nigra est, alia pampinea, incipienti uvae similis. - bostrychitin zoroastres crinibus mulierum similiorem vocat. - bucardia, bubulo cordi similis, babylone tantum nascitur. - bronteia, capiti testudinum, e tonitribus cadit, ut putant, restinguitque fulmine icta, si credimus. - boloe in hiberno inveniuntur, glabrae similitudine.

cadmitis eadem est quae ostracitis vocatur, nisi quod hanc caeruleae interdum cingunt bullae. - callais sappirum imitatur candidior et litoroso mari similis. - capnitis quibusdam videtur suum genus habere, pluribus iaspidis fumidae, ut suo loco diximus. - cappadocia et in phrygia nascitur, ebori similis. - callaicam vocant e turbido callaino. ferunt plures coniunctas semper inveniri. - catochitis corsicae lapis est, ceteris maior et magis mirabilis, si vera traduntur, inpositam manum veluti cummi retinens. - catoptritis in cappadocia provenit candore imaginem regerens. - cepitis sive cepolatitis candida est, venarum coeuntibus lineis in unum. - ceramitis testae colorem habet. - cinaediae inveniuntur in cerebro piscis eiusdem nominis, candidae et oblongae eventaque mirae, si modo est fides praesagire eas habitum maris nubili vel tranquilli. - ceritis cerae similis est, circos accipitri, corsoides canitiae capitis, corallachates curialio, aureis guttis distincta, corallis minio; gignitur in india et syene. - crateritis inter chrysolithum et electrum colorem habet, praedura natura. - crocallis ceras repraesentat. - cyitis circa copton nascitur candida et videtur intus habere partum, qui sentiatur etiam crepitu. - chalcophonos nigra est, sed inlisa aeris tinnitum reddit, tragoedis, ut suadent, gestanda. - chelidoniae duorum sunt generum, hirundinum colore, ex altera parte purpureae, in alia purpuram nigris interpellantibus maculis. - chelonia oculus est indicae testudinis, vel portentosissima magorum mendaciis. melle enim

colluto ore inpositam linguae futurorum divinationem praestare promittunt xv luna et silente toto die, decrescente vero ante ortum solis, ceteris diebus a prima in sextam horam. - sunt et chelonitides aliarum testudinum superficiei similes, ex quibus ad tempestates sedandas multa vaticinantur, eam vero, quae ex iis aureis guttis aspersa sit, cum scarabaeo deiectam in aquam ferventem tempestates commovere. - chloritis herbacei coloris est; eam in ventre motacillae avis inveniri dicunt magi congenitam ei et ferro includi iubent ad quaedam prodigiosa moris sui. - choaspitis a flumine dicta est, ex viridi fulgoris aurei. - chrysolampsis in aethiopia nascitur, pallida alias, sed noctu ignea. - chrysopis aurum videtur esse. - cetionides in aeolide nunc atarneo pago, quondam oppido, nascuntur, multis coloribus traluentes, alias vitreae, alias crystallinae, alias iaspidis, sed et sordidis tantus est nitor, ut imagines reddant ceu specula.

daphnean zoroastres morbis comitialibus demonstrat. - diadochos berullo similis est. - diphyes duplex, candida ac nigra, mas ac femina, genitale utriusque sexus distinguente linea. - dionysias, nigra ac dura, mixtis rubentibus maculis, ex aqua trita saporem vini facit et ebrietati resistere putatur. - draconitis sive dracontias e cerebro fit draconum, sed nisi viventibus absciso capite non gemmescit invidia animalis mori se sentientis. igitur dormientibus amputant. sotacus, qui visam eam gemmam sibi apud regem scripsit, bigis vehi quaerentes tradit et viso dracone spargere somni medicamenta atque ita sopiti praecidere. esse candore tralucido, nec postea poliri aut artem admittere.

encardia cognominatur enariste, in nigro colore effigie cordis eminente; altera eodem nomine viridi colore cordis speciem, tertia nigrum cor ostendit, reliqua sui parte candida. - enorchis candida est divisisque fragmentis testium effigiem repraesentat. - exhebenum zoroastres speciosam et candidam tradit, qua aurifices aurum poliant. - erythallis, cum sit candida, ad inclinationes rubescere videtur. - erotylos sive amphicomos sive hieromnemon democrito laudatur in argumentis divinationum. - eumeces in bactris nascitur, silici similis, et capiti supposita visa nocturna oraculi modo reddit. - eumitren beli gemmam, sanctissimi deorum sui, assyrii observant, porracei coloris, superstitionibus gratam. - eupetalos quattuor colores habet, caeruleum, igneum, minii, mali. - eureos nucleo olivae similis est, striata concharum modo, non adeo candida. - eurotias situ videtur operire nigrityam. - eusebes ex eo lapide est, quo traditur in tyro herculis templo facta sedes, ex qua pii facile surgebant. — epimelas fit, cum candida gemma superne nigricat.

galaxian aliqui galactiten vocant, similem proxime dictis, sed intercurrentibus sanguineis aut candidis venis. - galactitis ex uno colore lactis est. eandem leucogaean et leucographitim appellant et synechitim, in attritu lactis suco ac sapore notabilem, in educatione nutricibus lactis fecundam. infantium quoque collo adalligata salivam facere traditur, in ore autem liquescere, eadem memoriam adimere. mittunt eam nilus et achelous amnes. sunt qui smaragdum albis venis circumligatum galactiten vocent. - gallaica

argyrodamanti similis est, paulo sordidior; inveniuntur iunctae binae ternaeque. - gassinnaden medi mittunt, coloris orobini, veluti floribus sparsam; nascitur et in arbelis. haec quoque gemma concipere dicitur et intra se partum fateri concussa, concipere autem trimenstri spatio. - glossopetra, linguae similis humanae, in terra non nasci dicitur, sed deficiente luna caelo decidere, selenomantiae necessaria. quod ne credamus, promissi quoque vanitas facit; ventos enim ea comprimi narrant. - gorgonia nihil aliud est quam curalium. nominis causa, quod in duritiam lapidis mutatur emollitum in mari. hanc fulminibus et typhoni resistere adfirmant. - goniaeam eadem vanitate inimicorum poenas efficere promittunt.

heliotropium nascitur in aethiopia, africa, cypro, porraceo colore, sanguineis venis distincta. causa nominis, quoniam deiecta in vas aquae, fulgore solis accidente, percussu sanguineo mutat eum, maxime aethiopica. eadem extra aquam speculi modo solem accipit deprenditque defectus, subeuntem lunam ostendens. magorum inpudentiae vel manifestissimum in hac quoque exemplum est, quoniam admixta herba heliotropio, quibusdam additis precationibus, gerentem conspici negent. - hephaestitis quoque speculi naturam habet in reddendis imaginibus, quamquam rutila. experimentum est, si statim addita fervens aqua refrigerata sit aut si in sole adposita aridam materiam statim accendat. nascitur in coryco. - hermu aedoeon ex argumento virilitatis in candida gemma vel nigra, aliquando et pallida, ambiente circulo coloris aurei appellatur. - hexecontalithos, in parva magnitudine multicolor hoc sibi nomen adoptavit, reperitur in trogodytice. - hieracitis alternat tota miluinis nigrisque veluti plumis. - hammitis ovis piscium similis est, et alia velut e nitro composita, praedura alioqui. - hammonis cornu inter sacratissimas aethiopiae, aureo colore arietini cornus effigiem reddens, promittitur praedivina somnia repraesentare. - hormiscion inter gratissimas aspicitur ex igneo colore radians auro portante secum in extremitatibus candidam lucem. - hyaenia, ex oculis hyaenae lapides, ... inveniri dicuntur et, si credimus, linguae hominis subditi futura praecinere. - haematitis in aethiopia quidem principalis est, sed et in arabia et in africa invenitur, sanguineo colore, non omittendis promissis ad coarguendas magorum insidias. zachalias babylonius in iis libris, quos scripsit ad regem mithridatem, gemmis humana fata adtribuens hanc, non contentus oculorum et iocineris medicina decorasse, a rege etiam aliquid petitis dedit, eandem litibus iudiciisque interposuit, in proeliis etiam exanguem salutarem pronuntiavit. est et alia eiusdem generis, quae vocatur menui, ab aliis xuthos. ita appellant graeci e fulvo candicantes.

idaei dactyli in creta ferreo colore pollicem humanum exprimunt. - icterias cuti mali luridae similis et ideo salubris existimata contra regios morbos. est et alia eodem nomine lividior, tertia folio similis, prioribus latior et paene sine pondere, venis luridis, quartum genus in eodem colore nigriore luridis venis discurrentibus. - iovis gemma candida est, non ponderosa, tenera. hanc et drosolithon appellant. - indicae gentium suarum habent nomen, subrufo

colore, sed in attritu purpureo sudore manant. alia eodem nomine candida, pulvereo aspectu. - ion apud indos violacea est; rarum ut saturo colore luceat.

lepidotis squamas piscium variis coloribus imitatur, lesbias glaeabas, patriae habens nomen; invenitur tamen et in india. - leucophthalmos, rutila alias, oculi speciem candidam nigramque continet. - leucopoecilos candorem minii guttis ex auro distinguit. - libanochrus turis similitudinem ostendit et mellis sucum. - limoniatis eadem videtur quae smaragdos. - de liparea hoc tantum traditur, suffita ea omnes bestias evocari. - lysimachos, rhodio marmori similis auratis venis, politur ex maiore amplitudine in angustias, ut inutilia exterantur. - leucochrysos fit e chrysolitho interalbicante.

memnonia qualis sit, non traditur. - media nigra est, ab media illa fabulosa inventa; habet venas aurei coloris, sudorem reddit croci, saporem vini. - meconitis papavera exprimit. - mithrax e persis venit et rubri maris montibus, multicolor ac contra solem varie refulgens. - morochthos, colore porracea, lacte sudat. - mormorion ab india nigerrimo colore tralucet, vocatur et promnion, cum in ea miscetur et carbunculi color, alexandriion, ubi vero sardae, cyprum. nascitur et in tyro et in galatia; xenocrates et sub alpebus nasci tradit. hae sunt gemmae, quae ad ectypas sculpturas aptantur. - myrrhitis murae colorem habet faciemque minime gemmae, odorem unguenti, attrita etiam nardi. - myrmecias nigra habet eminentia similia verrucis, myrsinitis melleum colorem, odorem myrti. - mesoleucos fit mediam gemmam candido distinguente limbo, mesomelas nigra vena quemlibet colorem secante per medium.

nasamonitis sanguinea est nigris venis. - nebritis, libero patri sacra, nomen traxit a nebridum similitudine; alia e nigro generis eiusdem. - nipparene urbis et gentis persicae habet nomen, similis hippopotami dentibus.

oica barbari nominis e nigro et fulvo viridique et candido placet. - ombria, quam alii notiam vocant, sicut et ceraunia et brontea, cadere cum imbribus et fulminibus dicitur eundemque effectum habere; praeterea hac in aras addita libamenta non amburi. - onocardia cocco similis est, neque aliud de ea traditur. - oritis globosa specie a quibusdam et sideritis vocatur, ignes non sentiens. - ostracias sive ostracitis est testacea, durior ceramitide, achatae similis, nisi quod illa politura pinguescit. huic tanta duritia inest, ut fragmentis eius aliae gemmae scalpanantur. - ostritidi ostrea a similitudine nomen dedere. - ophicardelon barbari vocant, nigrum colorem binis lineis albis includentibus. - de opsiano lapide diximus priore libro. inveniuntur et gemmae eodem nomine ac colore non solum in aethiopia indiaque, sed etiam in samnio et, ut aliqui putant, in hispania litoribus eius oceani.

panchrus fere ex omnibus coloribus constat. - pangonus non longior digito, ne crystallus videatur, numero plurium angulorum facit. - paneros qualis sit, a metrodoro non dicitur, sed carmen timaridis reginae in eam, dicatum veneri, non inelegans ponit, ex quo intellegitur adiutam fecunditatem. hanc quidam paneraston vocant. - ponticarum plura sunt genera: est stellata nunc sanguineis, nunc auratis guttis, quae inter sacras habetur. alia pro stellis

eiusdem coloris lineas habet, alia montium convalliumque effigies. - phloginos, quam et chrysitim vocant, ochrae atticae adsimulata, invenitur in aegypto. - phoenicitis ex balani similitudine appellatur, phycitis algae. - perileucos fit ab oris gemmae ad radicem usque albo descendente. - paeanitides, quas quidam gaeanidas vocant, praegnantem fieri et parere dicuntur mederique parturientibus. natalis iis in macedonia iuxta monimentum tiresiae, species aquae glaciatae.

solis gemma candida est, ad speciem sideris in orbem fulgentis spargens radios. - sagdam chaldaei vocant et adhaerentem, ut ferunt, navibus inveniunt, prasini coloris. - samothraca insula dat sui nominis, nigram ac sine pondere, similem ligno. - sauritum in ventre viridis lacertae harundine dissecto inveniri tradunt. - sarcitis bubulas carnes repraesentat. - selenitis ex candido tralucet melleo fulgore imaginem lunae continens, redditque ea in dies singulos crescentis minuentisque sideris speciem, si verum est. nasci putatur in arabia. - sideritis ferro similis est; maleficio inlata aliquis discordiam facit. nascitur in aethiopia. sideropoecilos ex ea fit variantibus guttis. - spongitis nomen suum repraesentat. - synodontitis e cerebro piscium est, qui synodontes vocantur. - syrtitides in litore syrtium, iam quidem et lucaniae, inveniuntur, e melleo colore croco refulgentes, intus autem stellas continent languidas. - syringitis stipulae internodio similis perpetua fistula cavatur.

trichrus ex africa venit, nigra, sed tres sucos reddit, ab radice nigrum, medio sanguineum, summo ochrum. - thelyrrhizos, cinerei coloris aut rufi, candidis radicibus spectatur. - thelycardios colore ... cordis persas, apud quos gignitur, magnopere delectat; mucul eam appellant. - thracia trium generum est, livida aut pallidior, in tertio guttis sanguineis. - tephritis lunae novae speciem habet curvatae in cornua, quamvis in colore cineris. - tecolithos oleae nucleus videtur, neque est ei gemmae honos, sed lingentium calculos frangit pellitque.

veneris crines nigerrimi nitoris continent in se speciem rufi crinis. - veientana italica gemma est, veis reperta, nigram materiam distinguente limite albo.

zathenen in media nasci democritus tradit electri colore et, si quis terat in vino palmeo et croco, cerae modo lentescere odore magnae suavitatis. - zamilampis in euphrate nascitur, proconnesio marmori similis, medio colore glauco. - zoraniscaeos in indo flumine magorum gemma narratur, neque aliud amplius de ea.

est etiamnum alia distinctio, quam equidem fecerim subinde variata expositione, siquidem a membris corporis habent nomina: hepatitis a iocinere, steatitis singulorum animalium adipe numerosa, adadu nephros sive renes, eiusdem oculus, digitus; deus et hic colitur a syris. triophthalmos in onyche nascitur tres hominis oculos simul exprimens.

ab animalibus cognominantur: carcinias marini cancri colore, echitis viperae, scorptis scorpionis aut colore aut effigie, scaritis scari piscis, triglitis mulli, aegophthalmos caprino oculo, item alia suillo, et a gruis collo geranitis,

hieracitis ab accipitris, ae+titis a colore aquilae candicante cauda. myrmecitis innatam formicae repentis effigiem habet, scarabaeorum cantharias. lycophthalmos quattuor colorum est, rutila, sanguinea; media nigrum candido cingit, ut luporum oculi. taos pavoni est similis, itemque aspidi quam vocari timictoniam invenio.

rerum similitudo est in ammochryso velut auro harenis mixto, cenchrite sparsis milii granis, dryite truncis arborum; haec et ligni modo ardet. cissitis in candido perlucet hederæ foliis, quæ totam tenent narcissitim venis etiam cetera distinctam. cyamias nigra est, sed fracta ex se fabæ similitudinem parit. pyren ab olivæ nucleo dicta est; huic aliquando inesse piscium spinæ videntur; phoenicitis ut balanus. - chalazias grandinum et candorem et figuram habet, adamantinae duritiæ, ut narrent in ignes etiam additæ manere suum frigus. pyritis nigra quidem est, sed attritu digitos adurit. polyzonos in nigro multis distincta lineis candicat, astrapæa in candido aut cyaneo discurrentibus in medio fulminis radiis. in phlogitide intus flamma videtur ardere, quæ non exeat, in anthracitide scintillæ discurrere. - enhygros semper rotunditatis absolutæ in candore leni est; ad motum fluctuatur intus in ea, ut in ovis, liquor. - polythrix in viridi capillaturam ostendit, sed defluvia comarum facere dicitur. sunt et a leonis pelle et a pantheræ nominatæ. - colos appellavit drosolithum herbaceus, melichrum melleus, cuius plura genera, melichlorum geminus, parte flavus, parte melleus, crocian croci, polian canitie similitudinem quandam spargens e nigro, spartopolian rarior. rhoditis rosæ est, melitis mali coloris, chalcitis aeris, sycitis fici, bostrychitis in nigro ramosa candidis vel sanguineis frondibus, chernitis velut in petra candidis manibus inter se complexis. - anancitide in hydromantia dicunt evocari imagines deorum, synochitide teneri umbras inferum evocatas, dendritide alba defossa sub arbore, quæ caedatur, securium aciem non hebetari. - sunt et multo plures magisque monstrificæ, quibus barbara dedere nomina confessi lapides esse, non gemmas. nobis satis erit in his coarguisse dira mendacia magorum.

gemmae nascuntur et repente novæ ac sine nominibus, sicut olim in metallis aurariis lampsaci unam inventam, quæ propter pulchritudinem alexandro regi missa sit, auctor est theophrastus. cochlides, quæ nunc volgatissimæ, fiunt verius quam nascuntur, in arabia repertis ingentibus glaebis, quæ melle excoqui tradunt septenis diebus noctibusque sine intermissione: ita omni terreno vitiosoque decusso purgatam puramque glaebam artificum ingenio varie distinguere venas ductusque macularum quam maxime vendibili ratione spectantium, quondamque tantæ magnitudinis factas, ut equis regum in oriente frontalia ac pro phaleris pensilia facerent. et alias omnes gemmae mellis decoctu nitescunt, præcipue corsici in omni alio usu acrimonia abhorrentis. quæ variæ sunt, et ad unitatem excidere calliditati ingeniorum contingit, utque eadem nomen usitatum non habeant, physis appellant velut ipsius naturæ admirationem in iis venditantes.

cum finis nominum non sit - quæ persequi non equidem cogito, innumera

et graeca vanitate - , indicatis nobilibus gemmis, immo vero etiam plebeis, rariorum genera digna dictu distinxisse satis erit. illud modo meminisse conveniet, increscentibus varie maculis atque verrucis linearumque interveniente multiplici ductu et colore saepius mutari nomina in eadem plerumque materia.

nunc communiter ad omnium gemmarum observationem pertinentia dicemus opiniones secuti auctorum.

cavae aut extuberantes viliores videntur aequalibus. figura oblonga maxime probatur, deinde quae vocatur lenticula, postea epipedos et rotunda, angulosis autem minima gratia.

veras a falsis discernere magna difficultas, quippe cum inventum sit ex veris generis alterius in aliud falsas traducere, ut sardoniches e ternis glutinentur gemmis ita, ut deprehendi ars non possit, aliunde nigro, aliunde candido, aliunde minio sumptis, omnibus in suo genere probatissimis. quin immo etiam exstant commentarii auctorum - quos non equidem demonstrabo - , quibus modis ex crystallo smaragdum tinguant aliasque tralucentes, sardonichem e sarda, item ceteras ex aliis; neque enim est ulla fraus vitae lucrosior. nos contra rationem deprendendi falsas demonstrabimus, quando etiam luxuriam adversus fraudes muniri deceat. igitur praeter illa, quae in principatu cuiusque generis privatim diximus, tralucentes matutino probari censent aut, si necesse est, in quartam horam; postea vetant. experimenta pluribus modis constant: primum pondere, graviores enim sunt verae; dein frigore, eadem namque in ore gelidiores sentiuntur; post haec corpore. ficticiis pusula e profundo apparet, scabritia in cute et capillamenta, fulgoris inconstantia, priusquam ad oculos perveniat, desinens nitor. decussi fragmenti, quod in lamina ferrea uratur, efficacissimum experimentum excusate mangones gemmarum recusant, similiter et limae probationem. obsianae fragmenta veras gemmas non scariphant, in ficticiis scariphatio omnis candicat. iam tanta differentia est, ut aliae ferro scalpi non possint, aliae non nisi retuso, omnes autem adamante. plurimum vero in iis terebrarum proficit fervor.

gemmiferi amnes sunt acesinus et ganges, terrarum autem omnium maxime india. etenim peractis omnibus naturae operibus discrimen quoddam rerum ipsarum atque terrarum facere conveniet.

ergo in toto orbe, quacumque caeli convexitas vergit, pulcherrima omnium est iis rebus, quae merito principatum naturae optinent, italia, rectrix parensque mundi altera, viris feminis, ducibus militibus, servitiis, artium praestantia, ingeniorum claritatibus, iam situ ac salubritate caeli atque temperie, accessu cunctarum gentium facili, portuosis litoribus, benigno ventorum adflatu. quod contingit positione procurrentis in partem utilissimam et inter ortus occasusque mediam, aquarum copia, nemorum salubritate, montium articulis, ferorum animalium innocentia, soli fertilitate, pabuli ubertate. quidquid est quo carere vita non debeat, nusquam est praestantius: fruges, vinum, oleum, vellera, lina, vestes, iuveni. ne equos quidem in

trigariis ullos vernaculis praeferunt. metallis auri, argenti, aeris, ferri, quamdiu licuit exercere, nullis cessit terris et nunc intra se gravida pro omni dote varios sucos et frugum pomorumque sapores fundit. ab ea exceptis indiae fabulosis proximam equidem duxerim hispaniam quacumque ambitur mari, quamquam squalidam ex parte, verum, ubi gignit, feracem frugum, olei, vini, equorum metallorumque omnium generum, ad haec pari gallia. verum desertis suis sparto vincit hispania et lapide speculari, pigmentorum etiam deliciis, laborum excitatione, servorum exercitio, corporum humanorum durtia, vehementia cordis.

rerum autem ipsarum maximum est pretium in mari nascentium margaritis; extra tellurem crystallis, intra adamanti, smaragdis, gemmis, myrrinis; e terra vero exeuntibus in cocco, lasere, in fronde nardo, sericis vestibus, in arbore citro, in frutice cinnamo, casia, amomo, arboris aut fruticis suco in sucino, opobalsamo, murra, ture, in radicibus costo; ex iis, quae spirare convenit, animalibus in terra maximum dentibus elephantorum, in mari testudinum cortici; in tergo pellibus, quas seres inficiunt, et arabiae caprarum villo, quod ladanum vocavimus; ex iis, quae terrena et maris, conchyliis, purpurae. volucrum naturae praeter conos bellicos et commagenum anserum adipem nullum adnotatur insigne. non praetereundum est auro, circa quod omnes mortales insaniunt, decumum vix esse in pretio locum, argento vero, quo aurum emitur, paene vicensimum.

salve, parens rerum omnium natura, teque nobis quirritium solis celebratam esse numeris omnibus tuis fave.

The Biographies

The Porta Nigra Roman gate, Trier, Germany — Pliny's last official position was procurator of Gallia Belgica. The capital of this Roman province was Augusta Treverorum (Trier), named for the Treveri surrounding it.

THE LIFE OF PLINY by Suetonius

Translated by Alexander Thomson

PLINIUS SECUNDUS, a native of New Como , having served in the wars with strict attention to his duties, in the rank of a knight, distinguished himself, also, by the great integrity with which he administered the high functions of procurator for a long period in the several provinces intrusted to his charge. But still he devoted so much attention to literary pursuits, that it would not have been an easy matter for a person who enjoyed entire leisure to have written more than he did. He comprised, in twenty volumes, an account of all the various wars carried on in successive periods with the German tribes. Besides this, he wrote a Natural History, which extended to seven books. He fell a victim to the calamitous event which occurred in Campania. For, having the command of the fleet at Misenum, when Vesuvius was throwing up a fiery eruption, he put to sea with his gallies for the purpose of exploring the causes of the phenomenon close on the spot. But being prevented by contrary winds from sailing back, he was suffocated in the dense cloud of dust and ashes. Some, however, think that he was killed by his slave, having implored him to put an end to his sufferings, when he was reduced to the last extremity by the fervent heat.

INTRODUCTION TO PLINY THE ELDER by H. Rackham

GAIUS PLINIUS SECUNDUS — usually called Pliny the Elder to distinguish him from his nephew and ward, Gaius Plinius Caecilius Secundus, whose collected correspondence has preserved such a vivid picture of Roman life in the time of Trajan — belonged to a family of wealth and position in the North of Italy. He was born at Como in AD 23. After studying at Rome he started when twenty-three years old on an official career, serving in Germany under L. Pomponius Secundus, and rising to the command of a cavalry squadron. Seven or eight years later he came back to Rome and took up the study of law. During most of Nero's principate he lived in retirement, but towards the close of it he re-entered public life and became Procurator in Spain. He held this post until Vespasian won the principate, when he returned to Rome and was admitted to the Emperor's intimate circle; they had been acquainted in earlier days when at the front in Germany. He also launched into another field of activity, receiving a naval commission.

Throughout his busy career as a man of action he had kept up a constant practice of study and authorship. His interest in science finally cost him his life, at the age of 56. He was in command of the fleet at Misenum on the Bay of Naples in AD 79 when the famous eruption of Vesuvius took place on August 23 and 24, overwhelming the little towns of Herculaneum and Pompeii. Pliny as a man of science sailed across the bay to obtain a nearer view; he landed at Stabiae, and there was killed by poisonous fumes. The circumstances are recorded by his nephew in a letter to Tacitus (Pliny, *Epp.* VI. xvi). Vespasian had died and had been succeeded as Princeps by his son Titus two months before.

Pliny's earlier writings were on subjects suggested by his professional experiences, *e.g.*, the use of the javelin by cavalry, a history of the German wars, the training of the orator. During his retirement he produced *Dubius Sermo*, a treatise on grammar, and later a continuation down to his own time of the history of Rome by Aufidius Bassus; and lastly *Natural History*, the largest and most important of his works and the only one that has survived, although his historical writings on the defence of the German frontier and on the events of his own period were clearly works of value, the loss of which is much to be regretted. The substance of both, however, is doubtless largely incorporated in the writings of Tacitus and Suetonius, the former indeed repeatedly citing Pliny as his authority both in *Annals* and in *Histories*.

Natural History is dedicated to Titus, who is referred to in the Preface, § 3,

as 'sexies consul'; this dates the completion of the work at A.D. 77, two years before the author's death and the accession of Titus. It is an encyclopaedia of astronomy, meteorology, geography, mineralogy, zoology and botany, *i.e.* a systematic account of all the material objects that are not the product of man's manufacture; but among these topics, which are implied by the title, Pliny inserts considerable essays on human inventions and institutions (Book VII), as well as minor digressions on similar subjects interspersed in various other parts of the work. He claims in his Preface that the work deals with 20,000 matters of importance, drawn from 100 selected authors, to whose observations he has added many of his own; some of the latter he has indicated as they occur, and there are doubtless others not so labelled, but even so they form only a small fraction of the work, which is in the main a second-hand compilation from the works of others. In selecting from these he has shown scanty judgement and discrimination, including the false with the true at random; his selection is coloured by his love of the marvellous, by his low estimate of human ability and his consciousness of human wickedness, and by his mistrust of Providence. Moreover his compilations show little methodical arrangement, and are sometimes unintelligible because he fails to understand his authority, or else because he gives wrong Latin names to things dealt with by his authorities in Greek.

Nevertheless it is a mistake to underrate the value of his work. He is diligent, accurate, and free from prejudice. Though he had no considerable firsthand knowledge of the sciences and was not himself a systematic observer, he had a naturally scientific mind, and an unaffected and absorbing interest in his subjects. If he gives as much attention to what is merely curious as to what has an essential importance, this curiosity has incidentally preserved much valuable detail, especially as regards the arts; moreover anecdotes that used to be rejected by critics as erroneous and even absurd have now in not a few cases been corroborated by modern research. The book is valuable as an anthropological document: it is a storehouse of scattered facts exhibiting the history of man's reaction to his environment — the gradual growth of accurate observation, of systematic nomenclature and of classification, *i.e.* of Natural Science.

Pliny's own general attitude towards life, like that of other educated men of his day, may be styled a moderate and rational Stoicism.

A vivid account of his authorship written by his nephew may be appended here. The younger Pliny in reply to an enquiry from a friend, a great admirer of his uncle, gives (Epistles, III, v) a full list of his works, numbering seven in all and filling 102 libri or volumes. Of these the *Naturae historiarum (libri) triginta septem* is the latest. He calls it (§ 6) *opus diffusum, eruditum, nec minus verum quam ipsa nature*; and he goes on to describe by what means a busy lawyer, engrossed in important affairs and the friend of princes, contrived to find time for all this authorship (§ 7): 'He had a keen intelligence, incredible devotion to study, and a remarkable capacity for dispensing with

sleep. His method was to start during the last week of August rising by candlelight and long before daybreak, not in order to take auspices but to study; and in winter he got to work at one or at latest two a.m., and frequently at 12 p.m. He was indeed a very ready sleeper, sometimes dropping off in the middle of his studies and then waking up again. Before dawn he used to wait on the Emperor Vespasian, who also worked during the night; and then he went off to the duty assigned to him. After returning home he gave all the time that was left to study. Very often after lunch — with him a light and easily digested meal, as the fashion was in old days — in the summer, if he had no engagements, he used to lie in the sun and have a book read to him, from which he made notes and extracts; he read nothing without making extracts from it — indeed he used to say that no book is so bad but that some part of it has value. After this rest in the sun he usually took a cold bath, and then a snack of food and a very short siesta, and then he put in what was virtually a second day's work, going on with his studies till dinnertime. Over his dinner a book was read aloud to him and notes were made, and that at a rapid pace. I remember that one of his friends, when the reader had rendered a passage badly, called him back and had it repeated; but my uncle said to him, "Surely you got the sense? and on his nodding assent continued, Then what did you call him back for? This interruption of yours has cost us ten more lines!" Such was his economy of time. He used to leave the dinner table before sunset in summer and less than an hour after it in winter — this rule had with him the force of law. These were his habits when in the thick of his engagements and amid the turmoil of town. In vacation, only the time of the bath was exempted from study; and when I say the bath I mean the more central portions of that ritual, for while he was being shampooed and rubbed down he used to have something read to him or to dictate. On a journey he seemed to throw aside all other interests and used the opportunity for study only: he had a secretary at his elbow with book and tablets, his hands in winter protected by mittens so that even the inclemency of the weather might not steal any time from his studies; and with this object he used to go about in a chair even in Rome. Once I remember his pulling me up for going somewhere on foot, saying "You need not have wasted those hours! he thought all time not spent in study wasted. This resolute application enabled him to get through all those volumes, and he bequeathed to me 160 sets of notes on selected books, written on both sides of the paper in an extremely small hand, a method that multiplies this number of volumes! He used to tell how during his Lieutenant-governorship in Spain he had an offer of £3,500 for these notes, and at that date they were considerably fewer in number.'

TEXT

A large number of MS. copies of Pliny's *Natural History* have been preserved; the oldest date back to the 9th or possibly the 8th century A.D. Attempts have been made by scholars to class them in order of merit, but it

cannot be said that even those that appear to be comparatively more correct carry any paramount authority, or indeed show much agreement on doubtful points, while the mass of scientific detail and terminology and the quantity of curious and unfamiliar erudition that the book contains has necessarily afforded numerous opportunities for copyists' errors and for the conjectural emendation of the learned. Many of the textual problems raised are manifestly insoluble. Only a few variants of special interest are given in this edition.

Many editions have been printed, beginning with that published by Spira at Venice, 1469, an edition by Beroaldus published at Parma, 1476, and that of Palmarius at Venice, 1499. Commentaries start with *Hermolai Barbari Castigatianes Plinianaes, Romae*, 1492, 3.

The text of the present edition is printed from that of Detlefsen, Berlin, 1866; it has been checked by the Teubner edition of Ludwig von Jan re-edited by Karl Mayhoff in two volumes, 1905, 1909 (Volume I reissued 1933), which is admirably equipped with textual notes.

Useful are the commentary by C. Brotier in *usum Delphini* (1826); *Pliny: Chapters on the Hist. of Art* by K. Jex-Blake and B. Sellers (1896) and more recently *Pliny's Chapters on Chemical Subjects* by K. C. Bailey (1929); and D. J. Campbell's commentary on Book II (1936).

The Delphi Classics Catalogue

We are proud to present a listing of our complete catalogue of English titles, with [new titles](#) being added every month. Buying direct from our [website](#) means you can make great savings and take advantage of our instant Updates service. You can even purchase an entire series ([Super Set](#)) at a special discounted price.

Only from our website can readers purchase the special *Parts Edition* of our Complete Works titles. When you buy a Parts Edition, you will receive a folder of your chosen author's works, with each novel, play, poetry collection, non-fiction book and more divided into its own special volume. This allows you to read individual novels etc. and to know precisely where you are in an eBook. For more information, please visit our *Parts Edition* [page](#).

Series One

Anton Chekhov
Charles Dickens
D.H. Lawrence
Dickensiana Volume I
Edgar Allan Poe
Elizabeth Gaskell
Fyodor Dostoyevsky
George Eliot
H. G. Wells
Henry James
Ivan Turgenev
Jack London
James Joyce
Jane Austen
Joseph Conrad
Leo Tolstoy
Louisa May Alcott
Mark Twain
Oscar Wilde
Robert Louis Stevenson
Sir Arthur Conan Doyle
Sir Walter Scott
The Brontës
Thomas Hardy

Virginia Woolf
Wilkie Collins
William Makepeace Thackeray

Series Two

Alexander Pushkin
Alexandre Dumas (English)
Andrew Lang
Anthony Trollope
Bram Stoker
Christopher Marlowe
Daniel Defoe
Edith Wharton
F. Scott Fitzgerald

Pliny died in the eruption of Mt. Vesuvius (AD 79) on the beach at Stabiae

Main entrance of Villa San Marco in Stabiae — Stabiae was an ancient Roman town, located close to the modern town of Castellammare di Stabia, approximately 4.5 km southwest of Pompeii.

Plaster casts of the casualties of the pumice-fall at Pompeii
